Park Maintenance Standards
Fairfax County Park Authority

Foreword

The responsibility of maintaining the Fairfax County Park Authority's multitude of diverse facilities contained in over 23,000 acres of parkland and over 400 parks is shared by multiple operations with the Agency.

- The Park Operations Division manages all of the Park Authority's non-staffed parks and provides maintenance support to all staffed parks. There are six geographically defined maintenance operations (Area Crews) spread across the County that manage all aspects of maintenance in non-staffed parks and provide outside maintenance support to staffed parks within their defined areas. There are also five operations (Equipment Support, Facility Support, Forestry Crew, Mobile Crew, Turf Crew) that provide specialized maintenance support to the Area Crews and indoor and outdoor operations at the staffed parks countywide.
- The Park Services Division's manages maintenance operations at each of its golf courses, lake front parks, and within all of its RECenters.
- The Resource Management Division manages maintenance operations at many of its staffed parks, an active farm, and a garden park.

Due to the large number of parks requiring care, diversity of facilities within each park, and with the responsibility for maintaining varied types of facilities shared at times by multiple operations; the Park Authority has established a set of standards that are not defined by individual parks or park classification types, but are defined by facility types which allows the individual maintenance operations to customize their operations plans and to apply standards for only those facilities which they have responsibility for. The Park Authority's maintenance standards require the same frequency and standard of maintenance to be applied to all like facilities. For facilities that are similar in type but for varied reasons may require a different frequency or standard of maintenance, the standards are defined for the different levels of care.

Maintenance Tasks that are routine or recurring in nature are identified and listed for each Facility Type. The information relevant to each Maintenance Task is presented in three categories: Frequency, Labor Hours per Recurrence, and Total Annual Labor Hours. The Frequency identified with each Maintenance Task identifies how often maintenance is to occur and may show time frames for when during the year it should occur. When applicable, a total amount of occurrences per year is also given. The information provided can be used as a basis for the development of a preventive maintenance program when compared to the established maintenance inventory.

A standard has been created that identifies the total number of Labor Hours per Recurrence that are needed to complete a task. Since the number of staff available to complete tasks varies from operation to operation and day to day, the standards have been designed to allow each operation to determine the hours needed to complete the tasks regardless of the staff available to them. This also provides operations with varied crew sizes flexibility in determining how to efficiently and effectively complete multiple tasks. Tasks can either be completed by one staff member or by multiple staff members, depending upon the nature of the task. When one staff member is assigned to complete a task then the figure shown for that task under the Labor Hours per Recurrence category is approximately how long the task should take to complete. When multiple staff members are assigned to complete a task, then the figure shown for that task under the Labor Hours per Recurrence category can be divided by the number of staff members available to complete the task which will result in a figure that shows approximately how long the task should take to complete.

Maintenance tasks are reported and tracked through an Integrated Workplace Management System called Tririga. Tririga automates service requests and self service requests in demand maintenance, preventive maintenance, and project management for dispatching, approvals, scheduling, cost tracking, and reports such as leases, inventory, equipment use/life expectancy, and expenses. Park staff can initiate, track, manage, and report on all requests online.

Managed Landscapes

One of the Maintenance Tasks associated with some of the facilities in the Managed Landscapes section is mowing. The Park Authority has established five levels of mowing classifications that are applied to a portion of or all of the mowing areas within a park.

Class A – Formal lawn areas which typically are associated with facilities that are rented for weddings, meetings, or parties. Areas are mowed once every seven days at a height of 2 ½”.

Class B – Parks containing one or more developed facility. Facilities include: staffed facilities not already mowed as a Class “A”, recreation centers, athletic fields, courts, playgrounds, picnic and pavilion areas, amphitheaters, active historical and cultural resource properties, and master planned open play areas. Trail systems that do not directly support a developed facility, or are not within a park with a developed facility, will not be mowed as a Class “B”. Areas are mowed once every 14 days at a height of 2 ½” to 3”.

Class C – (This Class is also addressed in the Trails and Crossings Section) Parks containing areas with established and maintained natural surface trails (i.e. grass, dirt, woodchip), or street frontage developed with a sidewalk or surfaced roadside trail within a residential area, not already being mowed as part of a Class “A” or “B” site. Areas are mowed once every 28 days at a height of 2 ½” to 3”.

Class D – (This Class is addressed in the Trails and Crossings Section) Parks containing areas with surfaced trails (i.e. concrete, stone dust, gravel, asphalt), that are not already being mowed as part of a Class “A”, “B”, or “C” site. If there is street frontage with a sidewalk or surfaced roadside trail that connects to a Park Authority maintained trail and is adjoining a commercial or industrial area, then the street frontage should be mowed along with the trail. These trails are typically within a stream valley or a park without any developed facilities. Areas are mowed 3 times per year at a height of 3” to 4”.

Class E – Parks containing areas that are designated for meadow management, stormwater features where woody plants are undesirable, or planned for future development. It may be necessary to remove any large diameter trees and bushes prior to mowing. Areas are mowed once every 1 to 2 years at a height of 3” to 4”.

Much of the Park Authority’s mowing is performed with contracted mowing services. Staff performs all specialized mowing such as the mowing of athletic fields and golf courses, the mowing of facilities that require infrequent mowing like trails and meadows, and the mowing of parks where contracted mowing services have not yet been established.

Summary

While it is important to identify the individual Maintenance Tasks associated with various facilities, it is also beneficial to summarize the tasks for each facility. The Summary section was developed to provide a quick reference guide showing the total annual labor requirements to maintain each facility.

The Alexandria City Marina Operations Section of the Park Operations and Capital Development Division's mission is to:

“Provide efficient professional service to visiting boaters, tourists and citizens while providing an inviting maritime atmosphere in a manner that reflects well on the character of the City of Alexandria”

In order to fulfill the mission, Alexandria City Marina personnel are trained to:

- Act as goodwill ambassadors for the City by promoting tourism and local business patronage.
- Insure that Alexandria City Marina and Docking operations maintain a favorable relationship with neighboring residents and businesses.
- Exercise time and material cost consciousness, while implementing business practices that meet or exceed Marina Industry and City Standards. These practices are carried out in a labor-intensive environment requiring acute safety awareness on the part of each employee.
- Promote clean Marina practices and assist in developing programs and procedures to keep the Potomac River and City waterfront environment safe.

History

The renovation of the piers at the Torpedo Factory was completed in the spring of 1985. Construction was completed on the new Founders Park piers the following year. The combined projects provided the City with 51 transient boat slips for small vessels up to 40 feet in length, and a number of berthing areas for larger charter, cruise and ship of character vessels. With the anticipation of boating and pedestrian activity in these areas increasing, a City policy was developed concerning docking, security control, and fees.

In 1985 there was one commercial vessel permanently docked at the Alexandria City Marina site, the *Cherry Blossom*, and one ship of character docked at Waterfront Park, *Schooner Alexandria*. Today, six commercial vessels which provide site seeing tours, shuttle service, and private charters dock at the Alexandria City Marina. These vessels are the *Matthew Hayes*, *Miss Christin*, *Admiral Tilp*, *Cherry Blossom*, *Miss Mallory*, and *Potomac Bell*. One ship of character, the *Dory Boat*, is docked at Waterfront Park.

Today, Alexandria City Marina Staff oversee and coordinate the operation and maintenance of 61 boat slips, three T-head piers and hundreds of feet of seawall docking space within the Alexandria City Marina, as well as seawall docking at Waterfront Park. Alexandria City Marina Staff also serve as the first point of contact for citizens and tourists entering this gateway to the City of Alexandria, the City's waterfront and historic district.

Background

Overview

The Alexandria City Marina is surrounded by parks, quaint restaurants, shops, historic sites, and walking/bike trails. The Alexandria City Marina also hosts public concerts. For boating enthusiasts, the Alexandria City Marina is a 3-mile cruise from the Washington Marina in DC and the James River Creek Marina in Maryland, making it widely accessible within the region. In addition to affording a spectacular view of the Potomac River, the Alexandria City Marina has overnight boat slip docking with additional short-term docking space on sea walls and adjacent areas. The Alexandria City Marina offers docking for pleasure boats and commercial vessels.

Commercial Slip Agreements: Presently, the City holds license agreements with two commercial companies: Potomac River Boat Company (PRC) and L.A. Yachts. PRC docks five boats at the Alexandria City Marina. The vessels are used for tours, water taxi, and charters. L.A. Yachts docks the *Potomac Belle* at the Alexandria City Marina, this vessel is used solely for charters.

Each vessel has its own license agreement. The City negotiates with the company on the terms and docking fees for each vessel when the individual license comes up for renewal.

Current Services Provided

Current Operations

Pleasure Boat License Agreements: Forty slips are reserved for pleasure boat owners holding license agreements. The agreements run 1 April through 31 March, and the docking fees are paid on an annual basis. Rate increases went into effect July 1, 2006. The current rate is \$7.25 per foot per month, paid on an annual basis. The Alexandria City Marina maintains a wait list for the pleasure boat year-round slip spaces. There are approximately 50 names on the waitlist. By City Ordinance, pleasure boat license agreements are limited to boats with a maximum length of 40 feet.

Transient Pleasure Boats: The balance of the pleasure boat docking slips is used for transient boats. The fee for short-term visits, with a maximum length of four hours, is ten dollars. Visits over four hours are considered overnight stays and are assessed at a fee of one dollar per foot, per night during the off-season, and one dollar and a half per foot, per night for overnight docking in-season. Currently, during peak times in-season, the Alexandria City Marina is unable to accommodate all requests for docking space.

Commercial Vessels (short-term): Visiting cruise, charter, and commercial vessels, and ships of character dock at the Alexandria City Marina. The docking fee is three dollars per foot, per day. Two T-heads (one at the end of the A/B Pier, and one at the end of the G/H Pier) are used for docking these ships and large private yachts. Demand for these larger docking areas far exceeds the ability of the Alexandria City Marina to provide service. In-season, many requests are turned down due to lack of space. Commercial vessels seeking to dock more than four times per month must have approval from City Council. Visiting tall ships and ships of character add to the City's waterfront image and attract tourists.

Alexandria Fire Boat: The City's Fire Department docks their fire vessel at the Alexandria City Marina. The vessel is currently located on the E/F Pier.

Utilities: Of the 61 docking slips, two have 50 amp connections and fifty-nine have one 30 amp connection each. Both the A/B and C/D Pier T-heads have one 50 amp connection each. The G/H Pier T-head has one 100 amp and three 50 amp connections. A fire suppression system was installed in 2002. All slips and T-heads have one water bib hook-up each. Currently no phone/cable hook-up or laundry facilities are provided.

Showers/Restrooms: Shower and restroom facilities are only available for license agreement holders and overnight transient boaters. The facility is secured with an electronic key card system.

Pump-out: A pump-out station is available for agreement holders to use as part of their contract. For all others docking at the Alexandria City Marina the fee is \$25.00 per pump-out. Use of the station must be scheduled in advance, as the equipment is located in a docking space.

Waterfront Festival 2006

Festivals and Events

Waterfront Festival

The City Marina coordinates with the Department's Special Events Section and the American Red Cross every year in hosting the Waterfront Festival. This event commemorates Alexandria's maritime heritage. It features a number of tall ships, a blessing of the fleet, river cruises, races, arts and crafts, exhibits, food, music, and fireworks.

Host Tall Ships

Each summer the City Marina plays host to a variety of tall ships. Most notably this past summer were the *Kalmar Nyckel*, *Schooner Virginia* and *Sultana*. These ships are a huge draw for the public and offer a glimpse into Alexandria's history and rich maritime heritage.

Department of RPCA Staff

Tall Ship Approaching Marina

Parade of Lights

Each December, Alexandria's harbor lights up for this annual parade of boats. Boat owners, who compete for great prizes, beautifully and imaginatively decorate their vessels. These sailing and powerboats cruise the City's historic waterfront on the Potomac River, making their way up to Washington, DC for the conclusion of the parade. Boat owners are not the only people who can enjoy the event, as there are a number of Alexandria City Marina based activities including music, and on shore attractions for the visiting public.

Department of RPCA Staff

Vessel Safety Checks

In coordination with the United States Coast Guard (USCG), the Alexandria City Marina hosts this special day to allow its boaters and others on the river a chance to stop in and have the USCG inspect the vessels to ensure safe boating on the City's waterfront.

- Accommodate additional tour boat to be added to City waterfront to serve National Harbor in 2008.
- Clear logs and debris from the Alexandria City Marina.
- Perform daily maintenance of Alexandria City Marina boardwalks, sidewalks, gazebos and seawalls.
- Dock boats and collect related fees at Waterfront Park.
- Pick up litter and maintain the brick area behind the Torpedo Factory Arts Center.
- Coordinate and adhere to Homeland Security requirements.

Core Activities

- Coordinate Alexandria City Marina docking activities for tour boats, charter and commercial vessels, ships of character, transient boat visits per City Code 6.3.
- Assist boating traffic approaching and departing Alexandria City Marina.
- Assist boating traffic approaching and departing Waterfront Park.
- Maintain the navigational areas in the Alexandria City Marina to provide safe boating access:
 - Remove debris from the water.
 - Maintain Alexandria City Marina piers.
 - Maintain Alexandria City Marina amenities (ladders, pier lights, rescue rings, railings, etc.).
 - Maintain Alexandria City Marina walkways.
 - Maintain Alexandria City Marina grassy areas.
- Accept and process user fees and boat docking reservations.
- Staff dockmaster office and Alexandria City Marina facility and answer visitor questions.
- Provide storm preparedness planning and staffing.

Service Levels and Maintenance Options

Service and Maintenance Levels

Level 1 - Meeting Future Needs

Provide Core Activities

Provide Special Event Assistance and Additional Duties

Operating Hours: April-Oct: Mon-Th, 8am-10pm; Fri, 8am-12pm; Sat, 8am-12pm; Sun, 8am-9pm Nov-March: 9am-6pm daily

Staffing Levels: Three additional full-time staff, add seasonal funds as needed

Clean-up: Purchase boat and trash cleaning system for clean-up, provide staffing to operate, contract for debris removal

Security: Install security cameras in key areas along the waterfront

Facility: Explore possibilities for additional slip spaces and floating pier system

Operating Cost: \$786,265/year plus CIP

Level 2 - Meeting Projected Needs

Provide Core Activities

Provide 50% of Additional Duties

Operating Hours: April-Oct: Mon-Th, 8am-9pm; Fri, 8am-10pm; Sat, 8am-10pm; Sun, 8am-9pm Nov-March: 9am-5pm daily

Staffing Levels: Increase one part-time staff to full-time, add seasonal funds as needed

Clean-up: Contract Trash Cat service and staffing to monitor the contract

Security: Increase security contract to cover all un-staffed hours; install security system on piers

Facility: Explore the possibilities to create larger slip spaces, upgrade utilities; provide individually metered electrical hookups; repair or replace rope railings, sidewalks; and rebuild the Dockmaster's office

Operating Cost: \$447,442/year plus CIP

Level 3 - Current Level

Provide Core Activities

Operating Hours: April-Oct: Mon-Th, 10am-9pm; Fri, 10am-10pm; Sat, 8am-10pm; Sun, 8am-9pm Nov-March: 10am-5pm daily

Staffing Levels: In-season- 1 full-time, 2 part-time, plus seasonal, Out of season- 1 full-time, 2 part-time

Clean-up: Lack of staff or equipment necessary to clean up waterways

Security: 9pm-5am, no coverage in early morning; insufficient coverage during peak times; no security system on piers

Facility: Maintain at current level; including existing docking slip sizes and number, amount and type of utilities provided, stationary dock system, and present Dockmaster's office conditions

Budget FY07: \$226,637/plus CIP

Suggestions for Closing the Gap

- \$66,000. Fund the two Assistant Dockmaster positions as full-time employees. The Alexandria City Marina is currently funded for one 40 hour permanent full-time Dockmaster and two 30 hour permanent part-time Assistant Dockmaster positions.
- \$65,900. Alexandria City Marina staff funding needs to be increased to ensure that the Alexandria City Marina can be staffed from 8:00 a.m. - 9:00 p.m. daily. Contractor funding needs to be increased to ensure that the security contractor staffs the Alexandria City Marina from 9:00 p.m. - 8:00 a.m. daily and provides two staff persons on Friday, Saturday, and Sunday evenings. This funding will help to resolve unauthorized docking, vandalism and trespassing issues.
- \$30,000. Temporary staff and contracted security cost. Provide additional funding for contract staff for additional fall operating hours.
- If the staff funding gaps cannot be filled significantly, reduce the Marina operating hours to allow for a minimum of two Alexandria City Marina staff per shift for the off-season months and four Alexandria City Marina staff per shift for the in-season months (April - October).
- \$8,500. Purchase a work/maintenance cart for the use of the Alexandria City Marina staff to patrol the waterfront area, move supplies and equipment, and periodically assist with Alexandria City Marina trash removal.
- \$69,500. Fund part-time and seasonal staff to perform reservation, duties at the Alexandria City Marina.

Operational Changes/Actions To Be Taken**Suggestions for Closing the Gap**

- \$21,685. Additional funding needed for Alexandria City Marina supplies and materials. The Alexandria City Marina is funded \$16,000 annually for supplies and materials. The actual cost of supplies and materials is approximately \$37,685.

Suggestions for Closing the Gap

- Cost of annual Trex decking repairs are paid for by General Services. In addition, RPCA and General Services split the cost for water pipe repairs when the cost exceeds \$7,000. For the past two years the average cost to repair the water system damaged by winter freeze was \$14,000.
- \$45,000. Increase and designate capital improvement funding for repairs. Currently the Alexandria City Marina shares \$90,000 annually in capital funding with the City's swimming pools. The Alexandria City Marina needs a capital improvement funding program specifically designated for the Alexandria City Marina, waterfront and docking repairs. The Alexandria City Marina's equipment and amenities are continually subjected to the impacts of the environment including: storm surges, storm force winds, driving rains and UV damage. It is imperative that capital funding be provided to repair and replace infrastructure and amenity damages before they escalate in cost and risk.

Operational Changes/Actions To Be Taken

Suggestions for Closing the Gap

- A structural and utilities study of the Alexandria City Marina should be conducted to examine the Alexandria City Marina piers, seawalls, electric and water utilities, and associated ancillary amenities.

During the Waterfront Planning Process, an overall master plan for the Alexandria City Marina should be included.

Seek grant funding through the Boating Infrastructure program to offset some of the costs that will be needed to update and upgrade the Alexandria City Marina facility.

The Alexandria City Marina requires structural evaluation of the piers and bulkheads.

Park Maintenance Standards
Fairfax County Park Authority

Foreword

The responsibility of maintaining the Fairfax County Park Authority's multitude of diverse facilities contained in over 23,000 acres of parkland and over 400 parks is shared by multiple operations with the Agency.

- The Park Operations Division manages all of the Park Authority's non-staffed parks and provides maintenance support to all staffed parks. There are six geographically defined maintenance operations (Area Crews) spread across the County that manage all aspects of maintenance in non-staffed parks and provide outside maintenance support to staffed parks within their defined areas. There are also five operations (Equipment Support, Facility Support, Forestry Crew, Mobile Crew, Turf Crew) that provide specialized maintenance support to the Area Crews and indoor and outdoor operations at the staffed parks countywide.
- The Park Services Division's manages maintenance operations at each of its golf courses, lake front parks, and within all of its RECenters.
- The Resource Management Division manages maintenance operations at many of its staffed parks, an active farm, and a garden park.

Due to the large number of parks requiring care, diversity of facilities within each park, and with the responsibility for maintaining varied types of facilities shared at times by multiple operations; the Park Authority has established a set of standards that are not defined by individual parks or park classification types, but are defined by facility types which allows the individual maintenance operations to customize their operations plans and to apply standards for only those facilities which they have responsibility for. The Park Authority's maintenance standards require the same frequency and standard of maintenance to be applied to all like facilities. For facilities that are similar in type but for varied reasons may require a different frequency or standard of maintenance, the standards are defined for the different levels of care.

Maintenance Tasks that are routine or recurring in nature are identified and listed for each Facility Type. The information relevant to each Maintenance Task is presented in three categories: Frequency, Labor Hours per Recurrence, and Total Annual Labor Hours. The Frequency identified with each Maintenance Task identifies how often maintenance is to occur and may show time frames for when during the year it should occur. When applicable, a total amount of occurrences per year is also given. The information provided can be used as a basis for the development of a preventive maintenance program when compared to the established maintenance inventory.

A standard has been created that identifies the total number of Labor Hours per Recurrence that are needed to complete a task. Since the number of staff available to complete tasks varies from operation to operation and day to day, the standards have been designed to allow each operation to determine the hours needed to complete the tasks regardless of the staff available to them. This also provides operations with varied crew sizes flexibility in determining how to efficiently and effectively complete multiple tasks. Tasks can either be completed by one staff member or by multiple staff members, depending upon the nature of the task. When one staff member is assigned to complete a task then the figure shown for that task under the Labor Hours per Recurrence category is approximately how long the task should take to complete. When multiple staff members are assigned to complete a task, then the figure shown for that task under the Labor Hours per Recurrence category can be divided by the number of staff members available to complete the task which will result in a figure that shows approximately how long the task should take to complete.

Maintenance tasks are reported and tracked through an Integrated Workplace Management System called Tririga. Tririga automates service requests and self service requests in demand maintenance, preventive maintenance, and project management for dispatching, approvals, scheduling, cost tracking, and reports such as leases, inventory, equipment use/life expectancy, and expenses. Park staff can initiate, track, manage, and report on all requests online.

Managed Landscapes

One of the Maintenance Tasks associated with some of the facilities in the Managed Landscapes section is mowing. The Park Authority has established five levels of mowing classifications that are applied to a portion of or all of the mowing areas within a park.

Class A – Formal lawn areas which typically are associated with facilities that are rented for weddings, meetings, or parties. Areas are mowed once every seven days at a height of 2 ½”.

Class B – Parks containing one or more developed facility. Facilities include: staffed facilities not already mowed as a Class “A”, recreation centers, athletic fields, courts, playgrounds, picnic and pavilion areas, amphitheaters, active historical and cultural resource properties, and master planned open play areas. Trail systems that do not directly support a developed facility, or are not within a park with a developed facility, will not be mowed as a Class “B”. Areas are mowed once every 14 days at a height of 2 ½” to 3”.

Class C – (This Class is also addressed in the Trails and Crossings Section) Parks containing areas with established and maintained natural surface trails (i.e. grass, dirt, woodchip), or street frontage developed with a sidewalk or surfaced roadside trail within a residential area, not already being mowed as part of a Class “A” or “B” site. Areas are mowed once every 28 days at a height of 2 ½” to 3”.

Class D – (This Class is addressed in the Trails and Crossings Section) Parks containing areas with surfaced trails (i.e. concrete, stone dust, gravel, asphalt), that are not already being mowed as part of a Class “A”, “B”, or “C” site. If there is street frontage with a sidewalk or surfaced roadside trail that connects to a Park Authority maintained trail and is adjoining a commercial or industrial area, then the street frontage should be mowed along with the trail. These trails are typically within a stream valley or a park without any developed facilities. Areas are mowed 3 times per year at a height of 3” to 4”.

Class E – Parks containing areas that are designated for meadow management, stormwater features where woody plants are undesirable, or planned for future development. It may be necessary to remove any large diameter trees and bushes prior to mowing. Areas are mowed once every 1 to 2 years at a height of 3” to 4”.

Much of the Park Authority’s mowing is performed with contracted mowing services. Staff performs all specialized mowing such as the mowing of athletic fields and golf courses, the mowing of facilities that require infrequent mowing like trails and meadows, and the mowing of parks where contracted mowing services have not yet been established.

Operating Equipment

Staff members using equipment or performing maintenance or repairs on equipment should always follow the instructions and guidelines from the Operators Manual provided with each piece of equipment.

The Park Authority's vehicles and trailers are maintained and repaired by the Fairfax County's Department of Vehicle Services and are therefore not covered within the Park Authority's Maintenance Standards.

Natural Grass Athletic Fields

It has become apparent that natural grass fields are being replaced with synthetic surfaces due to the belief that synthetic surfaces are less expensive and easier to maintain than natural surfaces. A properly maintained synthetic is not necessarily an effective replacement if lower maintenance costs are the goal. The primary reason natural grass fields are being replaced by synthetic is usually due to the lack of initial maintenance dollars. Proper construction and maintenance of a natural grass field will provide a safe playable surface that is natural and pleasing to players, parents, and coaches. Additionally, natural grass fields are often replaced by synthetic for aesthetic reasons, perhaps because the natural grass has a great deal of wear in the highly trafficked areas by the end of the season. However, one should not confuse aesthetics with playability because a worn field often still plays very well, plus, the natural grass can be restored if the right maintenance or strategies are employed. The following technical resource provides a detailed look into the benefits and cost effectiveness of maintaining natural grass fields.

Natural Grass Benefits

Environmental Benefits of Natural Grass Surfaces

I. Water Conservation

A major point of discussion with natural turfgrass systems is the amount of water required to irrigate. Quite simply, most sports field systems equipped with supplemental irrigation are overirrigated. Most water overuse is due to human error or miscalculation. Understanding and following proper irrigation practices will lead to water conservation. Water conservation can also be achieved by:

1. Using drought resistant turfgrass species and cultivars within species. Visit the Turfgrass Water Conservation Alliance website for species and varieties that are recommended for drought resistance in your area.
2. Allowing turfgrass to grow a little taller for deeper root development based on season and turfgrass species.
3. Allowing turfgrass to enter dormancy in drought situations.
4. Encouraging deeper rooting of turfgrass cultivars by watering deeply and infrequently. Apply only what your soil can infiltrate in one hour. Avoid puddles and runoff.
5. Using recycled water sources for irrigation.
6. Install rain sensors to shut down irrigation during a rain shower.
7. Installation of devices such as soil moisture probes or evapotranspiration pans will improve irrigation efficiency.

Natural Grass Athletic Fields

II. Groundwater preservation and recharge

1. Dense aboveground turfgrass biomass traps and holds water which reduces excess runoff and allows more water to infiltrate into the soil. Ten-thousand square feet can absorb up to 6000 gallons of water.
 - a. A research study in Maryland compared surface water runoff losses between turfgrass and cultivated tobacco grown at the same site. During the tobacco-growing season (May-September), surface water runoff losses for the tobacco were 11 times greater than runoff losses from perennial turfgrass.
2. Extensive, fibrous turfgrass root system filters water percolating through the soil to enhance groundwater recharge.
3. Application of fertilizer has negligible potential for nutrient elements to pass through the rootzone into groundwater or be transported by runoff into surface water. Turfgrass roots are highly efficient at uptake of applied nutrients.
 - a. A research study in Maryland followed total losses for nitrogen and phosphorus between turfgrass and cultivated tobacco grown at the same site. Runoff from the tobacco plantings had 195 times more N and 240 times more P than runoff from the turf.
4. Proper fertilizer and pesticide applications keep water safe. Product selection and characteristics, timing, and equipment used in the application can all greatly improve both the product performance and non-target effects on the environment. Turfgrass managers typically avoid applying these materials just before heavy rain, on to frozen soil, or on dormant turfgrasses because these situations can increase the potential for surface and groundwater contamination. Avoid getting fertilizer prills on any hardscape where runoff from rain or irrigation can carry fertilizer into drainage systems.
5. Current trends with turfgrass fertilization are toward low nutrient application rates on a more frequent basis (i.e. 'spoon feeding', with product often delivered through a spray system) and an expanded use of slow release nitrogen carriers. Both of these practices are environmentally friendly.
6. Properly managed turfgrass ecosystems support abundant earthworm populations, which contribute to increased macropore space in the soil, resulting in higher soil water infiltration rates, higher water-holding capacity, and improved soil structure.

III. Enhanced entrapment and biodegradation of synthetic organic compounds

1. Turfgrass systems catch and filter polluted runoff water.
2. Decaying turfgrass leaves, crowns, stems, roots, and thatch support large populations of microscopic decomposers that reside in the soil. Soil microbes also decompose pesticides, potentially noxious organic chemicals, and various bacteria producing bodily fluids such as blood, vomit, spit, and phlegm.

IV. Soil erosion control and dust stabilization

1. Turfgrass root systems and aboveground canopy are one of the most cost efficient ways to control water and wind erosion of soil and increase water infiltration into the soil.
2. Turfgrass functions as a vegetative filter that reduces the quantity of sediment entering surface streams and rivers.
3. High shoot density and root mass of turfgrass contributes to soil surface stabilization to reduce erosion. A high biomass matrix provides resistance to lateral surface water flow.
4. Turfgrasses act as a trap for dust and other particulate matter, improving air quality.

V. Improved atmospheric conditions

1. Turfgrass contributes to reductions in noise levels by absorbing, deflecting, reflecting, and refracting the various sounds. There are also reductions in discomforting glare and light reflection.

Natural Grass Athletic Fields

2. Turfgrass reduces atmospheric carbon dioxide and releases oxygen. Grass plants produce their own food through the process of photosynthesis. The plants take in carbon dioxide and convert it into simple sugars. As a result of photosynthesis and taking up of carbon dioxide, oxygen is released into the atmosphere.
 - a. During an active growing season, 25 square feet of healthy turf will provide enough oxygen for one adult person for one day.

VI. Accelerated soil restoration

1. Improve soils through the addition of organic matter. As plant tissue dies, it is incorporated into the rootzone as organic matter.
2. Soil restoration of environmentally damaged areas (i.e. construction sites with topsoil stripped, burned-over land, garbage dumps, eroded rural landscapes, mining operations, and steep timber harvest areas) is accelerated when turfgrass is planted.

VII. Substantial heat dissipation-temperature moderation

1. Turfgrass dissipates high levels of radiant heat through the cooling process of transpiration.

Synthetic Surface Temperature Case Study

In spring 2002, Brigham Young University’s athletic department installed a synthetic surface on half of its football practice field. The other half is sand-based natural turf. Complaints about the heat of the synthetic surface prompted researchers to take temperature measurements and compare them with natural turf, bare soil, asphalt and concrete. They recorded temperatures at the surface and 2 inches below the surface.

Temperatures of surfaces at BYU practice fields in June 2002. Average air temperature = 81.42°F

Asphalt	109.62°F					
Bare Soil	98.23°F		90.08°F			

Source: “Synthetic Surface Heat Studies,” C. Frank Williams and Gilbert E. Pulley, Sports Turf Managers Association Annual Conference, January 2004.

The surface of the synthetic field averaged 117 degrees Fahrenheit while the natural grass surface averaged 78 degrees Fahrenheit and asphalt averaged 109 degrees Fahrenheit. Two inches below the synthetic turf surface, it was still 28 degrees hotter than the natural turf surface. Irrigation is installed on synthetic fields to help control surface temperatures. Researchers at Penn State University have found that temperature reductions last about 20 minutes. Researchers at BYU have found that irrigation cooled the synthetic surface from 174 degrees Fahrenheit to 85 degrees Fahrenheit, but during the summer in Utah, the surface could be back to 120 degrees Fahrenheit in five minutes.

These high temperatures make it dangerous for athletes as it increases the incidence of heat stroke, muscle cramping and overall fatigue.

Natural Grass Athletic Fields

Work conducted at the University of Missouri Turfgrass Research Center in 2010 regularly showed synthetic surface temperature increases of 50 to 70 degrees Fahrenheit over natural grass. Factors such as light, cloud cover, and breezes of 3 to 5 mph, reduced synthetic surface temperatures by 30 degrees. However, on clear, blue-sky days in mid-summer where air temperatures were at 98 degrees Fahrenheit with calm winds, temperatures would exceed 160 degrees Fahrenheit on synthetic surfaces. Natural grass under these conditions would range between 99 and 102 degrees.

VIII. Overall increase in human health

1. Closely mown areas of turfgrass reduce the number of nuisance pests that reside in taller grasses, such as ticks, which can carry Lyme disease and Rocky Mountain Spotted Fever.
2. Well maintained turfgrass areas are less likely to have weeds that are responsible for allergy-related pollens.
3. Fields with good quality turfgrass cover have higher traction, cushioning, and resiliency, and lower surface hardness, reducing the probability of injury in contact sports.
 - a. Ball roll and bounce are influenced by the grass cover and its management, as are player movements, such as running, stopping, pivoting, dodging, jumping, landing, and walking.
4. Turfgrasses can offer a low cost, safe playing surface for athletes.
 - a. Surface hardness is important when considering head injuries. Surface hardness is measured by dropping a weight (referred to as a missile) from a fixed height onto the playing surface. The missile contains an accelerometer that measures how fast the missile stops once it hits the surface. A numerical value, referred to as Gmax, is then generated. A high Gmax value means the missile stopped quickly and there is less absorption of force by the athletic surface and more absorption of force by the athlete, which indicates the surface is hard.

Fields can be tested using a Clegg Impact Tester or F355 device. Gmax values taken from each of these devices are not interchangeable because the missiles are different weights and are not dropped from the same height. In other words, 100 Gmax measured with the Clegg is not the same as 100 Gmax measured with the F355.

The NFL field testing program requires playing surface hardness of both natural and synthetic turf fields to be measured with the Clegg Impact Tester. Fields must be tested in multiple locations prior to every game and must be below 100 Gmax at all locations. If hardness levels begin to approach 100, steps must be taken to lower the Gmax value.

The American Society for Testing and Materials (ASTM) standard (F1936) uses the F355 device to test surface hardness on natural and synthetic fields and sets an upper limit of 200 Gmax. According to ASTM Standards, a value greater than 200 Gmax qualifies for the expectation that life threatening head injuries may occur. At this point the surface should be repaired or replaced. The Synthetic Turf Council (STC) recommends Gmax does not exceed 164 when using the F355 device.

Most synthetic fields upon completion measure Gmax in a range of 45 to 60 until the infill material settles in. In time, with use, relocation of crumb rubber, and separation of infill materials (those with sand and crumb rubber), increased Gmax readings can elevate to greater than 100 (using the Clegg Impact Tester). Gmax readings on synthetic fields are related to the thickness of the infill and proper grooming recommendations. Natural grass fields have several options to manage field hardness – increase soil moisture, mow taller, maintain good density, and add amendments. In a Penn State trial (2004), Gmax readings (using a Clegg Impact Tester) on a silt loam soil covered in Kentucky bluegrass ranged between 50 and 84 where traffic was applied and between 50 and 70 Gmax without traffic. Soil moisture ranged between 30 and 35 percent.

Natural Grass Athletic Fields

5. Aesthetics and recreational opportunities enhance physical and mental health of participants, relieve stress and contribute to enjoyment of life.
 - a. Studies have been done to test the health benefits of nearby green spaces by testing blood pressure and heart rate of participants. Results show that views of open green spaces promote quicker recovery in hospital patients. Participants in another study had quicker and more complete recovery from induced stress when exposed to turfgrass and other landscape settings compared to those who were not.
6. Native soil fields hold less potential for injury.
 - a. The most frequent injuries sustained on sports fields are those to the ankles and knees from rotating and changing directions on the field surface. A recent study at Michigan State University (Villwock et al., 2008) measured the effects that size and structure of infill materials would have on the rotational resistance of cleated shoes. Sixteen different surfaces were tested, including native soil and sand based fields, using testing methods conforming to the ASTM standard method for traction characteristics of an athletic shoe-surface interface. Cleated football shoes were mounted on a rigid foot-form and used on the surfaces. Results found that torque was significantly affected by field surface. Native soil fields reported the lowest torque overall.
7. Natural fields are the preferred playing surface among athletes. In 2010, a survey was conducted to evaluate what kind of playing surface NFL players preferred. 1619 players from all 32 teams participated in this survey.
 - 69% of the players preferred to play on natural grass fields
 - 14% preferred artificial infill
 - 9% had no preference

Players were also asked how they thought synthetic and natural grass surfaces affected their physical health:

	Artificial Infill Surface	Natural Grass Surface
Surface more likely to contribute to injury	82%	16%
Surface more likely to cause soreness and fatigue	89%	9%
Surface more likely to shorten career	89%	7%
Surface more likely to negatively affect quality of life after football	64%	4%

Natural Grass Limitations

I. Overuse

The overuse of many community sports facilities can push the limits of turfgrass to recover. Excessive traffic leads to compaction and bare areas, which can cause a surface to be unsafe and unplayable. Scheduling more events than a field can handle results in overuse.

To help prolong the life of natural fields:

- Rotate activities between fields.
- Limit use of fields to only necessary events, especially during rainy weather patterns.
- Change daily location of practices on the field.
- Shift fields of play to shift areas of concentrated wear.
- Buy portable goals and move them around the field for drills and practice, thus limiting wear in the area of the mounted goal posts.
- Have players do individual warm-ups off of the field.

Natural Grass Athletic Fields

- Execute team drills outside of painted numbers.
- Spread seed of climate and sport-appropriate, fast germinating grass species in wear areas before games and practices.
- Regularly educate field users regarding the importance of rotating traffic/use patterns around fields in order to maintain safety and optimum playability.

II. Standing Water

Inclement weather can lead to standing water and muddy conditions if the drainage system is not effective. This causes surfaces to be unsafe and unplayable.

To solve standing water problems, make sure there is a sufficient crown (i.e. slope) to move water off the field effectively. Regularly check to see that any installed collection basins and/or sub-surface drainage systems are operating effectively. If rain tarps are available, they can help keep water off of properly crowned fields and greatly improve field playability. Field managers should have the option to cancel events when inclement weather accelerates damage to the field.

Construction of Natural Grass Fields

The demise of many natural grass fields is in the initial construction or renovation work being done. Short-cuts due to budget constraints are temporary and will cost more in the long run. Well-constructed sports fields with proper maintenance will provide the type of playing surface so many parents, coaches and players desire.

Construction and renovation should begin with the selection of a knowledgeable contractor - someone with experience in sports field design and construction who carries a good portfolio with references and may be a certified field builder (CFB).

A good first step for field construction and renovation is ensuring the field has the correct crown and slope. This is where dollars should be spent in any project because if surface drainage is lacking, all else is lost. Crowns and slopes are equally important whether your field is constructed with native soils or modified soils or will have a sand-cap or sand-base. Drainage (surface and internal) is critical to a successful natural grass field.

Selection of the best growing medium for the turfgrass rootzone is also crucial for field health. The soil can be made up of native soil (modified or not) or a sand-based rootzone. The soil texture determines the degree of drainage (surface and internal), water holding capacity, and nutrient holding capacity.

Irrigation may or may not be a luxury and should be strongly considered for the durability and safety of natural grass fields. There are many different types of irrigation to consider, some being more efficient than others. Irrigation types and design should be based on the water source and pressure, number of fields or area, region of the country and type of turfgrass being grown. Regardless of the irrigation type, conduct regular irrigation audits to ensure distribution uniformity and be efficient with water usage. Mismanagement of irrigation will lead to other issues such as hot spots or diseases.

Turfgrass species selection is also an important component when constructing or renovating natural grass fields. Consider turfgrass varieties that offer good disease resistance and wear tolerance. The National Turfgrass Evaluation Program provides performance information on various turfgrass species and cultivars. If irrigation is not an option, select drought tolerant species of turfgrasses. The Turfgrass Water Conservation Alliance tests turfgrass species for drought tolerance and posts individual varieties that pass the test. Consideration of turfgrass species and varieties should always be made for good water conservation practices.

When constructing or renovating natural grass sports fields, it is important to follow the guidelines for field design and build. The end result will be a sports field that will perform as expected with proper maintenance. Parents, players and coaches can enjoy a playing surface that is natural and safe. Construction Costs for Various Types of Sports Field Surfaces

For a more complete understanding of what is involved with construction cost of a natural or synthetic field, please view the STMA Guide to Synthetic and Natural Turfgrass for Sports Fields.

- **Natural with On-site Native Soil (no added top soil or sod) - \$0.60-\$0.90 per sq. ft.**
- **Natural Turfgrass with Native Soils - \$1.25-\$2.50 per sq. ft.**
- **Natural with Sand Cap - \$2.60-\$3.85 per sq. ft.**
- **Natural with Sand and Drainage - \$4.25-\$5.00 per sq. ft.**
- **Synthetic Infill Systems (carpet, infill, and base) - \$4.50-\$10.25 per sq. ft.**

Maintenance Requirements for Natural Grass Fields

Maintenance of natural grass fields is critical to their success. Maintenance is often lacking due to budget constraints. However, when individuals feel that natural grass fields have failed, the money is always there for a conversion to a synthetic surface. Instead of giving up on a natural grass surface, raise the funds to provide good maintenance practices for a safe natural grass surface. Annual inputs of \$20,000 to \$30,000 per field can go a long way in the maintenance and performance of a natural grass field.

STMA provides many resources and opportunities to assist in the maintenance of natural grass fields. Educational bulletins, webinars, and educational conferences provide the support and tools necessary to address natural grass maintenance practices.

Maintenance Comparison Case Studies between Natural Grass Fields at North Scott Community School District and a Synthetic Field at Michigan State University

Disclaimer: Material and labor costs are highly variable depending on region of the country and type of facility. The following costs are based off of North Scott Community School District and Michigan State University, and are meant to provide a realistic representation for costs involved with building and maintaining athletic fields.

Natural – North Scott Community School District

North Scott Community School District is located in Eldridge, Iowa. School grounds and sports turf requiring maintenance totals 115 acres. The District maintains a native soil baseball field, softball field, and 214,000 square feet of native soil practice fields. The school also has a football stadium field with a 4 inch sand cap and a new, sand based soccer field built to USGA specifications. All of the grounds maintenance is done in house by three full time and three summer seasonal staff members. John Netwal, CGCS, is the Director of Operations for North Scott Community School District and has provided the following information.

Natural Turf Maintenance Equipment*

Tractor-mount sprayer	\$700
Utility tractor	\$15,000
Front end loader attachment for utility tractor	\$4,000
Broadcast spreader	\$400-\$1,200
Rotary-motion aerator attachment for tractor	\$6,300
Drag mat	\$300
Topdresser	\$7,000
Field painting equipment	\$8,400
Work Cart	\$4,500
Reel Mower	\$3,500-\$22,000
Rotary Mower	\$22,000-\$35,000
Trimmers	\$250-\$600
Seeder	\$250
Total	\$72,600-\$105,250

* With new tier 4 compliance regulations, equipment prices will likely increase 10-15% going into 2016-2017.

Total Straight Hourly Cost (Field only; 280 hours at \$18 per hour; benefits not included)	\$5,040
Total Supply Cost	\$6,220
Total Equipment Cost	\$3,500
Total Outside Contractor Repairs	\$8,000
Total Maintenance Cost	\$22,760

Bottom Line: Michigan State University synthetic field costs \$22,760 per year to maintain.

Maintenance Comparison between a Professional Level Natural Grass Field and Synthetic Field at Paul Brown Stadium, Cincinnati, Ohio

Disclaimer: Material and labor costs are highly variable depending on region of the country and type of facility.

Paul Brown Stadium is located in Cincinnati, Ohio and is home to the Cincinnati Bengals Football Club. Darian Daily is the Sports Field Manager at Paul Brown Stadium and is responsible for managing both natural and synthetic fields for the team. The practice facility is natural grass with a sand-based rootzone and totals 100,000 square feet. The game field is synthetic turf with crumb rubber infill and totals 102,000 square feet. All of the grounds maintenance is done in house by three full time and four seasonal staff members. Daily has provided a realistic comparison of maintenance costs between the natural grass and synthetic fields he manages.

Involving your STMA Sports Turf Manager

It is important to have a qualified professional to help with decision making and the gathering of information and costs. Hiring or involving a sports turf manager who can oversee construction and/or daily maintenance of a natural grass field is important for its success. If constructing a field, the sports turf manager can serve as a grow-in consultant to work with the architect and contractors (hiring a Certified Field Builder can assure quality construction and renovations when needed) to supervise the entire construction process. Mistakes during the construction phase often result in problems that sometimes can never be corrected or that will take years of management to overcome. A trained sports turf manager on staff will ensure that specifications are adhered to during construction. On a daily basis, your sports turf manager can oversee the care of the athletic fields, maintain the budget, manage staff, and communicate with users.

It is also important to invest in the continuing education of your sports turf manager to keep them current on industry trends and research. Make sure your sports field manager is involved with STMA for networking and continuing education opportunities. STMA also provides the opportunity to become certified through a rigorous training and testing program. Certified Sports Field Managers (CSFMs) are recognized in the industry for their professional development and knowledge of sport field construction and renovation.

Natural Grass Fields

The environmental and human health benefits alone make natural grass fields a desirable option when considering keeping or building an athletic field. The cost effectiveness of construction and annual maintenance only add to their appeal. It is important to have a complete understanding of the costs and benefits associated with both natural and synthetic surfaces when considering conversion from natural grass to a synthetic surface. Often times many of the benefits of natural grass systems are overlooked because of strong arguments and marketing efforts of synthetic turf companies.

Next Steps

To advocate the construction of a natural turfgrass surface or improve the quality of the current natural grass field:

- Involve your STMA Sports Turf Manager in decisions and gathering of information and costs.
- Organize a meeting to educate community, coaches, administration, athletes, and parents about the benefits of a natural turfgrass athletic field.
- Define resources needed to maintain a quality surface for your facility.
- Develop a budget.
- If constructing a field, meet with architects and contractors to find the best option for your situation.
- Schedule meetings to keep those involved updated on progress.
- Form committees to assist in logistics and fundraising.

Task Force Creation and Purpose

At the request of the Fairfax County School Board (School Board), in partnership with the Fairfax County Board of Supervisors (BOS) and the Fairfax County Park Authority Board (Park Board)¹, a joint Synthetic Turf Task Force was formed to develop recommendations on:

- The development of new synthetic turf fields, to include location recommendations for rectangular and diamond fields
- The funding of new synthetic turf fields, to include private and corporate partnership opportunities
- The planned replacement of existing and any new synthetic turf fields
- The regular on-going maintenance of existing synthetic turf fields

The task force was comprised of community leaders and county staff who had a direct connection to the current and future synthetic turf field efforts. (*Members are listed in Appendix I.*) The task force was charged with:

- Proposing recommendations that focus on ensuring fair and equitable access for all geographic areas of the county
- Providing a formal report on its findings and recommendations to the Fairfax County School Board, the Fairfax County Park Authority Board and Fairfax County Board of Supervisors for their collective review and action

Task Force Actions and Process

The Department of Neighborhood and Community Services (NCS) was designated as the lead agency for this effort. Staff members from the Park Authority and the Public Schools were appointed by their respective appointing authorities. School Board, BOS members, Park Authority Board members, and Athletic Council members were participated on the task force. Staff from the Department of Administration for Human Services was designated to provide project management support.

The task force met bi-weekly from August 2012 through June 2013. The task force conducted a review of existing fields, analyzed the financial support associated with the existing synthetic turf fields, and compiled an inventory. Policies and procedures from the participating organizations were reviewed. Data regarding funding sources, partnership agreements, project costs and other relevant information were gathered and reviewed. Supplemental research on other jurisdictions and relevant industry information was analyzed and discussed for its relevance to the Fairfax County community. The findings and recommendations included in this report reflect the combined efforts and consensus of all task force participants.

Synthetic Turf Development and Financing History

Over the last decade, as youth and adults sports participation steadily increased, the inventory of athletic fields was recognized as insufficient to meet the increasing demand. A Needs Assessment commissioned by the Fairfax County Park Authority (Park Authority) in 2004 (http://www.fairfaxcounty.gov/parks/needs2004/pdf/needsassessment_final.pdf) identified a rectangular field shortage of 95 fields needed to accommodate requirements for adult and youth rectangular field users.

Both the cost of new field development and availability of locations were identified as challenges. In 2003, the Fairfax County Athletic Council (Athletic Council) advocated for the resurfacing of existing fields to a synthetic turf surface to increase the playability of fields. During this same period, the Park Authority analyzed possible benefits of synthetic turf fields on park lands; a study conducted by county staff reported that conversion of an existing lighted natural grass field to synthetic turf would increase capacity by an additional 62 percent of playable time, as a synthetic turf surface can be utilized year round and in inclement weather, both during and immediately following rain or other weather events.

In the succeeding decade, the Park Authority and Fairfax County Public Schools (FCPS), in cooperation with a variety of community partners, embarked on an ambitious effort to build additional synthetic turf fields by leveraging various funding partnership models. These included public-private partnerships that utilized private donations, public bond financing and development proffer funds to pay for synthetic turf field development. Public land was identified on both FCPS- and Park Authority-owned properties. The majority of private cash donations were provided through community sports organizations and school booster clubs.

In 2003, the Park Authority oversaw the construction of the first synthetic turf field playing surface in Fairfax County: Lewinsville Park in McLean. This was followed the next year by the construction of a synthetic turf field at EC Lawrence Park in Centreville. Construction of additional synthetic turf fields continued over the next five years at park and school sites. Portions of the community funding came through a combination of sources, including user fees, fundraising and donations.

*** A summary of all synthetic turf locations, funding sources, and costs can be found in Appendix VI.**

New Resources Increased Capacity

In 2005, additional funding was required to complete planned development of synthetic turf fields. In recognition of the overall community benefit for the resulting increased capacity, the Athletic Council advocated for, and the County Board of Supervisors adopted, the creation of a Turf Field Development Fund. This program utilized a portion of revenues from the Athletic Services Application Fee (commonly referred to as the "\$5.50" fee) to offer annual mini-grants to spur development partnerships with community sports organizations. Of the current synthetic turf field inventory, 19 (28 percent) were partially funded by the Athletic Services Application Fee. The creation of the new Turf Field Development Fund and the concurrent financial support from the community helped to sustain the momentum of the synthetic turf field development effort until passage of the 2006 Park Bond referendum. That referendum specifically targeted synthetic turf field development and provided full funding for an additional 12 fields.

Implementation of the Two-Field Model at FCPS High School Sites

In 2009, Marshall High School became the first FCPS site that created a “two-field model.” The development was funded through proffer funds and contributions from community sports organizations. This became the new design model for synthetic turf field development at high schools, which included installation of synthetic turf surfaces on both the main stadium field and on a lighted auxiliary field on the school campus. The physical configuration of the two-field model increased the availability for field use by school athletic and physical education programs, as well as the surrounding community.

In 2010, Herndon High School became the first high school to successfully apply for mini-grant funds through the grant program administered by NCS, resulting in the county’s second two-field model. Nine of the county’s high schools have two-field models in place.

Partnership Efforts Accelerated Synthetic Field Turf Development

The current synthetic turf field inventory would not have been developed without the significant contributions in both leadership of and investment by members of community sports organizations, school booster clubs and community leaders. Identification of public land created opportunities to increase capacity for sports participation, for both community level and public schools programs. Development of synthetic turf fields on school properties for both community and school use, along with shared arrangements on county-owned park lands, has increased overall capacity.

As of spring 2013, Fairfax County has 67 synthetic turf fields of which 47 are currently in use and 20 are pending construction. County rectangular fields continue to be used by more than 130,000 sports participants (*duplicated count*) in athletic events and programs for cricket, field hockey, football, lacrosse, rugby and soccer. When the latest development phase is complete, Fairfax County will have the largest inventory of synthetic turf fields of all jurisdictions in the Washington, D.C., metropolitan area.

Significant funding from the community was leveraged to create the 67 synthetic turf fields built and in development.

* A summary of all synthetic turf locations, funding sources, and costs can be found in Appendix VI.

Community sports organizations and school booster clubs funded almost half of the cost for high school synthetic turf fields.

* A summary of all synthetic turf locations, funding sources, and costs can be found in Appendix VI.

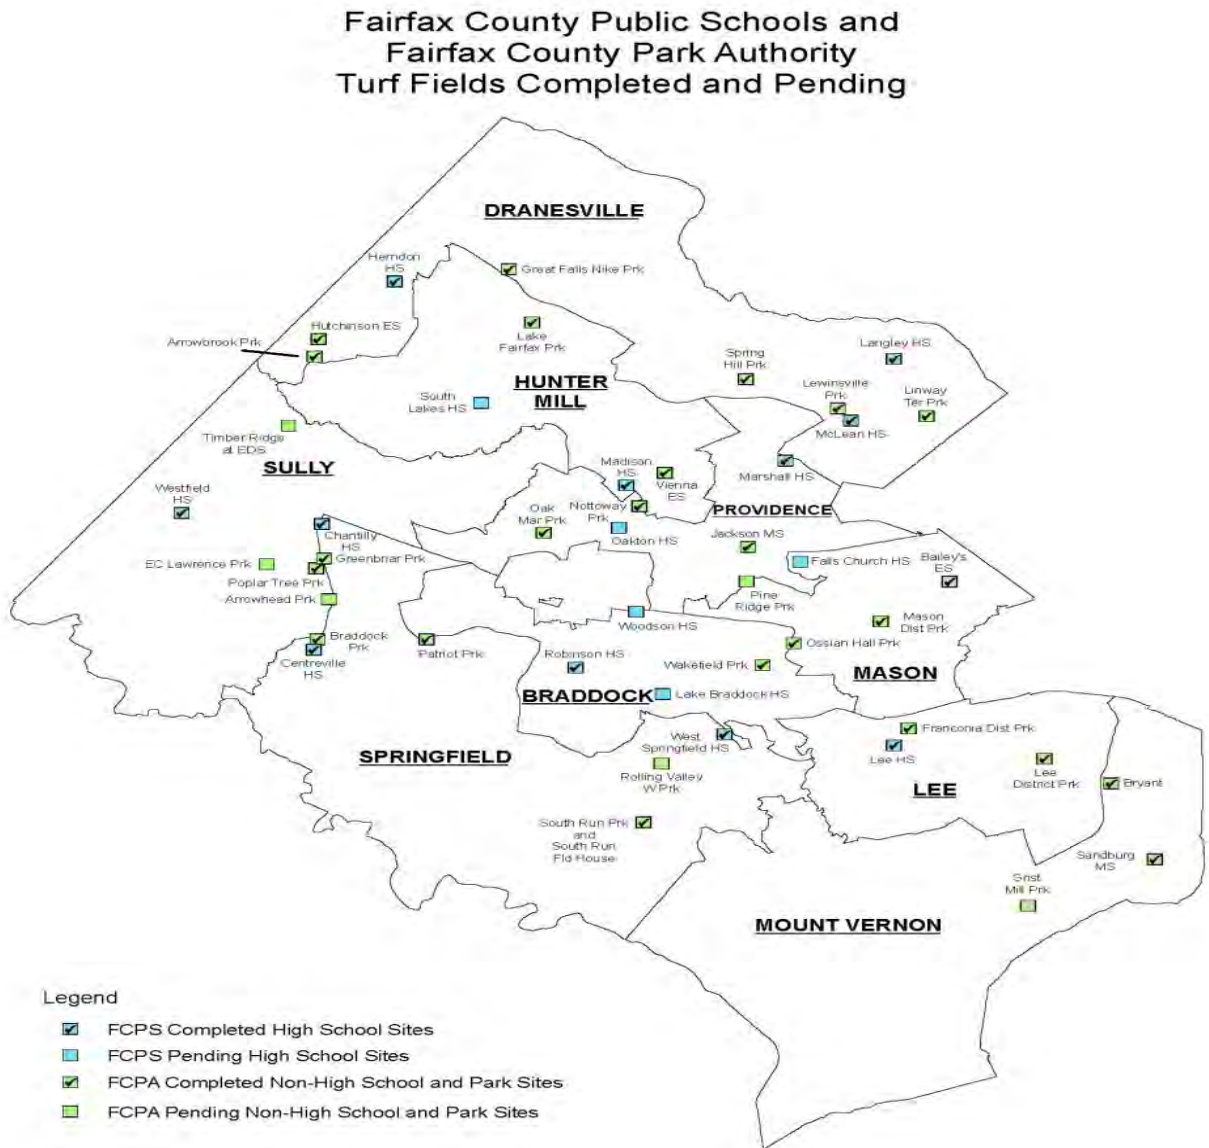

Park Authority Bond Funds funded the majority of the cost for park and other school synthetic turf field sites.

* A summary of all synthetic turf locations, funding sources, and costs can be found in Appendix VI.

Development – Analysis and Findings

Where are the fields located?

Park and School synthetic turf fields are scattered throughout Fairfax County. The task force analyzed location by supervisory district. The following map identifies exact locations of the county’s inventory of 67 synthetic turf fields built and in development:

Task Force Analysis – Background Questions and Responses

The following section provides information resulting from the analysis of the current environment on the history of the synthetic turf movement within the County and a summary of Task force findings.

Why build synthetic turf fields?

FINDING 1: Converting natural grass fields to synthetic turf fields provides a solution to the increased countywide demand for use of outdoor fields. As the Park Authority Needs Assessment pointed out in 2004, Fairfax County had a significant rectangular field shortage of 95 fields needed to accommodate requirements for adult and youth rectangular field users. The conversion to synthetic surfaces allows for year-round play and in most weather conditions which significantly increases the amount of playable time and thus affords the opportunity to help address the shortage of available field space.

2004 Park Authority Needs Assessment identified a rectangular field shortage of 95 fields. Conversion of natural grass fields to synthetic surfaces helps address that shortage.

What is the best field configuration? How can the county maximize community sports organizations' use and school's use for physical education instruction and high school athletic and other school program use?

FINDING 2: The optimal use of resources in the creation of synthetic turf fields on all sites (parks and schools) is a minimum two-field rectangular, or more, model. Including a diamond field (where physically possible), the following financial benefits exist for establishing a standard minimum two-field rectangular model at all sites:

- Land purchases are costly, and limited opportunities exist for stand-alone development throughout the county
- There is some flexibility with land at middle and elementary schools to leverage existing resources to maximize use
- Cost savings can be achieved through economy of scale of field construction and operations

- Opportunities exist for two-field models on park-owned properties at sites throughout the county, thereby increasing accessibility to more users

FINDING 3: In a two-field rectangular synthetic turf model at high schools, overall usage capacity is significantly increased, with both FCPS programs and community use equally benefitting. This provides community access to FCPS athletic fields that were previously not scheduled to the public through the field allocation process/system. A two-field model has the following benefits:

- Allows for increased use during the school day for physical education classes
- Avoids transportation issues for after-school practices to nearby middle and elementary schools and parks
- Increases field use time for community sports organizations during peak community use hours
- Best utilizes land available at school sites for community use
- Benefits the community sports organizations by the existence of a second, non-stadium field on school campus sites. The stadium field is heavily used by the FCPS sports teams and as such has a much more limited use for the community.
- Adds new fields to the public access inventory which were previously not available for scheduling
- Affords greater opportunity for community programs to use school fields
- Affords FCPS high school teams earlier practice times, makes more time available for community use of high school synthetic turf fields, and allows FCPS year-round use of FCPS synthetic turf fields from 3 – 5 p.m. on weekdays for practice

* A summary of grass versus synthetic turf usage can be found in Appendix VII.

Available field-use time is doubled, benefiting both school and community users.

Capacity is significantly increased at school sites using a two-field model and lighted fields.

- Who benefits in a two-field model:
- Public Schools instructional programs
 - Physical education
 - Interscholastic athletics
 - Intramural and after school programs
 - Community sports organizations

* A detailed breakdown on usage analysis can be found in Appendix VII.

Are synthetic turf fields safe?

FINDING 4: Synthetic turf fields have been installed and used throughout the region, the nation and internationally. The health and safety aspects of synthetic turf have been reviewed and addressed by many national and state organizations, including the U.S. Environmental Protection Agency, the Centers for Disease Control and Prevention, and numerous state agencies in California, Connecticut, New Jersey, and New York. They generally conclude that these fields do not pose a serious public health concern. A fact sheet was prepared and publicly published in consultation with the Fairfax County Health Department, Fairfax County Risk Management Division, Fairfax County Public Schools and Fairfax County Park Authority to provide information on research conducted by numerous state and national organizations who have studied these issues. (See Appendix IV.)

What is the average cost to build a synthetic turf field?

FINDING 5: Synthetic turf field and natural grass field development requirements are site specific. Development costs for full and oversized rectangular turf fields have ranged from approximately \$600,000 to \$900,000. Cost variances are attributed to the varying sizes of the fields, specific site design requirements, and incorporation of project-related amenities required for each project. Examples of site specific design features include those that address environmental factors, geotechnical findings, engineering layout, onsite/offsite storm water drainage/best management practice requirements, earthwork balancing, and related infrastructure improvements. Project-specific ADA accommodations and amenities may include creation of accessible trails, parking spaces, bleacher/players bench accessible pads, purchase and assembly of bleachers/benches, side-field goals for youth soccer, protection fencing, and community-requested landscape buffer enhancements. Any combination of these site-specific design features may contribute to the variances between the overall total costs of individual projects.

Are the Park Authority and FCPS methodologies for project development similar? Are there any efficiencies or cost savings that can be applied to future development?

FINDING 6: Project Definition: FCPS and Park Authority total project costs commonly include professional design service fees, permitting fees, and construction development costs. There are, however, significant variances in project related amenities incorporated into FCPS and Park Authority development projects. Additionally, Park Authority total project development costs include a standard staff salary recovery expense, calculated at 8 percent of the design and construction development cost for capital improvement projects. FCPS previously did not charge staff salaries to project development costs, but will implement a \$35,000 per-site fee for field development administrative costs in the summer of 2013.

FINDING 7: Competitive Pricing: Both the Park Authority and FCPS use the Fairfax County and Virginia State Procurement Regulations/guidelines, which include provisions for the use of National Cooperative State, Local and Municipal Contracts offering nationwide competitive pricing and competitive sealed bidding processes for the procurement of construction services.

FINDING 8: Contracting Efficiencies and Purchasing Practices: The Park Authority and FCPS have in the past identified opportunities for joint cooperative contract arrangements when in the best interest of the county. In 2008, staff partnered on joint contracting through U.S. Communities, a nationwide cooperative procurement program. Standards for the industry, price comparisons and other information sharing is routine and will continue on future synthetic turf field development efforts to maximize purchasing power and oversight of synthetic turf field development.

What is the capital investment for a synthetic turf field? Can bond funds be used?

FINDING 9: Synthetic turf field installations are permanent infrastructure investments.

The capitalized investment for a synthetic turf field could be considered as permanent infrastructure, with components requiring replacement on an 8- to 10-year life cycle, assuming conformance to regular maintenance consistent with manufacturing product warranties. Similar to other capital construction investments, fields must be scheduled for routine, ongoing maintenance, and complete component replacement, each effort designed to prolong its use life cycle. Renovations will typically include carpet and fill materials replacement.

Park Authority bond funds have been utilized to finance development projects at 29 sites. To date, FCPS school bond funds have not been used for the development of synthetic turf fields.

Are the county's synthetic turf fields in the right locations? Do some communities have fewer than needed?

The task force analyzed the location of the 67 synthetic turf fields in existence or in development to assess whether the distribution and location allows for equal access and fair usage across the county for public schools athletic and community sports organizations. The Task force examined this information on three levels:

- **Utilization by major youth group participants**
- **Total population**
- **Location of high schools without synthetic turf fields (16 have turf; 8 do not)**

Shortages of synthetic turf fields exist in some parts of the county, in large part as a result of reliance on community funding for development of synthetic turf fields.

FINDING 10: Based on its review of synthetic turf field location and utilization, the task force identified significant comparative shortfalls in available synthetic turf fields in the Mount Vernon and Lee Supervisory Districts. These areas of the county should be considered for the next opportunities for development of rectangular synthetic turf fields to address the shortfalls. Shortfalls were identified through analysis of several different data sources: overall numbers of sports participants in youth leagues and high school athletic programs, total population, and placement of synthetic turf fields at high schools within each respective supervisory district. The analysis revealed community shortfalls in available synthetic turf fields, as well as comparative uneven distribution at high school sites across the county. (See detailed analysis on page 16 and comparison used to assess adequacy of field distribution across the county.)

The task force concludes that the shortfalls in these districts are not the result of a conscious or deliberate plan; the history of the development of the synthetic turf fields across the county clearly shows that fields were developed when a combination of opportunities met with:

Synthetic Turf Task Force

- Community interest
- Site availability (with full size field and lighting infrastructure in place)
- Funding availability (through large community or private sector financial donations and/or development proffer funds)

Typically, it was only **after one or more of these opportunities were under consideration** that public financing to supplement community resources was even considered to support the development projects. The ultimate allocation of public funding also was influenced by the stated need for a particular community. Were there unmet field requests experienced as part of the county's management of countywide field scheduling and use policies? Did communities applying for grant funding to partially support synthetic turf field development provide justification for the placement of the field? In most of the synthetic turf fields developed in the county, funding sources (including those appropriated or recommended by the Park Authority, the Athletic Council and/or the Board of Supervisors) were leveraging significant investments for specific identified sites and completed the financing package to allow the projects to move forward.

What were the original guidelines regarding placement of synthetic turf fields?

FINDING 11: The Park Authority adopted criteria to identify fields that would be priority candidates for conversion to synthetic turf. The fields to be selected would be those that most closely meet the program criteria. The approved criteria, adopted by the Park Board on July 26, 2006, are:

- Existing rectangular field**
- Minimum playing surface size of 370' X 190'
- Currently lighted or master plan approval for lights exists
- Conversions that would require minimal site work and/or amenity improvements
- Permit approval by Department of Public Works and Environmental Services through a minor site plan or rough grading permit (RGP)
- Fields geographically distributed throughout the county
- Reduction of rectangular field deficiencies identified in the 2004 Park Authority Needs Assessment

**Any construction of synthetic turf fields on property owned by Fairfax County Public Schools will require a long-term agreement that addresses the construction, community use, maintenance and eventual replacement of the field.

Are other types of synthetic turf fields needed in the community for other sports?

FINDING 12: The 2004 Park Authority Needs Assessment identified a diamond field shortage of 13 fields. Diamond-configured synthetic turf fields are in the development stages for Fairfax Countywide use. Two current synthetic turf fields exist (Nottoway Park and Waters Field) and two future sites are identified in the Park Authority Master Plan for the Laurel Hill Sports Plex and Patriot Park. In 2005, when the Board of Supervisors directed the use of Athletic Services Application Fee revenue into specific sports-related projects (such as rectangular synthetic turf field development), the diamond field community advocated for the use of available funds to significantly enhance the maintenance program on their existing natural grass diamond fields. The Park Authority is currently conducting an updated needs assessment that will be completed in 2014, the results of which should be used to guide community engagement for future diamond synthetic turf field needs.

How should synthetic turf fields be funded in the future?

FINDING 13: Community sports organizations provided significant funding and leadership to create the inventory in place today. However, the success of the synthetic turf field development program did not come without some unintended consequences. As the economy dipped into recession in 2008, increased reliance upon an already significantly leveraged program caused some disparity in development opportunities. For instance, on high school sites where synthetic turf fields were successfully completed, over half of the funding was

raised by community sports organizations and school booster clubs in those communities. Geographic areas of the county without groups able to contribute at similar levels were left (and remain) without synthetic turf fields.

An additional issue identified by the task force is the capacity for some community sports organizations that borrowed funds to finance construction of synthetic turf fields. This has allowed their community to obtain such facilities in a timeframe that would not otherwise have been possible. However, this arrangement is reported to have left some of the organizations with significant loan debt. It will be important to assure that future arrangements forecast capacity to also contribute to maintenance and/or replacement needs on the field in question and the other natural grass fields on which they play.

FINDING 14: Community sports organizations have continued, and should continue, to play a significant role in the development of synthetic turf fields. To date, community sports organizations have contributed approximately 30 percent (\$16 million) of all funds for development through direct financial contributions and payment of the “\$5.50” fee. These contributions both leverage and reduce the county taxpayer funding investment for school children playing sports, physical education classes and community use for athletic league play for both children and adults.

FINDING 15: Reliance upon leveraged partnerships helped to create the inventory that exists today. Some communities will continue to have limited access to funding sources that other neighborhoods have had available. New strategies will need to be employed to overcome these challenges to ensure access for all county residents.

FINDING 16: Each school site has unique site capacity, a variety of community sports organizations and funding opportunities. Many contributing factors require individualized field development plans; for example, some sites are limited in size and could only be developed with a one-field model. A completely uniform development approach is not advantageous if community sports organizations’ opportunities can be leveraged to reduce taxpayer costs.

Are development proffer funds available to support synthetic turf field development?

FINDING 17: Development proffer funds have been used in specific past efforts, contributing approximately 12 percent of the total cost of all synthetic turf field development to date. However, proffer funds cannot be relied upon as an assumed “standard” source of funding for development or replacement of synthetic turf fields. Availability of proffers is dependent on land use patterns. Proffers will be variable and should not be factored into a standard formula for development of synthetic turf fields as they may or may not be available for a particular development effort. Development proffer funds were made available to support 7 of 16 high schools for synthetic turf field development (Madison, Marshall, Lee, Westfield, McLean, Oakton and Woodson High Schools). Funds totaled \$3.04 million for

11 synthetic turf fields, and represented approximately 16 percent of total high school sites development costs of \$19.3 million; however, 9 high schools were built through other funds sources. Timing of synthetic turf field construction, location and development activity in the community were all factors in determining applicability and appropriateness for use.

What is the justification for use of school general fund or bond financing for synthetic turf fields on school property?

FINDING 18: Synthetic turf fields are not included in the existing FCPS school construction education specifications, thereby excluding the development of synthetic turf fields in new school construction or renovation projects. To date, no FCPS bond funds have been used to pay for installation of synthetic turf fields, as the fields were not included in the school education specifications. However, should the School Board choose to do so, bond funding, including new or undesignated funds, as well as use of general FCPS operating funds, appear to be viable funding sources.

How have other jurisdictions financed synthetic turf fields?

FINDING 19: The task force reviewed various development and maintenance strategies of localities throughout the nation. A select listing of these jurisdictions is shown on the next page. In reviewing the data, it is clear that Fairfax County residents have created one of the largest synthetic turf field inventories and are at the forefront of communities addressing the sharing of public resources, long-term capacity and need, maintenance, and financing strategies for synthetic turf fields.

Other Locality Practices for Development, Maintenance and Replacement of Synthetic Turf Fields				
Jurisdiction	# of Fields	Development	Maintenance	Replacement
Fairfax County, VA	67 (41 parks and non-HS, 26 HS)	Bond financing BOS FCPS one-time funds Donations, grants, other Athletic application fee grant Proffers School boosters Community sports organizations	FCPA: General maintenance fund FCPS: Local school responsibility	Athletic booster clubs (15k/year), community field use agreements, turf field replacement fund (\$150k/year), FCPA Tournaments for Turf, County general fund appropriations (\$350k/year)
Montgomery County, MD	4 (2 schools, 2 parks)	Inclusion on high school renovation capital improvement plans New Construction: booster club, private donations Parks: tax, grant reimbursement, program open space grant	G-max testing done by manufacturers Annual cleaning of infill	Revenue replacement fund – user fee based
Loudoun County, VA	5 schools	School bond funds Private funding from athletic groups	Contracted project management and construction	Private funds through user fees
Arlington County, VA	10 (3 schools, 7 parks)	Included in capital expenditure budget	Weekly inspection. G-max tested by contract. General Operating Budget	General Obligation bonds, pay-as-you-go, rental fees, possible partnerships
Prince William County, VA	9 parks	Public-private partnerships – government and sports leagues	Maintained by Parks as part of regular operating. Weekly clearing, monthly sweeping and grooming. Aberdeen, MD	6 schools	Capital Improvement program, appropriated funds	Weekly inspection and grooming as needed. General Operating Budget	Under discussion; Money from grass maintenance re-directed to turf replacement.
Miami-Dade County, FL	9 parks	Public funds included in Capital Improvement Plan	Privately maintained, G-max tested twice per year. General Operating Budget	Under discussion
Asheville, NC	5 parks	Capital funds and partnerships	Soccer association purchased equipment; Park staff maintains and does work	Under discussion

Synthetic Turf Field Development Recommendations

Two charges were given to the task force regarding the development of new synthetic turf fields: recommendations for the location of rectangular and diamond fields; and funding recommendations for development of new synthetic turf fields. In response, the Task force recommends the following actions:

Recommendation 1: Synthetic turf fields and lights within school sites should be standard components in new school construction and future capital improvement renovation schedules. At high school sites, the two-field model should be standard for rectangular sports use.

Recommendation 2: The diamond sports community should be engaged to determine interest in expanding the conversion of natural grass softball and baseball fields to synthetic surfaces. The completion of the next Park Authority Needs Assessment should be used to guide that discussion to include gauging the desire of the diamond sports community to redirect a portion of the Athletic Services Application Fee (currently used for maintenance) to this effort and/or increase the fees for diamond sports participation.

Recommendation 3: Future synthetic turf field development should be guided by recommendations in this report for oversight, locations, development schedule and share of public funding allocations.

Recommendation 4: Install the two-field model at all high schools that currently do not have synthetic turf fields. Complete the 8 school sites to include 15 total synthetic turf fields within a three-year cycle—by 2016. BOS and School Board review options and adopt a variety of funding strategies to fund the development of turf fields for these 8 sites.

Convert rectangular stadium and auxiliary natural grass fields to synthetic turf at each of the following eight high schools:

- Annandale High School
- Edison High School
- Hayfield Secondary School
- Mount Vernon High School
- South County High School
- JEB Stuart High School (1 rectangular field per space constraints)
- Thomas Jefferson High School for Science and Technology
- West Potomac High School

Rationale:

1. Conversion of these eight school sites will provide 15 rectangular fields for both community and school athletic use. The purpose of this strategy is to resolve the equity issues that now exist in schools that do not have synthetic turf fields or will not receive synthetic turf fields in 2013.
2. This strategy will further address overall community use shortages in several identified areas of the county. Building these synthetic turf fields will increase the playability of fields located in the supervisory districts where demand exceeds availability. These fields will address the significant shortages identified in the Mount Vernon and Lee Districts.
3. Targeting the high schools:
 - is a prudent utilization of existing space and amenities (parking, lighting, bleachers and other infrastructure)
 - benefits the greatest number of county residents participating in public schools and community programs

Addition of 15 fields at High School Sites – Improvement by Supervisory District				
	FCPA & Non-HS School Synthetic Turf Fields	FCPS High School Synthetic Turf Fields	Total Synthetic Turf Fields	Proposed New Synthetic Turf Fields
Braddock	1	6	7	No change
Dranesville	9	4	13	No change
Hunter Mill	3	3	6	No change
Lee	2	5	7	+4
Mason	5	7	12	+5
Mount Vernon	3	6	9	+6
Providence	4	5	9	No change
Springfield	6	4	10	No change
Sully	8	1	9	No change
	41	41	82	15

Adding synthetic turf fields at the 8 recommended high school sites addresses the significant comparable shortages the task force identified in the southeast part of Fairfax County.

Recommendation 5: Continue to support community partnership opportunities directed at future synthetic turf field development, maintenance, and replacement.

Recommendation 6: Modify construction standards to incorporate new storm water management requirements and develop consistent guidelines for promotion of the county's adoption of the use of green construction.

Recommendation 7: Establish an oversight committee to oversee and periodically meet to monitor joint collaborative efforts for synthetic turf field development. Members should establish procedures consistent with the findings and recommendations in this report as a guide for their analysis. Members of the committee should include representatives from the following organizations:

- **Park Authority**
- **Fairfax County School Board**
- **Fairfax County Board of Supervisors**
- **Fairfax County Athletic Council**
- **Staff representation from the County (FCPA and NCS) and FCPS**

Synthetic Turf Field Development Funding Options

The task force reviewed several additional options for financing the development costs. Based on an estimated average of \$800,000 for synthetic turf field development, adding 15 synthetic turf fields to the existing inventory will cost approximately \$12.0 million. **Options to finance the development include the following:**

Funding Source Options	Funds Generated over a 3 year period
<p>Mini-Grants - Redirect Community Services Turf Field Mini-grant Program funds for targeted development of the 8 high school sites (suspending the mini-grant program)</p>	<p>\$1,050,000</p>
<p>Ability to Pay Expectation – Require community contribution for all eight schools from athletic booster clubs and community sports groups for field development.</p> <p>Tier 1: Require 25 percent contribution for 2 of 8 schools. (Calculation based on average field cost of \$800,000). Schools recommended for tier 1 participation: Thomas Jefferson and South County.</p> <p>Tier 2: Require 12.5 percent for Hayfield High School.</p> <p>Tier 3: Require 6.25 percent contribution (\$100,000 – or \$50,000 per field). Schools recommended for tier 3 participation: Annandale, Edison, Mount Vernon, West Potomac, JEB Stuart.</p> <p>(See Table 1, p. 25 for further detail)</p>	<p>Tier 1: \$800,000</p> <p>Tier 2: \$200,000</p> <p>Tier 3: \$450,000</p>
<p>Increase the Athletic Fee from \$5.50 per rectangular sports participants (lacrosse, soccer, football, cricket, rugby, field hockey), per season to \$8. Increases would be dedicated to development costs for the 15 new synthetic turf fields for the three-year development period.</p>	<p>\$750,000</p>
<p>Subtotal: (community support)</p>	<p>\$3,250,000</p>
<p>BOS: Direct all available and appropriate development proffer funding.</p>	<p>TBD</p>
<p>FCPS: Direct FCPS bond funds.</p>	<p>TBD</p>

Synthetic Turf Field Development: School Boosters/Adult-Youth Groups Contribution

It is the expectation that school booster clubs and community sports organizations will, collectively and to their best ability to pay, contribute up to twenty-five percent (25%) toward the development costs of a two-field synthetic turf field project. The ability to pay criteria will include, but may not be limited to, a school’s percentage of students eligible for the FCPS High School Free and Reduced Lunch Program. This program serves as one indicator on the economic viability of the student body and community.

Currently the development costs of a two-field synthetic turf field project are estimated at \$1.6M. The following table depicts the ability to pay scale and its application to the development of a two-field turf model:

Table 1. School Booster Clubs/Community Sports Organizations’ Ability to Pay on Development Costs of Two-Field Synthetic Turf Model

Percent Free/Reduced Lunch Student Body	Ability to Pay Expectation for Athletic Booster Club and Athletic Groups	Estimated Two-Field Synthetic Turf Project Costs \$1.6M	Impact of Ability to Pay Scale on (8) Remaining Schools (% at F/R) to be Turfed
33% or Greater	6.25%	\$100,000	<ul style="list-style-type: none"> ▪ Stuart HS * (55.2%) ▪ Mount Vernon HS (54.1%) ▪ Annandale HS (44.7%) ▪ West Potomac HS (38.1%) ▪ Edison HS (34.3%)
21% - 32%	12.50%	\$200,000	<ul style="list-style-type: none"> ▪ Hayfield Secondary (27.4%)
20% or Less	25.00%	\$400,000	<ul style="list-style-type: none"> ▪ South County HS (15.9%) ▪ Thomas Jefferson HS (2.2%)

*Stuart HS would be a one-field model (based on available space). As such, their contribution expectation would be \$50,000.

Replacement of Synthetic Turf Fields

Each synthetic turf field development project increases our community's expertise and provides additional learning opportunities for improvement. Similarly, the first replacement efforts are underway in the summer of 2013 for the first two synthetic turf fields developed in Fairfax County, Lewinsville Park in McLean, and EC Lawrence Park in Centreville.

Most manufacturers provide an eight-year warranty for a properly maintained synthetic turf field; it has been a generally accepted practice to assume a life expectancy of the synthetic turf field at no longer than 10 years. For planning purposes, Fairfax County adopted a budget estimate of a little more than half the installation funding, a generally accepted practice for the industry.

Based on a projected ten-year replacement cycle, the current 67 field inventory replacement requirements are already a regular financial commitment. Planning considerations include analysis of individual field playability, based on the differing levels of use, the nature of the Northern Virginia climate, and the importance of required maintenance efforts.

Current Funding for Synthetic Turf Field Replacement

FINDING 20: Preliminary planning for funding synthetic turf field replacement began in 2007. Total estimated available annual funding of \$740,000 is currently provided through the following funding sources:

- **Athletic Booster Clubs** - FCPS required booster clubs at schools where synthetic turf fields were installed to commit \$15,000 annually as a set-aside for future synthetic turf field replacement.
- **Community Field Use Agreements** – FCPA and FCPS developed community use agreements that allowed community partners to maintain their priority use benefits in exchange for contributions to replace synthetic turf fields at the end of the fields' life cycle.
- **Synthetic Turf Field Replacement Fund** – Established in FY 2012, funding for this purpose was redirected (\$150,000) from the Synthetic Turf Field Development Fund. A portion of athletic participation fees charged to rectangular field users, the "\$5.50 fee," was allocated for synthetic turf field replacement requirements.
