- **Tournaments for Turf** - The Park Authority initiated a Tournaments for Turf Program, in which tournaments are held for the purpose of generating additional revenue for the Synthetic Turf Field Replacement Fund.
- **County General Fund Appropriations** – The BOS approved use of a dedicated line item totaling \$350,000. When combined with the "\$5.50" fee redirected funds, total annual replacement funding, administered by NCS, is \$500,000. Currently, this funding leverages monies provided by existing community partners continuing to participate in the priority use agreements, for all synthetic turf field replacement requirements.

Synthetic Turf Task Force

These efforts are not sufficient to fully fund future replacement needs, for either the existing inventory or for the task force recommended expansion to 82 synthetic turf fields. Including the recommended additional 8 high schools in future development would increase this requirement by a total of **\$2.16 million** annually.

Fairfax County – Estimated Synthetic Turf Field Replacement Needs

Total Synthetic Turf Field Replacement - By Year and Location		FCPS Stadium	FCPS Non- Stadium & Park Authority	Total Current Field Inventory	Revised Total Including Recommended 8 New HS Sites
		16	51	67	82
Total replacement	Estimated \$450k each	\$7,200,000	\$22,950,000	\$30,150,000	\$36,900,000
Replacement fund (10 yr. est.)	School athletic booster funds \$15k per HS site per year = \$240k annually FXCO = \$500k annually (\$350k GF /\$150k app. fees)	\$2,400,000	\$5,000,000	\$7,400,000	\$8,600,000
Cumulative Shortage		\$4,800,000	\$17,950,000	\$22,750,000	\$28,300,000
10 yr. average replacement		\$480,000	\$1,795,000	\$2,275,000	\$2,830,000
Community contribution - Percentage of monies contributed to each by community group	Youth and adult community sports organizations – amounts are based upon percentages provided during synthetic turf field developmental phase	(\$223,200)	(\$390,150)	(\$613,350)	(\$669,600)
Annual Shortage		\$256,800	\$1,404,850	\$1,661,650	\$2,160,400

Assumptions:

- ✓ Synthetic turf field life cycle = 10 years
- ✓ Synthetic turf field replacement cost = \$450k
- ✓ Community contributions remain at least at initial percentage level of development commitments

Recommendation 8: Identify an ongoing funding source to fund the scheduled replacement of synthetic turf fields on Park Authority and FCPS sites.

Options to Fund Synthetic Turf Field Replacement Shortfall:

Option	Additional Annual Funding Generated
Annual replacement shortage	\$2,160,400
Redirect additional Synthetic Turf Field Development Program monies into the Synthetic Turf Field Replacement Fund.	\$150,000
Increase Athletic User fee charged to rectangular field users from \$5.50 to \$8 (per sport, per season).	\$250,000
Increase booster club responsibility from \$15,000 annually to \$20,000 annually	\$120,000
Tournament Field Rental User Fee - Increase field rental user fee from \$15 to \$50 for county teams and \$100 for non-county teams for post regular season rectangular field sports program tournaments. (Assumes approximately 625 teams from out of county, generating an additional \$53,000 annually and 1875 in-county teams generating an additional \$65,000 annually)	\$118,000
Subtotal—community funding in support of Synthetic Turf Field Replacement	\$638,000
Remaining annual additional funding requirement	\$1.53 million

Recommendation 9: Continue administration of the synthetic turf field replacement fund by NCS in support of future synthetic turf field replacement projects at FCPS and FCPA sites. Utilize project funding as directed by staff membership of the oversight committee proposed for establishment in Recommendation 6.

Maintenance of Synthetic Turf Fields

The task force reviewed current maintenance activities for FCPS and Park Authority natural grass and synthetic turf fields. The purpose was to determine who paid for the maintenance, analysis of the financial impact of increasing the inventory of synthetic turf fields and the implications for the community in the contributions made through boosters, community sports organizations, and other volunteers in the labor contributed to the upkeep of synthetic turf fields, as well as the financial capacity of various community sports organizations in support of the cost of maintaining synthetic turf fields. The Park Authority maintenance of the synthetic turf fields is centralized and

managed with Park Authority staff. Fairfax County Public Schools' maintenance is decentralized and conducted by a combination of high school staff and contractors. The two approaches to managing the maintenance should be further reviewed to see if efficiencies can be achieved.

What are the current practices for synthetic turf maintenance?

FINDING 21: Park Authority staff currently maintains synthetic turf fields at county parks and fields located on elementary and middle schools, as well as other non-high school FCPS sites. With the conversion of natural grass fields to synthetic turf, the Park Authority has found that the total annual operating cost of a synthetic turf field, including maintenance and utility costs, is comparable to a lighted and irrigated natural grass field because of the nature of year-round use.

- Natural grass field operating costs include a basic turf grass program with seeding, aerating, fertilizer and pesticides applications, soil testing and amendments.
- Synthetic turf fields operating costs include regular grooming, debris removal, minor carpet repairs and adding rubber infill to high use areas, and unique reconditioning requirements that include brushing, de-compaction, deep cleaning, repair of inlaid field lines and adding crumb rubber to low or high use areas. The synthetic turf fields are also annually G-max tested by a certified engineer to help ensure their safety.

Maintenance activities for both field types include trash collection, inspections, field lining, maintenance and repairs of lighting, bleachers, benches, goals and signage. The costs associated with these tasks are year-round or 12 months a year for synthetic turf fields and only 8 months a year for a natural grass fields. Natural grass fields have additional mowing costs.

Utility expenses are also similar for both field types. Natural grass fields require lighting and water for the 8-month playing season. While the synthetic turf fields don't require watering, savings from reduced water usage are redirected to cover the increased electricity requirements for athletic field lighting resulting from the increased use capacity to 12 months.

Park Authority synthetic turf fields are maintained to all manufacturers recommendations and recognized industry standards. The natural grass fields are maintained to a budget. The maintenance standards for the natural grass fields have been adjusted as the available funding remained constant. The adjustments were necessary as staff and utility costs increased and additional lighting and irrigations systems were added without associated increases in operating budgets.

FINDING 22: Due to the decentralized nature of the maintenance activities at each FCPS school sites, any achieved savings from natural grass maintenance to synthetic turf maintenance should be redirected to specific site operations, to include the maintenance and replacement of the synthetic turf fields.

Natural grass fields at high schools are maintained at various levels, depending on the use. Rectangular, stadium game fields and 90' and 60' game diamonds are maintained at a higher level than grass fields used primarily for practices. The number of fields, both game and practice, varies by campus. Additionally, athletic fields with Bermuda grass surfaces require a significantly higher level of care than cool season grasses.

The annual cost to maintain a natural grass, stadium rectangular field is between \$20,000 to \$40,000 per school. The variance is influenced by type of grass, size and configuration of the field, volume of usage, frequency of maintenance, impact of weather, cost of labor, and the use of field lights. The expenses associated with school athletic field maintenance are not covered by the operating budget. Athletic field maintenance, to include supplies, labor and materials, is paid for by athletic event gate receipts, booster donations, fundraising, and donated labor. The equipment used to maintain grass fields can include tractors, mowers, sweepers, groomers, aerators, seeders, and/or trimmers. While individual schools do have some field maintenance equipment, the inventory is often supplemented by equipment purchased by the community funding sources. There are some schools that are able to contract for athletic field maintenance; these services are paid for by the same community contributions.

Recommendation 10: Park Authority and FCPS should adopt a consistent maintenance program for synthetic turf fields utilizing agreed upon best practices in order to maximize use of equipment, staffing and other resources.

Recommendation 11: Create a joint FCPS and Park Authority field maintenance work group, tasked with meeting to address ongoing maintenance needs to include recurring operating budget requirements.

Appendix II. Board Actions/Resolutions

County of Fairfax, Virginia

MEMORANDUM

DATE: JUN 22 2012
TO: Board of Supervisors
FROM: Edward ~~F~~ Long Jr.
County Executive
SUBJECT: County/Schools Joint Task on Synthetic Turf Athletic Fields

The Fairfax County School Board passed a resolution at its December 15, 2011, meeting recommending the creation of a County/Schools Joint Task Force on Synthetic Turf Athletic Fields. In February 2012, Fairfax County School Board Chairman Jane K. Strauss sent a letter to Board of Supervisors Chairman Sharon Bulova and Fairfax County Park Authority Board Chairman William G. Bouie requesting support for this effort. At the April 10, 2012, Board of Supervisors (BOS) meeting, Board members affirmed their collective interest in working with the School Board and Park Board in this effort and referred the issue to staff to determine task force participation.

In the past few years, and in response to increased demand for athletic playing fields, Fairfax County, Fairfax County Public Schools, and the Fairfax County Park Authority have identified funds and partnered with local community groups and each other to develop more than 30 synthetic playing surfaces. The need for more fields continues to grow, and converting natural grass fields to synthetic surfaces provides the best solution to the county's need for more playing time on outdoor surfaces.

Staff from the Department of Neighborhood and Community Services (NCS) has met with staff from the Fairfax County Park Authority (FCPA) and the Fairfax County Public Schools (FCPS) to discuss this initiative. Subsequent to those discussions, it is the recommendation of all entities that the effort to convene and direct the task force be led by NCS staff as the community use scheduler of both park and school fields.

Under the direction of NCS, the joint task force will be responsible for developing recommendations to the BOS and the School Board on:

- the development of new synthetic fields, to include location recommendations
- the funding of new synthetic fields, to include private and corporate partnership opportunities
- the regular, on-going maintenance of existing synthetic fields
- the eventual replacement of developed synthetic fields

Throughout each of these recommendations, guidelines and processes will be reviewed with a focus on ensuring fair and equitable access for all geographic areas of the county.

Synthetic Turf Task Force

Board of Supervisors
County/Schools Joint Task on Synthetic Turf Athletic Fields
Page 2

The task force will be comprised of community leaders and staff that have a direct connection to the current and future synthetic turf field efforts, including:

- Fairfax County Public Schools
Megan McLaughlin, Braddock District School Board Representative
Lee Ann Pender, Director, Administrative Services
Bill Curran, Director, Student Activities and Athletics
- Fairfax County Athletic Council
Harold Leff, Chairman
Mark Meana, Vice Chairman
- Fairfax County Park Authority
William G. Bouie, Chairman, Park Board
Ken Quincy, Providence District Park Board Representative
John Dargle, Director, FCPA
Todd Johnson, Director, Park Operations Division, FCPA
Deborah Garris, Synthetic Turf Fields Branch, FCPA
- Neighborhood and Community Services
Chris Leonard, NCS Director
Karen Avvisato, Athletic Services Program Manager, NCS
Paul Jansen, Athletic Services Program, NCS

It is anticipated that official reporting of the task force's findings will be presented at a future joint School Board/Board of Supervisors meeting.

For further information, please contact Chris Leonard, NCS Director, at 703-324-5501.

- c:
- Jane K. Strauss, Chairman, Fairfax County School Board
 - Jack D. Dale, Superintendent, Fairfax County Public Schools
 - William G. Bouie, Chairman, Fairfax County Park Authority
 - Harold Leff, Chairman, Fairfax County Athletic Council
 - Patricia D. Harrison, Deputy County Executive
 - Robert A. Stalzer, Deputy County Executive
 - Christopher A. Leonard, Director, Neighborhood and Community Services
 - John W. Dargle, Director, Park Authority

THE FAIRFAX COUNTY SCHOOL BOARD

8115 GATEHOUSE ROAD, SUITE 5400, FALLS CHURCH, VA 22042

February 9, 2012

The Honorable Sharon Bulova
Chairman

Fairfax County Board of Supervisors
12000 Government Center Parkway, Suite 530
Fairfax, VA 22035

Mr. William G. Bouie
Chairman
Fairfax County Park Authority Board
Hemery Building - Suite 927
12055 Government Center Parkway
Fairfax, VA 22035

Dear Chairman Bulova and Chairman Bouie:

On December 15, 2011, the School Board approved a resolution recommending that the Board of Supervisors and the Park Authority Board create a joint task force to make recommendations on the development of turf fields in the future. All Fairfax County citizens would benefit from a multi-agency approach to the development and maintenance of turf fields across the county.

This joint task force would examine the need for additional rectangular and diamond turf fields, the requirements for ongoing field maintenance, and funding requirements for future field replacement. This joint effort between the Board of Supervisors, the Park Authority, and the School Board would be comprised of representatives from the Fairfax County Neighborhood Community Services, the Park Authority, Fairfax County Public Schools, and the Fairfax County Athletic Council. The joint task force would report on their recommendations by September 2012, to the Board of Supervisors, the School Board, and the Park Authority.

I hope the Board of Supervisors and the Park Authority will welcome this initiative to work collaboratively so that athletes and citizens across Fairfax County can equally enjoy the many benefits of turf fields.

Sincerely,

Jane K. Strauss
Chairman
Dranesville District

Agenda Item Details

Meeting	Dec 15, 2011 - Regular Meeting No. 10
Category	2. Meeting Opening - 7 p.m.
Subject	2.10 Resolution Recommending Joint Task Force on Turf Fields
Type	Action

RESOLUTION RECOMMENDING JOINT TASK FORCE ON TURF FIELDS

WHEREAS, Fairfax County citizens benefit from the installation of artificial turf fields at County parks and schools through increased available playing time; and

WHEREAS, progress has been made in installing such fields at over 30 locations in Fairfax County to include both Park Authority and Fairfax County Public Schools fields; and

WHEREAS, it is important to ensure that all geographic areas of the County enjoy equal access to such fields by installing additional fields in the future, to include all Fairfax County public high schools; and

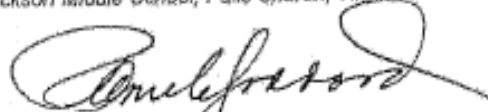

WHEREAS, it is important that both existing and future fields are maintained appropriately to ensure their continuing quality and maximum useful life for citizens and county high school students; and

WHEREAS, it is important that funds be identified to install new turf fields and replace all fields when the useful life is exhausted; and

NOW, THEREFORE, BE IT RESOLVED that the School Board recommends to the Board of Supervisors and the Park Authority Board the creation of a joint task force to examine and report by September 2012 to the Fairfax County School Board, the Fairfax County Park Authority Board, and the Fairfax County Board of Supervisors on the need for additional rectangular and diamond turf fields, the requirements for ongoing field maintenance, and funding requirements for future field replacement; and

FURTHERMORE BE IT RESOLVED that the School Board recommends that the joint task force be comprised of representatives from Fairfax County Neighborhood Community Services, Fairfax County Park Authority, Fairfax County Public Schools, and the Fairfax County Athletic Council.

I hereby certify the above Agenda Item 2.10 was adopted by the County School Board of Fairfax County, Virginia, at a regular meeting held on December 15, 2011, at Luther Jackson Middle School, Falls Church, Virginia.

Pamela Goddard, Clerk
County School Board of
Fairfax County, Virginia

February 22, 2012

RECEIVED

FEB 22 2012

1243
DIRECTOR OF NEIGHBORHOOD
AND COMMUNITY SERVICES

Ms. Jane K. Strauss, Chairman
Fairfax County School Board
8115 Gatehouse Road, Suite 5400
Falls Church, VA 22042

Dear Chairman Strauss:

I am very pleased to learn of the School Board's recent recommendation for the creation of a joint task force by the Fairfax County Board of Supervisors and the Fairfax County Park Authority Board in order to make recommendations on the development of synthetic turf fields in Fairfax County. The Park Authority Board recognizes the wisdom and benefits of collaboration at all levels and has supported vital partnerships since the field turf program's inception nearly a decade ago.

We applaud this opportunity to further explore the appropriate placement of new synthetic turf fields, the challenges of funding both new and replacement turf fields and our ongoing maintenance needs for rectangular and diamond turf fields. The need for synthetic turf fields continues to grow as both youth and adult leagues, and school sports draw ever increasing participation. I believe that the Department of Neighborhood and Community Services would be another important participant in this venture. Working together, ensuring that all stakeholders have a say, I am certain we can equitably meet the needs of the community.

The Park Authority Board stands ready to begin this process and will endeavor to meet the relatively short timeframe for the drafting of recommendations. I will discuss the specifics of the initiative with Board of Supervisors Chairman Sharon Bulova to seek her consensus how best to move forward with this proposal.

Sincerely,

William G. Bouie
Chairman

Appendix IV. Synthetic Turf Fact Sheet

Fact Sheet on Synthetic Turf Used in Athletic Fields

Synthetic turf fields using crumb rubber have been installed and used in many athletic and playing fields throughout Fairfax County, the United States and the world. Currently Fairfax County Public Schools and Parks have 48 rectangular athletic fields composed of synthetic turf material. Questions have been raised about potential health, safety, and environmental effects from the use of synthetic turf. This fact sheet was prepared in consultation with the Fairfax County Health Department, Fairfax County Risk Management Division, Fairfax County Public Schools and Fairfax County Park Authority to provide information on research conducted by numerous state and national organizations who have studied these issues.

Q: Why is synthetic turf used in Fairfax County?

A: Starting in the early 2000's the Park Authority along with other organizations in the County that provide athletic facilities began looking at alternatives to natural turf fields to meet the growing demand for use of athletic fields throughout the County.

Synthetic turf is a man-made product and is mostly installed in fields that are heavily used. Synthetic turf fields are used in Fairfax County because they:

- Provide even playing surfaces
- Provide similar playing conditions to natural turf fields
- Need no watering or mowing
- Use no fertilizers or pesticides
- Can be used year-round and in most weather
- Do not need to be closed to protect or re-sod grass
- Have a significant life cycle with reduced maintenance

Q: What are synthetic turf fields made of?

A: Synthetic turf fields installed in Fairfax County have been constructed using a synthetic carpet material that mimics natural grass along with a crumb rubber infill or sand/crumb rubber infill mixture and subsurface drainage systems. Synthetic turf fields are made of the following materials:

- A subsurface drainage layer composed of crushed stones with plastic tubing for drainage.
 - A top layer composed of plastic mesh with soft, plastic strands that resemble blades of grass.
-

- Crumb rubber infill, made from recycled tires, is added to the top layer to provide padding and keep the grass upright. Sand is sometimes mixed with the crumb rubber.

Q: What chemicals can be found in the synthetic turf crumb rubber?

A: The crumb rubber used in synthetic turf is mainly composed of recycled tires, which contain man-made and natural rubber. Based on the review of research studies and reports, certain chemicals have been identified in crumb rubber. These include small amounts of polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs) and heavy metals such as zinc, iron, manganese and lead.

Q: Can people be exposed to the chemicals found in crumb rubber?

A: To date, studies on the release of chemicals from crumb rubber have reported very low concentration of chemical exposure. Although the potential for health effects due to exposure to chemicals in crumb rubber is very low, there are three possible ways for people to have contact with these chemicals on artificial turf fields:

- Accidentally ingesting small amounts of crumb rubber by putting fingers in the mouth or not washing hands before eating after playing on the fields
- Breathing in dust and vapors while playing on the fields. Crumb rubber may become dust as it wears and the rubber may give off some vapors.
- Direct skin contact with the crumb rubber.

Q: Are any health effects associated with these chemicals found in synthetic turf crumb rubber?

A: The health and safety aspects of synthetic turf have been reviewed and addressed by many national and state organizations, including the U.S. Environmental Protection Agency, the Centers for Disease Control and Prevention, and numerous state agencies in California, Connecticut, New Jersey, and New York. They generally conclude that health effects are unlikely from exposure to the levels of chemicals found in synthetic turf and that these fields do not pose a serious public health concern. Specifically, a review of the available information on crumb rubber by the New York Department of Health indicates that ingestion, dermal, or inhalation exposures to chemicals in or released from crumb rubber do not pose a significant public health concern. A multi-agency report from the State of Connecticut concluded that the use of outdoor and indoor artificial turf fields is not associated with elevated health risk. Studies and reviews conducted by the California Office of Environmental Health Hazard Assessment found that synthetic turf fields do not represent a serious human health risk with regard to the inhalation of chemicals or particulates above these fields. These studies indicate that at much higher levels, these chemicals can cause serious health effects. Some PAHs may

pose a cancer risk for people exposed to high levels for long periods. VOCs can cause eye, nose, throat, and skin irritation. In young children, exposure to lead may cause learning and behavioral problems and lowered intelligence.

Q: Can people be exposed to these chemicals from other sources?

A: The PAHs and VOCs found in crumb rubber are very common in the urban environment. People can be exposed by breathing or eating or by getting dirt or dust on their skin. Rubber dust from car tires is a source of urban air pollution and soil pollution. PAHs are present in exhaust, smoke, soot, urban soil and char-broiled foods. VOCs are released into the air from gasoline, paint, building materials and many other sources. Lead is commonly found in soil and dust in the urban environment because, in the past, it was used in paint, gasoline and many other products.

Q: Does the heat generated by synthetic turf pose a health risk to users?

A: Like asphalt, the crumb rubber in synthetic turf fields absorbs heat from the sun and gets hotter than dirt or natural grass. On hot days, some synthetic turf fields may be too hot to play on. To protect yourself from the heat, health officials have recommended that you take the following precautions: drink lots of water, wear light and loose fitting clothes, always wear shoes, take breaks often, and exercise moderately. If you experience symptoms of heat related illness, such as dizziness, weakness, headache, nausea, vomiting or muscle cramps, move to a shaded area, drink water and rest. Seek medical attention if you do not feel better. It is especially important that adults supervising children take precautions on hot days.

Q: Are people who play on synthetic turf fields at risk of bacterial skin infections?

A: Bacterial skin infections, such as methicillin-resistant *S. aureus* (MRSA), have not been shown to be caused by synthetic turf fields. A multi-agency report to the California state legislature stated that the number of skin abrasions suffered on synthetic turf fields was greater than on natural turf fields, but the severity of the abrasions did not differ. The report found synthetic turf fields to harbor fewer bacterial species and a smaller number of live bacteria than natural turf fields.

MRSA has not been proven to be caused by synthetic turf field contact. Bacterial skin infections among athletes are due mainly to physical contact and sharing contaminated towels or sports equipment. Coaches and players should be aware of the potential for MRSA transmission and infection among athletes. All skin cuts or abrasions should be washed with soap and water and covered immediately. School athletic departments and sports leagues, should use good hygienic practices and prohibit the sharing of towels and equipment that rubs against bare skin.

Q: Should people continue to use synthetic turf fields with crumb rubber?

A: Regular physical activity is one of the most important parts of a healthy lifestyle. Synthetic turf fields allow access to open spaces for sports and physical activities. After any outdoor activity health organizations recommend that people should wash their hands before eating or drinking. On very hot days, users should limit activities, take rest breaks and drink water.

Q: What preventive measures can be taken to further reduce potential health and safety concerns of synthetic turf fields?

A: Hand-washing after using the field, especially before eating; discouraging eating while on the field; and monitoring for potential heat-related illness are recommended measures for minimizing potential risks associated with synthetic turf fields.

Q: Where can I get more information?

A: The following links provide additional information and details on the health assessment of synthetic turf fields:

- New York City Department of Health Artificial (Synthetic) Turf Fact Sheet: <http://www.nyc.gov/html/doh/html/eode/eode-turf.shtml>
- New York City Department of Health Air Quality Survey Of Synthetic Turf Fields: http://www.nyc.gov/html/doh/downloads/pdf/eode/turf_aqs_report0409.pdf
- New York City Department of Health Review of the Potential Health and Safety Risks From Synthetic Turf Fields: www.nyc.gov/html/doh/downloads/pdf/eode/turf_report_05-08.pdf
- Connecticut Department of Public Health Human Health Risk Assessment of Artificial Turf Fields: www.ct.gov/dep/lib/dep/artificialturf/dph_artificial_turf_report.pdf
- New York State Health Department Crumb-Rubber Infilled Synthetic Turf Athletic Fields Fact Sheet: http://www.health.ny.gov/environmental/outdoors/synthetic_turf/crumb-rubber_infilled/fact_sheet.htm
- Connecticut Academy of Science and Engineering Committee Report: Peer Review of an Evaluation of the Health and Environmental Impacts Associated with Synthetic Turf Playing Fields: www.ct.gov/dep/lib/dep/artificialturf/case_artificial_turf_review_report.pdf
- California Department of Resources Recycling and Recovery Report to the Legislature on Health Impacts of Outdoor Artificial and Natural Turf Fields: <http://www.calrecycle.ca.gov/publications/documents/tires/2011007.pdf>

Appendix V. FCPA Synthetic Turf Operation/Maintenance Cost

Lighted Rectangle Field Annual Operational Costs - FY2013								WORKING DRAFT As of 6/18/2013	
Level 1 Natural Grass Field									
Task Description	Frequency		Per Recurrence	Labor Hours	Hourly Shop Rate (Direct/Indirect Cost)	Labor Cost	Material Cost	Contracted Services	Total Task Cost Per Field
MAINTENANCE									
	3 Times Per Week (April - November)								
Remove Ground Trash and Empty Receptacles	1 Time Per Week (December - March)	116	0.2	23.20	\$52	\$1,206	\$73		\$1,279
Off Season Maintenance	Annually	1	13	13.00	\$52	\$676	\$279		\$955
Mowing	2 Times per Week (April - November)	64	0.8	51.20	\$52	\$2,662			\$2,662
Amenity Inspections, Maintenance and Repair (Benches, Bleachers, Goals, Signage)	As Needed			8.60	\$52	\$447	\$138		\$585
Field Lining	2 Times Per Year	2	2.5	5.00	\$52	\$260	\$82		\$342
Irrigation Maintenance and Repairs	2 Times Per Year	2	8	16.00	\$52	\$832	\$580	\$350	\$1,762
Lighting Inspections	Weekly	32	0.2	6.40	\$52	\$333			\$333
Lighting Maintenance and Repairs	2 Times Per Year	2	2.2	4.40	\$52	\$229		\$800	\$1,029
Maintenance Total									\$8,947
Turf Program									
Fertilizer Applications	4 Times Per Year	4	1.2	4.80	\$52	\$250	\$1,000		\$1,250
Aeration	2 Times Per Year	2	2.7	5.40	\$52	\$281			\$281
Pesticide Application	2 Times Per Year	2	3	6.00	\$52	\$312	\$400		\$712
Over Seeding	Annually	1	3.5	3.50	\$52	\$182	\$400		\$582
Soil Amendments	Every 3 Years	0.33	3.6	1.19	\$52	\$62	\$102		\$164
Soil Sampling	Every 3 Years	0.33	1	0.33	\$52	\$17	\$10		\$27
Field Inspections	Annually	1	1.2	1.20	\$52	\$62			\$62
Turf Program Total									\$3,078
UTILITIES									
Electricity	Annually								\$3,429
Water	Annually								\$2,102
Utilities Total									\$5,531
Natural Grass Per Field Total				127.0		\$6,605	\$3,064	\$800	\$17,556

(FCPA currently manages 15 lighted natural grass rectangle fields, which include 4 rectangle overlay fields.)

*Labor, Material, and Contracted Services costs are supported with monies from General Fund and County Construction Fund-Athletic Field Maintenance

Appendix VI. Synthetic Turf Financing Chart

Fairfax County Synthetic Turf Field Project Financing

	Site Name	District	Number of Fields	Lights	BOS ¹ (one-time appropriation)	FCPS (one-time funds)	Donations, Grants, Other	FCPA Bond	NCS ²	Proffers	School Boosters ³ (cash/loans)	Community Sports Organizations (cash/loans)	All Sources

Athletic Playing Fields and Artificial Turf: Considerations for Municipalities and Institutions

Municipalities, universities, schools and other institutions frequently need to make decisions about maintenance and installation of athletic playing fields. This may include choosing between natural grass and synthetic turf. Factors that may be considered include cost of installation and maintenance, number of days the field can be used, likelihood of player injuries, temperature of the playing environment, and athletes' exposure to chemicals.

The Massachusetts Toxics Use Reduction Institute (TURI) at UMass Lowell has worked with municipalities and other institutions to facilitate the adoption of turf management practices that are cost-effective and preferable for human health and the environment. This fact sheet introduces some of the considerations that are relevant to evaluating natural grass and artificial turf alternatives. TURI is also developing an alternatives assessment for sports turf, which will provide a detailed assessment of these factors.

Principles of toxics use reduction

TURI's work is based on the principles of toxics use reduction (TUR). The TUR approach focuses on identifying opportunities to reduce or eliminate the use of toxic chemicals as a means to protect human health and the environment. Projects to reduce the use of toxic chemicals often have additional benefits, such as lower life-cycle costs.

Children's environmental health

People of all ages benefit from a safe and healthy environment for work and play. However, special concerns exist for children. Children are uniquely vulnerable to the effects of toxic chemicals because their organ systems are developing rapidly and their detoxification mechanisms are immature. Children also breathe more air per unit of body weight than adults, and are likely to have more hand-to-mouth exposure to environmental contaminants than adults.¹ For these reasons, it is particularly important to make careful choices about children's exposures.

Artificial turf: chemicals in infill

Artificial turf is composed of several elements, including drainage materials, support and backing materials, synthetic fibers to imitate grass blades, and an infill that takes the place of soil. A number of concerns exist regarding chemicals in the artificial grass blades and infill. Here, we briefly review issues related to chemicals in infill. Toxic chemicals such as lead are also found in the artificial grass blades in some cases.²

Crumb rubber infill made from recycled tires. Crumb rubber made from recycled tires, also referred to as styrene butadiene rubber (SBR) infill, is currently the most widely used type of infill. This type of infill contains a large number of chemicals that are known to be hazardous to human health and the environment. These include polyaromatic hydrocarbons (PAHs); volatile organic compounds (VOCs); metals, such as lead, mercury, manganese, and zinc; and other chemicals. Some of the chemicals found in crumb rubber are known to cause cancer.³ Because of the large number of chemicals present in the infill, as well as the health effects of individual chemicals, crumb rubber made from recycled tires is the option that presents the most concerns related to chemical exposures.

Other synthetic materials. Other synthetic materials used to make artificial turf infill include EPDM rubber, thermoplastic elastomers (TPE), and Nike Grind (a proprietary rubber product made from recycled athletic shoes). These alternatives are sometimes marketed as safer alternatives. Relatively little information is available on the chemicals present in, or emitted from, these infills. Preliminary information suggests that these materials do contain some hazardous chemicals, but that they generally pose less of a concern than crumb rubber made from recycled tires.⁴ There is an urgent need for more information on these alternatives.

Mineral-based and plant-derived materials. Other materials used as infill can include sand, cork, and coconut hulls, among other materials. Again, these materials are likely to contain fewer hazardous chemicals than crumb rubber infill made from recycled tires, but the materials have not been well characterized or studied thoroughly.

Artificial turf and heat stress

In sunny, warm weather, artificial turf can become much hotter than natural grass, raising concerns related to heat stress for athletes playing on the fields.⁵ Research indicates that all synthetic turf reaches higher temperatures than natural grass, regardless of the infill materials.⁶

- A report by the New York State Department of Environmental Conservation found that surface temperatures on a synthetic turf field were 35°F to 42°F higher than those on natural grass.⁷
- Another study found that the highest temperature measured on synthetic turf was 60.3°F greater than that observed on natural grass.⁸
- In another study, artificial turf fibers reached temperatures of 156°F under direct sunlight, while the crumb rubber infill reached 101°F.⁹
- Measurements taken by sports managers at Brigham Young University found that the surface temperature of synthetic turf was 37°F higher than asphalt and 86.5°F hotter than natural turf. The hottest surface temperature recorded during the study was 200°F on a 98°F day. Even in October, the surface temperature reached 112.4°F.¹⁰

Irrigation can lower field temperature for a short time. A study by Penn State's Center for Sports Surface Research found that frequent, heavy irrigation reduces temperatures on synthetic turf, but temperatures rebound quickly under sunny conditions.¹¹ Another study found that irrigation could lower temperatures by 10 to 20 degrees, for a period of at least 20 minutes.¹² Another found that irrigation lowered the surface temperature from 174°F to 85°F; however, the temperature rebounded to 164°F after 20 minutes.¹³

Heat-related illness can be a life-threatening emergency. Experts note that athletic coaches and other staff need to be educated about heat-related illness and understand how to prevent it, including cancelling sport activities when appropriate.¹⁴

Injuries

Injury rates can be affected by a variety of factors, including the type and condition of the playing surface as well as equipment used and type and level of sport. Studies show variable outcomes in the rates and types of injuries experienced by athletes playing on natural and on artificial turf.¹⁵

One particular concern is increased rates of turf burns (skin abrasions) associated with playing on artificial turf. For example, a study by the California Office of Environmental Health Hazard Assessment found a

two- to three-fold increase in skin abrasions per player hour on artificial turf compared with natural grass turf.¹⁶ These study authors noted that these abrasions are a risk factor for serious bacterial infections, although they did not assess rates of these infections among the players they studied.

Environmental concerns

Environmental concerns include loss of wildlife habitat and contaminated runoff into the environment. A study by the Connecticut Department of Environmental Protection identified concerns related to a number of chemicals in stormwater runoff from artificial turf fields. These include both metals and organic compounds. They noted high zinc concentrations in stormwater as a particular concern for aquatic organisms. They also noted the potential for leaching of high levels of copper, cadmium, barium, manganese and lead in some cases. The top concerns identified in the study were toxicity to aquatic life from zinc and from whole effluent toxicity (WET).¹⁷ WET is a methodology for assessing the aquatic toxicity effects of an effluent stream as a whole.¹⁸

Current federal and state studies

A number of studies have examined the chemicals present in synthetic turf, with a particular focus on chemicals found in crumb rubber made from recycled tires. However, federal and state officials have identified a need for additional information. At the time of publication of this fact sheet, two key government studies are under way.

The California Office of Environmental Health Hazard Assessment (OEHHA), an office within the California Environmental Protection Agency, is conducting a three-year study of the potential health effects of exposure to synthetic turf as well as playground mats made from recycled waste tires. The project began in June 2015 and will be completed in June 2018. In the study, OEHHA will review the existing literature on chemicals in synthetic turf and playground mats; analyze samples of new and used synthetic turf and playground mats; develop exposure scenarios; and publish a risk assessment based on this information. OEHHA will also develop plans for a possible future study that would examine people's actual exposures through measurement of biological specimens or use of personal monitors.¹⁹

Three federal agencies have also recently begun a one-year assessment of potential health effects of exposure to synthetic turf. The agencies working on the study are the U.S. Environmental Protection Agency (EPA), the Consumer Product Safety Commission (CPSC), and the Agency for Toxic Substances and Disease Registry (ATSDR) within the Centers for Disease Control. Working with experts at OEHHA and elsewhere, the federal agencies will identify chemicals of concern found in crumb rubber made from recycled waste tires, as used in artificial turf fields and playgrounds; consider exposure scenarios; and identify areas for future study. The agencies will issue a draft status report by the end of 2016.²⁰ As background on the need for this study, the EPA website notes that, "Limited studies have not shown an elevated health risk from playing on fields with tire crumb, but the existing studies do not comprehensively evaluate the concerns about health risks from exposure to tire crumb."²¹

Natural grass

Natural grass fields can be the safest option for recreational space, by eliminating many of the concerns noted above. Natural grass can also reduce overall carbon footprint by capturing carbon dioxide. Grass fields may be maintained organically or with conventional or integrated pest management (IPM) practices. Organic turf management eliminates the use of toxic insecticides, herbicides and fungicides.

Organic management of recreational field space

Organic management of a recreational field space requires a site-specific plan to optimize soil health and minimize long-term costs. Over time, a well-maintained organic field is more robust to recreational use due to a stronger root system than that found in a conventionally managed grass field. Water needs also decrease over time. Key elements of organic management include the following steps.²²

- **Field construction:** Construct field with appropriate drainage, layering, grass type, and other conditions to support healthy turf growth. Healthy, vigorously growing grass is better able to out-compete weed pressures, and healthy soil biomass helps to prevent many insect and disease issues.
- **Soil maintenance:** Add soil amendments as necessary to achieve the appropriate chemistry, texture and nutrients to support healthy turf growth. Elements include organic fertilizers, soil amendments, microbial inoculants, compost teas, microbial food sources, and topdressing as needed with high-quality finished compost.
- **Grass maintenance:** Turf health is maintained through specific cultural practices, including appropriate mowing, aeration, irrigation, and over-seeding. Trouble spots are addressed through composting and re-sodding where necessary.

It is important to note that organic turf management requires proper training. Conventional turf management may follow a similar protocol each year; organic turf managers make adjustments based on changing conditions.

Installation and Maintenance Costs: Comparing Artificial Turf with Natural Grass

In analyzing the costs of artificial vs. natural grass systems, it is important to consider full life-cycle costs, including installation, maintenance, and disposal/replacement. Artificial turf systems of all types require a significant financial investment at each stage of the product life cycle. In general, the full life cycle cost of an artificial turf field is higher than the cost of a natural grass field.

Cost information is available through university entities, turf managers' associations, and personal communications with professional grounds managers. Information is also available on the relative costs of conventional vs. organic management of natural grass.

Installation. According to the Sports Turf Managers Association (STMA), the cost of installing an artificial turf system may range from \$4.50 to \$10.25 per square foot. For a football field with a play area of 360x160 feet plus a 15-foot extension on each dimension (65,625 square feet), this yields an installation cost ranging from about \$295,000 to about \$673,000. These are costs for field installation only, and full project costs may be higher. Costs for a larger field would also be higher.

In one site-specific example, information provided by the town of Natick, Massachusetts shows that the full project budget for the installation in 2015 of a new artificial turf field (117,810 square feet), along with associated landscaping, access and site furnishings, totaled \$1.2 million.²³

For natural grass, installation of a new field may not be necessary. For communities that do choose to install a new field, costs can range from \$1.25 to \$5.00 per square foot, depending on the type of field selected. For the dimensions noted above, this would yield an installation cost ranging from about \$82,000 to about \$328,000.²⁴

Maintenance. Maintenance of artificial turf systems can include fluffing, redistributing and shock testing infill; periodic disinfection of the materials; seam repairs and infill replacement; and watering to lower temperatures on hot days. Maintenance of natural grass can include watering, mowing, fertilizing, replacing sod, and other activities. In both cases, specialized equipment is needed. Communities shifting from natural grass to artificial turf may need to purchase new equipment for this purpose. According to STMA, maintenance of an artificial turf field may cost about \$4,000/year in materials plus 300 hours of labor, while maintenance of a natural grass field may cost \$4,000 to \$14,000 per year for materials plus 250 to 750 hours of labor.²⁵

Fifteen acres of playing fields in Marblehead, MA are managed organically. Annual maintenance costs are \$2,400-\$3,000 per 2-acre playing field, not including mowing costs. Mowing costs for a 2-acre field were estimated in 2010 to be \$10,000 annually. Thus, total maintenance costs per 2-acre field are \$12,400 to \$13,000 annually.²⁶

Natural grass maintenance: Conventional vs. organic costs. Organic turf maintenance can be cost-competitive with conventional management of natural grass. One study found that once established, an organic turf management program can cost 25% less than a conventional turf management program.²⁷

Disposal/replacement. Artificial turf also requires disposal at the end of its useful life. STMA estimates costs of \$6.50 to \$7.80 per square foot for disposal and resurfacing.²⁸ Those estimates yield \$426,563 - \$511,875 for a 65,625 square foot field and \$552,500 - \$663,000 for an 85,000 square foot field.

Annualized costs. In 2008, a Missouri University Extension study calculated annualized costs for a 16-year scenario. The calculation included the capital cost of installation; annual maintenance; sod replacement costing \$25,000 every four years for the natural fields; and surface replacement of the synthetic fields after eight years. Based on this calculation, a natural grass soil-based field is the most cost effective, followed by a natural grass sand-cap field, as shown in the table below.²⁹ Another study, conducted by an Australian government agency, found that the 25-year and 50-year life cycle costs for synthetic turf are about 2.5 times as large as those for natural grass.³⁰

Table 1: Comparison of annualized costs	
Field type	16-year annualized costs
Natural soil-based field	\$33,522
Sand-cap grass field	\$49,318
Basic synthetic field	\$65,849
Premium synthetic field	\$109,013

The Toxics Use Reduction Institute is a multi-disciplinary research, education, and policy center established by the Massachusetts Toxics Use Reduction Act of 1989. The Institute sponsors and conducts research, organizes education and training programs and provides technical support to help Massachusetts companies and communities to reduce the use of toxic chemicals.

In response to information requests from municipalities, TURI is currently developing a detailed alternatives assessment for sports turf. Preliminary sections of the assessment will be published in the order in which they are developed, and will be available on TURI's website at www.turi.org.

FAC 7541 Unit Calculations & Assumptions

FAC Description	Unit of Measure	FAC #	Measurement Assumptions
Public Restroom/Shower	SF	7385	1 male and 1 female facility, each with 2 WC, 3 lav, 2 shower, plus 2 urinal; each 20' x 15' = 300 SF, total 600 SF
Vehicle Parking, Surfaced	SF	8521	60 spaces x 15 x 20 FT = 18000 SF
EUPH Tent Pad	SF	7251	30 spaces x 10 x 10 = 3000 SF
Electric Power Line UG	LF	8123	{60 spaces x 50 ft frontage each X 50% (back to back) x 125% (accounting for home runs)} x .67 (2 wire vice 3) = 1256 LF
Electric Power Transformer	KV	8133	60 spaces x (100% @ 20 A + 20% @ 50 A + 70% @ 30A) + (30 tent sites @ 20 A) per NEC 551.71 = 500 KVA
Electric Lighting, Pole	EA	8122	200 ft spacing: 60 RV spaces @ 50 FT = 3000/200 = 15 poles; tents: 30 pads / 5 pads per light = 6, total 21
Water Distribution Line	LF	8421	same as electric line
Sewer and Industrial Waste Line	LF	8321	same as electric line
Sewage Lift Station	EA	8316	1 each

750 COMMUNITY FACILITIES - MORALE, WELFARE AND RECREATION (OUTDOOR)

750-1 GENERAL. The Navy's Outdoor Recreation Program introduces Sailors and their families to lifetime outdoor recreation activities, and provides them with participation opportunities. The associated values and benefits of participating in outdoor-related activities effectively contribute to Navy quality of life and retention efforts. Outdoor recreation has long lasting, broad scope effects on other areas of a participant's life. Benefits include increased self-esteem, overall happiness and general well being. The Outdoor Recreation Program promotes physical fitness, teamwork, leadership, skill development and environmental ethics. Examples of human powered outdoor recreation programs include:

Backpacking	Nordic Skiing	White Water Rafting
Canoeing	Rock Climbing	Scuba Diving
Sea Kayaking	Hiking	Orienteering
Snowshoeing	Mountain Biking	Surfing
Fishing	Camping	Alpine Skiing
Snowboarding	Rope Courses	Urban Bicycling
Adventure Races	In-line Skating	Adventure Travel
Skateboarding	BMX Biking	

The Outdoor Recreation Program also includes traditional outdoor recreation activities such as:

Golf	Basketball	Tennis
Volleyball	Baseball	Softball
Football	Soccer	Track and Field
Swimming	Sailing	

The extent and type of Outdoor Recreation Program depends on the Installation location, local geography, and patron interest. The 750 Series of Navy Category Codes provides for the various types of facilities that may be required to support the above programs. Facilities should be attractive, clean, uncluttered, and well maintained. Space should be available to support all core program activities.

750-1.1 Morale Welfare and Recreation (MWR), Navy Personnel Command (NPC) Role: The involvement of MWR representatives in the planning process is required, especially for all Category C business-based projects, in order to ensure a match between program needs, and the types and sizes of spaces to be provided. MWR programs are funded by a combination of nonappropriated funds (NAFs) and appropriated funds (APFs). MWR activities are divided into three categories following DoD policy on funding and function:

- **Category A** operations are authorized full APF funding and directly support mission essential requirements. Examples are gymnasiums, fitness centers, and sports programs.
- **Category B** operations are mission enhancing community support programs and are authorized significant APF support. Examples are outdoor recreation, child development, hobby shops, ITT, community pools, school age care, and youth development programs.
- **Category C** operations are business-based activities and are authorized minimal APF (such as SRM, environmental compliance, security, and health and safety support; interior renovation and new construction/additions are NAF funded) except at isolated/remote and OCONUS installations where Category C operations are treated the same as Category B operations. Examples are food and beverage operations, bowling centers, cottages, RV parks, slip rental marinas, and golf courses.

For Category B and C facilities an initial market survey and financial analysis or pro forma is required to determine if the facility will be self-sustaining or profitable, in the case of Category C operations. Once the Installation has completed their analysis, the proposal will be submitted via the regional command to NPC (after 1 October 2004, CNI Field Support Activity) through an Internal Needs Validation Study (INVS). If the project earns sufficient points through the INVS, it will move on to the Project Validation Assessment stage where the demand and scope will be confirmed through independent review.

750-1.4 **Overseas Adjustment:** For overseas activities the net to gross factor (typical net to gross is 1.25 or 25%) will increase as necessary to meet host nation building codes.

750-2 USING THE CRITERIA.

750-2.1 Size to Accommodate Demand

The below criteria provide the current approach for determining allowances for Morale, Welfare and Recreational (MWR) facilities. Facility allowances are sized to accommodate the projected demand for the anticipated functions. The projected demand will be estimated using a Market Survey approach. Existing Navy wide surveys (under 2 years old), MWR Pulse Point Surveys, and other local surveys can be used to determine the demand. Existing community facilities will be considered in the Market Analysis approach. The facility capacity requirements will be estimated using industry standards and comparable existing facilities, Navy, DoD, municipal, or commercial.

In addition to the above criteria, attention should be given to relevant planning information in the Base Master Plan, Regional or Functional Plan (RSIP), existing Unified Facilities Criteria (UFC) as developed, Design Manuals, Military Handbooks or Instructions for the specific facility type.

For **Marine Corps Installations** results of the **MWR Construction Program Patron Survey** will be used to provide Marine Corps specific patron desires. Construction Program Patron Survey data is available from the **Commandant of the Marine Corps (MW)**.

750-2.2 **Space Allowance Flexibility**

750-2.2.1 **Aggregate Space Allowances.** For many of these criteria, usage demand, capacity requirements and space allowances are calculated separately for component function-areas of the facility, and then totaled to derive overall facility space allowances. This procedure is designed to respond to local variations in the set of activities and spaces provided, and the relative demand for different activities depending on the needs of the installation population. This approach can also accommodate diverse existing facility situations, when considering additions or complementary new facilities.

750-2.2.2 **Space Programs versus Facility Allowances.** These criteria are used to determine the total space allowance for a facility. Even though area calculations for functional components of the facility are used in deriving the overall allowance, this does not fix the space sizes of the component program areas of the facility. Local installation decisions, in the space programming and design process, should determine the appropriate allocation of areas for each function-space within the total facility allowance. Any such decisions should be fully justified to the regional and CNI MWR program management to ensure compliance with Navy and DoD standards.

750-2.2.3 **Local Variation**

Local demand for program activities may depend on a variety of factors, in addition to the overall installation population, including

- Proportion and relative participation of different user groups among the population.
- Specific program of activities provided.
- Competing on-base and off-base facilities providing similar programs.
- Geographic distribution and accessibility of the user populations.

- Local climate conditions and operating seasons.
- Overseas situations and local customs.
- Installation geography.

750-2.3 **Population Basis for Demand Calculations**

See Chapter 1 of this instruction for general information on population definitions and base loading data.

750-2.4 **Recreational Planning Context**

Planning for MWR facilities should involve consideration of the individual facility in relationship to a comprehensive recreational program and facilities plan for the installation and the region. Consider the following factors, in addition to those relationships specifically indicated in the criteria for each facility:

- If other MWR facilities serving the same user population provide the same program activities, reduce the allowed capacity of the proposed facility by the capacity provided elsewhere at the installation or other nearby regional installations.
- Consider collocating the facility with other recreational facilities providing complementary programs, to provide the users with the increased convenience and attractiveness of clustered activities, and to take advantage of potential savings in support space requirements and operating costs.
- Size and locate an individual facility appropriately to the target population and geographical area its particular function is designed to serve. Convenient access for users should be considered in balance with the need for efficient facility operation and avoidance of duplicate facilities. Consider the DoD INST 1015.15 (Enclosure 3, Attachment 1) requirement for the use of appropriated funds (APF) for site development costs, archeological and ammunition clearances, water purification, demolition, excessive utility connections, and road service when selecting sites.
- Consider local community facilities. If the local community has a robust program and facilities for outdoor recreational activities consider partnerships with the local community for services, and/or other Public Private Venture initiatives.

750 10 OUTDOOR PLAYING COURTS (EA)

Design Criteria: Military Handbook (MIL-HDBK-1037/3) -- Outdoor Sports and Recreation Facilities

75010-1 **GENERAL.** See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75010-2 **DEFINITION.** Outdoor Playing Courts provide facilities and support services to meet the individual physical fitness and recreation needs of military personnel. The facilities may also serve dependents, retirees and authorized civilians. Activities that may be accommodated in Outdoor Playing Courts include: basketball, tennis, volleyball, skate/skateboard parks, and outdoor skating/roller hockey rink

75010-3 **RELATED FACILITIES.** Consideration should be given to collocating the Outdoor Playing Courts with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 44 Indoor Physical Fitness Center (Gym)
- 740 45 Fitness Room
- 740 84 Indoor Playing Courts
- 750 20 Playing Fields
- 740 55 Youth Center

75010-4 **DEMAND AND ALLOWANCES.** Demand, market analysis and survey information, as well as the number of existing leagues/teams if applicable determine the number of Outdoor Playing Courts provided at each installation. Provision of lighted courts is recommended where there is a high demand and/or climate warrants later usage by patrons. Youth Outdoor Playing Courts will be provided as needed. They should be sized and located for the youth population, i.e. near the youth center if there is one. The Courts will be sized in accordance with industry standards for the youth age group or adult age group as appropriate.

750 20 PLAYING FIELDS (EA)

Design Criteria: Military Handbook (MIL-HDBK-1037/3) -- Outdoor Sports and Recreation Facilities

75020-1 **GENERAL.** See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75020-2 **DEFINITION.** Playing Fields provide facilities and support services to meet the individual physical fitness, coordination, skills development, training and recreation needs of military personnel. The facilities may also serve dependents, retirees and authorized civilians. Activities which may be accommodated in Playing Fields include: baseball, football, soccer, softball, track and field, etc.

75020-3 **RELATED FACILITIES.** Consideration should be given to collocating the Playing Fields with the following recreational facilities in order to (i) take advantage of

potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 44 Indoor Physical Fitness Center (Gym)
- 740 45 Fitness Room
- 740 53 Indoor Swimming Pool
- 750 10 Outdoor Playing Courts.
- 740 55 Youth Center

75020-4 **DEMAND AND ALLOWANCES.** Demand, market analysis and survey information, as well as the number of existing leagues/teams if applicable determine the number of Outdoor Playing Fields provided at each installation. Provision of lighted fields is recommended for expanded usage. Provision of lighted fields and use of artificial turf or installed sprinkler systems may serve to reduce the total requirement for fields by allowing extended playing hours, extended play without the need for field maintenance/recovery. Youth Outdoor Playing Fields will be provided as needed. They should be sized and located for the youth population, i.e. near the youth center if there is one. The Fields will be sized in accordance with industry standards for the youth age group or adult age group as appropriate.

750 21 BATTING CAGE (EA)

75021-1 Batting cages may be provided at Installations where there is a demand, where a MWR survey supports the requirement, and there is no convenient local alternative. Size according to industry standards.

750 22 JOGGING TRACK (KM/MI)

75022-1 Jogging tracks are provided and sized as required.

750 23 GO-CART TRACK (KM/MI)

75023-1 Go-Cart Tracks may be provided as a Category C facility where they are determined to be profitable enterprises. Market analysis for this facility must be provided by MWR. Size according to demand and industry standards.

750 30 OUTDOOR SWIMMING POOL - INSTALLATION (SQ.M./SF)

75030-1 (Use CC 740 53 SWIMMING POOL - INDOOR for sizing standards). With appropriate demand analysis, outdoor pools may include water park features and spray parks.

**750 33 POOL PUMP/FILTER/TREATMENT FACILITY -
REMOTE (EA)**

75033-1 This code is for inventory purposes and only in those cases where such facilities are located in a structure remotely situated from the swimming pool proper.

750 34 WADING POOL/SPLASH POOL (EA)

75034-1 Wading pools normally are planned as adjuncts to main pools (see CC 740 53 Swimming Pool—Indoor). This code is for inventory purposes and only in those cases where wading pools are detached from the main facility.

750 35 ACTIVITY TV RECEIVER ANTENNA (EA)

75035-1 This Category Code Number is provided for inventory purposes only.

750 36 TV DISTRIBUTION SYSTEM (EA)

75036-1 Category Codes 750 35 and 750 36 are for inventory purposes only. Such facilities are provided only at remote installations where central TV reception and local distribution systems can be individually justified.

750 37 OUTDOOR ADVENTURE AREA (EA)

75037-1 Includes Ropes Courses, Natural Recreation Features (rock climbing, hiking trails, mountain bike trails, paintball ranges, motocross/BMX areas). Requirement is based on local availability (geography) and local demand. Size according to industry standards.

**750 38 OUTDOOR MWR EQUIPMENT RENTAL STORAGE
(SQ.M./SF)**

75038-1 Outdoor fenced area with lighting for storage of MWR rental equipment (not enclosed). Facility should be co-located with the Outdoor Recreation Center CCN 740-37, if there is one.

**750 39 MWR VEHICLE/RV/BOAT STORAGE COMPOUND
(SQ.M./SF)**

75039-1 Vehicle/RV/Boat Storage Compounds may be provided as Category C facilities where they are determined to be profitable enterprises. Markey analysis for

this facility must be provided by MWR. Size according to demand and industry standards. Covered spaces may be included where justified by demand.

750 40 GOLF COURSE (EA)

Design Criteria: Military Handbook (MIL-HDBK-1037/3) -- Outdoor Sports and Recreation Facilities

75040-1 **GENERAL.** See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75040-2 **DEFINITION.** Golf Courses are recreational facilities which may accommodate: recreational golfing, practice, instruction, tournaments, exhibitions, special events, and winter recreational activities such as cross-country skiing, ice skating, sledding and tobogganing. In addition to the Golf Course, space permitting, the facility may include a driving range, practice hole, chipping green with sand trap, and putting green(s). A Golf Course is a Category C MWR facility.

75040-3 **RELATED FACILITIES.** The Golf Course must be collocated with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 80 Golf Club House (including golf maintenance building/storage compound, chemical/fertilizer/pesticide storage and mixing building, and cart storage facilities).
- 750 56 Golf Driving Range.

75040-4 **DEMAND.** The Golf Course will be sized in accordance with a market survey approach. As a Category C facility the Golf Course must be profitable and a financial analysis or pro forma will be provided as well as the NPC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If project is financially sound it will be forwarded via the region to NPC (after 1 October 2004, CNI Field Support Activity) for INVS scoring and possible Project Validation Assessment.

75040-5 **FACILITY ALLOWANCE.** The Golf Course will be sized in accordance with industry standards. One resource for sizing criteria is the National Golf Foundation (NGF). Siting, water availability, and existing land area available will be the key considerations when planning a new Golf Course.

750 50 OUTDOOR THEATER (EA)

75050-1 No planning factors are available. If an outdoor theater (either seat- type or drive-in) is provided, the requirements for theaters (Code 740 56) must be reduced accordingly.

750 52 SKEET AND/OR TRAP RANGE (EA)

75052-1 Skeet and/or Trap Ranges may be provided as Category C facilities where they are determined to be profitable enterprises. Market analysis for this facility must be provided by MWR. Size according to demand and industry standards. In addition, suitable land must be available, and the activity must have a military population over 100. If a range building is authorized, see Category Code 740 52 for criteria. Table 75052-1 gives the corresponding land requirements. This facility must be self-sustaining.

Table 75052-1 Land Requirements for Skeet and Trap Ranges Land Area

Military Population (1)	Skeet Range	Trap Range
Up to 100	None	None
101 to 10,000	335m x 732m /1100' x 2400'	335m x 549m / 1100' x 1800'
10,001 to 15,000	335m x 732m /1100' x 2400'	335m x 576m / 1100' x 1890'
15,001 to 20,000	335m x 732m /1100' x 2400'	335m x 604m / 1100' x 1980'
20,001 to 25,000	335m x 732m /1100' x 2400'	335m x 631m / 1100' x 2070'
25,001 to 30,000	335m x 732m /1100' x 2400'	335m x 658m / 1100' x 2160'
30,001 to 40,000	335m x 777m /1100' x 2550'	335m x 686m / 1100' x 2250'
Over 40,000	335m x 823m / 1100' x 2700'	335m x 713m / 1100' x 2340'

(1) Military population consists of active duty military supported by the installation.

750 54 BAND STAND (EA)

75054-1 No planning factors are available. Requests for this facility will require individual justification.

750 56 GOLF DRIVING RANGE (EA)

75056-1 Installations, where the necessary land is already available, and the facility will be profitable as a Category C facility, are authorized a golf driving range. See Category Code 750-40

750 57 MWR OPERATED RECREATION GROUNDS (EA)

75057-1 No specific guidance is available. Local conditions usually will govern the development of any parks, playgrounds, or picnic areas. Recreation Pavilions (Code 740 78) are authorized in conjunction with these facilities.

750 58 RECREATIONAL CAMPGROUND-TENT (SQ.M./SF)

75058-1 Please see CCN 750-59 for general description of campground. This CCN will be used for tent camping vs. RV's. No vehicle pads are required. See Table 75059-1 for sanitary facilities requirements for tent campgrounds.

750 59 RECREATION CAMPGROUND - RV (SQ.M./SF)

Project Review: Base MWR representatives, EFD, NAVFAC HQ, BUPERS (Pers-656D)
Design Criteria: *(Military Handbook is not currently available)*

75059-1 **GENERAL.** See General Notes to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75059-2 **DEFINITION.** Recreational Campgrounds provide the military community with outdoor recreation opportunities at locations with attractive natural resources. To complement the camping experience, and depending on location, Recreational Campgrounds may offer activities such as boating, canoeing, fishing, hiking, hunting, skiing and swimming. Facilities should be designed to take advantage of the natural features of the site, from vegetation to good views to unusual topography. At the same time, development should be environmentally appropriate, and not threaten the preservation of the natural heritage and scenic resources.

The planning criteria in this Category Code addresses only the camping sites and patron support facilities such as showers, toilets and laundromats. Other campground support facilities (particularly in relatively remote locations) such as an on-site manager's office, community room, kitchen, and convenience stores are not included in this Category Code. See CCN 740-92. Recreational campgrounds are encouraged to make use of the Camp Host concept to assist in the management of the campground. Space allowances for MWR Rental Cabins are addressed under Category Code 740 81.

Dump stations should generally be provided at campgrounds that accommodate RV's.. (CCN 750 59). The sizing and design of dump stations will vary according to local conditions (such as topography, soil conditions, proximity to water sources, etc.). All dump station facilities must comply fully with all applicable environmental regulations.

75059-3 **RELATED FACILITIES.** Where such locations are adjacent to the sea or other body of water, support facilities such as marinas, boat ramps and RV/vehicle/boat storage compounds maybe sited in close proximity to Recreational Campgrounds.

75059-4 **SPACE ALLOWANCE.** The total number of camping and/or RV sites provided at a location is primarily determined by two considerations:

- The Recreational Campground will be sized in accordance with a market survey approach. As a Category C facility the Campground must be profitable and a financial analysis or pro forma will be provided as well as the NPC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If the project is financially sound it will be forwarded via the region to NPC (after 1 October 2004, CNI Field Support Activity) for INVS Scoring and possible Project Validation Assessment.

- Capacity of the location to accommodate the proposed facilities at a recommended level of use density, and other site planning requirements for access and provision of utilities.

75059-4.1 The number of campsites which may be accommodated per acre will vary depending on the natural features (topography, geology, vegetation, etc.) of the proposed location and the desired degree of privacy between individual sites. Development of as few as 2.4 sites per hectare (6 sites per acre) to a maximum of 5.7 sites per hectare (14 sites per acre) is recommended as a planning guideline. However, this guideline may be modified by the financial analysis, which may, for example, indicate that 2.4 sites per hectare (6 sites per acre) may be too low to justify the investment required to provide the necessary infrastructure (paths, roads, patron support facilities, utilities, etc.). Furthermore, the financial analysis may also indicate a total minimum number of sites required to justify the investment in this recreational resource and the corresponding support building (CCN 740-92). RV Campsites should be planned with a vehicle pad 20 feet by 40 feet. Minimum separation between campsites should be 37 feet. It is recommended that, where financially feasible, the RV Campground include a mix of back-in and pull-through sites.

75059-4.2 Once the total number of campsites at a location has been determined, the required patron support facilities may be selected from the criteria in Table 75059-1.

Table 75059-1 Sanitary Facilities Requirements for Recreational Campgrounds

#Tent/Trailer	#Water Closets (M/F)	#Lavatories (M/F)	#Showers (M/F)	#Urinals
1-15	1/1	1/1	1/1	1
16-30	1/2	2/2	1/1	1
31-45	2/2	3/3	1/1	1
46-60	2/3	3/3	2/2	2
61-80	3/4	4/4	2/2	2
81-100	3/4	4/4	3/3	2

Notes for Table 75059-1:

(1) For recreational areas having more than 100 tent/trailer/camper/RV sites, provide one additional water closet and lavatory per each additional 30 sites, and one additional urinal per each additional 60 sites.

(2) For laundry facilities, provide one washer and one dryer for every increment of 12 sites or portion thereof.

75059-4.3 All facilities, which have the potential for causing environmental contamination—for example, dumpsters and dump stations—, must comply fully with all applicable local, state and federal regulations. The planning of Recreational Campgrounds located in areas under the jurisdiction of other agencies such as State

Parks and Forests Divisions, the U.S. Forest Service and the National Park Service, must adhere to all applicable development guidelines and review procedures.

Figure 75059-1 Recreational Campground – Medium Size Support Facility

750 60 MARINA (EA)

75060-1 This facility requires special considerations and must be developed based on local conditions and supported by a detailed analysis. As a Category C facility, the Marina must be profitable and a financial analysis or pro forma will be provided as well as the NPC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If the project is financially sound it will be forwarded via the Region to NPC (after 1 October 2004, CNI Field Support Activity) for INVS Scoring and possible Project Validation Assessment. For a Category B sailing program marina, it is necessary to document the demand and to ensure that APF will be available to support operation of the sailing program. A marina support building or boathouse is authorized in conjunction with a marina and should be programmed as a part of the project nomination and validation process.. See Code 740 87 for marina support building criteria. There are two categories of Marina: Category B is the MWR sailing program and Category C is the rental slips operation.

750 61 RECREATIONAL PIER (EA)

75061-1 This CCN is used for stand-alone recreational pier facilities (e.g. fishing piers) where there is no existing Marina.

FAC 7541 Recreational Camp and Trailer Park

FAC 7541 Description: “Trailer parking sites/pads or tent pads, with associated facilities for recreational trailers, vehicles or tents. SUC based upon an area providing **100 camping sites.**”

There are 255 recreational camps and trailer parks in the inventory for FMM 11.2. (Note that this does not include facilities covered under FAC 7542, Miscellaneous Outdoor Recreation Facility).

Related FACs are:

- 7120 Family Housing Trailer/Relocatable
- 7130 Family Housing Trailer Site

These parks are frequently co-located with other outdoor MWR facilities, (marina, beach, athletic courts) and/or on installations with access to commissary, exchange, laundry, eating facility, and other commercial support.

Components in this FAC may include:

- Paved roads with adequate turn-around area
- Paved parking for rv plus vehicle
- Privacy screens for sites
- Trails and sidewalks
- Utilities: water, electricity, sewer, cable tv, telephone at pad/site
- Exterior lighting
- Restroom/latrine
- Shower facilities
- Laundry facility
- Outdoor shelter
- Pavilion or picnic area w/barbeque pits
- Tent sites may have electricity or water
- Signs
- Management/check-in building for larger sites
- Community building (with kitchen) for group events

A separate excel file provides a numerical sample of the number of rv pads, cabins, tents and mix of services on which to base cost estimates.

750 COMMUNITY FACILITIES - MORALE, WELFARE AND RECREATION (OUTDOOR)

750-1 GENERAL. The Navy's Outdoor Recreation Program introduces Sailors and their families to lifetime outdoor recreation activities, and provides them with participation opportunities. The associated values and benefits of participating in outdoor-related activities effectively contribute to Navy quality of life and retention efforts. Outdoor recreation has long lasting, broad scope effects on other areas of a participant's life. Benefits include increased self-esteem, overall happiness and general well being. The Outdoor Recreation Program promotes physical fitness, teamwork, leadership, skill development and environmental ethics. Examples of human powered outdoor recreation programs include:

Backpacking	Nordic Skiing	White Water Rafting
Canoeing	Rock Climbing	Scuba Diving
Sea Kayaking	Hiking	Orienteering
Snowshoeing	Mountain Biking	Surfing
Fishing	Camping	Alpine Skiing
Snowboarding	Rope Courses	Urban Bicycling
Adventure Races	In-line Skating	Adventure Travel
Skateboarding	BMX Biking	

The Outdoor Recreation Program also includes traditional outdoor recreation activities such as:

Golf	Basketball	Tennis
Volleyball	Baseball	Softball
Football	Soccer	Track and Field
Swimming	Sailing	

The extent and type of Outdoor Recreation Program depends on the Installation location, local geography, and patron interest. The 750 Series of Navy Category Codes provides for the various types of facilities that may be required to support the above programs. Facilities should be attractive, clean, uncluttered, and well maintained. Space should be available to support all core program activities.

750-1.1 Morale Welfare and Recreation (MWR), Navy Personnel Command (NPC) Role: The involvement of MWR representatives in the planning process is required, especially for all Category C business-based projects, in order to ensure a match between program needs, and the types and sizes of spaces to be provided. MWR programs are funded by a combination of nonappropriated funds (NAFs) and appropriated funds (APFs). MWR activities are divided into three categories following DoD policy on funding and function:

- **Category A** operations are authorized full APF funding and directly support mission essential requirements. Examples are gymnasiums, fitness centers, and sports programs.
- **Category B** operations are mission enhancing community support programs and are authorized significant APF support. Examples are outdoor recreation, child development, hobby shops, ITT, community pools, school age care, and youth development programs.
- **Category C** operations are business-based activities and are authorized minimal APF (such as SRM, environmental compliance, security, and health and safety support; interior renovation and new construction/additions are NAF funded) except at isolated/remote and OCONUS installations where Category C operations are treated the same as Category B operations. Examples are food and beverage operations, bowling centers, cottages, RV parks, slip rental marinas, and golf courses.

For Category B and C facilities an initial market survey and financial analysis or pro forma is required to determine if the facility will be self-sustaining or profitable, in the case of Category C operations. Once the Installation has completed their analysis, the proposal will be submitted via the regional command to NPC (after 1 October 2004, CNI Field Support Activity) through an Internal Needs Validation Study (INVS). If the project earns sufficient points through the INVS, it will move on to the Project Validation Assessment stage where the demand and scope will be confirmed through independent review.

750-1.4 **Overseas Adjustment:** For overseas activities the net to gross factor (typical net to gross is 1.25 or 25%) will increase as necessary to meet host nation building codes.

750-2 USING THE CRITERIA.

750-2.1 Size to Accommodate Demand

The below criteria provide the current approach for determining allowances for Morale, Welfare and Recreational (MWR) facilities. Facility allowances are sized to accommodate the projected demand for the anticipated functions. The projected demand will be estimated using a Market Survey approach. Existing Navy wide surveys (under 2 years old), MWR Pulse Point Surveys, and other local surveys can be used to determine the demand. Existing community facilities will be considered in the Market Analysis approach. The facility capacity requirements will be estimated using industry standards and comparable existing facilities, Navy, DoD, municipal, or commercial.

In addition to the above criteria, attention should be given to relevant planning information in the Base Master Plan, Regional or Functional Plan (RSIP), existing Unified Facilities Criteria (UFC) as developed, Design Manuals, Military Handbooks or Instructions for the specific facility type.

For **Marine Corps Installations** results of the **MWR Construction Program Patron Survey** will be used to provide Marine Corps specific patron desires. Construction Program Patron Survey data is available from the **Commandant of the Marine Corps (MW)**.

750-2.2 **Space Allowance Flexibility**

750-2.2.1 **Aggregate Space Allowances.** For many of these criteria, usage demand, capacity requirements and space allowances are calculated separately for component function-areas of the facility, and then totaled to derive overall facility space allowances. This procedure is designed to respond to local variations in the set of activities and spaces provided, and the relative demand for different activities depending on the needs of the installation population. This approach can also accommodate diverse existing facility situations, when considering additions or complementary new facilities.

750-2.2.2 **Space Programs versus Facility Allowances.** These criteria are used to determine the total space allowance for a facility. Even though area calculations for functional components of the facility are used in deriving the overall allowance, this does not fix the space sizes of the component program areas of the facility. Local installation decisions, in the space programming and design process, should determine the appropriate allocation of areas for each function-space within the total facility allowance. Any such decisions should be fully justified to the regional and CNI MWR program management to ensure compliance with Navy and DoD standards.

750-2.2.3 **Local Variation**

Local demand for program activities may depend on a variety of factors, in addition to the overall installation population, including

- Proportion and relative participation of different user groups among the population.
- Specific program of activities provided.
- Competing on-base and off-base facilities providing similar programs.
- Geographic distribution and accessibility of the user populations.

- Local climate conditions and operating seasons.
- Overseas situations and local customs.
- Installation geography.

750-2.3 **Population Basis for Demand Calculations**

See Chapter 1 of this instruction for general information on population definitions and base loading data.

750-2.4 **Recreational Planning Context**

Planning for MWR facilities should involve consideration of the individual facility in relationship to a comprehensive recreational program and facilities plan for the installation and the region. Consider the following factors, in addition to those relationships specifically indicated in the criteria for each facility:

- If other MWR facilities serving the same user population provide the same program activities, reduce the allowed capacity of the proposed facility by the capacity provided elsewhere at the installation or other nearby regional installations.
- Consider collocating the facility with other recreational facilities providing complementary programs, to provide the users with the increased convenience and attractiveness of clustered activities, and to take advantage of potential savings in support space requirements and operating costs.
- Size and locate an individual facility appropriately to the target population and geographical area its particular function is designed to serve. Convenient access for users should be considered in balance with the need for efficient facility operation and avoidance of duplicate facilities. Consider the DoD INST 1015.15 (Enclosure 3, Attachment 1) requirement for the use of appropriated funds (APF) for site development costs, archeological and ammunition clearances, water purification, demolition, excessive utility connections, and road service when selecting sites.
- Consider local community facilities. If the local community has a robust program and facilities for outdoor recreational activities consider partnerships with the local community for services, and/or other Public Private Venture initiatives.

750 10 OUTDOOR PLAYING COURTS (EA)

Design Criteria: Military Handbook (MIL-HDBK-1037/3) -- Outdoor Sports and Recreation Facilities

75010-1 **GENERAL.** See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75010-2 **DEFINITION.** Outdoor Playing Courts provide facilities and support services to meet the individual physical fitness and recreation needs of military personnel. The facilities may also serve dependents, retirees and authorized civilians. Activities that may be accommodated in Outdoor Playing Courts include: basketball, tennis, volleyball, skate/skateboard parks, and outdoor skating/roller hockey rink

75010-3 **RELATED FACILITIES.** Consideration should be given to collocating the Outdoor Playing Courts with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 44 Indoor Physical Fitness Center (Gym)
- 740 45 Fitness Room
- 740 84 Indoor Playing Courts
- 750 20 Playing Fields
- 740 55 Youth Center

75010-4 **DEMAND AND ALLOWANCES.** Demand, market analysis and survey information, as well as the number of existing leagues/teams if applicable determine the number of Outdoor Playing Courts provided at each installation. Provision of lighted courts is recommended where there is a high demand and/or climate warrants later usage by patrons. Youth Outdoor Playing Courts will be provided as needed. They should be sized and located for the youth population, i.e. near the youth center if there is one. The Courts will be sized in accordance with industry standards for the youth age group or adult age group as appropriate.

750 20 PLAYING FIELDS (EA)

Design Criteria: Military Handbook (MIL-HDBK-1037/3) -- Outdoor Sports and Recreation Facilities

75020-1 **GENERAL.** See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75020-2 **DEFINITION.** Playing Fields provide facilities and support services to meet the individual physical fitness, coordination, skills development, training and recreation needs of military personnel. The facilities may also serve dependents, retirees and authorized civilians. Activities which may be accommodated in Playing Fields include: baseball, football, soccer, softball, track and field, etc.

75020-3 **RELATED FACILITIES.** Consideration should be given to collocating the Playing Fields with the following recreational facilities in order to (i) take advantage of

potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 44 Indoor Physical Fitness Center (Gym)
- 740 45 Fitness Room
- 740 53 Indoor Swimming Pool
- 750 10 Outdoor Playing Courts.
- 740 55 Youth Center

75020-4 **DEMAND AND ALLOWANCES.** Demand, market analysis and survey information, as well as the number of existing leagues/teams if applicable determine the number of Outdoor Playing Fields provided at each installation. Provision of lighted fields is recommended for expanded usage. Provision of lighted fields and use of artificial turf or installed sprinkler systems may serve to reduce the total requirement for fields by allowing extended playing hours, extended play without the need for field maintenance/recovery. Youth Outdoor Playing Fields will be provided as needed. They should be sized and located for the youth population, i.e. near the youth center if there is one. The Fields will be sized in accordance with industry standards for the youth age group or adult age group as appropriate.

750 21 BATTING CAGE (EA)

75021-1 Batting cages may be provided at Installations where there is a demand, where a MWR survey supports the requirement, and there is no convenient local alternative. Size according to industry standards.

750 22 JOGGING TRACK (KM/MI)

75022-1 Jogging tracks are provided and sized as required.

750 23 GO-CART TRACK (KM/MI)

75023-1 Go-Cart Tracks may be provided as a Category C facility where they are determined to be profitable enterprises. Market analysis for this facility must be provided by MWR. Size according to demand and industry standards.

750 30 OUTDOOR SWIMMING POOL - INSTALLATION (SQ.M./SF)

75030-1 (Use CC 740 53 SWIMMING POOL - INDOOR for sizing standards). With appropriate demand analysis, outdoor pools may include water park features and spray parks.

**750 33 POOL PUMP/FILTER/TREATMENT FACILITY -
REMOTE (EA)**

75033-1 This code is for inventory purposes and only in those cases where such facilities are located in a structure remotely situated from the swimming pool proper.

750 34 WADING POOL/SPLASH POOL (EA)

75034-1 Wading pools normally are planned as adjuncts to main pools (see CC 740 53 Swimming Pool—Indoor). This code is for inventory purposes and only in those cases where wading pools are detached from the main facility.

750 35 ACTIVITY TV RECEIVER ANTENNA (EA)

75035-1 This Category Code Number is provided for inventory purposes only.

750 36 TV DISTRIBUTION SYSTEM (EA)

75036-1 Category Codes 750 35 and 750 36 are for inventory purposes only. Such facilities are provided only at remote installations where central TV reception and local distribution systems can be individually justified.

750 37 OUTDOOR ADVENTURE AREA (EA)

75037-1 Includes Ropes Courses, Natural Recreation Features (rock climbing, hiking trails, mountain bike trails, paintball ranges, motocross/BMX areas). Requirement is based on local availability (geography) and local demand. Size according to industry standards.

**750 38 OUTDOOR MWR EQUIPMENT RENTAL STORAGE
(SQ.M./SF)**

75038-1 Outdoor fenced area with lighting for storage of MWR rental equipment (not enclosed). Facility should be co-located with the Outdoor Recreation Center CCN 740-37, if there is one.

**750 39 MWR VEHICLE/RV/BOAT STORAGE COMPOUND
(SQ.M./SF)**

75039-1 Vehicle/RV/Boat Storage Compounds may be provided as Category C facilities where they are determined to be profitable enterprises. Markey analysis for

this facility must be provided by MWR. Size according to demand and industry standards. Covered spaces may be included where justified by demand.

750 40 GOLF COURSE (EA)

Design Criteria: Military Handbook (MIL-HDBK-1037/3) -- Outdoor Sports and Recreation Facilities

75040-1 **GENERAL.** See introduction to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75040-2 **DEFINITION.** Golf Courses are recreational facilities which may accommodate: recreational golfing, practice, instruction, tournaments, exhibitions, special events, and winter recreational activities such as cross-country skiing, ice skating, sledding and tobogganing. In addition to the Golf Course, space permitting, the facility may include a driving range, practice hole, chipping green with sand trap, and putting green(s). A Golf Course is a Category C MWR facility.

75040-3 **RELATED FACILITIES.** The Golf Course must be collocated with the following recreational facilities in order to (i) take advantage of potential savings in space requirements and operating costs, and (ii) provide users with the increased convenience of clustered facilities:

- 740 80 Golf Club House (including golf maintenance building/storage compound, chemical/fertilizer/pesticide storage and mixing building, and cart storage facilities).
- 750 56 Golf Driving Range.

75040-4 **DEMAND.** The Golf Course will be sized in accordance with a market survey approach. As a Category C facility the Golf Course must be profitable and a financial analysis or pro forma will be provided as well as the NPC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If project is financially sound it will be forwarded via the region to NPC (after 1 October 2004, CNI Field Support Activity) for INVS scoring and possible Project Validation Assessment.

75040-5 **FACILITY ALLOWANCE.** The Golf Course will be sized in accordance with industry standards. One resource for sizing criteria is the National Golf Foundation (NGF). Siting, water availability, and existing land area available will be the key considerations when planning a new Golf Course.

750 50 OUTDOOR THEATER (EA)

75050-1 No planning factors are available. If an outdoor theater (either seat- type or drive-in) is provided, the requirements for theaters (Code 740 56) must be reduced accordingly.

750 52 SKEET AND/OR TRAP RANGE (EA)

75052-1 Skeet and/or Trap Ranges may be provided as Category C facilities where they are determined to be profitable enterprises. Market analysis for this facility must be provided by MWR. Size according to demand and industry standards. In addition, suitable land must be available, and the activity must have a military population over 100. If a range building is authorized, see Category Code 740 52 for criteria. Table 75052-1 gives the corresponding land requirements. This facility must be self-sustaining.

Table 75052-1 Land Requirements for Skeet and Trap Ranges Land Area

Military Population (1)	Skeet Range	Trap Range
Up to 100	None	None
101 to 10,000	335m x 732m / 1100' x 2400'	335m x 549m / 1100' x 1800'
10,001 to 15,000	335m x 732m / 1100' x 2400'	335m x 576m / 1100' x 1890'
15,001 to 20,000	335m x 732m / 1100' x 2400'	335m x 604m / 1100' x 1980'
20,001 to 25,000	335m x 732m / 1100' x 2400'	335m x 631m / 1100' x 2070'
25,001 to 30,000	335m x 732m / 1100' x 2400'	335m x 658m / 1100' x 2160'
30,001 to 40,000	335m x 777m / 1100' x 2550'	335m x 686m / 1100' x 2250'
Over 40,000	335m x 823m / 1100' x 2700'	335m x 713m / 1100' x 2340'

(1) Military population consists of active duty military supported by the installation.

750 54 BAND STAND (EA)

75054-1 No planning factors are available. Requests for this facility will require individual justification.

750 56 GOLF DRIVING RANGE (EA)

75056-1 Installations, where the necessary land is already available, and the facility will be profitable as a Category C facility, are authorized a golf driving range. See Category Code 750-40

750 57 MWR OPERATED RECREATION GROUNDS (EA)

75057-1 No specific guidance is available. Local conditions usually will govern the development of any parks, playgrounds, or picnic areas. Recreation Pavilions (Code 740 78) are authorized in conjunction with these facilities.

750 58 RECREATIONAL CAMPGROUND-TENT (SQ.M./SF)

75058-1 Please see CCN 750-59 for general description of campground. This CCN will be used for tent camping vs. RV's. No vehicle pads are required. See Table 75059-1 for sanitary facilities requirements for tent campgrounds.

750 59 RECREATION CAMPGROUND - RV (SQ.M./SF)

Project Review: Base MWR representatives, EFD, NAVFAC HQ, BUPERS (Pers-656D)
Design Criteria: *(Military Handbook is not currently available)*

75059-1 **GENERAL.** See General Notes to 750 series category codes for General Instructions regarding facility allowance planning procedures.

75059-2 **DEFINITION.** Recreational Campgrounds provide the military community with outdoor recreation opportunities at locations with attractive natural resources. To complement the camping experience, and depending on location, Recreational Campgrounds may offer activities such as boating, canoeing, fishing, hiking, hunting, skiing and swimming. Facilities should be designed to take advantage of the natural features of the site, from vegetation to good views to unusual topography. At the same time, development should be environmentally appropriate, and not threaten the preservation of the natural heritage and scenic resources.

The planning criteria in this Category Code addresses only the camping sites and patron support facilities such as showers, toilets and laundromats. Other campground support facilities (particularly in relatively remote locations) such as an on-site manager's office, community room, kitchen, and convenience stores are not included in this Category Code. See CCN 740-92. Recreational campgrounds are encouraged to make use of the Camp Host concept to assist in the management of the campground. Space allowances for MWR Rental Cabins are addressed under Category Code 740 81.

Dump stations should generally be provided at campgrounds that accommodate RV's.. (CCN 750 59). The sizing and design of dump stations will vary according to local conditions (such as topography, soil conditions, proximity to water sources, etc.). All dump station facilities must comply fully with all applicable environmental regulations.

75059-3 **RELATED FACILITIES.** Where such locations are adjacent to the sea or other body of water, support facilities such as marinas, boat ramps and RV/vehicle/boat storage compounds maybe sited in close proximity to Recreational Campgrounds.

75059-4 **SPACE ALLOWANCE.** The total number of camping and/or RV sites provided at a location is primarily determined by two considerations:

- The Recreational Campground will be sized in accordance with a market survey approach. As a Category C facility the Campground must be profitable and a financial analysis or pro forma will be provided as well as the NPC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If the project is financially sound it will be forwarded via the region to NPC (after 1 October 2004, CNI Field Support Activity) for INVS Scoring and possible Project Validation Assessment.

- Capacity of the location to accommodate the proposed facilities at a recommended level of use density, and other site planning requirements for access and provision of utilities.

75059-4.1 The number of campsites which may be accommodated per acre will vary depending on the natural features (topography, geology, vegetation, etc.) of the proposed location and the desired degree of privacy between individual sites. Development of as few as 2.4 sites per hectare (6 sites per acre) to a maximum of 5.7 sites per hectare (14 sites per acre) is recommended as a planning guideline. However, this guideline may be modified by the financial analysis, which may, for example, indicate that 2.4 sites per hectare (6 sites per acre) may be too low to justify the investment required to provide the necessary infrastructure (paths, roads, patron support facilities, utilities, etc.). Furthermore, the financial analysis may also indicate a total minimum number of sites required to justify the investment in this recreational resource and the corresponding support building (CCN 740-92). RV Campsites should be planned with a vehicle pad 20 feet by 40 feet. Minimum separation between campsites should be 37 feet. It is recommended that, where financially feasible, the RV Campground include a mix of back-in and pull-through sites.

75059-4.2 Once the total number of campsites at a location has been determined, the required patron support facilities may be selected from the criteria in Table 75059-1.

Table 75059-1 Sanitary Facilities Requirements for Recreational Campgrounds

#Tent/Trailer	#Water Closets (M/F)	#Lavatories (M/F)	#Showers (M/F)	#Urinals
1-15	1/1	1/1	1/1	1
16-30	1/2	2/2	1/1	1
31-45	2/2	3/3	1/1	1
46-60	2/3	3/3	2/2	2
61-80	3/4	4/4	2/2	2
81-100	3/4	4/4	3/3	2

Notes for Table 75059-1:

(1) For recreational areas having more than 100 tent/trailer/camper/RV sites, provide one additional water closet and lavatory per each additional 30 sites, and one additional urinal per each additional 60 sites.

(2) For laundry facilities, provide one washer and one dryer for every increment of 12 sites or portion thereof.

75059-4.3 All facilities, which have the potential for causing environmental contamination—for example, dumpsters and dump stations—, must comply fully with all applicable local, state and federal regulations. The planning of Recreational Campgrounds located in areas under the jurisdiction of other agencies such as State

Parks and Forests Divisions, the U.S. Forest Service and the National Park Service, must adhere to all applicable development guidelines and review procedures.

Figure 75059-1 Recreational Campground – Medium Size Support Facility

750 60 MARINA (EA)

75060-1 This facility requires special considerations and must be developed based on local conditions and supported by a detailed analysis. As a Category C facility, the Marina must be profitable and a financial analysis or pro forma will be provided as well as the NPC Internal Needs Validation Study (INVS), and finally the Project Validation Assessment. The Planner will accomplish the initial demand investigation and review along with local MWR personnel. If the project is financially sound it will be forwarded via the Region to NPC (after 1 October 2004, CNI Field Support Activity) for INVS Scoring and possible Project Validation Assessment. For a Category B sailing program marina, it is necessary to document the demand and to ensure that APF will be available to support operation of the sailing program. A marina support building or boathouse is authorized in conjunction with a marina and should be programmed as a part of the project nomination and validation process.. See Code 740 87 for marina support building criteria. There are two categories of Marina: Category B is the MWR sailing program and Category C is the rental slips operation.

750 61 RECREATIONAL PIER (EA)

75061-1 This CCN is used for stand-alone recreational pier facilities (e.g. fishing piers) where there is no existing Marina.

FAC 7602 MONUMENT AND MEMORIAL

FY24 SUC: \$306.12 / EA
Source: Inflated from previous FY using ENR labor and material cost indices to measure actual inflation
Original Source: Commercial Sources, 2010

FAC 7602 MONUMENTS AND MEMORIALS

There are 2729 monuments and memorials in the inventory. This FAC is based on Army, Navy, Air Force CAC Codes which are titled 'monument and memorial' or 'outdoor monument and memorial'. This group includes "Items such as commemorative plaques, military equipment displays, statues, and the like." Assumption that all are free-standing outdoor facilities. (Note that this does not include facilities covered under FAC 7603 Cemeteries).

Size, material, age, components and level of required care vary widely within this category. Areas for cost research included specific maintenance costs for these items:

A. Commemorative plaque horizontal on ground or on a base ((Note that plaque and base may or may not be of the same material)

- Bronze/other metal
- Marble
- Composite
- Granite/other stone
- Glass/other material

B. Commemorative plaque vertical freestanding

- Bronze/other metal
- Marble
- Composite
- Granite/other stone
- Glass/other material

C. Statue/sculpture and base (Note that statue/sculpture and base may or may not be of the same material)

- Bronze/other metal
- Marble
- Composite
- Granite/other stone
- Masonry

D. Equipment display or other assembly of equipment which may be firefighters equipment, military equipment (planes, tanks, jeeps, etc.) or special equipment like Pentagon memorial benches and area, commemorative benches, shelter, etc. This usually includes informative plaques attached to equipment or free-standing.

ANNUAL MAINTENANCE PROGRAMS AND COST

For category A and B Commemorative/informative plaques flat and upright, small memorials or monuments (grave marker & tombstone as examples)

For most accessible information, researched maintenance, cleaning and minor repair costs and schedule for gravestones, tombstones, plaques, etc. as the closest match to

items in this category A/B. (EG. Arlington cemetery in 2007 had funding to clean memorials every other year, versus the desired practice of cleaning annually.)

Maintenance includes cleaning with material-appropriate products, removal of encroaching vegetation, inspection and documentation of changes in surface, all as described for statue/sculpture below.

Maintenance may include repainting or touch-up of lettering as needed. Maintenance may include photography, videography or other documentation for record-keeping on item condition.

Maintenance may require realigning, straightening, or even resetting due to subsidence or other ground disturbance caused by water, frost, vandals, animals, etc. A full resetting involves removal, new concrete base, curing and resetting, plus cleanup of work area – time up to 8 man-hours plus materials. The Connecticut Gravestone Network (2009) estimated average of \$1000 per tombstone to reset. (UK price (2010) to refix was estimated at 235 -423 pounds (\$369-\$664)– new dowels, ground anchor, bearer and drilling/preparing ground). This could be a restoration cost rather than maintenance, depending on circumstances and extent of work.

Depending on geographic area, item requirements and available funding, maintenance cleaning and minor repair may occur at 6, 12, 24 or 36 month intervals. (eg. Arlington cemetery in 2007 stated the cleaning of each memorial took place every 2 years)

Other Cost Sources:

In general, memorial cleaners quote between \$60-\$200, depending on size and material (internet search of multiple sources)

UK surface clean lawn memorial = 82 pounds (\$128), for traditional memorial (upright) \$152 pounds (\$237).

Stone and bronze marker \$60; Taller than 6" monument/memorial \$75-\$90 per visit; will provide estimates for bronze plaques, etc. (www.memorialcleaners.com)

Bronze markers refinished so the lettering is bright and the background is restored to its original brown color, by shipping them back to the manufacturer, or contracting with monument companies. Cost will run \$150 to \$200 for a single 2x1 foot marker.

In most cemeteries – the annual fee or maintenance fee covers site, and does NOT include maintenance of the tombstone (cleaning, minor repairs, etc) unless contracted as a separate charge thru memorial caretakers or cemetery. Assume maintenance for any monument or memorial in FAC 7602 is funded separately from site maintenance.

For Category C: Statues and Sculptures

For statues and sculptures, recommended maintenance includes **annual** regular washing with dilute solution of detergent, water rinse, soft brushes or sponges; inspection and documentation of changes in surface patina, pitting, streaking, corrosion, blanching, structural problems or damage; removal of encroaching vegetation to discourage bird, animal, insect or vandal damage; clearing of weep holes for drainage; repointing or minor repair structural repair; and application of protective coating as appropriate (wax, resin, paint, sealer, etc).

For bronze/metal statues – recommend professional cleaning and relacquering on a five to ten-year cycle, which may require removal and reinstallation of parts. Geographic location, materials, condition, and prior maintenance will determine the schedule.

Maintenance of the memorial may include covering or enclosure, fencing, seating or sidewalks, landscaped area, fountain, etc. which are intrinsic part of memorial. (Williamstown Art Conservation Center Technical Bulletin, Woodlawn Cemetery Maintenance Plan, Minnesota Mall Maintenance Report). Reported cost range which agrees with other sources:

1. Savannah - **\$1500** annually quoted by city official for cleaning of monument
2. Charlotte Dept of Transportation Queens Table Monuments and Four Sites (connected): Annual costs projected by city for maintenance of monument **\$1200** per year
3. City of NY Parks and Recreation: Typical annual maintenance for figural bronze **\$1000 to \$2000**

For Category D. Equipment Grouping

Complexity of maintenance within this group varies depending on components involved. Examples:

- Plaque plus several antique fire vehicles (DOD Firefighters Memorial, Goodfellow AFB)
- Plaque plus one or more tanks, planes, etc: Most military installations
- Individual benches and setting: pentagon memorial

NOTE ON OUTSIDE ASSISTANCE. Maintenance funding or actual maintenance MAY come from private sources, groups, individuals, or volunteers to supplement or even replace DOD O&M funding.

In private and local government practice, donors of a memorial **must guarantee** payment of future maintenance costs from endowment, trust fund, pre-payment, before the government agencies will accept donation of new or transferred existing property as memorials. This approach allows agencies to consider the overall public

benefit for taking the donation versus the long-term cost and budgeting capability to maintain the memorial/monument. This protects agencies from incurring unexpected and unjustifiable expenses over the expected life of the donation.

For new memorials proposals, expected maintenance costs are built into the overall project cost estimate, so that the full, rather than initial, cost to taxpayers is considered.

For existing or new DOD memorials, volunteers or interest groups with a strong vested interest in a monument/memorial have provided in-kind or financial support where DOD funding cannot offer the best level of care for the facility. Donations from these private sources, groups or individuals are NOT considered in determining the FAC 7602 SUC, but their participation can result in lower spending levels than DOD might otherwise incur.

LODGE BROTHERS MEMORIALS					
GENERAL INFORMATION	STONE TYPES	LAWN MEMORIALS	TRADITIONAL DESIGNS	KERBSET MEMORIALS	CREMATION MEMORIALS
SPECIAL MEMORIALS	LETTERING/ INSCRIPTIONS	RENOVATION/ MAINTENANCE	OTHER SERVICES	ORDERS/ ENQUIRIES	PRICES
✦ RENOVATION & MAINTENANCE ✦ When a memorial is to be renovated it is always necessary for one of our experienced staff to inspect the memorial before the work commences. We are then able to compile a report of all the work that will be needed in order to restore the memorial to its original condition. The following prices are, therefore, a guide to the costs that may be involved. However, each enquiry will be dealt with individually and priced accordingly. Our estimates are free of charge and our clients are under no obligation to accept them.					

Cleaning

Surface clean Lawn Memorial (headstone & base) using chemicals	£82.25
Surface clean Traditional Memorial using chemicals	£152.75
Thoroughly clean Lawn Memorial using abrasive machines and chemicals	£152.75
Thoroughly clean Traditional Memorial using abrasive machines and chemicals	£305.50
Re-beat inscription	From £35.25

Please note, it is not always possible to use abrasive machines where there is existing lettering. Often the lettering would need to be re-cut or cleaned around using a sandblaster or scraper.

Re-fixing

NAMM Re-fix Lawn (including new dowels, ground anchor, bearer and drilling/preparing memorial)	£235.00
Re-fix Traditional Complete re-fix drilling and dowelling but joints (guide price only)	From £423.00

Lettering (Price per letter up to 1" high. Letters over 1" priced plus 50% per ¼")

Letter carver's call out fee	From	£70.50
Sandblast technician call out fee	From	£164.50
MARBLE	Sandblasted and Enamel Painted	£3.23
	Hand cut only	£3.23
	Hand cut and Enamel Painted	£3.84
	Hand cut and Lead Filled	£4.16
GRANITE	Sandblasted and Enamel Painted	£3.35
	Sandblasted and Gilded	£3.82

	Hand cut and Enamel Painted	£4.16
	Hand cut and Gilded	£4.77
	Raised Lead Enamel Painted	£8.04
	Raised Lead Gilded	£8.65
MARBLE & GRANITE	Re-Enamel Incised	£1.29
	Re-Gilded	£1.82

The methods used to create a cut, drilled and lead filled letter mean it is often not possible to replace just one or two letters. The process involved may lead to the loosening or misshaping of letters already present.

Memorial Interiors

The centre of many kerbside memorials are often filled with soil for planting. Families may move away and it can become difficult for them to maintain this area of the memorial. Our memorial staff are able to excavate the existing centre and lay any of the following in place of the soil:

Grey Granite Chippings on concrete chipping bed	£176.25
White Marble Chippings on concrete chipping bed	£193.88
Green, Cobalt Blue, Turquoise or White fossite chippings	£211.50

Maintenance

Where families have moved away or the upkeep of a grave is physically too difficult, we offer maintenance agreements on a 5 year contract basis. The memorial is visited twice a year, chemically cleaned, tidied around, levelled, joints re-pointed, photographed and a report made out on the condition of the memorial.

Please contact us if interested in taking out a maintenance agreement.

ALL PRICES ARE EXCLUSIVE OF V.A.T.

Memorial Cleaners List of Services

Below is a listing of services offered. Gravesite beautification treatments and cleaning methods used on your monuments may vary depending on age, condition, type of stone, surface finish, and cemetery rules. This step is taken to preserve your memorials and cemetery surroundings.

Cleaning Price Chart Estimates and Descriptions

- All prices below are estimations and could vary depending on the job and the location.
- Please call or email us today for a fast, more accurate quote!
- These are cleaning prices only and do not include restoration services.

Services Offered	Pay Per Visit				Memorial Premium Service Plans						
	Initial Visit*		Follow-Up Visit**		One Year		Two Year		Three Year		
	Single	Double	Single	Double	Single	Double	Single	Double	Single	Double	
Stone & Bronze Markers	\$60	\$75	\$40	\$45	\$140	\$165	\$220	\$255	\$300	\$345	
Small to Medium Headstones	less than 4' tall	\$75	\$100	\$50	\$60	\$175	\$220	\$275	\$340	\$375	\$460
	4' - 6' tall	\$90	\$125	\$60	\$75	\$210	\$275	\$330	\$425	\$450	\$575
Large Headstones (taller than 6') Monuments & Memorials	Large headstones and monuments vary greatly in size and difficulty cleaning. It is impossible to make an estimated quote for every large headstone and monument. Please call us today for an accurate quote.									Call or email for an Estimate!	

<p>Bronze Plaques</p>	<p>We take great care when cleaning your bronze plaque. We thoroughly examine the condition of the plaque, clean, wax and polish the surface ensuring a longer lifetime. We do offer full restorations for bronze plaques if needed, for more information visit our restoration page or give us a call.</p>	<p>Call or email for an Estimate!</p>
<p>Above Ground Tombs, Vaults and Sepulchers</p>	<p>Our above ground vault cleaning service is the same as our stone cleaning services but the prices will vary depending on location, stone age, condition and the size of the vault. Please call us for a more accurate vault cleaning quote.</p>	<p>Call or email for an Estimate!</p>
<p>Mausoleums & Columbariums</p>	<p>Our columbarium and mausoleum cleaning services carry the same excellence and dedication to preservation as our stone cleaning services but the prices will vary depending on location, stone age, condition and the size of the structure. Please call us for a more accurate mausoleum care quote.</p>	<p>Call or email for an Estimate!</p>
<p>Private or Family Cemeteries</p>	<p>Our services include mowing, trimming, clearing brush, minor landscaping, stone setting and leveling, memorial gravestone care and routine maintenance for private or family owned cemeteries.</p>	<p>Call or email for an Estimate!</p>
<p>Repair, Restoration & Deep Stain Removal</p>	<p>Our gravestone and monument restoration and repair services include mending, leveling and stone setting, along with surface restoration and deep stain removal. We can restore bronze plaques, place markers and bronze vases or urns. After our restoration service we highly recommend you schedule regular follow-ups to prevent your memorial from future deterioration.</p>	<p>Call or email for an Estimate!</p>

***Initial Visit**

- All initial visits should be scheduled at least five days in advance unless specially requested.
- Express service may be available depending upon availability for an additional charge.
- Your initial visit will consist of the following, depending on the job. Vandalism and condition inspection, full thorough cleaning, polishing, surface stain removal, biocide treatment, grass trimming & edging, insecticide application, fresh flowers and digital before and after photos.
- If vacancies are available major holiday visits can be scheduled for "Pay Per Visit" first time customers on a first come basis.

****Follow-Up Visit**

- All follow up visits **must be scheduled within one year of the initial visit** to qualify for follow-up pricing.
- All follow-up visits should be scheduled at least five days in advance.
- Biocide treatments are performed with annual follow-up visits.
- A follow-up visit consists of the following, depending on the job. vandalism and condition inspection, light general cleaning, grass trimming, insecticide application, fresh flowers and digital before and after photos.
- If vacancies are available major holiday visits can be scheduled for "Pay Per Visit" follow-up customers on a first come basis.

Holiday Visit

- Holiday visits should be scheduled at least five days in advance.
- Holiday visits may be used for any special occasion like birthdays or major holidays such as Memorial Day or Mothers Day.
- Holiday visits will be given the normal follow-up visit care along with any special holiday requests or placements of flowers, candles, etc.
- Due to popular demand holiday visits are reserved for our Premium Service Plan customers exclusively unless specially requested.
- If vacancies are available major holiday visits can be scheduled for "Pay Per Visit" customers on a first come basis.

Adjusted Occurrences are the occurrences remaining after subtracting Repair/Replacement Overlaps. Overlap reduction removes a repair when it occurs the same year as a replacement.

Description	Frequency	Qty Unit	Total In-House	Total Incl OP	Design Life/Frequency	Occurrences in Design Life	Adjusted Occurrences	Life Cost	Adjusted Cost
Repair switchboard meter	10	12.00 Ea.	\$14,623.45	\$17,209.49	4.5000	4	4	\$68,837.95	\$68,837.95
Maintenance and repair of general wiring lightning protection system	1	11.00 M.L.F.	\$1,204.50	\$1,483.75	45.0000	45	45	\$66,768.93	\$66,768.93
Replace lighting fixture exit light	20	14.00 Ea.	\$2,464.91	\$2,989.10	2.2500	2	2	\$5,978.20	\$5,978.20
Repair 500 kva transformer, primary, liquid filled	10	8.00 Ea.	\$20,880.49	\$24,042.94	4.5000	4	4	\$96,171.75	\$96,171.75
Replace transformer 500 KVA, liquid filled	30	8.00 Ea.	\$534,616.00	\$612,390.17	1.5000	1	1	\$612,390.17	\$612,390.17
Maintenance and inspection primary transformer, dry	0.5	8.00 Ea.	\$338.75	\$424.41	90.0000	90	90	\$38,196.82	\$38,196.82
Replace transformer 500 KVA, dry	30	8.00 Ea.	\$351,087.53	\$404,373.58	1.5000	1	1	\$404,373.58	\$404,373.58
Repair switchgear 1200 A mainframe	5	12.00 Ea.	\$21,642.63	\$25,389.03	9.0000	9	7	\$228,501.24	\$177,723.18
Maintenance and inspection switchgear, mainframe	1	12.00 Ea.	\$819.08	\$1,026.18	45.0000	45	45	\$46,178.24	\$46,178.24
Replace switchgear 1200 A mainframe	20	12.00 Ea.	\$51,011.13	\$61,527.58	2.2500	2	2	\$123,055.17	\$123,055.17
Replace fuse	25	16.00 Ea.	\$7,310.32	\$8,394.70	1.8000	1	1	\$8,394.70	\$8,394.70
Repair switchgear, - (5% of total C.B.), indoor, less than 600 V	10	8.00 Ea.	\$6,227.72	\$7,199.47	4.5000	4	4	\$28,797.87	\$28,797.87
Maintenance and inspection switchgear, indoor, less than 600 V	3	8.00 Ea.	\$338.75	\$424.41	15.0000	15	15	\$6,366.14	\$6,366.14
Replace switchgear, 225 A	30	8.00 Ea.	\$16,356.62	\$19,972.36	1.5000	1	1	\$19,972.36	\$19,972.36
Replace TV cable outlet	20	24.00 Ea.	\$1,786.69	\$2,224.52	2.2500	2	2	\$4,449.04	\$4,449.04
Replace lamp exit light	5	14.00 Ea.	\$228.85	\$272.14	9.0000	9	9	\$2,449.27	\$2,449.27
Maintenance and inspection patch panel	0.5	4.00 Ea.	\$364.03	\$456.08	90.0000	90	90	\$41,047.33	\$41,047.33
Replace patch panel	15	1.00 Ea.	\$886.40	\$1,066.81	3.0000	3	3	\$3,200.42	\$3,200.42
Minor chain link fence repairs, per 10 LF	1	1.00 Ea.	\$28.55	\$35.16	45.0000	45	45	\$1,582.02	\$1,582.02
Replace bent 1-5/8" top rail, per 20 LF	2	1.00 Ea.	\$116.39	\$137.68	22.5000	22	22	\$3,029.05	\$3,029.05
Replace broken barbed wire arm	2	1.00 Ea.	\$63.94	\$79.36	22.5000	22	22	\$1,745.85	\$1,745.85
Replace 6' x 18' cantilever slide gate	5	2.00 Opng.	\$10,190.75	\$11,623.67	9.0000	9	9	\$104,613.00	\$104,613.00

1.0 Abstract

The funding available to local agencies in Indiana to manage roadways has decreased in recent years, and many agencies cannot provide adequate maintenance with the available resources. Consequently, agencies are doing everything they can to evaluate the least expensive method to maintain their roads that will meet their objectives and needs. In some cases, the most appropriate surface type is a paved road, and in some cases, it is a gravel road. The decision as to the most appropriate surface type depends on a variety of factors, such as cost, traffic volume, development and public input. The purpose of this study was to review the applicable research and develop an assessment procedure that local agencies in Indiana can use to help determine the most appropriate surface type for a given road.

2.0 Introduction

The funding available to manage roadways has decreased in recent years, and many agencies find it challenging to provide adequate maintenance on their roadways with the available resources. Agencies do not have control over the price of materials needed to maintain roads, and most agencies do not get an increase in their budget when costs increase. Furthermore, in Indiana, many local agencies have had decreasing revenues in recent years (Indiana LTAP Center, 2009). When these decreasing revenues are considered in conjunction with increasing material and labor costs, the challenges are exacerbated. Consequently, agencies are doing everything they can to evaluate the least expensive method to maintain their roads that will meet their objectives and needs. While a road with new asphalt overlay is relatively inexpensive to maintain once it has been paved, the cost to pave the road is high, and as the road deteriorates, it gets more expensive to maintain. As budgets become constrained, it is not possible to re-pave all the roads that need to be paved on an appropriate schedule. To address this situation, some agencies in Indiana are converting paved roads back to gravel. On the other hand, as development in an area changes, as traffic on a gravel road increases, and as the vehicles on the road get heavier, the required maintenance on a gravel road increases. In this situation, it may be appropriate to convert a gravel road to a paved road with an overlay of asphalt.

The decision as to the most appropriate surface type, gravel or paved with an asphalt overlay, depends on a variety of factors. This decision has been faced by numerous other agencies and as a result it has been researched by agencies in other states. The purpose of this study was to review the applicable research and develop an assessment procedure that local agencies in Indiana can use to help determine the most appropriate surface type for a given road.

To assure that the proposed assessment procedure reflects the needs of agencies and conditions in Indiana, LTAP surveyed local agencies for information such as the maintenance practices for paved and gravel roads, the costs of these activities, and the factors that affect their decision regarding the most appropriate road surface.

It is also worthwhile to briefly address nomenclature. This report refers to “gravel” throughout the document. The term “gravel” is used as a generic term for simplicity, however, it is acknowledged that some agencies may actually be using “stone” rather than “gravel” for their aggregate surfaced roads. Similarly, this report refers to “asphalt” roads throughout the document. This may encompass both hot-mix asphalt (HMA) and warm-mix asphalt (WMA). Finally, this report refers to “paved roads” as those with an asphalt mixture surface. Chip seals may also be considered paved roads. Although not directly addressed in this report, the assessment procedures presented could be used to evaluate a chip seal road relative to either a gravel road or paved road with an asphalt mixture surface.

3.0 Literature Review

Numerous agencies have conducted research to address the decision as to whether a road should be paved or gravel. This section includes a brief review of some of the documents that were considered most relevant to the decision-making process in Indiana. For additional information, see the annotated bibliographies in the appendices of *Local Road Surfacing Criteria* (Zimmerman & Wolters, 2004) and *Economics of Upgrading an Aggregate Road* (Jahren, et al., 2005).

3.1 A Framework for Selecting the Appropriate Road Surface

The decision whether a road should be paved or gravel depends on the needs of the local road users, the agency objectives and resources, and the costs and benefits of the alternative surfaces. The costs and benefits of a road surface are strongly influenced by the maintenance practices, which may vary significantly between agencies. There are numerous documents that provide information on recommended maintenance practices for gravel roads (Skorseth & Selim, 2005), (Huntington, 2010), (AASHTO, 2007) and paved roads (AASHTO, 2007), (Johnson, 2000), however, there is limited data regarding the costs associated with maintaining gravel and paved roads. Many agencies do not track this cost closely, and there is limited data in the literature. Moreover, the frequency of maintenance often varies significantly depending on the specific road.

The need for maintenance depends on the physical characteristics of the road (including base, drainage and surface characteristics), the traffic load (including vehicle volume and truck volume), and the environment (including precipitation and snow removal activities). Another challenge is that there may be a substantial discrepancy between the maintenance practices documented in reference material, and the maintenance practices that local agencies typically implement. This discrepancy often stems from local agencies being tasked with maintaining many miles of road using limited resources. A final challenge is that most maintenance and management recommendations presume best design conditions, namely that low-volume rural roads were designed with an adequate base and drainage. In practice, many low-volume rural roads were never “designed” in the conventional sense (e.g., constructed based on a set of plans that includes cross section, drainage, base and surface material to reflect geotechnical considerations and expected traffic volume). Rather, they are the result of unimproved roads evolving to gravel over time. It would be impractical and cost prohibitive to reconstruct all the low-volume local roads according to low-volume pavement design standards. These limitations should be kept in mind as the decision on whether a road should be paved or gravel is contemplated.

Gravel and paved roads differ in many aspects, including construction and maintenance costs, drainage, smoothness and types of vehicle that can be accommodated (Kentucky Transportation Center, 1988). Gravel roads have lower construction and maintenance costs, but also have more dust problems, lower operational speeds, and higher user costs. On the other hand, paved roads are smoother, provide greater protection of the of the base and subgrade material, and may be

able to accommodate a wider range of vehicle types, However, these benefits may come at a cost, and may not be appropriate for all roads (Kentucky Transportation Center, 1988).

One of the most concise and comprehensive documents regarding the decision as to whether to pave a gravel road was developed by The Kentucky Transportation Center (Kentucky Transportation Center, 1988), and includes ten factors to consider when deciding whether to pave a gravel road. This document was subsequently included in its entirety in *Gravel Roads Maintenance and Design Manual*, published by the US Department of Transportation (DOT) (Skorseth & Selim, 2005). Key concepts include:

- **Management plan.** Roads should be paved in a systematic manner and reflect a comprehensive management plan. Although beyond the scope of this document, additional information about management plans can be found in documents such as *Asset Management Guide for Local Agencies in Michigan* (Cambridge Systematics, Inc., 2007).
- **Traffic volumes.** Minimum traffic volumes should be met, however, no specific volume threshold is identified.
- **Engineering design standards.** Improvements and their estimated cost must reflect current standards for design, construction and maintenance, including:
 - Safety considerations (such as design speed, sight distance, alignment, and lane width) and adequate pavement width. Some engineers suggest that only roads 22 ft or wider should be paved; this threshold would preclude most county roads in Indiana from being paved, including many roads that are currently paved.
 - Adequate base and drainage design (including grading, plasticity, and optimum moisture content of soil).
- **Life cycle cost analysis, including user costs.** Improvement should compare all costs throughout the road's life cycle, including capital and maintenance costs, as well as user costs.
 - Some costs are common to both surface types (such as roadside maintenance) and other costs vary depending on the surface type. For example, asphalt patching and resealing will be incurred for paved roads, whereas re-graveling, grading and stabilization, and dust control will be incurred for gravel roads. Costs for signs and striping should be considered, but may not vary for paved and gravel road options.
 - User costs are typically higher for gravel roads due to increased fuel consumption, tire wear, maintenance and repair costs. The AASHTO Manual on User Benefit Analysis is referenced for the determination of user costs (AASHTO, 1977), and includes conversion factors for gravel, stone and earth are relative to the cost of travelling on a paved surface. This is shown in Figure 3-1.
- **Public opinion.** Improvement should consider, but not rely exclusively on, public opinion.

Reference (Winfrey, 1968) as referenced in (AASHTO, 1977)

Figure 3-1. User Costs

An underlying principal of this framework is that paving the road is much more significant than merely providing an asphalt overlay, and the decision must be made in a holistic context that considers engineering factors, cost, and the impact to the public.

It is important to emphasize that every agency is different; circumstances and considerations may vary significantly from agency to agency. This is potentially true of technical standards (e.g., desirable design speeds for low-volume roads), costs, and desired maintenance practices. For example, dust control is a significant expense for gravel roads; however, some agencies provide limited or no dust control. If an agency does not utilize dust control, it will reduce costs substantially, but it will also impact public acceptance of gravel roads.

Public acceptance of gravel roads may also vary. In most cases, public opinion favors paved roads, but there are exceptions. It has also been suggested that a gravel road in an agricultural area is preferable to a poorly maintained paved road, since the gravel road can be graded by the nearby farmers when needed, whereas maintenance of an asphalt road in poor condition can only

be addressed by the local highway department. In some cases, even residents may prefer gravel, as was reported by Kimley-Horn in a report for a local agency north of Atlanta (Kimley-Horn and Associates, Inc., 2009), where the gravel roads have been described as scenic, pastoral, and peaceful (Nurse, January 24, 2009). Some residents believe gravel roads keep down the speed and volume of traffic, which is desirable from the perspective of local walkers, equestrians and cyclists. Furthermore, it has been suggested that the gravel roads make undesirable development (higher density development) less likely. Public opinion rarely is unanimous, however, and some residents think gravel roads are difficult to maintain and as a result pose a safety hazard.

The costs associated with gravel and paved roads also vary significantly. Many local agencies do not closely track costs, and difficulties in estimating life cycle costs are exacerbated by widely differing maintenance practices, differing maintenance needs for different roads, and a general lack of data for low-volume roads. As noted in *When to Pave a Gravel Road* (Kentucky Transportation Center, 1988), maintenance costs for all options must be determined before any conclusions can be reached. However, in some cases, no data exists upon which to base estimates of maintenance costs on low-volume roads.

Other agencies have taken the basic framework for decision making put forth by Kentucky and expanded it or tailored it to their circumstances. Minnesota has developed a framework for decision making based on a historical cost analysis in Minnesota, a method for estimating the cost of maintaining roads, and an example using economic analysis to support decision making (Jahren, et al., 2005). South Dakota developed a computer program to provide a framework for decision making (Zimmerman & Wolters, 2004). The Excel-based program developed by South Dakota allows local agencies to utilize economic factors (costs), or a combination of economic and non-economic factors in the analysis to determine the most appropriate surface for a local road. Other agencies have also developed computer programs to assist in decision making (Eck, 1987).

Other research has explored not only the decision as to whether the road should be paved, but also the optimal time for paving the road (Bhandari, 1979). There are also a number of papers and reports that assess the relative benefits and costs of gravel and paved roads in other countries (Gannon, 1999), including Africa (Archondo-Callao R. , 1999), Finland (Tervalta, 1995), and Nicaragua (Archondo-Callao, Mendez-Talavera, & Cantarero-Zeas, 2003).

3.2 Gravel Road Costs

The appropriate estimation of costs is critical to the analysis of an appropriate surface type. While it is difficult to put forth cost values with confidence, there are some estimates that have been published for maintaining gravel roads. The annual cost of maintaining gravel roads in Kentucky was \$3,010 per mile in 1988, equivalent to \$5,871 in 2012 when adjusted for inflation (Bureau of Labor Statistics, 2012). Details about this cost are shown in Table 3-1. More recently, the South Dakota Department of Transportation (Zimmerman & Wolters, 2004) estimates that the cost of maintaining a gravel road varies depending on the average daily traffic (ADT), as

shown in Table 3-2. Although not shown in the table, an example agency cost for gravel in South Dakota is \$6,843 per mile (Zimmerman & Wolters, 2004), equivalent to \$8,348 in 2012 when adjusting for inflation.

This South Dakota value is more than one and one-half times higher than the cost estimated by the Minnesota Local Road Research Board of \$4,160 per mile in 2005, equivalent to \$4,909 in 2012 (Jahren, et al., 2005); Minnesota costs are shown in Table 3-3. South Dakota also makes a distinction between the cost of a gravel road and a stabilized gravel road. The cost for a stabilized gravel road is significantly higher than for gravel, as can be seen by comparing data from Table 3-2 and Table 3-3. Although not shown in the table, an example agency cost for maintaining stabilized gravel roads in South Dakota is \$10,297 per mile (Zimmerman & Wolters, 2004), equivalent to \$12,138 in 2012 when adjusting for inflation. Additional details about specific elements of the maintenance cost for Kentucky, South Dakota and Minnesota are provided in Table 3-1, Table 3-2, Table 3-3, and Table 3-4.

Reference: (Jahren, et al., 2005)

The difference in cost to maintain a gravel road in Minnesota and South Dakota is partially attributable to different frequencies for maintenance activities. South Dakota's maintenance program includes "blading" 50 times per year (at \$65 per mile) whereas the Minnesota cost reflects "grading" 21 times a year (at \$67 per mile). In this case, it is reasonable to assume that "blading" and "grading" are analogous activities. However, it does highlight the fact that different agencies use different vocabulary to describe activities, and it is important to make sure that activities and costs are being appropriately attributed, given these differences in vocabulary.

Differences are also attributable to different costs in different locations. South Dakota's maintenance program includes re-gravelling at \$7,036 per mile every six years, whereas Minnesota's program includes re-gravelling at \$13,800 per mile every five years when traffic exceeds 100 vehicles per day. The lower cost in South Dakota may be due to varying costs, as well as more frequent blading, and the addition of spot graveling, an activity that is not included in Minnesota.

Neither the South Dakota nor Minnesota costs include dust control, crown and cross section re-shaping, or ditch maintenance in the gravel road maintenance cost. Dust control can be very expensive, and may include a variety of treatments, from calcium chloride (cement stabilization) to emulsion sealants and soybean oil products (Ohio Soybean Council, 2012). Some agencies consider chip and seal or thin asphalt overlays as dust control. Again, this emphasizes the wide range of practices and the difficulties inherent in a lack of common vocabulary. Ironically, while some agencies recommend cement stabilization for dust control, others have cited that a potential disadvantage of cement stabilization is dust problems due to the smaller aggregate size and resulting denser composition, and the fact that the surface may result in a higher vehicle speed and higher traffic volume (Kimley-Horn and Associates, Inc., 2009). Dust control is an important consideration and can represent a substantial cost; agencies should refer to documents such as *Dust Control on Low-Volume Roads* for additional information (Lunsford, 2001).

The impact of different maintenance activities and frequencies is illustrated by the three gravel maintenance scenarios developed for one local agency. The scenarios ranged from \$34,000 per mile per year to \$16,600 per mile per year, as described below (Kimley-Horn and Associates, Inc., 2009).

- \$34,000 per year: blading at \$1,500 per mile 21 times a year, re-graveling at \$13,000 per mile every six years, and spot graveling at \$650 per mile every other year. Note that this scenario does not include dust abatement or ditch-shaping. This high cost was caused by the high frequency of blading.
- \$19,000 per year: blading twice a year, re-shaping the cross section and ditch maintenance (\$7,400 per mile) once a year, spot graveling once a year, dust abatement (\$2,050 per mile) three times a year, and re-graveling every six years.

- \$16,600 per year: blading twice a year, re-shaping the cross section and ditch maintenance once a year, spot graveling once a year, and dust abatement three times a year.

The above scenarios illustrate that from a cost perspective, maintenance is a primary factor affecting the decision of whether a road should be paved or gravel. These findings are confirmed by another report for a local agency, which found that a wide range of costs to maintain a gravel road in Wyoming (BenchMark Engineers, P.C., 2006). Reported annual maintenance cost varied from \$584 per mile to \$20,348, and estimated maintenance costs were as follows (BenchMark Engineers, P.C., 2006):

- \$3,640 per mile per year for typical maintenance.
- \$7,280 per mile per year for above average maintenance.
- \$13,520 per mile per year for roads requiring a high level of maintenance with water.
- \$42,640 per mile per year for roads requiring frequent maintenance with chloride.

3.3 Paved Road Costs

As with gravel road costs, paved road costs can vary significantly, and cost differences may be attributable to different characteristics of each individual road, different maintenance practices, local costs, and traffic. The potential impact of traffic on the cost for both gravel and paved roads is illustrated in Figure 3-2, based on data collected from four counties over a five year period in Minnesota. This chart is based on actual data from multiple agencies. The thickness of the asphalt surface course, the adequacy of the base, the age of the roadway, the drainage, and the maintenance practices vary for different jurisdictions and for different roads. Generally, the cost of maintaining a road would be expected to increase with increasing traffic.

Potential costs associated with maintaining pavement include periodic overlays of asphalt, crack sealing, surface treatments (chip sealing, fog sealing, etc.), and patching. Local practices may vary significantly, and the use of one maintenance practice may affect the need for and cost of other maintenance practices. For example, use of a chip seal may extend the pavement life and increase the intervals between overlays. One maintenance schedule for a seven-year cycle for asphalt is shown in Table 3-5, based on data reported in Minnesota. Costs for asphalt roads for South Dakota are shown in Table 3-6. Although not shown in the table, an example agency cost for asphalt in South Dakota is \$4,570 per mile (Zimmerman & Wolters, 2004), equivalent to \$5,570 per mile in 2012 when adjusting for inflation. This cost reflects crack sealing every 3 years (\$1,200 per mile), seal coating every 4 years (\$7,000 per mile), an overlay every 20 years (\$37,000 per mile), and striping and marking every 4 years (\$280 per mile).

Reference (Jahren, et al., 2005)

Figure 3-2. Surface-Related Maintenance Cost Varies Depending on Traffic Volume

Similarly, the reported average annual cost for asphalt maintenance in Minnesota is \$2,460 per mile (includes seal coat every 7 years, but not the initial \$130,000 resurfacing cost), equivalent to \$2,900 per mile in 2012 when adjusting for inflation. If the expected life of the asphalt resurfacing is 14 years, the equivalent annual cost for asphalt resurfacing would be \$9,290 per mile, for a total resurfacing and maintenance cost of \$11,750 per mile, equivalent to \$13,805 per mile in 2012 when adjusting for inflation.

3.4 Considerations in the Identification of the Appropriate Surface

Cost is a primary consideration in the decision as to the most appropriate surface type. In Minnesota, the report concluded that the maintenance cost savings alone could not justify the investment in an asphalt upgrade (Jahren, et al., 2005). Still, some benefits, like safety, economic development and quality of life, in addition to the reduced maintenance cost, can justify the improvement. Many benefits cannot easily be assigned monetary value. Adding to the complexity of the decision making is the fact that there are a variety of surface treatments that can be considered for implementation. In some cases, an upgrade may be justified based on maintenance cost if the upgrade is minimal. For example, a “lightly-surfaced road”, such as a seal coat, may be warranted since it would require a smaller investment compared to asphalt (Jahren, et al., 2005). The term “lightly-surfaced road” again points to the important consideration of vocabulary. The term “paved road” may have different implications for different agencies. Some agencies consider chip seal over gravel a pavement, and others

Table 3-5. Asphalt Road Costs for a Seven-Year Cycle in Minnesota (cost per mile)

Year	1	2	3	4	5	6	7	8	Total
Maintenance	\$1,600	\$1,600	\$1,600	\$1,600	\$1,600	\$1,600	\$1,600	\$1,600	\$12,800
Resurfacing	\$130,000							\$6,000*	\$136,000

consider it dust control. Similarly, the thickness of an asphalt overlay has a significant impact on cost and durability. One report identified ten different project alternatives that could be used to upgrade an unsealed road (Archondo-Callao R. , 2011). Although the term “unsealed road” was not explicitly defined in the paper, this is a term that is used to describe roads in Australia and New Zealand, and it typically refers to an unimproved road or a gravel road with such low maintenance that it functions as an unimproved road. Alternatives to improve an unsealed road included gravel (\$91,732 per mile), double surface treatment (\$247,838 per mile), and asphalt with a thickness of 50 mm (\$321,868 per mile), 100 mm (\$397,507 per mile) or 150 mm (\$473,146 per mile). Each alternative was evaluated for zero and full maintenance. Obviously there are multiple options for maintenance between these two extremes, however, only these two scenarios were evaluated. The results indicated that for a low-volume road with an annual average daily traffic (AADT) of 30 vehicles per day or less, gravel is the best option, regardless of whether there is zero or full maintenance. As the volume on a gravel road increases, the frequency of maintenance increases, which ultimately increases the cost of the project. As the volume on a road increases, it is more cost effective to pave the road rather than increase the frequency of maintenance. The minimum volume required to justify each of the improvements is shown in Table 3-7.

Table 3-7. AADT to Justify Alternative Upgrades

Alternative	Zero Maintenance	Full Maintenance
Double surface treatment	70 vehicles per day	97 vehicles per day
Asphalt 50 mm (2 in.)	98 vehicles per day	130 vehicles per day
Asphalt 100 mm (4 in.)	127 vehicles per day	161 vehicles per day
Asphalt 150 mm (6 in.)	156 vehicles per day	193 vehicles per day

Reference: (Archondo-Callao R. , 2011)

Although most reports do not identify a single volume threshold as the catalyst for paving a road, volume is an important consideration. Volumes of 200 vehicles per day (Jahren C. , 2002) to as low as 50 vehicles per day (Paige-Green, 1998) have been suggested. At the other end of the spectrum, one report suggests that an AADT of 500 vehicles is an appropriate threshold for dust control on gravel roads (UMA Engineering Ltd, 1987). Others suggest that it is not the volume but the load that should be considered (Luhr & McCullough, 1983).

Other factors that have an important impact on the economic analysis include the analysis period and assumptions regarding future interest and inflation rates. If the conversion of a gravel road requires substantial stabilization or other work to improve the base and drainage, then the period over which this activity is amortized will have a significant impact on the economic viability of the project. There is no standard life cycle, but the importance of this factor should be carefully considered.

4.0 Methodology

The project reported in this document focused on reviewing procedures developed in other states, identifying appropriate practices for Indiana and surveying local agencies to identify basic costs for Indiana. The result of these activities is two assessment procedures that can be utilized by local agencies. The assessment procedures provide reasonable default maintenance activities, intervals, and costs. Nevertheless, local agencies are encouraged to use their own costs and intervals to more accurately reflect their practices.

Review of existing literature and feedback from local officials was used to generate the proposed assessment procedures. Initial conversations with county engineers provided basic information which was used to develop a multiple choice survey questionnaire. The resulting survey (shown in Appendix A) was administered to local highway superintendents and county engineers who attended the Indiana Association of County Engineers and Supervisors (IACHES) business meeting in December 2012. Approximately 30 engineers and supervisors were present and participated in the survey.

5.0 Assessment Procedures

Two assessment procedures may be used to help determine the most appropriate surface type for a rural road. The first procedure simply compares the cost of each alternative. The second procedure is a ranking procedure that allows agencies to balance the impacts of multiple criteria. In both assessments, two alternatives are considered, a gravel road and a paved road. It would be possible for an agency to consider other alternatives, such as chip and seal over gravel, but for simplicity, this analysis is limited to gravel and paved with an asphalt overlay.

While these procedures focus on the comparison of gravel and paved roads, it is important to note that the decision regarding the most appropriate road surface type should be made in the context of a road management plan. In fact, all road maintenance and improvement activities should be evaluated and implemented in the context of a larger road management plan. A road management plan includes (Cambridge Systematics, Inc., 2007):

- Current inventory of roads and their conditions,
- List of appropriate preservation and maintenance activities, estimated costs and expected benefits.
- Performance measures and performance goals.
- Procedure for evaluating proposed and alternative activities.
- List of priorities and proposed projects over a multi-year period.
- Documentation of results.

A road management plan is a valuable way of quantifying the costs and benefits of all maintenance, reconstruction and construction activities. This information can then be used to help guide future decisions for maintenance and paving. A road management plan also helps assure that all road investments are efficient, improves accountability and provides important information that can be communicated to decision makers and the public. In addition to being part of a road management plan, it is important that all road improvements incorporate appropriate technical considerations. All road improvements should:

- Meet current standards for design, construction and maintenance (AASHTO, 2011).
- Reflect an adequate level of service (Transportation Research Board, 2010).
- Consider safety, both of the road itself, and of nearby developments. Safety components of the road that must be considered include design speed, sight distance, alignment and lane width (AASHTO, 2010), (AASHTO, 2011), (AASHTO, 2001). Recognize that changing the surface type may have unintended safety consequences. For example, paving a road may increase speeds on the road, increasing the needed sight distance. Alternately, converting a road to gravel may change the path of emergency response vehicles, increasing the response times for some rural areas.

It is also important to note that the surface of the road is just one component, and the life cycle cost and the serviceability of the road are strongly influenced by many features other than the

surface material. Merely adding an asphalt overlay to a road with an inadequate base or improper drainage is never an appropriate or cost effective solution in the long term.

5.1 Cost Assessment

The cost of each alternative must be quantified and should include all costs, both capital and maintenance. Costs include, but are not limited to, costs to prepare the roadway (such as grinding up the existing roadway), costs to improve the roadway if needed (such as base stabilization or drainage), capital and or reconstruction costs (such as an overlay or re-graveling), and on-going maintenance costs.

The examples used in this analysis do not include costs for signs, drainage, vegetation management, or snow removal, because it is presumed that both alternatives would incur similar costs. Similarly, the cost does not include the cost for pavement marking, because most low-volume paved roads do not have pavement markings, nor do gravel roads. According to the Manual of Uniform Traffic Control Devices (MUTCD), centerlines should be placed on rural arterials and collectors that are 18 feet or more in width and with an ADT of 3,000 vehicles per day or greater (Federal Highway Administration, 2011). Most local roads that will be evaluated with this assessment technique are two lane roads with substantially less traffic, generally with an ADT of under 500 vehicles per day, and thus would not be required to have pavement markings. The procedure could easily be expanded to include these costs, if desired.

A framework for the inclusion of user costs (costs to drivers) is also provided; this may be included or omitted, at the discretion of the local agency. Another possibility would be to include user costs as a weighted cost (BenchMark Engineers, P.C., 2006).

Another consideration is the time value of money. The analysis presented here considers all prices in 2012 dollars. It would also be possible to index the values to consider projected inflation and interest rates. However, for simplicity constant 2012 dollars were used in this analysis. This assumption can be justified due to the relatively low interest and inflation rates in recent history, the uncertainty associated with forecasting future interest rates and inflation rates, and previous research that suggests that a good case can be made for letting interest and inflation cancel completely and simplify the resulting life cycle cost calculations (Eisenberger, Remer, & Lorden, 1978).

5.1.1. Gravel Road Cost

It is important to recognize that there is no one best maintenance practice, since local resources and priorities may vary significantly. In this assessment, minimal, moderate and high maintenance levels have been identified to illustrate a range of potential practices that may be appropriate for different agencies and on different roads.

Activities for each of the three maintenance levels and the equivalent annual cost for each are shown in Table 5-1. The concept was developed based on the literature (Archondo-Callao R. ,

2007), (Jahren, et al., 2005) (Zimmerman & Wolters, 2004), and with input from engineers and highway superintendents in local Indiana county agencies.

Table 5-1. Schedule for Maintenance on Gravel Roads (cost per mile)

Activity	Cost per Mile or Frequency	Maintenance Level		
		Minimal	Moderate	High
Dust Control	Frequency (applications per year)	None	2	4
	Cost per application	\$500	\$500	\$500
	Equivalent annual cost	\$0	\$1,000	\$2,000
Blade	Frequency (per year)	2	5	9 (once a month, March through November)
	Cost per blading	\$150	\$150	\$150
	Equivalent annual cost	\$300	\$750	\$1,350
Re-gravel	Frequency (years that re-gravel will last)	8	5	4
	Cost per re-graveling	\$12,000	\$12,000	\$12,000
	Equivalent Annual Cost	\$1,500	\$2,400	\$3,000
Reshape/Crown	Frequency (per year)	None	1	2
	Cost per reshaping	\$300	\$300	\$300
	Equivalent annual cost	\$0	\$300	\$600
Spot Gravel/ Annual Maintenance	Cost for spot graveling (per year)	\$200	\$500	\$700
Total		\$2,000	\$4,950	\$7,650

The appropriate level of maintenance on a road will also vary depending on the adjacent development, the resources available, and the weather (e.g., frequent rains or excessively dry weather may alter the maintenance needed). The proposed assessment procedure is flexible, and local agencies can modify the schedule and costs to reflect their practices, costs and the specific activities for a given road. Costs vary significantly from agency to agency within Indiana. Table 5-2 illustrates the range in the cost of #53/#73 stone, which varies from \$12.05 in Hancock County to \$16.85 in Fayette County, a difference of over 30 percent. Another factor that affects cost is the cost to transport materials from the plant to the agency jurisdiction and within the jurisdiction to the road.

Table 5-2. Aggregate Prices Vary Throughout Indiana

2012 Gross Price per Ton	Hancock County	Madison County	Henry County	Wayne County	Fayette County	Madison County
#53/#73 Stone	\$12.05	\$12.25	\$16.25	\$16.35	\$16.85	\$14.75

5.1.2. Conversion from Gravel to Asphalt and from Asphalt to Gravel

Conversion costs are an important consideration and include all costs to prepare and convert the existing road to a new surface type. These costs may vary depending on the specific practices of each agency and the condition of the existing road. Estimated conversion costs for Indiana counties are shown in Table 5-3. The cost for conversion from gravel to asphalt includes the cost to stabilize the base in preparation for an asphalt overlay (the cost to grind the asphalt and stabilize the base is \$30,000 per mile). The cost for conversion from asphalt to gravel includes the cost to grind up the existing asphalt, which is presumably in poor condition, and stabilize the base. This stabilized base is then ready for a new asphalt overlay, or for a surface coat of gravel. Ideally, similar base preparation and stabilization would be necessary for a road in very poor condition, regardless of whether a gravel or asphalt surface is used. In practice, however, few agencies do extensive base improvements or stabilization on roads that will remain gravel. For this reason, there is typically no capital cost to maintain a road as gravel. In this case, the cost for re-gravelling a gravel road is included as a maintenance cost.

5.1.3. Paved Road Costs

Maintenance of asphalt roads is necessary to increase the expected life of the road and ensure the performance, safety, and overall quality of the road. Maintenance activities that may occur include asphalt overlay, crack sealing, chip sealing, and patching, as shown in Table 5-4, which is based on input from local agencies. This schedule should be used as a guideline to help local agencies create their own maintenance schedule.

Table 5-3. Estimated Costs Associated with Surface Conversions

Conversion Activity	Cost per Mile
Estimated Costs for Existing Asphalt Road in Poor Condition	
Convert to gravel: Grind asphalt, stabilize base and add new gravel surface	\$42,000
Maintain asphalt: Grind asphalt, stabilize base and add new asphalt overlay	\$112,000
Estimated Costs for Existing Gravel Road	
Convert to asphalt	\$150,000
Maintain as Gravel Road	\$0

Table 5-4. Schedule for Maintenance on Asphalt Roads

Activity		Cost per Mile or Frequency	Equivalent Annual Cost per Mile
Asphalt Overlay	Frequency (years between overlay)	14 years	\$5,857
	Cost per overlay	\$82,000	
	Equivalent Annual Cost		
Crack Sealing	Frequency (years between crack seal) ¹	2 to 3 years	\$536
	Cost per application	\$2,500	
	Applications in life of overlay ²	3	
	Total Cost for Crack Sealing in 14 Year Life of Asphalt Overlay	\$7,500	
	Equivalent Annual Cost		
Chip Seal	Frequency (years between chip seal)	7 years	\$1,071
	Applications in life of overlay	1	
	Cost per resurfacing	\$15,000	
	Total Cost for Chip Seal in 14 Year Life of Asphalt Overlay	\$15,000	
	Equivalent Annual Cost		
Patching / Annual Maintenance	Annual cost per patching	\$600	\$600
Total			\$8,064

¹ Reference on interval for crack sealing: (Johnson, 2000)

² Assume crack sealing occurs at years 3, 10, and 12; and chip seal occurs at year 7, and new asphalt overlay occurs at year 14.

5.1.4. User Costs

In addition to construction and maintenance costs, it may also be appropriate to consider user costs. Vehicle costs are higher for gravel surfaces due to increased operating and maintenance costs. Vehicle maintenance increases significantly due to tire and engine wear, and oil consumption. With an average speed of 35 mph, user costs on gravel roads are almost 35 percent greater than paved roads, as was shown in Figure 3-1.

One estimate for user operating expenses is shown in Table 5-5. These costs are generally consistent with reimbursement rates of \$0.44 per mile in Indiana (State of Indiana, 2011). Combined with the conversion factor from Figure 3-1, the estimated cost for operating a vehicle on a gravel road is 14.33 cents per mile higher than on a paved road. For a road with a traffic volume of 100 vehicles per day, the difference in vehicle operating cost is \$14.33 per day, or \$5,229 per year. Although this cost is significant, it is borne by vehicle owners and not the agency. User costs may be included at the discretion of the local agency. Note that this analysis does not consider the value of any time savings that may accrue from higher speeds on a paved road, nor does it consider the cost savings from a reduced trip length that may result if a road is paved and consequently vehicles shift their preferred route. User costs may also be scaled and included with a weighting factor (BenchMark Engineers, P.C., 2006), although doing so is beyond the scope of this document.

Table 5-5. User Costs per Mile

Element	Cost per Mile (cents)
Paved	
Gas	17.29
Oil	0.67
Maintenance and Repair	4.54
Tires	0.83
Vehicle Depreciation	17.60
Total Cost for Paved per Mile	40.93
Gravel	
Conversion Factor for Gravel is 1.35 (see Figure 2-1)	
Total Cost for Gravel per Mile (40.93 * 1.35)	55.26
Difference in Cost Between Paved and Gravel per Mile	14.33

References: (Enterprise, 2012), (Pierce Transit, 2012), (Internal Revenue Service, 2012).

Example 1- Cost Assessment

Compare the cost of converting one mile of an asphalt road in poor condition to a gravel road maintained at a high maintenance level, without considering user costs, for a 14 year analysis period. The ADT for the road is 100 vehicles per day.

Solution

The estimated costs for converting to asphalt and maintaining a gravel road at a moderate maintenance level are based on the information in Table 5-1, Table 5-3 and Table 5-4. The resulting estimated equivalent annual costs for asphalt and gravel are shown in Table 5-6 and Table 5-7.

Table 5-6. Example 1. Cost for Asphalt (14-year analysis period)

Activity	Cost per Mile	Equivalent Annual Cost per Mile
Grind asphalt in poor condition and stabilize base	\$30,000	\$2,143
Asphalt overlay	\$82,000	\$5,857
Crack seal		\$536
Chip seal		\$1,071
Patching/Annual Maintenance		\$600
Total		\$10,207

Table 5-7. Example 1. Cost for Gravel Maintained at Moderate Level (14-year analysis period)

Activity	Cost per Mile	Equivalent Annual Cost per Mile
Grind asphalt in poor condition and stabilize base	\$30,000	\$2,143
Initial gravel surface and re-gravel every 5 years	\$12,000	\$2,400
Dust control		\$1,000
Blade		\$750
Reshape/Crown		\$300
Spot Gravel/Annual Maintenance		\$500
Total		\$7,093

Comparing the costs for the two options, the gravel road option is the preferred option since it has a lower equivalent annual cost (\$7,093 for gravel vs. \$10,207 for paved).

Example 2 - Cost Assessment

Compare the cost of converting one mile of an asphalt road in poor condition to a gravel road maintained at a moderate maintenance level, considering user costs for a 14 year analysis period. The ADT for the road is 100 vehicles per day.

Solution

The estimated costs for converting to asphalt and maintaining a gravel road at a moderate maintenance level are based on the information in Table 5-1, Table 5-3 and Table 5-4 as calculated in *Example 1*. User cost information is based on information in Table 5-5. The resulting estimated equivalent annual costs for asphalt and gravel considering user costs are shown in Table 5-8 and Table 5-9.

Table 5-8. Example 2. Cost for Asphalt (14-year analysis period)

Activity	Cost per mile	Equivalent Annual Cost per Mile
Road Cost from Table 5-6		\$10,207
User Cost		
Cost per vehicle	\$0.41	
Cost for 100 vehicles per day	\$41	
Cost for 100 vehicles per day for a year		\$14,965
Total		\$25,172

Table 5-9. Example 2. Cost for Gravel Maintained at Moderate Level (14-year analysis period)

Activity	Cost per mile	Equivalent Annual Cost per Mile
Road Cost from Table 5-7		\$7,093
User Cost		
Cost per vehicle	\$0.55	
Cost for 100 vehicles per day	\$55	
Cost for 100 vehicles per day for a year		\$20,075
Total		\$27,168

Comparing the costs for the two options, the paved road option is the preferred option since it has a lower annual cost (\$25,135 for paved vs. \$27,168 for gravel). As can be seen by comparing *Examples 1* and *2*, including the user costs in the cost assessment makes a significant difference in the cost and the preferred option.

5.2 Multi-objective Assessment

Cost is an important consideration, however, in many cases it is not the only factor that should be considered when evaluating whether a road should be paved. In some cases, cost may not even be the most important consideration for a given agency. For this reason, a second assessment procedure is presented based on multi-objective assessment. In this document, the alternatives are a gravel road and a paved road. However, it would be possible for an agency to use this procedure to consider other alternatives, such as chip and seal over gravel. In this assessment procedure, each alternative (paved and gravel) is rated according to the following attributes:

- Cost
- Traffic volume
- Development and expected growth rate
- Public preference.

This procedure is flexible, and can be expanded to consider additional attributes. Similarly, attributes that are not a priority can be removed from consideration. Each attribute is briefly discussed below.

5.2.1 Cost

Minimizing cost is an important objective for most agencies. Costs include conversion costs, maintenance costs, and possibly user costs, as discussed in the previous section.

5.2.2 Traffic Volume

Traffic volume is an important consideration for many agencies. Higher volume roads are generally a higher priority for most agencies. In many cases, roads that carry higher traffic volumes also require more maintenance, particularly for gravel roads. A reasonable threshold to justify paving based on volume would be in the range of 100 vehicles per day (the most frequently cited value in the survey) to 200 vehicles per day (the average value in the survey), based on the survey responses in Indiana.

5.2.3 Development and Expected Growth Rate

The density and type of development on and near a road affect the functional classification of the road and the importance of the road's contribution to the transportation network. Generally speaking, paved roads typically serve areas with dense residential, commercial and industrial development, whereas gravel roads may adequately serve low-density residential and agricultural land.

5.2.4 Public Preference

Public preference and political considerations can be an important consideration in many jurisdictions. Responses from county agencies in Indiana suggest the public generally prefers paved roads to gravel roads. Paved roads are generally smoother, allow higher operating speeds, generate less dust and result in lower user costs.

5.2.5 Assessment Procedure

The multi-objective assessment procedure requires that the merits of each alternative be compared based on the chosen attributes. This is accomplished by calculating a score for each alternative. The score is based on a weighting factor for each attribute, and a scaled value for each alternative.

- **Weighting Factor.** Each of the four attributes is assigned a weighting factor to indicate its importance relative to the other attributes. Weighting refers to “how decision makers attach relative levels of important to these criteria” (Sinha & Labi, 2007). The weighting factors presented in this procedure are based on input from the Indiana engineers and surveyors.
- **Scaled Value.** Each alternative is given a scaled value to indicate its score for each attribute. Scaling converts a measurement of each attribute from its original dimension to a scale that is “uniform and commensurate across all performance criteria” (Sinha & Labi, 2007).
- **Total Score.** A total score for each alternative can then be determined based on the weighting factors and the scaled values for each attribute.

5.2.6 Weighting Factors

There are many ways to establish weights for the attributes. In this procedure, the weighting factors were determined based on the results of the survey and were assigned in a range from 0 to 1, as shown in Table 5-10. The weighting factors for all the attributes must sum to 1.0, and the attributes with higher values reflect greater importance. Weighting factors can be adjusted to reflect local priorities. For example, if development and public preference were considered to be equally important, each could be assigned a weight of 0.15.

Table 5-10. Weighting Factor for Each Attribute

Attribute	Weight
Cost	0.35
Traffic Volume	0.35
Development	0.20
Public Preference	0.10

5.2.7 Scaled Value

Scaling is important to allow all attributes to be expressed in comparable units. A scale of 0 to 100 is used, with 100 being highly favorable. Since reducing costs is an objective for local agencies, the scaled value for cost, S_{cost} , for the least cost alternative, $C_{minimum}$, is considered highly favorable and is rated at 100. The scaled value for the second alternative, $C_{alternative}$, is calculated based on the percent difference between the two alternatives, as shown below.

$$S_{cost} = 100 - 100 \left[\frac{C_{alternative} - C_{minimum}}{\left(\frac{C_{alternative} + C_{minimum}}{2} \right)} \right] \quad \text{Eq. 1}$$

If the costs are relatively close, than the scaled values for cost are relatively close. If the costs vary dramatically, there will be a larger difference between the scaled cost values. Example 3 provides an example calculation of the scaled values for cost.

Example 3. Calculation of Scaled Value for Cost

Determine the scaled value for Alternative A with a cost of \$10,170 and Alternative B with a cost of \$7,093.

Solution

The scaled cost for both alternatives can be calculated using Eq. 1. In this example, the minimum cost is \$7,093.

$$S_{cost} = 100 - 100 \left[\frac{C_{alternative} - C_{minimum}}{\left(\frac{C_{alternative} + C_{minimum}}{2} \right)} \right] \quad \text{Eq. 2}$$

$$S_A = 100 - 100 \left[\frac{10,207 - 7,093}{\left(\frac{10,207 + 7,093}{2} \right)} \right] \quad \text{Eq. 3}$$

$$S_A = 64 \quad \text{Eq. 4}$$

$$S_B = 100 - 100 \left[\frac{7,093 - 7,093}{\left(\frac{7,093 + 7,093}{2} \right)} \right] \quad \text{Eq. 5}$$

$$S_B = 100 \quad \text{Eq. 6}$$

The scaled values for traffic volume, development and public preference are shown in Table 5-11, Table 5-12, and Table 5-13. The scaled values in Table 5-11 are based on survey responses. In all cases, local agencies can adjust the scaled values to reflect local perspectives.

Table 5-11. Scaled Value for Traffic Volume

Traffic Volume (veh/day)	< 50	50 to 99	100 to 149	150 to 199	200 to 249	250 to 299	300 to 374	375 to 449	≥ 450
Scaled Value Gravel	90	75	60	55	40	30	15	10	0
Scaled Value Paved	10	25	40	45	60	70	85	90	100

Table 5-12. Scaled Value for Development

Development	Agriculture	Low Density Residential	Industrial, Commercial, Moderate or High Density Residential
Scaled Value – Gravel	50	50	0
Scaled Value – Asphalt	50	50	100

Table 5-13. Scaled Value for Public Preference

Public Preference	Gravel Road Low Maintenance	Gravel Road Moderate Maintenance	Gravel Road High Maintenance	Paved Road
Scaled Value	0	5	10	100

5.2.8 Total Score

Calculation of the total score combines the weighting factors and scaled values into a single score to allow the best alternative to be selected. The total score is calculated for each alternative as the sum of the product of the weighting factor (W_i) and its scale value (S_i) for all attributes. The alternative with the highest total score is presumed to be the best alternative, based on the priorities expressed through the weighting factors and the relative benefits expressed through the scaled values for each alternative as shown in Eq. 4 and Eq. 5.

$$Score_{Total} = \sum_{i=0}^4 W_i S_i \quad \text{Eq. 7}$$

$$Score_{Total} = 0.35 S_{Cost} + 0.35 S_{Traffic\ Volume} + 0.20 S_{Development} + 0.10 S_{Public\ Preference} \quad \text{Eq. 8}$$

The application of this multi-objective assessment procedure is illustrated in the following examples.

Example 4 - Multi-objective Assessment

Using the multi-objective assessment procedure, compare the cost of converting one mile of an asphalt road in poor condition to a gravel road maintained at a moderate level, without considering user costs, for a 14 year analysis period. The road, which is in a low density residential area, has an ADT of 50 vehicles per day.

Solution

The alternatives are:

- Alternative A – Grind asphalt road in poor condition, stabilize base and overlay with asphalt.
- Alternative B – Grind asphalt road in poor condition, stabilize base, and convert to a gravel road and maintain at a moderate maintenance level.

The estimated costs for converting to asphalt and maintaining a gravel road at a moderate and high maintenance level are based on the information in Table 5-3, and Table 5-4. The resulting estimated equivalent annual costs for asphalt and gravel maintained at a moderate level are shown in Table 5-14 and Table 5-15.

**Table 5-14. Example 4. Cost for Alternative A, Asphalt
(14-year analysis period)**

Activity	Cost per Mile	Equivalent Annual Cost per Mile
Grind asphalt in poor condition and stabilize base	\$30,000	\$2,142
Asphalt overlay	\$82,000	\$5,857
Crack seal		\$536
Chip seal		\$1,071
Patching/Annual Maintenance		\$600
Total		\$10,207

**Table 5-15. Example 4. Cost for Alternative B, Gravel Maintained at Moderate Level
(14-year analysis period)**

Activity	Cost per Mile	Equivalent Annual Cost per Mile
Grind asphalt in poor condition and stabilize base	\$30,000	\$2,142
Gravel at conversion and re-gravel every 5 years	\$12,000	\$2,400
Dust control		\$1,000
Blade		\$750
Reshape/Crown		\$300
Spot Gravel/Annual Maintenance		\$500
Total		\$7,093

The scaled value for cost must be calculated based on the cost of the Alternative A, the asphalt with a cost of \$10,170, and the minimum cost, which is \$7,093 for Alternative B, the gravel road with moderate maintenance, as shown in Example 3.

$$S_A = 100 - 100 \left[\frac{10,207 - 7,093}{\left(\frac{10,207 + 7,093}{2} \right)} \right] \quad \text{Eq. 9}$$

$$S_A = 64 \quad \text{Eq. 10}$$

$$S_B = 100 \quad \text{Eq. 11}$$

The scaled values for traffic volume, development and public preference can be found by referring to Table 5-11, Table 5-12, and Table 5-13.

For Alternative A, $S_{Traffic\ Volume} = 40$, $S_{Development} = 50$, and $S_{Public\ Preference} = 100$

For Alternative B, $S_{Traffic\ Volume} = 60$, $S_{Development} = 50$, and $S_{Public\ Preference} = 5$

The score for each alternative can now be calculated based on the weighting factors and scaled values.

$$Score_{Total} = 0.35 S_{Cost} + 0.35 S_{Traffic\ Volume} + 0.20 S_{Development} + 0.10 S_{Public\ Preference} \quad \text{Eq. 12}$$

$$Score_A = 0.35(64) + 0.35(25) + 0.20(50) + 0.10(100) = 51 \quad \text{Eq. 13}$$

$$Score_B = 0.35(100) + 0.35(60) + 0.20(50) + 0.10(5) = 72 \quad \text{Eq. 14}$$

On the basis of the total score, Alternative B, the gravel road with moderate maintenance, has a higher score and is therefore the preferred alternative.

Example 5 - Multi-objective Assessment

Using the multi-objective assessment procedure, compare the cost of converting one mile of an asphalt road in poor condition to a gravel road maintained at a moderate level, without considering user costs, for a 14 year analysis period. The road, which is in a low density residential area, has an ADT of 250 vehicles per day.

Solution

The alternatives are:

- Alternative A – Grind asphalt road in poor condition, stabilize base and overlay with asphalt.
- Alternative B – Grind asphalt road in poor condition, stabilize base, and convert to a gravel road and maintain at a moderate maintenance level.

The estimated costs for converting to asphalt and maintaining a gravel road at a moderate and high maintenance level are based on the information in Table 5-3, and Table 5-4. The resulting estimated equivalent annual costs for asphalt and gravel maintained at a moderate level are shown in Table 5-14 and Table 5-15.

The cost ratio for each alternative must be calculated using based on the cost of the alternative and the minimum cost, which is \$7,093 for Alternative B, the gravel road with moderate maintenance, as shown in Example 3.

$$S_A = 100 - 100 \left[\frac{10,207 - 7,093}{\left(\frac{10,207 + 7,093}{2} \right)} \right] \quad \text{Eq. 15}$$

$$S_A = 64 \quad \text{Eq. 16}$$

$$S_B = 100 \quad \text{Eq. 17}$$

The scaled values for traffic volume, development and public preference can be found by referring to Table 5-11, Table 5-12, and Table 5-13.

For Alternative A, $S_{Traffic\ Volume} = 70$, $S_{Development} = 50$, and $S_{Public\ Preference} = 100$

For Alternative B, $S_{Traffic\ Volume} = 30$, $S_{Development} = 50$, and $S_{Public\ Preference} = 5$

The score for each alternative can now be calculated based on the weighting factors and scaled values.

$$Score_{Total} = 0.35 S_{Cost} + 0.35 S_{Traffic\ Volume} + 0.20 S_{Development} + 0.10 S_{Public\ Preference} \quad \text{Eq. 18}$$

$$Score_A = 0.35(64) + 0.35(70) + 0.20(50) + 0.10(100) = 67 \quad \text{Eq. 19}$$

$$Score_B = 0.35(100) + 0.35(30) + 0.20(50) + 0.10(5) = 56 \quad \text{Eq. 20}$$

On the basis of the total score, Alternative A, the asphalt road, has a higher score and is the preferred alternative. Notice that the increase in volume affected the preferred alternative.

Example 6 - Multi-objective Assessment

Using the multi-objective assessment procedure, compare the cost of converting one mile of an asphalt road in poor condition to a gravel road maintained at a moderate level, without considering user costs, for a 14 year analysis period. The road, which is in a low density residential area, has an ADT of 200 vehicles per day.

Input from the community stakeholders indicates that public preference should not be directly considered, and the weighting values for cost and traffic volume should be weighted higher. The revised weighting factors are shown in Table 5-16. Input from the community stakeholders also indicates that gravel is not an acceptable alternative for any residential development, so the scaled values for development are adjusted as shown in Table 5-17.

Table 5-16. Example 6. Revised Weighting Factors Reflecting Local Input

Attribute	Cost	Traffic Volume	Development	Preference
Weight	0.40	0.40	0.20	0

Table 5-17. Example 6. Revised Scaled Values Reflecting Local Input

Development	Agriculture	Low Density Residential	Industrial, Commercial, Moderate or High Density Residential
Scaled Value – Gravel	50	0	0
Scaled Value – Asphalt	50	100	100

Solution

The alternatives are:

- Alternative A – Grind asphalt road in poor condition, stabilize base and overlay with asphalt.
- Alternative B – Grind asphalt road in poor condition, stabilize base, and convert to a gravel road and maintain at a moderate maintenance level.

The estimated costs for converting to asphalt and maintaining a gravel road at a moderate and high maintenance level are based on the information in Table 5-3, and Table 5-4. The resulting estimated equivalent annual costs for asphalt and gravel maintained at a moderate level are shown in Table 5-14 and Table 5-15.

The cost ratio for each alternative must be calculated using Equation 1 based on the cost of each alternative and the minimum cost, which is \$7,093 for Alternative B, the gravel road with moderate maintenance.

$$S_A = 100 - 100 \left[\frac{10,207 - 7,093}{\left(\frac{10,207 + 7,093}{2} \right)} \right] \quad \text{Eq. 21}$$

$$S_A = 64 \quad \text{Eq. 22}$$

$$S_B = 100 \quad \text{Eq. 23}$$

The scaled values for traffic volume and development can be found by referring to Table 5-11 and Table 5-17.

For Alternative A, $S_{\text{Traffic Volume}} = 60$, $S_{\text{Development}} = 100$

For Alternative B, $S_{\text{Traffic Volume}} = 40$, $S_{\text{Development}} = 0$

The score for each alternative can now be calculated using Equation 3 based on the weighting factors and scaled values.

$$Score_{Total} = 0.40 S_{Cost} + 0.40 S_{Traffic} + 0.20 S_{Development} + 0.0 S_{Public} \quad \text{Eq. 24}$$

Volume *Preference*

$$Score_A = 0.40(64) + 0.40(60) + 0.20(100) + 0 = 70 \quad \text{Eq. 25}$$

$$Score_B = 0.40 (100) + 0.40 (40) + 0.20(0) + 0 = 56 \quad \text{Eq. 26}$$

On the basis of the total score, Alternative A, the asphalt road, has the higher score and is the preferred alternative.

6.0 Conclusion

This report provides two assessment methodologies to provide guidance for a local agency in deciding whether a road should be paved or gravel. The report includes estimated costs for maintaining local roads based on information provided by local agencies in Indiana. The first assessment procedure provides a basic framework for comparing the cost of each alternative. The second procedure is a multi-objective assessment procedure that allows agencies to estimate a score for each alternative based on multiple attributes, such as cost, traffic volume, development and public preference.

It is recommended that the assessment procedures in this report be used as one tool in the decision-making process. In all cases, the local agency can modify the procedure to fit local needs. Local agencies can utilize the maintenance procedures and costs associated with their practices; similarly, for the multi-objective assessment procedure, the local agency can modify the weighting factors and the scaled values to reflect local priorities.

The decision to upgrade a gravel road to paved, or alternately, to convert a paved road back to gravel is not always easy. The decision may encompass not only cost, but also user preferences, community needs and preferences, economic development, and overall quality of life. While important considerations, these factors are inherently challenging to quantify. This report provides one tool, and it is intended to support local agencies in their decision making, rather than constrain them.

Appendix A. Survey of Indiana Highway Engineers and Supervisors

This appendix provides the results of a survey of local highway superintendents and county engineers who attended the Indiana Association of County Engineers and Supervisors (IACHES) business meeting in December 2012.

1.) Which factor do you think has the greatest impact when deciding whether a road should be paved or gravel?

	Responses	
	(percent)	(count)
Cost (capital and maintenance)	40.62%	13
Traffic volume	40.62%	13
Percent trucks	0%	0
Development / expected growth rate	9.38%	3
Public preference (dust) / political considerations	9.38%	3
Totals	100%	32

2.) Which factor do you think has the second greatest impact when deciding whether a road should be paved or gravel?

	Responses	
	(percent)	(count)
Cost (capital and maintenance)	25.81%	8
Traffic volume	45.16%	14
Percent trucks	3.23%	1
Development / expected growth rate	9.68%	3
Public preference (dust) / political considerations	16.13%	5
Totals	100%	31

3.) Which factor do you think has the third greatest impact when deciding whether a road should be paved or gravel?

	Responses	
	(percent)	(count)
Cost (capital and maintenance)	12.50%	4
Traffic volume	9.38%	3
Percent trucks	9.38%	3
Development / expected growth rate	46.88%	15
Public preference (dust) / political considerations	21.88%	7
Totals	100%	32

4.) What traffic volume (ADT) generally warrants a paved road?

	Responses	
	(percent)	(count)
There is not a specific volume	18.75%	6
≤ 50 vehicles a day	6.25%	2
100 vehicles a day	28.12%	9
150 vehicles a day	3.12%	1
200 vehicles a day	12.50%	4
250 vehicles a day	6.25%	2
300 vehicles a day	12.50%	4
350 vehicles a day	3.12%	1
400 vehicles a day	3.12%	1
≥ 450 vehicles a day	6.25%	2
Totals	100%	32

5.) What is the average cost for one of your highway department workers? (hourly cost for salary only)

	Responses	
	(percent)	(count)
≤ \$12	7.69%	2
\$14	23.08%	6
\$16	57.69%	15
\$18	11.54%	3
\$20	0%	0
\$22	0%	0
\$24	0%	0
\$26	0%	0
≥ \$28	0%	0
Totals	100%	26

6.) How many miles of gravel have you converted to HMA in the past 10 years?

	Responses	
	(percent)	(count)
Zero, we have not converted any gravel roads to HMA	32.26%	10
≤ 10 miles	38.71%	12
15 miles	3.23%	1
20 miles	16.13%	5
25 miles	0%	0
30 miles	0%	0
40 miles	3.23%	1
50 miles	0%	0
60 miles	0%	0
≥ 70 miles	6.45%	2
Totals	100%	31

7.) How many miles of HMA have you converted to gravel in the past 10 years?

	Responses	
	(percent)	(count)
Zero, we have not converted any HMA roads to gravel	74.19%	23
≤ 10 miles	16.13%	5
15 miles	0%	0
20 miles	6.45%	2
25 miles	0%	0
30 miles	0%	0
40 miles	0%	0
50 miles	0%	0
60 miles	0%	0
≥ 70 miles	3.23%	1
Totals	100%	31

8.) What is the cost for an HMA overlay per mile? (contract price or materials, labor and equipment)

	Responses	
	(percent)	(count)
≤ \$50,000	13.33%	4
\$65,000	40%	12
\$80,000	6.67%	2
\$95,000	20%	6
\$110,000	10%	3
\$125,000	6.67%	2
\$140,000	0%	0
\$165,000	3.33%	1
≥ \$180,000	0%	0
Totals	100%	30

An HMA overlay provides a better driving surface but does not address structural problems with the road.

9.) How thick is the HMA overlay you typically use to improve the driving surface on a county road?

	Responses	
	(percent)	(count)
1 inch	12.90%	4
1.5 inches	38.71%	12
2 inches	29.03%	9
2.5 inches	6.45%	2
≥ 3 inches	12.90%	4
Totals	100%	31

An HMA overlay provides a better driving surface but does not address structural problems with the road.

10.) What is the ideal interval between HMA overlays?

	Responses	
	(percent)	(count)
< 10 years	12.50%	4
10 years	15.62%	5
12 years	12.50%	4
15 years	31.25%	10
18 years	9.38%	3
20 years	12.50%	4
25 years	3.12%	1
30 years	3.12%	1
≥ 35 years	0%	0
Totals	100%	32

An HMA overlay provides a better driving surface but does not address structural problems with the road.

11.) How much does it cost to crack seal a mile of HMA road? (one application, materials, labor and equipment, ideal overlay cycle)

	Responses	
	(percent)	(count)
We do not do this activity	16.67%	5
≤ \$1,000	10%	3
\$1,500	20%	6
\$2,000	13.33%	4
\$2,500	10%	3
\$3,000	6.67%	2
\$3,500	10%	3
\$4,000	3.33%	1
\$4,500	3.33%	1
≥ \$5,000	6.67%	2
Totals	100%	30

Crack seal: A localized treatment method used to prevent water and debris from entering a crack, which might include routing to clean the entire crack and to create a reservoir to hold the sealing.

12.) What is the annual cost to patch HMA road per mile? (material, labor and equipment cost, ideal overlay cycle)

	Responses	
	(percent)	(count)
We do not do this activity	0%	0
≤ \$100	6.45%	2
\$200	12.90%	4
\$300	12.90%	4
\$400	19.35%	6
\$500	9.68%	3
\$750	16.13%	5
\$1,000	6.45%	2
\$1,250	3.23%	1
≥ \$1,500	12.90%	4
Totals	100%	31

Patching: Repair distress and improve ride quality

13.) How much does it cost for a chip seal, seal coat or surface treatment on an HMA road? (include material, labor and equipment cost)

	Responses	
	(percent)	(count)
We do not use a chip seal, seal coat or surface treatment on an HMA road	12.50%	4
≤ \$2,500	3.12%	1
\$5,000	9.38%	3
\$7,500	3.12%	1
\$10,000	15.62%	5
\$12,500	9.38%	3
\$15,000	21.88%	7
\$20,000	15.62%	5
\$25,000	9.38%	3
≥ \$30,000	0%	0
Totals	100%	32

Surface treatments: Used to waterproof the surface, seal small cracks, reduce oxidation of the pavement surface, and improve friction.

14.) Ideally, how often would you apply a chip seal, seal coat or surface treatment on an HMA road?

	Responses	
	(percent)	(count)
We do not typically chip seal an HMA road	12.50%	4
≤ 3 years	3.12%	1
5 years	18.75%	6
6 years	9.38%	3
7 years	34.38%	11
8 years	3.12%	1
9 years	9.38%	3
10 years	6.25%	2
11 years	0%	0
≥ 12 years	3.12%	1
Totals	100%	32

Surface treatments: Used to waterproof the surface, seal small cracks, reduce oxidation of the pavement surface, and improve friction.

15.) What is typically the basis for maintenance on your HMA roads (e.g., overlay, chip seal)?

	Responses	
	(percent)	(count)
On a defined schedule (e.g., every 30 years for an overlay, every 7 years for chip seal, etc.)	3.23%	1
As needed, based on road condition, public comments and/or agency observations	61.29%	19
Combination of a defined schedule and as needed	35.48%	11
Totals	100%	31

16.) How much does it cost to grind the surface and stabilize the base of an existing HMA road in very poor condition? (per mile, material, labor and equipment)

	Responses	
	(percent)	(count)
We do not do this activity	22.58%	7
≤ \$5,000	3.23%	1
\$10,000	3.23%	1
\$15,000	25.81%	8
\$20,000	9.68%	3
\$25,000	9.68%	3
\$30,000	3.23%	1
\$40,000	3.23%	1
\$50,000	6.45%	2
≥ \$60,000	12.90%	4
Totals	100%	31

17.) How much does it cost for one application of dust control on a mile of gravel road? (material, labor and equipment cost)

	Responses	
	(percent)	(count)
We do not do this activity	51.85%	14
≤ \$500	18.52%	5
\$1,000	11.11%	3
\$1,500	7.41%	2
\$2,000	3.70%	1
\$2,500	0%	0
\$3,000	0%	0
\$3,500	0%	0
≥ \$4,000	7.41%	2
Totals	100%	27

Dust Control: Reduce emanation of fugitive dust

18.) How much does it cost to blade a gravel road? (per mile, materials, labor and equipment)

	Responses	
	(percent)	(count)
We do not do this activity	9.38%	3
≤ \$40	18.75%	6
\$60	3.12%	1
\$80	6.25%	2
\$100	21.88%	7
\$125	3.12%	1
\$150	6.25%	2
\$200	6.25%	2
\$250	6.25%	2
≥ \$300	18.75%	6
Totals	100%	32

Blading: Remove surface defects; minor crown restoration

19.) How much does it cost for gravel to gravel a gravel road? (per mile, MATERIALS ONLY)

	Responses	
	(percent)	(count)
We do not do this activity	10.34%	3
≤ \$250	6.90%	2
\$500	6.90%	2
\$750	3.45%	1
\$1,000	0%	0
\$2,500	24.14%	7
\$5,000	17.24%	5
≥ \$7,500	31.03%	9
Totals	100%	29

Re-gravel: Restore structural capacity; improve quality of surfacing gravel; replace lost gravel. Some agencies add a couple of inches every few years to re-gravel a road.

20.) How much does it cost to re-gravel a gravel road? (per mile, MATERIALS, LABOR AND EQUIPMENT)

	Responses	
	(percent)	(count)
We do not do this activity	17.24%	5
≤ \$1,000	3.45%	1
\$2,000	6.90%	2
\$3,000	0%	0
\$4,000	0%	0
\$5,000	13.79%	4
\$6,000	6.90%	2
\$8,000	13.79%	4
\$10,000	6.90%	2
≥ \$12,000	31.03%	9
Totals	100%	29

Re-gravel: Restore structural capacity; improve quality of surfacing gravel; replace lost gravel. Some agencies add a couple of inches every few years to re-gravel a road.

21.) How frequently do you re-gravel a gravel road?

	Responses	
	(percent)	(count)
We do not do this activity	23.33%	7
≤ 2 years	26.67%	8
3 years	10%	3
5 years	26.67%	8
7 years	3.33%	1
10 years	3.33%	1
12 years	3.33%	1
≥ 15 years	3.33%	1
Totals	100%	30

Re-gravel: Restore structural capacity; improve quality of surfacing gravel; replace lost gravel. Some agencies add a couple of inches every few years to re-gravel a road.

22.) How much does it cost to reshape/crown a mile of gravel road? (materials, labor and equipment)

	Responses	
	(percent)	(count)
We do not do this activity	17.24%	5
≤ \$50	6.90%	2
\$100	10.34%	3
\$150	3.45%	1
\$200	10.34%	3
\$250	6.90%	2
\$300	6.90%	2
\$400	17.24%	5
\$500	10.34%	3
≥ \$600	10.34%	3
Totals	100%	29

Reshape/Crown: Change the cross section to improve drainage; recover material from the foreslope or ditch; blend surface gravel; restore crown; remove surface defects and correct defects in the cross section.

23.) How much does it cost to spot gravel/patch and conduct other annual maintenance on a gravel road? (per mile for materials, labor and equipment)

	Responses	
	(percent)	(count)
We do not do this activity	9.68%	3
≤ \$100	9.68%	3
\$150	3.23%	1
\$200	12.90%	4
\$250	9.68%	3
\$300	9.68%	3
\$400	6.45%	2
\$500	12.90%	4
\$750	12.90%	4
≥ \$1000	12.90%	4
Totals	100%	31

Spot gravel / patching: correct isolated defects in the roadway

24.) What is typically the basis for maintenance activities on your gravel roads?

	Responses	
	(percent)	(count)
On a defined schedule (e.g., every month or twice a year depending on the activity)	3.45%	1
As needed, based on road condition, public comments and/or agency observations	65.52%	19
Combination of a defined schedule and as needed	31.03%	9
Totals	100%	29

25.) How much does it cost to improve the base of a gravel road and overlay with HMA (per mile, material, labor and equipment)

	Responses	
	(percent)	(count)
We do not do this activity	3.45%	1
≤ \$50,000	3.45%	1
\$75,000	10.34%	3
\$100,000	6.90%	2
\$125,000	24.14%	7
\$150,000	20.69%	6
\$175,000	3.45%	1
\$200,000	13.79%	4
\$225,000	6.90%	2
≥ \$250,000	6.90%	2
Totals	100%	29

Summary of Survey Results

Question #	Description	Average	Minimum	Maximum	Mode
4	ADT	204	50	450	100
5	Hourly Worker Salary	\$15	\$12	\$18	\$16
6	Gravel to HMA Road Conversions (miles)	26	10	70	10
7	HMA to Gravel Road Conversions (miles)	23	10	70	10
8	Asphalt Overlay Cost	\$81,833	\$50,000	\$165,000	\$65,000
9	Overlay Thickness (inches)	2	1	3	2
10	Overlay Frequency (years)	14	8	30	15
-	Estimated Overlay Annual Cost	\$6,002	\$2,778	\$15,625	\$4,333
11	Crack Seal Cost	\$2,500	\$1,000	\$5,000	\$1,500
12	Patching/Annual Maintenance Cost	\$616	\$100	\$1,250	\$750
13	Chip Seal Cost	\$14,018	\$2,500	\$25,000	\$15,000
14	Chip Seal Frequency (years)	7	3	11	7
-	Estimated Chip Seal Annual Cost	\$2,218	\$556	\$5,000	\$3,333
16	Stabilize Base of Asphalt Cost	\$28,333	\$5,000	\$60,000	\$15,000
17	Dust Control Cost	\$1,423	\$500	\$4,000	\$500
18	Blading Cost	\$148	\$40	\$300	\$100
19	Re-gravel Cost (Materials Only)	\$4,317	\$250	\$7,500	\$7,500
20	Re-gravel Cost	\$8,208	\$2,000	\$12,000	\$12,000
21	Re-gravel Frequency (years)	5	2	15	5
-	Estimated Re-gravel Annual Cost	\$2,019	\$417	\$5,000	\$2,000
22	Reshaping Cost	\$315	\$50	\$600	\$400
23	Spot Gravel Cost	\$454	\$100	\$1,000	\$200
25	Improve Base of Gravel Road and Overlay with Asphalt	\$149,107	\$50,000	\$250,000	\$125,000

Note: All costs are per mile.

Average values were typically used except for dust control and re-gravel cost, in which case the mode was used.

The mode was used for dust control since some agencies may have considered chip seal as a form of dust control; chip seal is considerably more expensive.

The mode was used for re-gravel cost because the range of possible answers may not have been high enough since the highest category (\$12,000 or more) was the most frequent answer.

FAC 8512 ROAD, UNSURFACED

FY24 SUC: \$0.72 / SY

Source: Inflated from previous FY using ENR labor and material cost indices to measure actual inflation

Original Source: Based upon published studies by USDOT, Kansas State University, State of Maine, State of Washington and City of Milton, GA

FAC 8513 VEHICLE BRIDGE

FY24 SUC: \$31.99 / SY

Source: Inflated from previous FY using ENR labor and material cost indices to measure actual inflation

Original Source: Three studies were used to revise the unit cost:\n\n The "Historical Life Cycle (LC) Costs of Steel and Girder Bridges" report was prepared for the American Iron and Steel Institute and the Short Span Steel Bridge Alliance by Dr. Michael Barker, Professor of Civil Engineering at the University of Wyoming, May 2016, using data for multiple bridges (PennDOT Database), projected to 2014.\n\n A Connecticut DOT life cycle cost study of the Moses Wheeler Bridge provides cost in 2009 dollars.\n\n A Kentucky life cycle cost study (dissertation) of the bridge carrying Hunteartown Road over the Bluegrass Parkway provides a cost estimate from 2015.

The resulting average of these three studies is:

Study	Cost/SF	Cost/SY	Year	Inflation	FY17 SUC
Michael Baker		\$ 3.52	2014	1.070819	3.76607
Connecticut	\$ 2.91	\$ 26.20	2009	1.163282	30.47799
Kentucky	\$ 3.72	\$ 33.50	2015	1.046557	35.05966
				Average	23.10124

Note: The Barker study is based data extracted from the Pennsylvania DOT database.

HISTORICAL LIFE CYCLE COSTS OF STEEL & CONCRETE GIRDER BRIDGES

**Prepared For
American Iron & Steel Institute
Steel Marketing Development Institute
Short Span Steel Bridge Alliance
National Steel Bridge Alliance
American Galvanizers Association**

**Michael G. Barker, PhD, PE
Professor
Civil & Architectural Engineering
University of Wyoming**

May 31, 2016

Executive Summary

Since the early 1990's, the Federal Highway Administration (FHWA) has promoted the consideration of Life Cycle Costs Analysis (LCCA) in the design and engineering of bridges. LCCA determines the "true cost" of bridge alternatives considering the time value of money. The Life Cycle Cost analyses employed in this study uses the Perpetual Present Value Cost (PPVC) of bridge alternatives for an equivalent comparison between the alternatives.

Over the years, the author has worked with state departments of transportations and local county engineers on effective and economical bridge construction. A frequent question that arises during meetings is the difference in Life Cycle Costs between steel and concrete girder bridges. Both the concrete industry and the steel industry site various anecdotal advantage above the other for the Life Cycle Costs over the life of the bridge. There has historically been a healthy competition between material types for new bridge construction. However, there is industry and owner confusion on how the different types of bridges compare on a Life Cycle Cost basis.

This study developed useful owner information on historical Life Cycle Costs for typical steel and concrete state bridges in Pennsylvania. Typical bridges are defined in the study as those with concrete decks supported by steel rolled beams, steel plate girders, precast concrete boxes, or precast concrete beams. PennDOT historical records for bridges built between 1960 and 2010 were used to develop a database for the Life Cycle Cost study. Initial and maintenance costs considered include total project costs (more than just superstructure) as recorded in the PennDOT records. The PennDOT database used for the Life Cycle Cost analyses only includes a subset of the total bridge inventory due to missing cost and date data for a majority of the individual bridges. The database consists of 1186 state bridges out of 6587 (18% of the eligible inventory) built between 1960 and 2010.

The initial costs, Life Cycle Costs, and future costs of the 1186 bridges in the database are examined with respect to variability in bridge type, bridge length, number of spans, and bridge life. The steel bridges in the database are also examined with respect to protective coating systems. Consideration of the specific numbers and any conclusions must be taken in the context that the results represent the bridges that made it into the database, and the database is not as comprehensive as desirable for drawing conclusions. Therefore, interpreting the tables and figures showing comparisons of initial costs, Perpetual Present Value Costs, maintenance and future costs, and bridge life is left to the reader.

A conclusion that can be drawn is that all the types of bridges are fairly competitive in both Initial Costs and Perpetual Present Value Costs. The average initial costs vary from \$174/ft² to \$226/ft² and the average Perpetual Present Value Costs vary between \$218/ft² (Prestressed I Beam) and \$278/ft² (Prestressed Adjacent Box). For bridge life, the lowest average life was 73 years (Prestressed I Beam) and the longest was 82 years (Steel I Beam). The coefficient of variation (standard deviation / mean) of the PPVC was approximately 20%, which is considerably high. With the relatively small differences in the PPVC averages, given the dispersion of the PPVC costs (standard deviation), any of the bridge types may have the least Perpetual Present Value Cost for a given project.

Even though this research was limited to only a subset of PennDOT bridges, the analyses demonstrate the potential benefits of LCC analysis for bridge construction and management. A study of a more comprehensive database of bridges on the initial costs, Life Cycle Costs and future costs of different types of bridges over a diverse set of circumstances would be very useful for bridge owners and managers. With a more comprehensive database, not only would there be a more accurate comparison of bridge types, an accurate comparison of design details, such as jointless decks, rebar coatings, steel protection systems, and other construction details could be completed.

Acknowledgements

This study is a result of the author's discussions with state and county bridge engineers' questions on Life Cycle Costs of bridges. The work is an attempt to give bridge owners Life Cycle Cost data so that they can make informed decisions in their bridge programs.

The author would like to acknowledge financial support from the Steel Marketing Development Institute, the National Steel bridge Alliance, and the American Galvanizers Association.

The professionals of the Pennsylvania Department of Transportation deserve special thanks. PennDOT Bridge Engineer Tom Macioce eagerly agreed to be part of the study, a welcome agreement given the difficulty the author had in securing bridge data. Gathering the necessary historical data was a daunting task. The engineers at PennDOT, and especially Civil Engineer Katherine Schopman, devoted many hours mining and verifying historical records so the author could develop an accurate bridge database for the Life Cycle Cost study.

1 - Introduction

1.1 Background

Since the early 1990's, the Federal Highway Administration (FHWA) has promoted the consideration of Life Cycle Costs Analysis (LCCA) in the design and engineering of bridges. LCCA is an economic method to compare design alternatives over the entire life of the structure. The method considers not only initial costs, but also the future costs, their timing, and the service life of the bridge. LCCA determines the "true cost" of bridge alternatives, considering the time value of money, for an equivalent monetary comparison.

For instance, if one alternative has a high initial cost and no future costs, LCCA can compare this to an alternative that has a lower initial cost and a major costly rehabilitation at 40 years. LCCA methods discount future costs to equivalent today costs for a direct economic comparison.

There has historically been a healthy competition between material types for new bridge construction. The most prevalent material types being used for typical bridges (those considered in this study) include steel rolled beams or plate girders and precast concrete box or beam superstructures with concrete decks. However, there is industry and owner confusion on how the different types of bridges compare on a Life Cycle Cost basis.

Both the concrete industry and the steel industry site various anecdotal advantage above the other for the Life Cycle Costs over the life of the bridge, and both are correct. Yes, given the competition between steel and concrete, different characteristics across the country's regions, diverse design and construction techniques employed by owners, varied maintenance program efforts, etc, sometimes steel may show an advantage and sometimes concrete may show an advantage. This is especially true for a bridge at an individual site, in a specific region, and with particular environmental characteristics.

Over the years, the author has worked with state departments of transportation and local county engineers on effective and economical bridge construction. A frequent question that arises during meetings is the difference in Life Cycle Costs between steel and concrete girder bridges. The discussion entails anecdotal information from the concrete industry and the steel industry. The concrete industry, using their projected maintenance and rehabilitation assumptions, can show that a precast beam bridge with integral abutments has lower Life Cycle Costs than a painted steel beam bridge with end deck joints in a northern state that uses road salt. The steel industry can show, with their assumptions, that a galvanized steel bridge with a jointless deck has a lower Life Cycle Cost in that same environment. Although the discussions are helpful, the issue remains unsettled. Owners want to consider LCC in bridge design decisions, but many are uncomfortable with this anecdotal discussion.

1.2 Objectives

The objective of this study was to develop useful owner information on historical Life Cycle Costs for typical bridges across the country. A database of bridges across the country was to be developed for the

Life Cycle Cost analyses. For each bridge in the database, the LCC analysis requires: the year built and the initial cost; dates and costs for repairs, maintenance and rehabilitations, and the reasons for the work; and the end-of-service life that may be actual or estimated. The intent was to develop historical Life Cycle Cost data for bridges owned by state departments of transportation (state) and those owned by counties (local). There is a significant difference between state and local bridges in both initial costs and maintenance costs.

The typical bridges in the study are simple- and multi-span “regular type” rolled steel, plate girder, precast I-beam, and precast box beam bridges. The years of inclusion were set to bridges built between 1960 (modern era for prestressed concrete and steel construction techniques) and 2010. Different geographical regions were to be included to examine wet and dry, cold and warm, and various environmental condition climates. For the steel bridges, the plan was to examine the influence of painted, weathering steel and galvanized protection systems. It was also desired to study the impact of other characteristics that would have an influence such as type of construction, deck material and joint details, deck rebar coatings, traffic volume and original design loads.

As stated above, the objective of this study was to develop useful owner information on historical Life Cycle Costs for typical state owned and local owned bridges across the country. The author worked with several select states and various select counties to develop a comprehensive database of bridges. However, the effort was, for the most part, unsuccessful. The data collection requirement of knowing each bridge’s entire life of initial costs and future costs and dates was problematic for the owners due to the high amount of time and resources required to collect the data. Of the states contacted, only the Pennsylvania Department of Transportation had the necessary complete data for a subset of their bridge inventory. At the local level, although some counties had complete data for a few of their bridges, the number of bridges was small and using only a few bridges from a wide range of counties would not result in a consistent study, nor would the result be representative of county bridges.

Therefore, although the study was intended to examine state and local bridges across the country, the study was limited to state owned bridges in Pennsylvania. Also, the PennDOT database used for the Life Cycle Cost analyses only includes a subset of the total bridge inventory due to missing data for the majority of the individual bridges. The final Life Cycle Cost database consists of 1186 state bridges out of 6587 built between 1960 and 2010. This means the database represents 18% of the inventory. The report describes the criteria applied to development of the PennDOT bridge database that is used for the Life Cycle Cost analyses.

1.3 Summary of Results

The report presents the Life Cycle Cost analyses for the bridge database. The initial costs, Life Cycle Costs, and future costs of the 1186 bridges in the database are examined with respect to variability in bridge type, bridge length, number of spans, and bridge life. The steel bridges in the database are also examined with respect to protective coating systems.

The database must be considered only a snapshot of the total PennDOT bridge inventory. The criteria removed 82% of the eligible bridges built between 1960 and 2010, mostly due to incomplete initial cost,

maintenance records and external contract records. If these records were complete, the database would be much larger and the resulting Life Cycle Cost analyses would more accurately represent the PennDOT bridge inventory. Consideration of the specific numbers and any conclusions must be taken in the context that the results represent the bridges that made it into the database, and the database is not as comprehensive as one would like.

However, the study shows that all the types of steel and concrete bridges are fairly competitive in both average Initial Costs and average Life Cycle Costs. With the dispersion of costs (standard deviation) any of the bridge types may have the least Life Cycle Cost for a given project.

1.4 Benefits and Future Work

This historical Life Cycle Cost study was limited to state bridges in Pennsylvania. Even though this research was limited to only a subset of PennDOT bridges, the analyses demonstrate the potential benefits of LCC analysis for bridge construction and management. A study of a more comprehensive database of bridges on the initial costs, Life Cycle Costs and future costs of different types of bridges over a diverse set of circumstances would be very useful for bridge owners and managers. Although extending this work would take considerable effort, other states and counties could be contacted in an effort to obtain a comprehensive bridge database.

2 - Life Cycle Costs

2.1 Introduction

Life Cycle Costs (LCC) analysis is an economic tool that allows comparison of competing project alternatives. For instance, does spending additional funds now that will reduce future maintenance costs make economic sense? A difficulty in comparing alternatives, even when represented in the same terms such as dollars, is that when the dollars are spent has an influence on equivalency due to inflation and discounting.

2.2 Time Value of Money and Discount Rate

Expenditures that occur at various times in the future will have values that depend on the time of the expenditure. A dollar in 1990 has more purchasing power than a dollar in 2014. This is called inflation. Expenditures that occur at various times in the future also must consider the opportunity value of time. Delayed expenditures (future) have the opportunity for economic return (for instance interest) that could be earned on the delayed monies. A dollar today is worth significantly more than a dollar in ten years because the dollar today could be invested and earn interest. This is called discounting. An effective Discount Rate (DR) that considers the effect of inflation (removes inflation) can be determined so that initial and future expenditures can be used to discount cash flow (time value of money) using constant (today) dollars. The DR (effective) will take care of the inflation (due to using constant today dollars) and the discounting for value of time (opportunity for economic return). The present value cost of a future cost (in today's constant dollars) occurring at year N with an effective discount rate of DR is:

$$\text{Present Value Cost} = \text{Future Cost}(1 + DR)^{-N}$$

For instance, if a concrete deck repair would cost \$1000 today, but it occurs 20 years in the future, at a discount rate of 2.3% the present value cost of that repair in the future is:

$$\text{Present Value Cost} = \$1000(1 + 0.023)^{-20} = \$634.58$$

With inflation, the actual cost in 20 years will exceed the constant dollar today cost of \$1000, but the \$634.58 invested today will grow over the 20 years at an interest rate (greater than the discount rate) that will be able to pay for the inflated actual cost at year 20. The effective Discount Rate allows Time Value of Money analysis using today's costs (constant dollars) and removes the need to consider inflation and discounting separately.

Discount rate has various meanings for different industries such as banking, the Federal Reserve, pensions and insurance companies. For LCC analysis, the discount rate represents the effective interest rate, accounting for inflation, used to discount cash flow (time value of money). The discount rate used in this work is taken from the Federal Office of Management and Budget Circular No. A-94, *Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs*, Appendix C.

The OMB Circular No A-94 defines nominal and real discount rates for current and past years. The real discount rate is the effective discount rate that accounts for inflation. Table 1 presents historical real discount rates based on interest rates on treasury notes and bonds of specified maturities.

Table 1: OMB Circular A-94 Historical Real Discount Rates

Year	Treasury Notes and Bonds Maturity					
	3 Year	5 Year	7 Year	10 Year	20 Year	30 Year
1979	2.8	3.4	4.1	4.6	#N/A	5.4
1980	2.1	2.4	2.9	3.3	#N/A	3.7
1981	3.6	3.9	4.3	4.4	#N/A	4.8

1989	4.1	4.8	5.3	5.8	#N/A	6.1
1990	3.2	3.6	3.9	4.2	#N/A	4.6
1991	3.2	3.5	3.7	3.9	#N/A	4.2
1992	2.7	3.1	3.3	3.6	#N/A	3.8
1993	3.1	3.6	3.9	4.3	#N/A	4.5
1994	2.1	2.3	2.5	2.7	#N/A	2.8
1995	4.2	4.5	4.6	4.8	#N/A	4.9
1996	2.6	2.7	2.8	2.8	#N/A	3
1997	3.2	3.3	3.4	3.5	#N/A	3.6
1998	3.4	3.5	3.5	3.6	#N/A	3.8
1999	2.6	2.7	2.7	2.7	#N/A	2.9
2000	3.8	3.9	4	4	#N/A	4.2
2001	3.2	3.2	3.2	3.2	#N/A	3.2
2002	2.1	2.8	3	3.1	#N/A	3.9
2003	1.6	1.9	2.2	2.5	#N/A	3.2
2004	1.6	2.1	2.4	2.8	3.4	3.5
2005	1.7	2	2.3	2.5	3	3.1
2006	2.5	2.6	2.7	2.8	3	3
2007	2.5	2.6	2.7	2.8	3	3
2008	2.1	2.3	2.4	2.6	2.8	2.8
2009	0.9	1.6	1.9	2.4	2.9	2.7
2010	0.9	1.6	1.9	2.2	2.7	2.7
2011	0	0.4	0.8	1.3	2.1	2.3
2012	0	0.4	0.7	1.1	1.7	2
2013	-1.4	-0.8	-0.4	0.1	0.8	1.1
2014	-0.7	0	0.5	1	1.6	1.9
2015	0.1	0.4	0.7	0.9	1.2	1.4

Table 1 shows that the discount rate was fairly high in the 1980s, lower in the 1990s, and considerably low in recent years. This work uses (somewhat arbitrarily) the discount rates from 2011 in the Life Cycle Cost analyses. The thought is that 2011 is fairly recent and the very recent discount rates (2015) will tend to increase as the economy improves. It is acknowledged that this selection is subjective, but realizing that as long as the discount rate is consistent across the bridge database, the difference between small changes of discount rate would be minimal. Where the value of the discount rate would

have a significant impact would be where one bridge has a higher initial cost and lower future costs compared to a bridge with lower initial cost and higher future costs. These situations are not prevalent in the final LCC bridge database. This work also assumes a long term investment outlook and uses the 30 year maturity level. Therefore, from Table 1, the discount rate used for the Life Cycle Cost analyses in this work is 2.3%.

2.3 Life Cycle Cost Analysis

Life cycle cost analysis represents the “total” cost of a bridge over the life of the bridge and results in an equivalent life cycle cost amount. The cost amount is typically represented by either an Equivalent Uniform Annual Cost (EUAC) or a Present Value Cost (PCV). The EUAC is the life cycle cost amount annualized over the life of the bridge. The PVC represents a present amount that, at a given discount rate (DR), will be enough to pay the initial cost of the bridge and all future costs that are associated with the bridge over its life. This study uses the Present Value Cost in the Life Cycle Cost Analyses.

The data required for the LCC analysis are the initial cost and any future costs and their time frames associated with the bridge over the life of the bridge. Figure 1 demonstrates a LCC analysis for an academic bridge example that has an 80 year life. It assumes future maintenance and rehabilitation costs and the timing of those costs as shown in Figure 1.

For an Initial Cost (IC)

Assume:

Deck = 5% IC (every 20 years)

Rehab = 20% IC (every 40 years)

Demo = 10% IC

Salvage = -3% IC

Main/Ins = 0.1% IC per year

Figure 1: Life Cycle Cost Analysis Example Bridge

The initial cost of the bridge is IC. Deck repair is assumed to cost 5% of the initial cost and to occur every 20 years (except for a major rehabilitation year). The major rehabilitation occurs at 40 years and costs 20% of the initial cost. Demolishing the bridge at 80 years costs 10% of the initial, but there is salvage materials that return 3% of the initial cost (negative is to make the salvage a benefit). Yearly regular maintenance and inspection costs are assumed to be 0.1% of the initial cost. These cost numbers are only used here to demonstrate the LCC analysis and do not necessarily represent a real bridge example. The time value of money equations can be found in any economics book.

The present value cost for all costs associated with this example bridge is:

$$PVC = IC[1 + 0.05(1 + 0.023)^{-20} + 0.05(1 + 0.023)^{-60} + 0.20(1 + 0.023)^{-40} + 0.10(1 + 0.023)^{-80} - 0.03(1 + 0.023)^{-80} + 0.001 \frac{(1 + 0.023)^{-80} - 1}{0.023(1 + 0.023)^{-80}}] = 1.17IC$$

The idea is that if the owner invested 1.17 times the initial cost now, the bridge could be built and all future costs would be covered with the extra 17% of the initial cost for a bridge lasting 80 years.

However, when comparing bridges that have different bridge lives, a present value cost by itself is not sufficient. For instance, if this bridge lasts 80 years with a $PVC = 1.17IC$, it cannot be directly compared to the present value cost of a bridge that lasts only 60 years. Therefore, a common method to directly compare bridges with different life spans is to use either Equivalent Uniform Annual Costs (EUAC) or a Perpetual Present Value Cost (PPVC). Both are equivalent in terms of use for alternative comparisons and the PPVC is used in this work.

The Perpetual Present Value Cost (PPVC) is determined by assuming that at the end of the bridge's life, it is replaced by an identical bridge into perpetuity. This is demonstrated in Figure 2.

Figure 2: Perpetual Life Cycle Cost Analysis Example Bridge

The PPVC for all costs associated with this bridge into perpetuity is:

$$PPVC = PVC \left[\frac{(1 + 0.023)^{80}}{(1 + 0.023)^{80} - 1} \right] = 1.17IC[1.19] = 1.40IC$$

The idea is that if the owner invested 1.40 times the initial cost now, the bridge could be built and all future costs, including replacing the bridge every 80 years, would be covered with the extra 40% of the initial cost for a bridge lasting into perpetuity. The benefit of using the PPVC is that it allows direct comparisons between any set of bridges.

2.4 Sensitivity of PPVC

The Perpetual Present Value Cost will be sensitive to several variables in the Life Cycle Cost analysis. The primary variables are:

Bridge Life

Future Costs

Magnitude of Future Costs

Timing of Future Costs

Discount Rate

Within Steel Bridges – Coating Systems (Weathering Steel , Galvanized & Painted)

The next sections demonstrate the sensitivity using the example bridge from above. The Life Cycle Cost analysis of the PennDOT final LCC bridge database will attempt to examine these variables.

2.4.1 Bridge Life

Assuming the same generic future deck (5%IC @ 20 years), rehabilitation (20%IC @ 40 years), maintenance and inspection (0.1%IC yearly), demolition (10%IC) and salvage costs (-3%IC), Figure 3 shows the PPVC for bridges with a bridge life from 40 to 120 years.

Figure 3: Perpetual Present Value Cost vs. bridge Life

It is clear that bridge life has a large impact on the PPVC. A bridge that lasts 80 years (previous example) has a PPVC of 1.40IC. But, if that bridge only lasts 40 years due to poor performance, the PPVC is over 1.80IC, a significantly large increase in Life Cycle Costs. However, if the bridge life can be extended to 120 years, the PPVC is lower than 1.30IC. This type of analysis can be used to analyze bridge preservation efforts.

2.4.2 Magnitude of Future Costs

To examine the sensitivity to the magnitude of future costs, Figure 4 compares the PPVC with 100% of all future costs considered to the PPVC where the future costs are assigned to be only 90% of the assumed values. The difference is rather small meaning that the PPVC is not all that sensitive to changes in the cost of the future cost.

Figure 4: Perpetual Present Value Cost vs. Amount of Future Cost

2.4.3 Timing of Future Costs

Bridge preservation efforts and regular simple maintenance can extend bridge life and delay major rehabilitations and significant required maintenance. Life Cycle Cost analysis can determine the impact. Figure 5 demonstrates the effect for the example bridge.

Figure 5: Perpetual Present Value Cost vs. Delayed Future Costs

If deck repair and major rehabilitation is delayed 50% (deck at 30 years vs. 20 and Rehab at 60 years vs. 40), the PPVC is significantly lowered. Of course at 40 years there is little difference since there is little future cost.

2.4.4 Discount Rate

The discount rate used for the PennDOT database is 2.3%. The decision to use 2.3% was explained earlier. However, there would be a direct impact on PPVC if the rate varied. Figure 6 illustrates a comparison of the PPVC between a discount rate of 2.3% and a rate of 5%. The 5% rate represents a similar set of circumstances used to select the 2.3% rate, except for the year 1995. In Figure 6, only the future costs (deck repair, rehabilitation, demolition and salvage) are considered to better show the comparison since initial costs would not change.

Figure 6: Perpetual Present Value Cost vs. Discount rate

The present value costs for the future maintenance significantly decrease with the higher discount rate. Using an accurate discount rate would be important for examining maintenance and rehabilitation alternatives within a bridge structure. However, when comparing bridges in a database, as long as the bridge histories are somewhat similar, the difference would be consistent over the bridge database. Where the value of the discount rate would have a significant impact in a database comparison analysis would be when one bridge has a higher initial cost and lower future costs compared to a bridge with lower initial cost and higher future costs. These situations are not prevalent in the final LCC bridge database.

2.4.5 Steel Bridge Coating Systems

Coating systems for steel bridges is an important maintenance and preservation issue. Using weathering steel, galvanizing or painting are required to protect the steel from corrosion. Each method of protection has initial costs and possibly required maintenance. Life Cycle Cost analysis can be used to examine the overall effectiveness of the different protection systems. For instance, galvanizing may have a higher initial cost, but if there is little to no future maintenance required, galvanizing may have a

lower Life Cycle Cost than a lower initial cost system like painting that requires re-painting costs in the future. For the example bridge, Figure 7 compares the cost of future painting costs to the previous PPVC bridge. It is assumed that re-painting the bridge costs 7% of the initial cost and that it occurs every 20 years, except during the major rehabilitation year. This is not a true comparison of painted vs. galvanized or weathering steel since no difference in the initial cost was considered. However, it does demonstrate the impact from having to re-paint the bridge every 20 years.

Figure 7: Perpetual Present Value Painted vs. Non-Painted

For a bridge that has an 80 year life, the PPVC for a non-painted bridge was 1.40IC. With a re-painting model of a 7%IC cost every 20 years, the PPVC increases to 1.47IC, a 5% increase. Using Life Cycle Cost analysis, one can examine what additional initial cost would be “worth” not having to re-paint the bridge.

2.5 Summary of Life Cycle Costs

The Life Cycle Cost procedures developed in this chapter will be applied to the bridge database developed in Chapter 3. An example bridge was used here to study the sensitivity of the Perpetual Present Value Cost to variables that may have a significant impact on the PPVC. It is noted here that the example was not very realistic in terms of maintenance and rehabilitation that actually occurs on the nation’s bridges. However, it develops considerations and concepts that will be applied to the PennDOT bridge database. The Life Cycle Cost analyses in Chapter 4 will examine different bridge types for the variables discussed in the sensitivity study as much as is possible for the bridge database developed in Chapter 3.

3 - The PennDOT Database

3.1 PennDOT Database Criteria

The database is developed from files supplied by the PennDOT Bridge Division. Inventory files, PennDOT performed department maintenance files, and external contractor maintenance and rehabilitation files were combined to develop the final database to use in the Life Cycle Cost study. Initial and maintenance costs considered include total project costs as represented in PennDOT records. Therefore, non-superstructure costs are included even though the study pertains to the superstructure only. It is assumed that the non-superstructure costs even out over the large database so the relative comparisons between bridge types is not affected. The following describes the development of the final LCC database. The final LCC database used for this Life Cycle Cost study was limited to the following criteria:

- Modern typical bridge structures

 - Precast I-Beam, Box Adjacent, and Box Spread bridges

 - Steel Rolled Shape and Welded Plate Girder bridges

- Bridges built between 1960 and 2010

- Bridges with complete and accurate department maintenance records

 - Known dates

 - Known costs

 - Consider any maintenance cost that is equal to or greater than $\$0.25/\text{ft}^2$

- Bridges with known initial costs

- Bridges with complete and accurate external contractor maintenance and rehabilitation records

 - Known dates

 - Known costs

- Initial cost limitation to bridges with initial cost less than $\$500/\text{ft}^2$ and greater than $\$100/\text{ft}^2$

For a bridge to be included in the final LCC database, all of the above criteria must be satisfied. If any one of the criterion are not, the bridge is not included in the LCC study. Although care was exercised in developing the database, errors may be present due to inaccurate or missing data in the PennDOT inventory and maintenance files. Individual bridge information was not reviewed by PennDOT state or district personnel for accuracy. It is assumed that any errors cancel out over the database so relative comparisons between bridge types is not affected. The following demonstrates the application of the criteria to develop the final LCC database.

3.2 Initial Database

The PennDOT inventory database includes 25,403 structures of which there are 8466 classified as Precast Box Beam – Spread, Precast Box Beam – Adjacent, Precast I Beam, Steel I Beam – Rolled Shape, and Steel I Welded Girder – Plate Girder bridges. All other types of bridge structures were not considered in this work. The Life Cycle Cost study examined the modern era of bridge construction defined as bridges built from 1960 to the present. The study is also limited to bridges built up to 2010. Table 2 shows the total number of bridges in each category in the PennDOT inventory file and also the number of bridges in each category built between 1960 and 2010. This initial database was the starting point in the process to develop the final database for the LCC study.

Table 2: PennDOT Bridge Inventory Initial Database

Bridge Type	Total Number of Bridges	Number of Bridges 1960 - 2010
Steel I Beam	1347	550
Steel I Girder	1112	1017
P/S Box - Adjacent	1814	1440
P/S Box - Spread	2648	2196
P/S I Beam	1545	1384
Total	8466	6587

3.2.1 Department Performed Maintenance Criterion

The initial bridge database was compared to PennDOT’s department performed maintenance files. The criteria are that the maintenance performed must have valid dates and costs for all maintenance performed and that the maintenance costs are equal to or greater than \$0.25/ft². This removes a great portion of bridges in each category since there are many examples of maintenance that was performed that did not have accurate records. For example, a bridge may have 3 valid maintenance records, but one that did not have a valid date. This bridge would not be included in the final LCC database. One caveat to the acceptance is that any maintenance performed in 2015 was considered a valid date, but the date of that maintenance event was defined to be December of 2014. This is because the LCC study is based on the year 2014 (due to the Construction Cost Indices used) and any error in the time value of money conversions would be miniscule. There are also many bridges that did not have any department maintenance that are included in the intermediate database. The remaining bridges in this intermediate database are shown in Table 3.

Table 3: Intermediate Database with Valid Department Maintenance Records

Bridge Type	Number of Bridges with Valid Maintenance	Number of Bridges with No Maintenance	Intermediate Database Totals
Steel I Beam	99	362	461
Steel I Girder	131	574	705
P/S Box - Adjacent	151	1177	1328
P/S Box - Spread	381	1684	2065
P/S I Beam	204	937	1141
Total	966	4734	5700

There were 1853 bridges that had documented department maintenance that exceeded \$0.25/ft² performed. Of those, 966 had maintenance records that had known dates and known costs associated with the maintenance efforts. This means that 887 bridges were removed from the database due to incomplete department maintenance information. These are bridges that would certainly have an impact on the Life Cycle Cost analysis averages. Lower percentages of bridges with valid maintenance records would tend to decrease LCC averages over the database. However, the impact on the averages will be relatively small since future discounted maintenance costs are small compared to initial costs as will be demonstrated in the LCC analyses. Table 4 illustrates the number of bridges with documented department maintenance and those that had valid maintenance information.

Table 4: Department Maintenance Bridge Database Numbers

Bridge Type	Number of Bridges with Maintenance	Number of Bridges with Valid Maintenance	Percentage of Bridges with Valid Maintenance
Steel I Beam	188	99	52.7%
Steel I Girder	443	131	29.6%
P/S Box - Adjacent	263	151	57.4%
P/S Box - Spread	512	381	74.41%
P/S I Beam	447	204	45.6%
Total	1853	966	52.1%

There were also 4734 bridges that had no documented department maintenance that exceeded \$0.25/ft². This results in 83% (4734/5700) of the bridge database will be bridges where only the initial cost will be used in the LCC analyses. Higher percentages of no maintenance bridges will tend to lower Life Cycle Cost averages across the database. However, the impact on the averages will be relatively small since future discounted maintenance costs are small compared to initial costs as will be demonstrated in the LCC analyses. Table 5 presents the number of bridges with no documented department maintenance and the percentage of the total intermediate database.

Table 5: No Department Maintenance Bridge Database Numbers

Bridge Type	Bridges in Intermediate Database	Number of Bridges with No Maintenance	Percentage of No Maintenance Bridges in Database
Steel I Beam	461	362	78.5%
Steel I Girder	705	574	81.4%
P/S Box - Adjacent	1328	1177	88.6%
P/S Box - Spread	2065	1684	81.6%
P/S I Beam	1141	937	82.1%
Total	5700	4734	83.1%

The bridges considered in the database were built between 1960 and 2010. The department maintenance performed considered was any maintenance exceeding \$0.25/ft² up to the year 2014 (with a few in early 2015 back-dated to end of 2014). Any maintenance that may be performed on a bridge in the future, while a certainty, is not considered in the LCC analyses. This means that each bridge is assumed to have no additional future maintenance until its end-of-life. The impact of this will be a lowering of LCC cost averages across the database. However, each bridge type would have a similar impact as long as the average year built is similar (newer bridges would tend to have no early maintenance). It will be shown in the final LCC database that the average year built is similar for the different types of bridges.

3.2.2 Initial Cost Criterion

PennDOT records were searched to determine if the initial cost for the bridges in this intermediate database were available. This criterion also removed additional bridges from the database since there were many examples where initial costs could not be determined. Table 6 presents the number of bridges in the intermediate database that did have initial cost records that results in a new intermediate database.

Table 6: Intermediate Database with Valid initial Costs

Bridge Type	Number of Bridges with Valid Maintenance and Initial Costs	Number of Bridges with No Maintenance and Initial Costs	Number of Bridges with Valid Maintenance and Initial Costs
Steel I Beam	27	139	166
Steel I Girder	89	367	456
P/S Box - Adjacent	56	431	487
P/S Box - Spread	151	617	768
P/S I Beam	101	447	548
Total	424	2001	2425

The intermediate database has 5700 bridges with valid department maintenance records or bridges with no department maintenance. Of these 5700 bridges, the initial bridge cost for 2425 (42.5%) could be determined. As would be expected, many of the older bridges had incomplete records and were removed from the database. The removed bridges included a representative number from each bridge type. Therefore, the average year built was not affected and the impact of the reduction should be similar for all bridge types.

3.2.3 External Contract Maintenance and Rehabilitation Criterion

In terms of the Life Cycle Cost Analyses, there is no difference between department performed maintenance and external contract maintenance and rehabilitation. In the PennDOT records, the two types of efforts are located in different databases. The development of the final LCC database applied them separately as shown herein. To be included in the final LCC database, the criteria is that the external contract records must have valid dates and costs. The intermediate database that includes bridges with valid or no department maintenance and valid initial costs includes 2425 bridges (Table 6). There were 603 instances of bridges in the intermediate database that had external contracts performed. Of these 603, there were only 26 that had known dates and known costs associated with the work. This means that 565 of the 2425 had to be removed from the database resulting in a final eligible database of 1860 bridges. Table 7 presents the database number of bridges for each category.

Table 7: Intermediate Database that Meets External Contract Criteria

Bridge Type	Number of Bridges with Valid Maintenance and Initial Costs	Number of Bridges Removed due to Missing External Contract Information	Number of Bridges with Valid Maintenance, Initial Costs, and Contracts
Steel I Beam	166	81	85
Steel I Girder	456	192	264
P/S Box - Adjacent	487	63	424
P/S Box - Spread	768	149	619
P/S I Beam	548	80	468
Total	2425	565	1860

The impact of the removal of bridges with documented contracts, but not valid dates and costs, would be similar to the impact from bridges with invalid department maintenance. Also, the same rule that any future contracts that may be performed on a bridge is not considered. With department maintenance, as discussed above, the discounted future costs are usually small compared to the initial costs. For external contracts that involve major rehabilitation, this is not as prevalent and the discounted future rehabilitation costs may be significant. This would result in the average Life Cycle Costs would increase since many of these bridges have been removed from the database. However, there is no manner to predict major rehabilitation dates or costs for the database bridges. Therefore, it is assumed that the different types of bridges would be impacted similarly.

3.2.4 Initial Cost Limitation Criterion

There are bridges built that have unrealistic initial costs due to project specific characteristics. A bridge may have unreasonably high costs due to extremely complicated site characteristics or lower than normal costs due to existing abutments or other atypical beneficial characteristics. To consider typical bridges of the different types, it was decided to remove bridges from the database that had initial costs exceeding \$500/ft² and those with costs less than \$100/ft². The limits were selected in consultation with the PennDOT Bridge Engineer where the remaining bridges were considered “typical” in his estimation. The criteria removed 155 bridges from the database

3.3 Final LCC Bridge Database

Table 8 presents the final LCC database that will be used for the Life Cycle Cost analyses and the percentage compared to the total number of bridges built from 1960 to 2010 from Table 2.

Table 8: Final LCC Database that Meets All Criteria

Bridge Type	Number of Bridges that Meet All criteria	Percentage of 1960 – 2010 database
Steel I Beam	82	14.9%
Steel I Girder	230	22.6%
P/S Box - Adjacent	400	27.8%
P/S Box - Spread	581	26.5%
P/S I Beam	412	29.8%
Total	1705	25.9%

There were 6587 Precast Box Beam – Spread, Precast Box Beam – Adjacent, Precast I Beam, Steel I Beam – Rolled Shape, and Steel I Welded Girder – Plate Girder eligible bridges identified as being built between 1960 and 2010. Of those, 1705 were found to meet the criteria for the final LCC database. This represents 25.9% of the eligible bridges, a decent percentage of the total. However, the database must be considered only a snapshot of the total PennDOT bridge inventory for the bridge types. The criteria removed nearly 75% of the eligible bridges built between 1960 and 2010, mostly due to incomplete initial cost, maintenance records and external contract records. If these records were complete, the database would be much larger and the resulting Life Cycle Cost analyses would more accurately represent the PennDOT bridge inventory.

3.4 End Of Life Prediction

In the Life Cycle Cost Analyses, the end of life of the bridge (when the bridge needs replacement) defines the life cycle of the bridge. Since the bridges in the final LCC database are all currently in service, it was necessary to estimate an end of life date for each bridge. This was accomplished through the use of average deterioration rates based on the Condition Ratings of the superstructure. This study is interested in the Life Cycle Costs of the superstructure only, so the condition ratings of the deck and substructure were not considered.

3.4.1 Deterioration Rates

To model the deterioration rate, it was assumed that the condition rating decreased linearly over time and the bridge is assumed to be replaced when the condition rating reached 3.0. Also it is assumed that the condition rating is 9.0 when the structure was built. Thus, for a given bridge in the year 2014, the deterioration rate is:

$$\text{Deterioration Rate} = \frac{(2014 \text{ Condition Rating}) - 9}{2014 - (\text{Year Built})}$$

This has many drawbacks such as deterioration rates are not necessarily linear, rehabilitations tend to raise condition ratings, there is no consideration of average daily traffic, and preservation (maintenance) efforts are not represented.

All 6587 of the bridges built between 1960 and 2010 were used to determine the average deterioration rates for the different types of bridges. Table 9 presents the average deterioration rates and the coefficient of variation of the data within each bridge type.

Table 9: Average Deterioration Rates

Bridge Type	Number of Bridges 1960 - 2010	Deterioration Rate (Condition Rating Loss/Year)	Coefficient of Variation (Mean/St. Deviation)
Steel I Beam	550	-0.07114	54.7%
Steel I Girder	1017	-0.08144	57.4%
P/S Box - Adjacent	1440	-0.08125	50.9%
P/S Box - Spread	2196	-0.07988	70.9%
P/S I Beam	1384	-0.08383	63.3%

It is clear that the variation of the deterioration rate is very high. This is somewhat expected given the variation of bridge characteristics and environments. Other models were considered for deterioration rates. PennDOT assumes certain remaining life based on a non-linear deterioration rate and a Business Plan Network. These were considered for this study, but were found to be difficult to apply and draw conclusions given the limited database of bridges. However, a side-study (not shown here) showed that the differences were small for the averages in Table 9 and the PennDOT method for the bridges in a Business Plan Network of 1. Therefore, given little alternative, the average deterioration rates in Table 9 were used to estimate the remaining life of each bridge in the final LCC database.

3.4.2 Remaining Life and Bridge Life

To estimate the remaining life for each bridge, it is assumed that the bridge will be replaced when the superstructure condition rating reaches 3.0 for the deterioration rates from Table 9:

$$\text{Remaining Life} = \frac{3 - (2014 \text{ Condition Rating})}{(\text{Average Deterioration Rate})}$$

The bridge life becomes:

$$\text{Bridge Life} = 2014 - (\text{Year Built}) + \text{Remaining Life}$$

Table 10 presents the average year built and the average bridge life for the different bridge types in the final LCC database.

Table 10: Final LCC Database that Meets All Criteria

Bridge Type	Number of Bridges in Final LCC Database	Average Year Built	Average Bridge Life (years)
Steel I Beam	82	1981	81.3
Steel I Girder	230	1977	79.2
P/S Box - Adjacent	400	1985	74.0
P/S Box - Spread	581	1984	79.9
P/S I Beam	412	1984	74.5

3.4.3 End of Life Year

The life cycle starts at the year the bridge is built and goes through the year it is replaced (end of life year). The Life Cycle Cost Analyses for each bridge in the final LCC database requires discounting future costs to current value. This means that the year for the bridge replacement (end of life) is necessary for the analyses. Given the remaining life, the end of life year becomes:

$$\text{End of Life Year} = 2014 + \text{Remaining Life}$$

3.5 Summary

Table 11 presents a summary of the final LCC bridge database to be used in Life Cycle Costs studies in the next chapter.

Table 11: Final LCC Bridge Database Summary

Bridge Type	Number of Bridges in Final LCC Database	Percentage of 1960 – 2010 database	Average Year Built	Average Bridge Life (years)
Steel I Beam	82	14.9%	1981	81.3
Steel I Girder	230	22.6%	1977	79.2
P/S Box - Adjacent	400	27.8%	1985	74.0
P/S Box - Spread	581	26.5%	1984	79.9
P/S I Beam	412	29.8%	1984	74.5
Total	1705	25.9%		

Appendix A lists the bridges in the database used for the Life Cycle Cost Analyses. Not all of the 1705 bridges in Table 11 were included in the LCC database as explained in the next section. In the appendix,

there are three tables for each type of bridge type. The first lists the general information for each bridge. For the steel bridges, the first table also lists the rebar, geometry, and material characteristics since this study examined variations within steel bridge types. The second table lists the initial cost for the bridge, maintenance costs, year from year built, and type of maintenance, and external contract work. All costs are reduced to dollars/ft² of surface deck area. The monetary values are all in constant 2014 dollars as will be explained in the next chapter. The third table presents the Life Cycle Cost results for each bridge. It presents the Perpetual Life Cycle costs, initial costs, maintenance plus external contract costs, along with the basic bridge characteristics. The third table also presents the averages and standard deviations for the bridge data.

4 - PennDOT Database Life Cycle Cost Analyses

4.1 Database Life Cycle Costs

The final LCC bridge database is analyzed for Life Cycle Costs according to the procedures previously demonstrated in Chapter 2. However, the Chapter 2 example was generic with all costs associated with the bridge known. The bridge database, of course, is missing some of the variables used in the example. For instance, there was no data on demolition costs or salvage costs. Also, there is no attempt to add routine maintenance and inspection costs. The database includes the initial cost for the structure, valid maintenance costs, and valid external contract costs. These costs are listed in the second table in Appendix A for each bridge type in constant 2014 dollars. The Life Cycle Cost analyses conducted in this study use constant 2014 dollars.

4.2 Constant 2014 Dollars

The database presented in Appendix A was developed from the criteria previously discussed. The valid initial costs, maintenance costs and external contract costs collected were actual dollars spent at the time of the cost. Therefore, they must be inflated to an equivalent amount in 2014. The dollars at the time expended are transformed into constant 2014 dollars using the Construction Cost Indices (CCI) provided by Engineering News Record publications. Given an expenditure in a past year 19XX, the equivalent 2014 dollars can be determined by:

$$2014 \text{ Dollars} = \frac{CCI \ 2014}{CCI \ 19XX} 19XX \text{ Dollars}$$

Table 12 Shows the Historical Construction Cost Indices from 1960 to 2014.

As an example, if a bridge's initial cost is \$330,000 and it is built in 1994, the equivalent 2014 initial cost for the bridge is:

$$2014 \text{ Bridge Initial Cost} = \frac{9806}{5408} \$330,000 = 1.813(330,000) = \$598,370$$

In terms of inflation, this means a bridge built in 2014 costs 81.3% more than a bridge built in 1994.

The cost data for all the bridges in Appendix A are in constant 2014 dollars. Therefore, the study assumes that all of the bridges are built in 2014 for the Life Cycle Cost analyses. The constant 2014 dollars is necessary to (1) account for inflation to transform past built bridges to 2014 using the Construction Cost Index and (2) the discount rate for all future costs considers future inflation and discounting future costs with the discount rate is applied to constant 2014 dollars.

Table 12: Historical Construction Cost Indices from 1960 to 2014 (Engineering News Record)

Year	CCI	Year	CCI	Year	CCI
2014	9806	1995	5471	1976	2401
2013	9547	1994	5408	1975	2212
2012	9308	1993	5210	1974	2020
2011	9070	1992	4985	1973	1895
2010	8799	1991	4835	1972	1753
2009	8570	1990	4732	1971	1581
2008	8310	1989	4615	1970	1381
2007	7966	1988	4519	1969	1269
2006	7751	1987	4406	1968	1155
2005	7446	1986	4295	1967	1074
2004	7115	1985	4195	1966	1019
2003	6694	1984	4146	1965	971
2002	6538	1983	4066	1964	936
2001	6343	1982	3825	1963	901
2000	6221	1981	3535	1962	872
1999	6059	1980	3237	1961	847
1998	5920	1979	3003	1960	824
1997	5826	1978	2776		
1996	5620	1977	2576		

4.3 Life Cycle Cost Example PennDOT Bridge 30570

The Life Cycle Cost analysis will be demonstrated using Precast Box Beam – Spread PennDOT Bridge 30570. The results are shown in Appendix A.

BrKey: 30570

Bridge Type: P/S, Box Beam (Spread)

County: Shuykill

Location: 0.75 mi. N of Exit 107(33)

Year Built: 1969

Spans: 3

Length: 176 ft

Deck Area: 7621 ft²

Super Cond Rating: 5

Using the average Precast Box Beam – Spread bridge deterioration rate of -0.07988 from Table 9, with a superstructure condition rating of 5, the remaining life is:

$$\text{Remaining Life} = \frac{(3 - 5)}{-0.07988} = 25 \text{ years}$$

The bridge life is estimated to be:

$$\text{Bridge Life} = 2014 + 25 - 1969 = 70 \text{ years}$$

There were two incidents of department maintenance and one external contract. For this example, total costs and costs/ft² of deck area are shown. The remainder of this report will use costs/ft² for direct comparisons. The costs at the time of the work and year of the work are:

Initial Cost:	Year = 1969	Cost = \$141475 (\$18.56/ft ²)	Work: Bridge Construction
External Contract:	Year = 1988	Cost = \$58401 (\$7.66/ft ²)	Work: Latex Overlay
Maintenance 1:	Year = 2009	Cost = \$1891 (\$0.25/ft ²)	Work: Repair Concrete Deck
Maintenance 2:	Year = 2013	Cost = \$2510 (\$0.33/ft ²)	Work: Repair Concrete Deck

To transform the costs to constant 2014 dollars, the Construction Cost Indices are applied. To set the time frame for the Life Cycle Cost analysis, the date of maintenance from the built date is determined. The inputs for the LCC analysis are:

Initial Cost:	Year = 0	Cost = \$18.56/ft ² (9806/1269)	= \$143.45/ft ²
External Contract:	Year = 19	Cost = \$7.66/ft ² (9806/4519)	= \$ 16.63/ft ²
Maintenance 1:	Year = 40	Cost = \$0.25/ft ² (9806/8570)	= \$ 0.28/ft ²
Maintenance 2:	Year = 44	Cost = \$0.33/ft ² (9806/9547)	= \$ 0.34/ft ²

The bridge life timeline is shown in Figure 8.

Figure 8: PennDOT Bridge 30750 Life Cycle Cost Timeline

To determine the Present Value Cost, the future costs are discounted to year 0 with a discount rate of 2.3% and added to the initial cost:

$$PVC = \$143.45 + \$16.63(1.023)^{-19} + \$0.28(1.023)^{-40} + \$0.34(1.023)^{-44} = \$154.49/ft^2$$

The Present Value Cost of only the future costs (maintenance and contracts) is:

$$Maintenance\ PVC = 16.63(1.023)^{-19} + 0.28(1.023)^{-40} + 0.34(1.023)^{-44} = \$11.04/ft^2$$

Finally, to compare this bridge with others in the PennDOT database, the Perpetual Present Value Cost for Bridge 30570 is:

$$PPVC = \$154.49 \left[\frac{(1 + 0.023)^{70}}{(1 + 0.023)^{70} - 1} \right] = 1.256(\$154.49) = \$193.97/ft^2$$

4.4 Removal of Non-Typical Bridges

There are 1705 bridges in Table 11 that met the database selection criteria. However, there are only 1186 that are used for the Life Cycle Cost comparisons. For the Life Cycle Cost analyses, bridges were removed based on Perpetual Present Value Costs that were considered non-typical. The idea is to compare typical bridges based on the bridge type averages. Therefore, working with the PennDOT Bridge Engineer, a removal criterion was set to be bridges that have a Perpetual Present Value Costs exceeding plus or minus one standard deviation from the mean of the entire bridge type group. This removes bridges that have either unreasonably high or low PPVC due to complicated or simple projects and keeps what is considered typical bridges. Table 13 shows the original number of bridges in the Table 11 database and the number of bridges used for the Life Cycle Cost study.

Table 13: Final Life Cycle Cost Database

Bridge Type	Number of Bridges in Table 11 Database	Number of Bridges in LCC Study Database	Percentage Removed with “Typical Bridge” Criterion
Steel I Beam	82	54	34%
Steel I Girder	230	144	37%
P/S Box - Adjacent	400	282	30%
P/S Box - Spread	581	397	32%
P/S I Beam	412	309	25%
	1705	1186	30%

From Table 13, the percentage of bridges removed with the “Typical Bridge” criterion is fairly consistent over the bridge types. The opinion is that the final Life Cycle Cost database represents typical bridges for the different bridge types and that the averages can be used for comparison. Appendix A contains the 1186 individual bridge results for each bridge type for the final Life Cycle Cost database.

4.5 Life Cycle Cost Results

For each bridge type, the third table in Appendix A lists the PPVC, Initial and present value of all future maintenance costs. Each bridge can be compared to any other within a bridge type or over different bridge types using the PPVC. The third table also lists year built, bridge life, length and number of spans. At the top of the third table are averages and standard deviations for all of these quantities.

Table 14 presents the results of the Life Cycle Cost study for the averages over the database. The PPVC is the quantity to equally compare over different bridge types. The least expensive alternative is the P/S I Beam, followed by the Steel I Beam. Another important consideration for bridge owners is bridge life. Both of the steel bridge types (rolled and girder) have the longest average bridge life. However, since the standard deviations, average length, average number of spans, and average life all vary considerably between the bridge types, it is worth studying these variables a little closer.

Table 14: Life Cycle Cost Results Using Total Database

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Length	Avg # Spans	Avg Year Built	Avg Life
Steel I Beam	54	\$232.78	\$194.78	\$0.42	166	2.19	1980	82
Steel I Girder	144	\$273.71	\$226.10	\$0.21	406	4.07	1976	80
P/S Box - Adjacent	282	\$278.30	\$223.74	\$0.96	89	1.31	1987	74
P/S Box - Spread	397	\$256.11	\$210.65	\$2.06	89	1.56	1986	79
P/S I Beam	309	\$217.50	\$174.10	\$0.20	212	2.43	1985	73

4.5.1 Variability in Perpetual Present Value Cost

Table 15 repeats the averages for PPVC for the different bridge types, but it also presents the standard deviation in the PPVC.

Table 15: Statistical Characteristics of Perpetual Present Value Cost

	Mean	St. Dev	Pr(PPVC<\$300)
Steel I Beam	\$232.78	\$57.51	87.9%
Steel I Girder	\$273.71	\$65.60	65.6%
P/S Box - Adjacent	\$278.30	\$48.02	67.4%
P/S Box - Spread	\$256.11	\$53.51	79.4%
P/S I Beam	\$217.50	\$54.85	93.4%

Assuming that the behavior follows a Normal distribution, Figure 9 demonstrates the Probability Density Function (PDF) PPVC behavior of the different bridge types. The PDF shows the mean and the standard deviation characteristics. All of the bridge types are similar in both mean and standard deviation. There is no one type of bridge that is clearly less expensive or more uncertain in the cost than another. This is especially true given the limited database that is used in the Life Cycle Cost study.

Figure 9: Probability Density Function for Perpetual Present Value Cost

A useful way to use such data is to ask the question, what is the probability that the PPVC is less than \$300/ft² for the different bridge types? Still assuming the probability distribution is Normal, any statistics textbook can determine that the probability (shown in Table 15) is:

$$Probability(PPVC < \$300/ft^2) = \Phi\left(\frac{300 - Mean}{St. Deviation}\right)$$

This analysis is demonstrated in Figure 10 where the Cumulative Density Function (CDF) is plotted for the different bridge types. There is a 93% probability (confidence for bridge owners) that a Precast I Beam bridge, and an 88% probability that a Steel I Shape Beam bridge, will have a Perpetual Present Value Cost less than \$300/ft². The probabilities decrease for the other types of bridges.

Figure 10: Cumulative Density Function for Perpetual Present Value Cost

4.5.2 Variability in Bridge Life

A similar analysis can be conducted for bridge life. Table 16 repeats the averages for bridge life for the different bridge types, but it also presents the standard deviation in the bridge life.

Table 16: Statistical Characteristics of Bridge Life

	Mean	St. Dev.	Pr(Life>75yrs)
Steel I Beam	82	10.83	73.0%
Steel I Girder	80	15.40	62.7%
P/S Box - Adjacent	74	10.47	45.6%
P/S Box - Spread	79	11.15	65.6%
P/S I Beam	73	11.91	44.3%

Assuming that the behavior follows a Normal distribution, Figure 11 demonstrates the Probability Density Function (PDF) bridge life behavior of the different bridge types. The PDF shows the mean and the standard deviation characteristics. All of the bridge types are similar in mean bridge life and standard deviation (with some differences). There is no one type of bridge that clearly has a significantly longer bridge life (except there is a difference between steel and concrete as a whole) or more uncertain bridge life than another.

Figure 11: Probability Density Function for Bridge Life

Again, a useful way to use such data is to ask the question, what is the probability that the Bridge Life exceeds 75 years for the different bridge types? Still assuming the probability distribution is Normal, any statistics textbook can determine that the probability (shown in Table 16) is:

$$Probability(Life > 75 \text{ years}) = 1 - \Phi\left(\frac{75 - Mean}{St. Deviation}\right)$$

This analysis (assuming Normal distribution) is demonstrated in Figure 12 where the Cumulative Density Function (CDF) is plotted for the different bridge types.

Figure 12: Cumulative Density Function for Bridge Life

There is a 73% probability (confidence for bridge owners) that a Steel I Shape Beam bridge, but only a 44% probability that a Precast I Beam bridge, will have a Bridge Life that exceeds 75 years. The probabilities are between the two for the other types of bridges.

4.5.3 Variability in Average Number of Spans

There is a significant difference in average number of spans between the bridge types. The following examines sub-groups of the bridge types for various numbers of spans. Table 17 shows the results for simple-span bridges. There are 608 simple span bridges that meet the criteria and the re-application of the “Typical Bridge” PPVC criterion.

Table 17: Life Cycle Cost Results for Simple Span Bridges

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Length	Avg # Spans	Avg Year Built	Avg Life
Steel I Beam	22	\$302.38	\$253.90	\$0.13	90	1.00	1981	84
Steel I Girder	21	\$318.73	\$263.02	\$0.25	128	1.00	1979	81
P/S Box - Adjacent	215	\$300.74	\$241.81	\$1.00	65	1.00	1987	74
P/S Box - Spread	245	\$294.67	\$245.40	\$1.06	54	1.00	1988	81
P/S I Beam	105	\$287.24	\$234.67	\$0.04	108	1.00	1989	76

For all the bridge types, the PPVC increases compared to the entire database results. This is expected since most of the time simple-span bridges have higher cost per ft². The ranking also changes some with the three concrete bridge types being the least expensive. However, all the bridge types are fairly competitive as they were for the entire database.

Table 18 presents the results for 2-span bridges. There are 184 two-span bridges that meet the criteria and the re-application of the “Typical Bridge” PPVC criterion. For 2-span bridges, some of the PPVC increase and some decrease compared to the overall results. Steel I Girder bridges have the least PPVC, followed by Precast Box Beam – Spread bridges. However, like in previous examples, all of the bridge types are competitive.

Table 18: Life Cycle Cost Results for 2-Span Bridges

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Length	Avg # Spans	Avg Year Built	Avg Life
Steel I Beam	16	\$234.04	\$193.99	\$0.05	198	2.00	1988	81
Steel I Girder	24	\$210.49	\$175.04	\$0.24	243	2.00	1976	81
P/S Box - Adjacent	32	\$242.74	\$191.74	\$1.53	155	2.00	1987	72
P/S Box - Spread	59	\$226.78	\$183.55	\$0.08	127	2.00	1989	74
P/S I Beam	53	\$230.78	\$183.02	\$0.18	209	2.00	1985	71

To consider any bridge that exceeds a simple span, Table 19 has the results for all the bridges that have a number of spans that exceed one (all multi-span bridges). There are 614 multi-span bridges that meet the criteria and the re-application of the “Typical Bridge” PPVC criterion.

Table 19: Life Cycle Cost Results for All Multi-Span Bridges (Number of Spans > 1)

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Length	Avg # Spans	Avg Year Built	Avg Life
Steel I Beam	35	\$213.82	\$177.00	\$0.62	213	2.80	1980	80
Steel I Girder	123	\$262.12	\$217.78	\$0.19	460	4.66	1976	80
P/S Box - Adjacent	70	\$214.90	\$170.96	\$1.21	181	2.63	1983	73
P/S Box - Spread	170	\$190.13	\$152.34	\$3.29	158	2.82	1980	77
P/S I Beam	216	\$193.38	\$153.66	\$0.21	260	3.15	1983	73

All of the different bridge type average PPVC decreases compared to the overall database for multi-span bridges. Here Precast Box Beam – Spread bridges have the least PPVC, but, again, all of the bridge types are competitive with Steel I Girder (high average number of spans) bridges on the high end of PPVC.

4.5.4 Variability in Average Bridge Length

The Steel Marketing Development Institute, through the Short Span Steel Bridge Alliance, defines short span bridges as those with a length of 140 ft or less. To consider short span bridge behavior, Table 20 presents the results for all bridges that have a maximum span of 140 ft. There are 708 multi-span bridges (most of them precast concrete boxes) that meet the criteria and the re-application of the “Typical Bridge” PPVC criterion. Here the Steel I Beam bridges are the least expensive with Precast Box Beam – Spread next. All of the average PPVC are greater than those of the entire database.

Table 20: Life Cycle Cost Results for Bridge Length Maximum = 140 ft

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Length	Avg # Spans	Avg Year Built	Avg Life
Steel I Beam	27	\$266.24	\$222.08	\$0.16	84	1.26	1978	82
Steel I Girder	18	\$311.26	\$257.19	\$0.29	119	1.00	1977	81
P/S Box - Adjacent	240	\$292.38	\$235.03	\$0.95	69	1.09	1987	74
P/S Box - Spread	325	\$272.20	\$225.14	\$2.16	64	1.23	1986	81
P/S I Beam	98	\$281.64	\$231.20	\$0.05	104	1.08	1987	77

For bridges that have bridge length greater than 140 ft, Table 21 presents the results. There are 479 multi-span bridges (most of them precast concrete boxes) that meet the criteria and the re-application of the “Typical Bridge” PPVC criterion. The three concrete bridge types have the least average PPVC.

Table 21: Life Cycle Cost Results for Bridge Length > 140 ft

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Length	Avg # Spans	Avg Year Built	Avg Life
Steel I Beam	28	\$216.25	\$180.08	\$0.69	234	2.86	1982	80
Steel I Girder	96	\$256.79	\$213.34	\$0.19	281	3.02	1975	80
P/S Box - Adjacent	48	\$214.14	\$170.45	\$1.41	213	2.77	1983	73
P/S Box - Spread	75	\$191.14	\$153.59	\$0.90	206	3.16	1981	74
P/S I Beam	232	\$195.38	\$154.71	\$0.25	258	3.05	1984	72

4.5.5 Summary of PPVC Comparisons

Drawing absolute Life Cycle Cost conclusions between different bridge types is difficult given the PennDOT database used in the analyses. The database comprises bridges that met all of the criteria, including known dates and costs for all maintenance performed, known dates and costs for all external contracts performed, and known initial costs. There were many bridges that had maintenance and external contracts, but without known dates or costs. These bridges were removed from the database. There were many bridges with most of the information known, but one item missing. These bridges were removed from the database. Therefore, the database is biased towards bridges that did not have maintenance or external contracts since these would not have been removed as long as they had initial costs. The results do not include a large number of bridges that have maintenance. So, consideration of

the specific numbers must be taken in context that the numbers represent the bridges that made it into the database, and the database is not as comprehensive as one would like.

However, a conclusion that can be drawn is that all the types of bridges are fairly competitive in both Initial Costs and Perpetual Present Value Costs. With the dispersion of costs (standard deviation) any of the bridge types may be least expensive for a given project.

4.5.6 Future Costs

The benefit in considering Life Cycle Costs in bridge project decisions is that a LCC analysis considers future costs and bridge life. Both are important aspects for bridge management. Bridge life was addressed above with the steel bridge types having a slight advantage over the concrete types. One indicator of how much future maintenance costs and bridge life impact Life Cycle Costs would be the ratio of PPVC and Initial Cost. The ratio would contain an influence from bridge life since the PPVC assumes the bridge is replaced into perpetuity. Table 22 presents the average PPVC, Initial Cost, the present value cost of all future maintenance costs, bridge life, and the ratio of PPVC and Initial Cost. The average Future Cost is the sum of all maintenance and external contract work for each bridge type divided by the number of bridges for that bridge type.

Table 22: Life Cycle Costs and PPVC/Initial Cost for Total Database

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Life	PPVC/Initial Cost
Steel I Beam	54	\$232.78	\$194.78	\$0.42	82	1.20
Steel I Girder	144	\$273.71	\$226.10	\$0.21	80	1.21
P/S Box - Adjacent	282	\$278.30	\$223.74	\$0.96	74	1.24
P/S Box - Spread	397	\$256.11	\$210.65	\$2.06	79	1.22
P/S I Beam	309	\$217.50	\$174.10	\$0.20	73	1.25

For instance, for Steel I Beam bridges, the result indicates that, for this database, on average it takes 20% more than the initial cost to take care of all future maintenance costs and replace the bridge into perpetuity. The reason that the above statement states “for this database” is that the database is biased towards bridges with no maintenance costs.

When comparing the bridge types, the steel type bridges have a lower future cost component (1.20 and 1.21 vs. 1.22 – 1.25). This is a combination of future maintenance costs and bridge life. Precast I beam bridges have the lowest Future Cost of \$0.20, but an average bridge life of only 73 years, whereas Steel I Beam bridges have a higher Future Cost of \$0.42, but the average bridge life is 82 years. The combination of the two variables results in Steel I Beam bridges having a lower PPVC/Initial Cost of 1.20 while the Precast I Beam bridges have a ratio Of 1.25.

4.5.7 Maintenance and External Contracts

The second table in Appendix A lists the maintenance and external contracts that were performed on each bridge for each bride type in the database. Table 23 lists the types of maintenance that are included in the database.

Table 23: Maintenance Definitions for the Database

Group	PennDOT Designation	Description
1 - Concrete Deck	6-D744303-RPR.CONC.DECK	Concrete Deck (Repair)
	20-D744102-RPR.STL.EXP.DAM	Steel Dams (Repair/Rehab)
2 - Deck Joints	2-A743301-RESEAL DK.JOINT	Reseal Deck Joint
	33-B744102-RPR/RPLCOMPR.SEAL	Compression Seal (Repair/Rehab)
	4-A744101-REPAIR DK.JOINT	Repair/Reseal Deck Joint
3 - Structure Framing	25-A744602-RPR/RPL.STEEL BEAM	Stringer (Repair/Replace) - Steel
	54-D744602-RPR/RPLSTLDIAPHRAM	Diaphragm/Lateral Bracing (Repair/Replace) - Steel
	49-C744602-RPR.STEELGIRDER	Girder (Repair) - Steel
	42-A744603-RPR/RPL.CONC.BEAM	Stringer (Repair/Replace) - Concrete
	69-B744603-RPR/RPLCONC DIAPHRAM	Diaphragm (Repair/Replace) - Concrete
	45-D744503-RPL.BRGPED/SEAT	Pedestal Seat (Reconstruct)
4 - Painting	EXTERNAL CONTRACT WORK	Various Superstructure Work
	57-A743201-SPOT PAINT SUPERSTR	Superstructure Spot Painting
	65-C743201-PAINT SUPERSTRUCTURE	Superstructure Full Painting
5 - Protection	80-A743401-PROT.CTG.TO SUPERSTR	Superstructure Protective Coating

The maintenance work is divided into five groups: Concrete Deck, Deck Joints, Structure Framing, Painting and Protection. Noting that the database has concerns in terms of completeness of information, Tables 24 through 26 present maintenance characteristics for the Concrete Deck, Deck Joints and Structure Framing groups.

Table 24: Maintenance Characteristics for Concrete Deck Repair

	# Bridges	# Occurrences	Avg Age to Repair	Average Cost per (\$/ft ²)	% of Bridges Repaired	Avg Cost over all Bridges
Steel Rolled	54	12	42	\$0.29	22.22%	\$0.06
Steel Plate	144	22	39	\$0.89	15.28%	\$0.14
Concrete Box Adjacent	282	32	35	\$6.95	11.35%	\$0.79
Concrete Box Spread	397	82	37	\$1.15	20.65%	\$0.24
Concrete I-beam	309	78	40	\$0.46	25.24%	\$0.12

Table 25: Maintenance Characteristics for Deck Joints

	# Bridges	# Occurrences	Avg Age to Repair	Average Cost per (\$/ft ²)	% of Bridges Repaired	Avg Cost over all Bridges
Steel Rolled	54	16	37	\$0.32	29.63%	\$0.09
Steel Plate	144	42	36	\$0.64	29.17%	\$0.19
Concrete Box Adjacent	282	25	32	\$3.43	8.87%	\$0.30
Concrete Box Spread	397	51	33	\$0.91	12.85%	\$0.12
Concrete I-beam	309	51	35	\$0.94	16.50%	\$0.16

Table 26: Maintenance Characteristics for Structure Framing

	# Bridges	# Occurrences	Avg Age to Repair	Average Cost per (\$/ft ²)	% of Bridges Repaired	Avg Cost over all Bridges
Steel Rolled	54	4	38	\$9.87	7.41%	\$0.73
Steel Plate	144	19	38	\$1.08	13.19%	\$0.14
Concrete Box Adjacent	282	2	27	\$63.81	0.71%	\$0.45
Concrete Box Spread	397	18	25	\$44.04	4.53%	\$2.00
Concrete I-beam	309	6	39	\$0.51	1.94%	\$0.01

The number of occurrences is the total number of maintenance events that were performed for that bridge type. The average cost per event is the total cost of all occurrences divided by the number of occurrences. The percentage of bridges repaired is the number of occurrences divided by the number of bridges. However, this may have some inaccuracy since the same repair may have been applied to a bridge more than once. The same inaccuracy may be present in the average cost over all bridges in that the average cost of each repair times the number of occurrences is divided by the number of bridges in the database for each bridge type.

The results shown are for the database as developed and the number of maintenance occurrences is fairly low. With the limited number of bridges in the database that have valid maintenance records, it is difficult to draw meaningful conclusions. However, the Concrete Box type bridges, when maintenance is required, have high maintenance costs for deck repair and structure framing. Concrete Box type bridges are configured to where the deck is part of the structure framing, so there is a cross-over when trying to separate the deck from the box.

So, again, consideration of the specific numbers must be taken with the context that the numbers represent the bridges that made it into the database, and the database is not as comprehensive as one would like. However, if the database was comprehensive, such a study could be very beneficial to bridge owners and managers.

4.5.8 PennDOT Steel Bridge Database

Within the steel type bridge database, additional characteristics were examined. For instance, curved steel bridge construction is more complicated than straight bridges. Fracture-critical bridges, having additional scrutiny over non-fracture-critical bridges, may result in additional initial and future costs. Also, coating systems can have an influence on initial and future costs. Table 27 examines these variables. The following discusses the results within the limited steel bridge PennDOT database.

Table 27: Steel I Beam and Steel I Girder Bridges

	# Bridges	PPVC	Initial Cost	Future Cost	Avg Length	Avg # Spans	Avg Year Built	Avg Life
Steel Rolled - All	54	\$232.78	\$194.78	\$0.42	166	2.19	1980	82
Steel Rolled - Straight	46	\$229.94	\$193.19	\$0.48	160	2.22	1979	82
Steel Rolled - Weathering	15	\$242.75	\$203.95	\$0.07	164	1.47	1983	83
Steel Girder - All	144	\$273.71	\$226.10	\$0.21	406	4.07	1976	80
Steel Girder - Straight	100	\$273.54	\$225.58	\$0.21	330	3.18	1976	80
Steel Girder - Weathering	11	\$254.04	\$215.76	\$0.03	263	2.45	1974	83
Steel Girder - Non Fract. Crit.	132	\$272.53	\$225.11	\$0.23	359	3.50	1976	80

4.5.8.1 Curved vs. Straight Steel Bridges

When comparing the results for straight bridges and the results for all of the bridges, for both the Steel I Beam and Steel I Girder bridges in the database, there is little difference between curved and straight bridges for PPVC, Initial Costs, Future Costs, or Bridge Life. Although there are not that many curved bridges in the database (8 I beam (15%) and 44 I Girder (30%)), the additional costs associated with curved bridges does not increase the all bridge data significantly ($(\$232.78 - \$229.94) / \$229.94 = 1.2\%$ for I Beam and nearly nothing for I Girder).

4.5.8.2 Fracture-Critical Steel Bridges

There were 12 fracture-critical bridges in the Steel I Girder database. The PPVC for the fracture-critical bridges is actually lower than the PPVC for all I Girder bridges. From this database analysis, it does not appear that fracture-critical designation has a significant impact on Life Cycle Costs.

4.5.8.3 Painted vs. Weathering Steel

The database includes 15 I Beam and 11 I Girder bridges that used weathering steel. The remainder of the bridges are assumed to be painted. When comparing the painted to the weathering steel bridges, the results are mixed. For PPVC, the weathering steel I Beam bridges have a higher (4.3%) PPVC than the overall PPVC, but the I Girder weathering steel bridges have a lower (0.4%) PPVC. However, what is consistent is that future costs are significantly less for weathering steel bridges than for painted bridges. Also, the bridge life increased slightly.

4.5.8.4 Galvanizing

There were no galvanized bridges that made it into the Life Cycle Cost database. This is unfortunate because protective coating systems is an important aspect of steel bridges and galvanizing has become an economical and effective protection system. Recent information shows that Hot Dipped Galvanizing initial costs are approximately equal to or even less than a quality 3-coat paint system. Of course paint systems need maintenance over the bridge life, whereas galvanizing usually does not, or it may require a zinc-rich spot painting at about 60 years. Group 4 in Table 23 shows the painting maintenance for the steel bridges. Table 28 lists the number of paint maintenance events where there were 4 I Beam and 11 I Girder paint maintenance records. The present value of the average future painting costs for these bridges are \$1.44/ft² and \$0.21/ft², respectively. If galvanizing was an option, these future costs would be eliminated. However, since there were no galvanized bridges in the database, no direct comparisons can be made in this study.

Table 28: Painted Steel I Beam and Steel I Girder Bridges

	# Bridges	# Occurrences	Avg Age to Repair	Average Cost per (\$/ft ²)
Steel Rolled	54	4	34	\$1.44
Steel Plate	144	11	39	\$0.21

4.5.8.5 Summary of PennDOT Steel Bridge Database

The discussion on characteristics of steel bridges, whether it is curved vs. straight, fracture-critical, or painted vs. weathering steel vs. galvanizing, is based on the limited PennDOT database developed herein. Hard conclusions are difficult to discern due to the limitations within the database. However, with a more comprehensive database, these types of studies would be beneficial to bridge owners and managers.

4.6 Summary

This chapter determined the Life Cycle Costs for the Life Cycle Cost bridge database. The initial costs, Life Cycle Costs, and future costs of the 1186 bridges in the database are examined with respect to variability in bridge type, bridge length, number of spans, and bridge life. The steel bridges in the database are also examined with respect to protective coating systems. Drawing hard conclusions from the results is difficult knowing that the database is limited with respect to the PennDOT bridge inventory. Chapter 5 presents a summary of the study and conclusions from the results.

5 - Summary and Conclusions

5.1 Review of Objectives and Life Cycle Cost Database

The objective of this study was to examine historical Life Cycle Costs of typical steel and concrete bridges across the United States. This requires collecting the life histories of bridges, including initial costs, maintenance, rehabilitation and bridge life. Unfortunately, except for the Pennsylvania Department of Transportation, the select number of states and counties contacted for this study were not able to provide the required data on their bridges due to the large amount of time and resources required to collect this data. Therefore the Life Cycle Cost study contained in this report is limited to state bridges in the PennDOT inventory. Even within the PennDOT inventory, only 18% (1186 bridges out of a possible 6587) of the bridges built between 1960 and 2010 had complete historical records and are included in the Life Cycle Cost analyses. The database must be considered only a snapshot of the total PennDOT bridge inventory. The criteria applied removed 82% of the eligible bridges, mostly due to incomplete initial cost, maintenance records and external contract records. If these records were complete, the database would be much larger and the resulting Life Cycle Cost analyses would more accurately represent the PennDOT bridge inventory.

5.2 Interpreting Results and Conclusions

The report examines the initial costs, Life Cycle Costs, and future costs of the bridges in the database with respect to variability in bridge type, bridge length, number of spans, and bridge life. The types of bridges in the database include steel rolled shape beam, steel plate girder, precast box, and precast beam bridges. The steel bridges in the database are also examined with respect to protective coating systems.

Therefore, given the nature of the database used, interpreting the tables and figures showing comparisons of initial costs, Perpetual Present Value Costs, maintenance and future costs, and bridge life is left to the reader. Consideration of the specific numbers and any conclusions must be taken in the context that the results represent the bridges that made it into the database, and the database is not as comprehensive as desirable for drawing conclusions.

A conclusion that can be drawn, however, is that all the types of bridges are fairly competitive in both Initial Costs and Perpetual Present Value Costs. The average initial costs vary from \$174/ft² to \$226/ft² and the average Perpetual Present Value Costs vary between \$218/ft² (Prestressed I Beam) and \$278/ft² (Prestressed Adjacent Box). For bridge life, the lowest average life was 73 years (Prestressed I Beam) and the longest was 82 years (Steel I Beam).

The coefficient of variation (standard deviation / mean) of the PPVC was approximately 20%, which is considerably high. With the relatively small differences in the PPVC averages, given the dispersion of the PPVC costs (standard deviation), any of the bridge types may have the least Perpetual Present Value Cost for a given project.

5.3 Future Work

Even though this research was limited to only a subset of PennDOT bridges, the analyses demonstrate the potential benefits of LCC analysis for bridge construction and management. A study of a more comprehensive database of bridges on the initial costs, Life Cycle Costs and future costs of different types of bridges over a diverse set of circumstances would be very useful for bridge owners and managers. With a more comprehensive database, not only would there be a more accurate comparison of bridge types, an accurate comparison of design details, such as jointless decks, rebar coatings, steel protection systems, and other construction details could be completed. The author worked with several states and many counties to try to develop a broad database of bridges across the country. However, these particular states and local owners could not provide the necessary historical data. Although extending this work would take considerable effort, other states and counties could be contacted in an effort to obtain a comprehensive bridge database.

Appendix A - PennDOT Bridge Database

The PennDOT Bridge Database is Divided by Bridge Type:

Steel I-Beam

Steel I Welded Girder

Precast Box Beam – Adjacent

Precast Box Beam – Spread

Precast I Beam

ABSTRACT OF DISSERTATION

LIFE-CYCLE COST ANALYSIS OF REINFORCED CONCRETE BRIDGES REHABILITATED WITH CFRP

The deterioration of highway bridges and structures and the cost of repairing, rehabilitating, or replacing deteriorated structures is a major issue for bridge owners. An aging infrastructure as well as the need to upgrade structural capacity for heavier trucks adds to the problem. Life-cycle cost analysis (LCCA) is a useful tool for determining when the deployment of fiber-reinforced polymer (FRP) composite components is an economically viable alternative for rehabilitating deteriorated concrete bridges.

The use of LCCA in bridge design and rehabilitation has been limited. The use of LCCA for bridges on a project level basis has often been limited to the non-routine design of major bridges where the life-cycle cost model is customized.

LCCA has historically been deterministic. The deterministic analysis uses discrete values for inputs and is fairly simple and easy to do. It does not give any indication of risk, i.e. the probability that the input values used in the analysis and the resulting life-cycle cost will actually occur.

Probabilistic analysis accounts for uncertainty and variability in input variables. It requires more effort than a deterministic analysis because probability distribution functions are required, random sampling is used, and a large number of iterations of the life-cycle cost calculations are carried out. The data needed is often not available.

The significance of this study lies in its identification of the parameters that had the most influence on life-cycle costs of concrete bridge and how those parameters interacted. The parameters are: (1) Time to construct the new bridge; (2) traffic volume under bridge (when applicable); (3) value of time for cars; and (4) delay time under the bridge during new bridge construction (when applicable). Using these parameters the analyst can now “simulate” a probabilistic analysis by using the deterministic approach and reducing the number of iterations. This study also extended the use of LCCA to bridge rehabilitations and to bridges with low traffic volumes. A large number of bridges in the United States have low traffic volumes. For the highway bridge considered in the

parametric study, rehabilitation using FRP had a lower life-cycle cost when compared to the new bridge alternative.

ACKNOWLEDGEMENTS

I wish to acknowledge the Kentucky Transportation Cabinet for construction bid cost and vehicle crash data. I wish to thank the FHWA Kentucky Division for assistance in providing the bridge data needed to determine unit costs for new bridge construction. I wish to thank Dr. Issam Harik, Dr. Hans Gesund, Dr. Bradley D. Davis, Dr. Timothy R. Taylor, and Dr. Glenn C. Blomquist for their guidance. Support for this research was provided by the University of Kentucky, Department of Civil Engineering, O. H. Raymond Fellowship.

CHAPTER ONE: INTRODUCTION

The deterioration of highway bridges and structures is a major problem worldwide. In 2010 about 25.9 percent of the 604,493 bridges in the United States are deficient (USDOT 2013a). This includes both structurally deficient and functionally obsolete bridges. About 11.7 percent of the bridges are structurally deficient.

There are various reasons to replace or rehabilitate deficient bridges (Seible et al. 1991; Arduini and Nanni 1997; Weissmann and Harrison 1998; Lees et al. 2002; Aidoo et al. 2004; Nezamian and Setunge 2007; Choi et al. 2008; Kim and Harries 2013). The reasons may be design, construction, or operation related. Design related reasons include design errors, changes in design specifications, and deficiencies in design specifications. Construction related reasons include construction errors and deficiencies in construction specifications. Operation related reasons include element deterioration, increases in traffic volumes, truck collisions, earthquakes, and increases in legal loads (commercial vehicle sizes and weights) and permit loads.

There are three alternatives for dealing with deficient bridges (Klaiber et al. 1988; Alkhrdaji et al. 2000; Deniaud and Cheng 2003; Flowers et. al. 2010). One alternative is to do nothing. This often leads to load posting the bridge for weight restrictions. Load posting imposes financial hardships on those who then must detour around the posted bridge and can increase congestion on the alternate routes. Another alternative is to rehabilitate the bridge to increase the live load capacity. A third alternative is to replace the bridge.

Bridge Strengthening

There are some advantages to bridge strengthening in lieu of replacement or load posting (Klaiber et al. 1988; Reed et al. 2002; Tavakkolizadeh and Saadatmanesh 2003; Jones et al. 2004; Flowers et. al. 2010; Okeil et al. 2013). Bridge rehabilitation extends the service life of existing bridges. It can cost less to strengthen a bridge than to replace it. The reduced construction time can minimize construction-related impacts such as an increase in traffic delay and congestion, the disruption to local businesses, and environmental impacts (i.e. noise and air quality).

There are several traditional methods to increase the live load capacity of existing bridges (Berger and Gorgon 1978; Klaiber et al. 1988; Nezamian and Setunge 2007). One method is to add supplemental supports or members. Another is to strengthen critical members by increasing their cross section or replacing them. Live load capacity can be increased by reducing dead load, usually by replacing the normal weight concrete deck with a lightweight concrete one. Another is to change the behavior of the structural system by making simple spans continuous or making non-composite beams composite. Most of these methods require closing the bridge or limiting traffic. This has an economic impact on the travelling public (Carolin et al. 2005; Hoult and Lees 2009). One alternative that can minimize these impacts is the addition of external reinforcement.

One traditional method for adding external reinforcement is externally bonded steel plates (Klaiber et al. 1988; Reed et al. 2002; Petrou et al. 2008). It can be accomplished with minimal disruption to traffic (Carolin et al. 2005). However, problems with using steel have led to the search for alternate materials (Bakis et al. 2002; Deniaud and Cheng 2003; Petrou et al. 2008). The two primary issues with using steel plates are

corrosion of the steel and the heavy weight of the plates. Fiber-reinforced polymer (FRP) plates can be used in place of steel (Arduini and Nanni 1997; Chaallal et al. 1998; Malek and Patel 2002; Monti and Santini 2002; Alagusundaramoorthy et al. 2003; Choi et al. 2008; Petrou et al. 2008; Hoult and Lees 2009).

Fiber-reinforced Polymers

Fiber-reinforced polymers (FRPs) are being used to strengthen concrete bridges (Alkhrdaji et al. 2000; Shekar et al. 2003; Ekenel et al. 2005; Catbas et al. 2006; Täljsten et al. 2007). The benefits and advantages of FRP composites are widely reported in the published literature (Spadea et al. 1998; Bakis et al. 2002; Alagusundaramoorthy et al. 2003; Deniaud and Cheng 2003; Tavakkolizadeh and Saadatmanesh 2003; Aidoo et al. 2004; Shahrooz and Boy 2004; El Maaddawy and Soudki 2005; Kim et al. 2008; Allen and Atadero 2012; Kim and Harries 2013; Wang et al. 2013). They include a high strength-to-weight ratio, a high tensile strength, superior fatigue resistance, excellent corrosion resistance, strong chemical resistance, advantageous electromagnetic properties, and versatility of use.

The FRP strengthening technique has several advantages (Shahawy et al. 2000; Malek and Patel 2002; Deniaud and Cheng 2003; Wang et al. 2004; Nezamian and Setunge 2007; Soudki et al. 2007; Kim et al. 2008; Allen and Atadero 2012; Kim and Harries 2013; Wang et al. 2013). One of the primary advantages is its lightweight. As a result it is easy to install, requires a minimum amount of equipment to support, and can be installed quickly. This simplifies construction and reduces the amount of time required for installation which can lower the cost. FRP systems can be installed without disrupting

traffic on the bridge which decreases the impact on the travelling public. They can increase the ductility, shear resistance, and flexural strength of bridge members. The system can be designed to provide strength where needed. It may be possible to bond FRPs to surfaces that are curved and wrap them to match member geometry. Some other advantages include reduced maintenance costs, minimal reduction in clearances, and minimal changes in member dimensions.

Life-cycle Cost Analysis

The cost of repairing, rehabilitating, or replacing deteriorated structures is a major issue for State Departments of Transportation (DOT). The National Bridge Investment Analysis System model estimates a backlog of bridge investments in 2010 of \$106.4 billion (USDOT 2013a). It is estimated that \$20.5 billion annually is needed to eliminate the backlog of deficient bridges by the year 2028, which is a 60 percent increase over the \$12.8 billion currently being spent (ASCE 2013). An aging infrastructure as well as the need to upgrade structural capacity for heavier live loads (trucks) adds to the backlog. FRP can be used to repair and rehabilitate existing concrete bridges (Bae et al. 2013). Life-cycle cost analysis (LCCA) is a useful tool for determining when FRP is an economically viable method for rehabilitating deteriorated concrete bridges.

The Federal Highway Administration (FHWA) defines Life-Cycle Cost Analysis as “an engineering economic analysis tool useful in comparing the relative merit of competing project implementation alternatives” (FHWA 2002). All costs are considered, both agency and user. The effects of agency activities such as construction on user costs are accounted for. The alternative with the lowest life-cycle cost is identified.

LCCA has historically been deterministic (FHWA 2002, Pittenger et al. 2012). The deterministic analysis uses discrete values for inputs and is fairly simple and easy to do. Published tables of discount factors simplified computational effort required. Since a deterministic analysis gives only a single life-cycle cost it does not give any indication of risk, i.e. the probability that the input values used in the analysis and the resulting life-cycle cost will actually occur (FHWA 2002). Costs and timings do however vary and this variability can affect the choice of alternative.

Probabilistic analysis accounts for uncertainty and variability in input variables (FHWA 2002, Reigle and Zaniewski 2002, Smith et al. 2005). It allows for simultaneous variations in more than one input parameter. A probabilistic analysis requires more effort than a deterministic analysis because probability distribution functions are required, random sampling is used, and a large number of iterations of the life-cycle cost calculations are carried out. In addition the results are tracked and stored for further statistical analysis.

A deterministic sensitivity analysis can be done to partially address the uncertainty and variability of input parameters. However the analysis only varies one parameter at a time and the “compounding” effect of changes in multiple inputs is not addressed. Some changes when individually applied increase life-cycle costs and others decrease life-cycle costs. When taken together the changes may additive or subtractive.

Dissertation Objective and Tasks

The objective of this study is to determine when rehabilitating a reinforced concrete bridge with externally applied fiber reinforced polymer composites had a lower life-cycle cost than bridge replacement.

In order to achieve the objective of this study, the following tasks are carried out:

- 1) Conduct a literature search to identify the current state-of -the-art in life cycle cost analysis for highway bridges to identify areas needing further research (Chapters 2 and 3);
- 2) Comparison of the life-cycle cost of reinforced concrete bridges rehabilitated using externally applied FRP composites with a new replacement bridge (Chapter 4);
- 3) Conduct a sensitivity analysis to identify the variables that primarily influence the life-cycle costs (Chapter 5); and
- 4) Determine the probability when rehabilitation has the lower life-cycle cost (Chapter 6);

Tasks 2, 3, and 4 were accomplished by applying the methodology to a reinforced concrete T-beam bridge.

Dissertation Significance

The significance of this study lies in its identification of the parameters that had the most influence on life-cycle costs of concrete bridge and how those parameters interacted. The identification of those parameters with the most influence can allow analysts to “simulate” a probabilistic analysis by using the deterministic approach but

with a reduced number of iterations. The study extended the use of LCCA to bridge rehabilitations and to bridges with low traffic volumes. A large number of bridges in the United States have low traffic volumes. The study introduced the use of time declining discount rates for longer analysis periods.

Parametric studies included a bridge over a highway, a bridge over a highway with modified construction time and cost, a bridge over a highway with a limited number of random variables, a bridge over a waterway, and a bridge over a waterway with modified construction time and cost. The bridge included in the studies was a reinforced concrete bridge that was either rehabilitated with fiber reinforced polymer composites or replaced with a new bridge.

The methodology can be easily programmed in a spreadsheet. Bridge owners can then perform these analyses to assist with the decision making process as it relates to rehabilitating or replacing a concrete bridge. The methodology can easily be applied to other bridge types.

CHAPTER TWO: LITERATURE REVIEW

A historical background on life-cycle cost analysis (LCCA) is presented by Ozbay et al. (2004). The use of economic analysis in highway engineering was first introduced in the 19th century. In 1847 Gillespie published the *Manual of the Principles and Practices of Road Making*. In this manual the cheapest road is not necessarily the one that costs the least but the one with the greatest return on investment. In 1960 the American Association of State Highway Officials (AASHO) Redbook introduced LCCA to transportation. In 1969 the engineering economist Winfrey published *Economic Analysis for Highways*. During this time research began on user and vehicle operating costs. The American Association of State Highway and Transportation Officials (AASHTO) pavement design guides, 1983 and 1993, included LCCA for economic analysis. Sections 1024 and 1025 of the Intermodal Surface Transportation Efficiency Act of 1992 contain provisions for life cycle costs of bridges, tunnels, and pavements. Federal Executive Order 12893 was issued in 1994 and stated that “Benefits and costs should be measured and appropriately discounted over the full life cycle of each project.” The National Highway System (NHS) Designation Act of 1995 required the use of LCCA on NHS projects that cost \$25 million or more. The FHWA issued its policy on LCCA in 1996. To assist in the implementation of LCCA for pavements FHWA Demonstration Project 115, “Life-Cycle Cost Analysis in Pavement Design,” was made available in 1998. In conjunction with this workshop a technical bulletin (Walls III and Smith 1998) and a spreadsheet based program were developed. National Cooperative Highway Research

Program Report 483 (Hawk 2003) provides a methodology and guidance manual for the LCCA of individual bridges in a project level analysis.

A three-stage survey on LCCA usage was conducted in 2001 and 2002. It obtained information from 39 state DOTs (Ozbay et al. 2004). The results were reported by offices or divisions using LCCA and by the types of projects on which LCCA is used. Of the respondents 68 percent of the design and research offices, 37.5 percent of the materials and pavement offices, and 12.5 percent of bridges offices reported using LCCA. All of the respondents reported using LCCA for pavement projects and only 25 percent reported using LCCA for bridge projects.

Life-cycle Cost Analysis for Pavements

As shown by the results of the LCCA survey most of the usage has been for pavements. It has been used to evaluate design alternatives on a project-level basis (Kulkarni 1984; Beg et al. 2000; Safronetz and Sparks 2003; Lee et al. 2011). The California Department of Transportation (Caltrans) has mandated the use of LCCA to evaluate pavement design alternatives (Lee et. al. 2011). It has been used to evaluate rehabilitation, preventive maintenance, preservation alternatives, and construction techniques (Reigle and Zaniewski 2002; Smith et al. 2005; Gerbrandt and Berthelot 2007; Praticò et al. 2011; Pittenger et al. 2011 and 2012; Pour and Jeong 2012). LCCA has been used to optimize the timing and location of road infrastructure (pavements and bridges) maintenance projects (Evdorides et al. 2002), optimize resource allocation (Gerbrandt and Berthelot 2007), and to estimate annualized life-cycle costs of constructing and maintaining representative road segments that included pavements, bridges, and other

road infrastructure components (Swan et al. 2007). Katz (2004) used LCCA to compare FRP reinforced concrete pavement to steel reinforced concrete pavement.

Life-cycle Cost Analysis for Bridges

Many bridge management systems (BMS) use some form of life-cycle cost analysis on a network level (Safi et al. 2012). A BMS typically includes deterioration, life-cycle cost, and budget optimization procedures (Saito and Sinha 1987; Al-Subhi et al. 1990; Shirole et al. 1991; James et al. 1991; Frangopol et al. 2000; Patidar et al. 2007). Chen and Johnston (1990) reported on using economic analysis of alternatives to optimize bridge management decisions (time and cost) for maintenance, rehabilitation, and replacement. Elbehairy et al. (2009) reported on a bridge management system that uses decisions made on the project-level and network-level to optimize bridge repairs. Johnson et al. (1998) reported on using economic analysis to make a preliminary selection of a rehabilitation option, compare the cost and benefits of various rehabilitation alternatives to the no rehabilitation alternative, and establish priorities. Cady (1985) reported on using minimum life-cycle costs for bridge deck protection, repair, rehabilitation, and replacement strategies for the Pennsylvania Department of Transportation. LCCA was used to optimize maintenance of a reinforced concrete bridge deck (Mullard and Stewart 2012) and a reinforced concrete girder bridge (Zhu and Liu 2013).

The use of LCCA in bridge design and rehabilitation has been limited. Fagen and Phares (2000) used LCCA to evaluate a bridge-replacement alternative for low-volume county roads. Okasha et al. (2012) used LCCA to compare steel bridges fabricated with a

new maintenance-free steel and conventional painted carbon steel. Ehlen and Marshall (1996) used LCCA to compare concrete beams reinforced with FRP to beams reinforced with conventional steel. Ehlen (1997, 1999) used LCCA to compare FRP bridge decks to reinforced concrete decks. Grace et al. (2012) used LCCA to compare bridge decks reinforced with carbon fiber-reinforced polymer (CFRP) to bridge decks reinforced with conventional steel. The use of LCCA for bridges on a project level basis has been limited to the non-routine design of major bridges where the life-cycle cost model is customized (Thompson, 2004). Meiarashi et al. (2002) compared the life-cycle costs of a CFRP suspension bridge and a steel bridge.

Life-cycle Cost Analysis for Bridge Rehabilitation

LCCA tools for evaluating and comparing bridge rehabilitation strategies, especially fiber reinforced polymers, on a project level are needed. Klaiber et al. (1987) recommended using a life-cycle cost analysis to compare strengthening and replacement options on a project level. Limited information on life-cycle costs and the lack of simple LCCA tools have kept FRP from being used more (Hastak and Halpin 2000; Thompson 2004; Trejo and Reinschmidt 2007a). Cosenza and Manfredi (2002) and Porter and Harries (2007) identified and reported on the need for life-cycle analysis tools for FRP. These tools would allow designers to justify the use of high performance materials such as FRP even though initial costs are higher (Trejo and Reinschmidt 2007b).

The rehabilitation of reinforced concrete bridges with FRP extends the service life of the bridge which postpones the need for replacement. Since FRP can be installed without major impact on traffic it can reduce the user costs due to the repair or

rehabilitation. When it increases the live load capacity of a bridge it also reduces user costs for those vehicles that no longer need to detour around the bridge. LCCA tools would allow designers to justify the use of high performance materials such as FRP even though initial costs are higher (Trejo and Reinschmidt 2007b).

CHAPTER THREE: LIFE-CYCLE COST ANALYSIS

In a life-cycle cost analysis future costs are discounted to their present value. Costs (initial and future) can be either nominal or real (constant) dollars. While nominal dollars directly include the effect of inflation real dollars do not. Although either can be used in a LCCA they should not be combined in the same analysis and the use of real dollars is recommended (FHWA 2002). Three types of analyses were used in the study: deterministic, sensitivity, and probabilistic.

Discount Factors

Discount factors are used to calculate the present value of future costs (Blank and Tarquin 1998). The discount factor for a single amount (P/F) depends on the discount rate, i , and the time that the cost occurs, n :

$$(P/F, i, n) = \frac{1}{(1+i)^n} \quad (3.1)$$

The discount factor for a uniform series (P/A) depends on the discount rate and the time over which the costs occur, n :

$$(P/A, i, n) = \frac{(1+i)^n - 1}{i(1+i)^n} \quad (3.2)$$

In order to conduct the LCCA an appropriate discount rate must be selected. This allows future and present costs to be combined (James et al. 1991). For analysis periods longer than 50 years the use of a time declining discount rate is recommended (Boardman et al. 2011). A discount rate of 3.5 percent was used for costs occurring 50 or less years in the future and 2.5 percent for costs occurring more than 50 years in the future (Boardman et al. 2011).

Bridge Alternatives

The bridge used in the study is based on an existing bridge located in Woodford County in Central Kentucky. It is a four span continuous reinforced concrete T-beam structure that carries Hometown Road over the Bluegrass Parkway. There are two lanes on the bridge and four lanes, two in each direction, under the bridge. The maximum span length is 60 feet (18.3 m) and the total bridge length is 204.1 feet (62.2 m). The typical cross section of the existing bridge is shown in Figure 3.1a.

Two alternatives were considered, rehabilitation and replacement. Since the alternatives need to achieve the same level of service or utility, comparable benefits and no externalities, the rehabilitation alternative included deck restoration and safety work. Otherwise LCCA is not appropriate for comparing alternatives and a Benefit-Cost Analysis should be done instead (FHWA 2002). The first alternative was to rehabilitate the existing bridge. The rehabilitation consisted of externally applied CFRP to strengthen it for shear, latex modified concrete (LMC) overlay to improve the deck condition, and retrofitting the existing bridge rail with thrie beam for safety. The second alternative was to replace the existing bridge with a two span prestressed concrete I-beam bridge. The total length of the new bridge is 204 feet (62.2 m). The typical cross section of the replacement bridge is shown in Figure 3.1b. A typical installation of thrie beam retrofit is shown in Figure 3.2.

The analysis period is the time interval used to evaluate all future costs. The length of the analysis period was selected to include at least one major rehabilitation activity after any initial construction (FHWA 2002) and was the same for both alternatives in order to fairly compare results. The analysis period for this study was 75

years which is the designated service life for new bridges designed using the AASHTO Load and Resistance Factor Design specifications (AASHTO 2010a).

Remaining Service Life

The remaining service life (RSL) is the amount of service life remaining for an alternative at the end of the analysis period. In this study this occurs only for the rehabilitation alternative. The RSL is to account for remaining service life of the new bridge constructed at the end of the service life of the bridge rehabilitation. RSL is not the same as salvage value. With RSL the bridge remains in service while with a salvage value the bridge is demolished and materials reused.

The value of any remaining service life depends on when the activity occurs relative to the end of the analysis period. The value of the RSL was determined using activity cost and the amount of service life remaining past the end of the analysis period (Walls III and Smith 1998). The value was assumed to linearly decrease from the full value at the time of its construction to zero at the end of its service life. An RSL was calculated when the construction of an activity occurred before the end of the analysis period but the end of its service life occurred after. When timing of an activity was greater than or equal to the analysis period the RSL and the cost of the activity are equal and there was no net change in life-cycle cost.

In the probabilistic analysis the service lives of the replacement bridge, deck overlay, and deck replacement varied. As a result the activity timings also varied and more than one deck overlay and deck replacement may occur in an analysis period. In addition any activity that would possibly occur five years or closer to the end of the bridge

replacement service life was assumed to not have occurred since replacement would most likely be planned. Expressions were developed to calculate the RSL value for the possible timings of deck overlays and replacements and 21 test examples were used to verify the expressions.

Deck overlay number 1

$$RSL = \left(\frac{T_{DR1} - SL_{BR}}{T_{DR1} - T_{OV1}} \right) (C_{OV}) = \left(\frac{T_{DR1} - SL_{BR}}{SL_{OV}} \right) (C_{OV}) \quad (3.3)$$

Deck replacement number 1

If $T_{DR2} < T_{BR} + SL_{BR}$

$$RSL = \left(\frac{T_{DR2} - SL_{BR}}{T_{DR2} - T_{DR1}} \right) (C_{DR}) \quad (3.4)$$

If $T_{DR2} \geq T_{BR} + SL_{BR}$

$$RSL = \left(\frac{T_{BR} + SL_{BR} - SL_{BR}}{T_{BR} + SL_{BR} - T_{DR1}} \right) (C_{DR}) = \left(\frac{T_{BR}}{T_{BR} + SL_{BR} - T_{DR1}} \right) (C_{DR}) \quad (3.5)$$

Deck overlay number 2

If $T_{DR2} < T_{BR} + SL_{BR}$

$$RSL = \left(\frac{T_{DR2} - SL_{BR}}{T_{DR2} - T_{OV2}} \right) (C_{OV}) = \left(\frac{T_{DR2} - SL_{BR}}{SL_{OV}} \right) (C_{OV}) \quad (3.6)$$

If $T_{DR2} \geq T_{BR} + SL_{BR}$

$$RSL = \left(\frac{T_{BR} + SL_{BR} - SL_{BR}}{T_{BR} + SL_{BR} - T_{OV2}} \right) (C_{OV}) = \left(\frac{T_{BR}}{T_{BR} + SL_{BR} - T_{OV2}} \right) (C_{OV}) \quad (3.7)$$

Deck replacement number 2

$$RSL = \left(\frac{T_{BR}}{T_{BR} + SL_{BR} - T_{DR2}} \right) (C_{DR}) \quad (3.8)$$

Deck overlay number 3

$$RSL = \left(\frac{T_{BR}}{T_{BR} + SL_{BR} - T_{OV3}} \right) (C_{OV}) \quad (3.9)$$

where:

T_{BR} = timing of bridge replacement (years)
 T_{DR1} = timing of deck replacement number 1 (years)
 T_{DR2} = timing of deck replacement number 2 (years)
 T_{OV1} = timing of deck overlay number 1 (years)
 T_{OV2} = timing of deck overlay number 2 (years)
 T_{OV3} = timing of deck overlay number 3 (years)
 SL_{BR} = service life of bridge replacement (years)
 SL_{OV} = service life of deck overlay (years)
 C_{DR} = cost of bridge deck replacement (\$)
 C_{OV} = cost of deck overlay (\$)

RSL test examples used included:

1. 75-year Bridge Service Life (Mean), T_{BR} = 20 years, T_{OV1} = 40 years, T_{DR1} = 60 years, T_{OV2} = 80 years, T_{DR2} = 100 years (Mean Activity Timings)
2. 70-year Bridge Service Life (Minimum), T_{BR} = 20 years, T_{OV1} = 40 years, T_{DR1} = 60 years, T_{OV2} = 80 years, T_{DR2} = 100 years (Mean Activity Timings)
3. 90-year Bridge Service Life (Maximum), T_{BR} = 20 years, T_{OV1} = 40 years, T_{DR1} = 60 years, T_{OV2} = 80 years, T_{DR2} = 100 years, T_{OV3} = 120 years (Mean Activity Timings)
4. 70-year Bridge Service Life (Minimum), T_{BR} = 10 years, T_{OV1} = 25 years, T_{DR1} = 40 years, T_{OV2} = 55 years, T_{DR2} = 70 years, T_{OV3} = 85 years (Minimum Activity Timings)

5. 90-year Bridge Service Life (Maximum), $T_{BR} = 10$ years, $T_{OV1} = 25$ years, $T_{DR1} = 40$ years, $T_{OV2} = 55$ years, $T_{DR2} = 70$ years, $T_{OV3} = 85$ years (Minimum Activity Timings)
6. 70-year Bridge Service Life (Minimum), $T_{BR} = 25$ years, $T_{OV1} = 50$ years, $T_{DR1} = 75$ years, $T_{OV2} = 100$ years (Maximum Activity Timings)
7. 90-year Bridge Service Life (Maximum), $T_{BR} = 25$ years, $T_{OV1} = 50$ years, $T_{DR1} = 75$ years, $T_{OV2} = 100$ years, $T_{DR2} = 125$ years (Maximum Activity Timings)
8. 80-year Bridge Service Life, $T_{BR} = 20$ years, $T_{OV1} = 40$ years, $T_{DR1} = 60$ years, $T_{OV2} = 80$ years, $T_{DR2} = 100$ years, $T_{OV3} = 120$ years (Mean Activity Timings)
9. 75-year Bridge Service Life, $T_{BR} = 10$ years, $T_{OV1} = 25$ years, $T_{DR1} = 40$ years, $T_{OV2} = 55$ years, $T_{DR2} = 70$ years, $T_{OV3} = 85$ years (Minimum Activity Timings)
10. 85-year Bridge Service Life, $T_{BR} = 20$ years, $T_{OV1} = 40$ years, $T_{DR1} = 60$ years, $T_{OV2} = 80$ years, $T_{DR2} = 100$ years, $T_{OV3} = 120$ years (Mean Activity Timings)
11. 75-year Bridge Service Life, $T_{BR} = 20$ years, $T_{OV1} = 45$ years, $T_{DR1} = 70$ years, $T_{OV2} = 95$ years, $T_{DR2} = 120$ years
12. 90-year Bridge Service Life, $T_{BR} = 25$ years, $T_{OV1} = 45$ years, $T_{DR1} = 70$ years, $T_{OV2} = 90$ years, $T_{DR2} = 115$ years
13. 75-year Bridge Service Life, $T_{BR} = 15$ years, $T_{OV1} = 35$ years, $T_{DR1} = 55$ years, $T_{OV2} = 75$ years, $T_{DR2} = 95$ years
14. 80-year Bridge Service Life, $T_{BR} = 15$ years, $T_{OV1} = 35$ years, $T_{DR1} = 55$ years, $T_{OV2} = 75$ years, $T_{DR2} = 95$ years
15. 80-year Bridge Service Life, $T_{BR} = 10$ years, $T_{OV1} = 30$ years, $T_{DR1} = 50$ years, $T_{OV2} = 70$ years, $T_{DR2} = 90$ years

16. 90-year Bridge Service Life, $T_{BR} = 10$ years, $T_{OV1} = 30$ years, $T_{DR1} = 50$ years,
 $T_{OV2} = 70$ years, $T_{DR2} = 90$ years, $T_{OV3} = 110$ years
17. 75-year Bridge Service Life, $T_{BR} = 15$ years, $T_{OV1} = 30$ years, $T_{DR1} = 45$ years,
 $T_{OV2} = 60$ years, $T_{DR2} = 75$ years, $T_{OV3} = 90$ years
18. 85-year Bridge Service Life, $T_{BR} = 15$ years, $T_{OV1} = 35$ years, $T_{DR1} = 50$ years,
 $T_{OV2} = 70$ years, $T_{DR2} = 85$ years, $T_{OV3} = 105$ years
19. 90-year Bridge Service Life, $T_{BR} = 20$ years, $T_{OV1} = 45$ years, $T_{DR1} = 65$ years,
 $T_{OV2} = 90$ years, $T_{DR2} = 110$ years
20. 85-year Bridge Service Life, $T_{BR} = 15$ years, $T_{OV1} = 30$ years, $T_{DR1} = 50$ years,
 $T_{OV2} = 65$ years, $T_{DR2} = 85$ years, $T_{OV3} = 100$ years
21. 75-year Bridge Service Life, $T_{BR} = 15$ years, $T_{OV1} = 35$ years, $T_{DR1} = 60$ years,
 $T_{OV2} = 80$ years, $T_{DR2} = 105$ years

Bridge Activities and Costs

All activities associated with each alternative (initial construction, rehabilitation, and routine maintenance) are identified. The number of activities can be different for each alternative. Activities include routine maintenance (on an annual basis unless detailed data is available), preventive maintenance (preservation), repair, and rehabilitation. A schedule of activity timing includes the performance period or service life of each activity, when work zones and detours will be used, how long work zones will be in place, and the length of detours. The activity timings used in this study are summarized in Table 3.1.

Expenditure stream diagrams show all activities, costs associated with those activities, and activity and cost timing in a single graphic. This can be a visual aid for the analyst and when presenting the LCCA results. Any remaining service life for the rehabilitation alternative is shown at the end of the analysis period as a negative cost. Example expenditure stream diagrams for the replacement and rehabilitation alternatives are shown in Figure 3.

The estimated time to construct the bridge replacement and deck restoration are based on an analysis of contract completion dates included in Kentucky Transportation Cabinet (KYTC) bridge and deck restoration projects let from January 2013 to October 2014. A listing of the projects used is contained in Appendix A. Details of the time analysis are contained in Appendix B.

There are two general categories of costs, agency and user costs (Zimmerman et al. 2000, Beg et al. 2000, FHWA 2002). Costs that were similar for both alternatives were eliminated from the analysis. These are typically user costs during normal operations, i.e. no maintenance or construction activities that require a work zone with traffic restrictions.

Agency Costs

Agency costs include the costs of new construction, repair, rehabilitation, and maintenance of bridges and bridge components. Other agency costs include the cost of design, condition assessment of existing structures, right-of-way acquisition, utility adjustments, and any salvage value. Some costs can be estimated on a unit cost basis, i.e. bridge replacement, deck replacement, repairs, and routine annual maintenance.

However, some of these costs are only for the actual construction. The cost of preliminary engineering (PE), construction engineering (CE), maintenance of traffic (MOT), and any demolition are added to the cost of actual construction. The agency cost parameters used are summarized in Table 3.2.

Agency cost data was obtained from bridge replacement, deck restoration, and guardrail projects constructed in Kentucky and published data. The bid data analysis herein is from the Kentucky Transportation Cabinet (KYTC) projects let from January 2013 to October 2014. The bid data analysis determined unit costs for prestressed concrete girder bridges, deck replacement, bridge removal, deck removal, latex modified concrete (LMC) overlays, bridge overlay approach pavement, bridge rail retrofit, and maintenance of traffic. Details of the analyses are contained in Appendix C for unit construction costs and Appendix D for maintenance of traffic costs.

Bridge replacement projects and roadway projects that included new and replacement bridges were used to determine the unit costs for prestressed concrete girder bridges, deck replacement, and the percentage of the contract price for maintenance of traffic during bridge replacement. The analysis used the bid data (116 bidders) for 30 prestressed concrete I-beam bridges to determine the cost of bridge and deck replacement and the bid data (93 bidders) for 27 bridge projects to determine the percentage of contract price for maintenance of traffic costs. The bridge removal cost was determined using the bid data (23 bidders) for the removal of 10 continuous reinforced concrete T-beam bridges. The deck removal cost used the bid data (three bidders) for two bridges.

Bridge deck restoration projects were used to determine the unit costs for LMC overlays, bridge overlay approach pavement, and the percentage of the contract price for

maintenance of traffic costs during bridge rehabilitation. The analysis used the bid data (595 bidders) for 108 bridges.

Guardrail projects were used to determine the unit cost for bridge rail retrofit with thrie beam. The analysis used the bid data (six bidders) for two bridges.

The unit cost for carbon fiber-reinforced polymer (CFRP) wrap was based on published cost data (e.g. O’Conner et al. 1999). O’Connor et al. (1999) reported costs of CFRP used to strengthen a reinforced concrete pier cap of a bridge in New York. Hag-Elsafi et al. (2001) reported costs of CFRP used to strengthen a reinforced concrete T-beam bridge in New York. Wipf et al. (2004) reported costs of CFRP used to repair impact damaged prestressed concrete beams in Iowa.

A survey by the Washington State Department of Transportation (DOT) in 2002 collected engineering cost data from 25 states. The average cost of PE was 10.3 percent and for CE was 11.2 percent. These values tend to be higher for more complex urban projects than for rural projects (Alam et al. 2005).

Annual routine bridge maintenance costs are the sum of annual maintenance costs for the various bridge components. Wipf et al. (1987) reported annual maintenance costs using data provided by some states. The average annual cost for reinforced concrete deck girders (old bridge) and prestressed concrete beams (new bridge) were converted to 2013 dollars using gross domestic product (GDP) deflators (U.S. Department of Commerce).

Bridge Replacement Cost

The total cost to replace the existing bridge included the costs for PE, CE, removing the existing bridge, constructing the new bridge and approaches, and

maintaining traffic during the construction. The cost of bridge removal and construction were estimated using unit costs and estimated bridge areas. The cost of approach roadway construction was estimated as a percent of the bridge construction cost. The cost of maintenance of traffic was estimated as a percent of the cost of bridge removal, bridge construction, and approach roadway construction. The cost of PE was estimated as a percentage of bridge and approach roadway construction costs. The cost of CE was estimated as a percentage of bridge removal, bridge construction, and approach roadway construction costs.

Bridge Deck Replacement Cost

The total cost to replace the existing bridge deck included the costs for PE, CE, removing the existing reinforced concrete bridge deck and rails, constructing the new reinforced concrete bridge deck and rails, and maintaining traffic during the construction. The cost of bridge deck removal and construction were estimated using unit costs and estimated bridge areas. The cost of maintenance of traffic was estimated as a percent of the cost of bridge deck removal and bridge deck construction. The bridge deck construction unit cost was developed using a subset of bridge construction bid items, those items used to construct the reinforced concrete deck and rails. The cost of PE was estimated as a percentage of bridge deck construction cost. The cost of CE was estimated as a percentage of bridge deck removal and construction costs.

Bridge Deck Restoration Cost

The total cost to construct the bridge deck restoration included the costs for PE, CE, constructing the deck overlay, construct the overlay approach pavement, and maintaining traffic during construction. The costs for PE and CE were estimated as a percentage of deck overlay and overlay approach pavement costs. The quantity of deck overlay for the existing bridge was estimated to be 5,100 ft² (474 m²) and for the replacement bridge to be 5,712 ft² (531 m²). The quantity of overlay approach pavement for the existing bridge was estimated to be 278 yd² (232 m²) and for the replacement bridge to be 355 yd² (297 m²).

Bridge Rehabilitation Cost

The total cost to rehabilitate the existing bridge included the costs for PE, CE, applying the CFRP, restoring the bridge deck, retrofitting the existing bridge rail with thrie beam rail, and maintaining traffic during construction. The cost of CFRP application, bridge deck restoration, and bridge deck approach pavement construction were estimated using unit costs and estimated areas or lengths as appropriate. The cost of maintenance of traffic was estimated as a percent of the cost of bridge rehabilitation construction. The costs of PE and CE were estimated as a percentage of CFRP, deck restoration, and bridge rail retrofit costs. The quantity of CFRP wrap was estimated assuming the girder stems are wrapped with two plies on the bottom and both faces of each stem from the supports to the quarter points in the adjacent spans. An additional ply is added longitudinally near the top of both stem faces for anchorage of the wrapped plies. This resulted in an estimated quantity of single ply CFRP of 5,700 ft² (530 m²).

User Costs

User costs include the costs of time delays (value of time), vehicle operation, and crashes (FHWA 2002, AASHTO 2010b, Watts et al. 2012). Crash costs include costs for property damage only, injury, and fatality crashes. The user cost parameters used are summarized in Table 3.3.

Long term user costs are those costs due to load limits, height restrictions, narrow widths, and poor horizontal alignment. Load limits and height restrictions cause some vehicles to detour around a bridge. Detours lead to an increase in travel time, vehicle operating costs, and accident rates. Narrow bridge widths lead to an increase in travel time due to reduced operating speeds and crashes (Son and Sinha 1997). Deck condition, functional classification, bridge width, and approach roadway alignment can influence accident risks (Thompson et al. 2000). A very badly spalled deck increases user costs as drivers tend to slow down which increases travel time as well as vehicle operating costs (Markow et al. 1993).

Short term user costs are those costs due to work zones for bridge maintenance, repair, rehabilitation, or replacement. When a bridge is closed all traffic must detour around the bridge. When one or more lanes are closed there are increases in travel time and crash rates. Sufficient data to determine any increase in crash rates may not be available. Drivers may also opt to detour around a work zone, where possible, to avoid work zone congestion.

Vehicle operating costs can be broken down by vehicle class, passenger cars and heavy trucks as a minimum, and could also include busses and utility trucks (dos Santos et al. 2011). In order to use a variety of vehicle types the number of each vehicle type

needs to be known. Since this is typically not known, this study used an average value for automobiles, pickups, vans, and sport utility vehicles and another value for commercial trucks (Barnes and Langworthy 2004). The “baseline” case is based on a fuel price of \$1.50 per gallon (\$0.40 per liter) and costs for maintenance/repair, tires, and depreciation in 2003 dollars. This study adjusted the fuel cost using \$3.25 per gallon (\$0.86 per liter) and converted the other costs to 2013 dollars using GDP deflators. The average cost to operate personal vehicles is then 27.25 cents per mile (16.9 cents per kilometer) and the cost to operate commercial trucks is 73.4 cents per mile (45.6 cents per kilometer). The baseline costs and the adjusted costs are summarized in Table 3.4.

The value of time can be broken down by personal and business travel (USDOT 2012). The values are per person-hour. Two weighted averages for automobiles are given: one for local travel and one for intercity travel. The weighted averages were determined using distributions of travel by trip purpose on various modes. This study assumed an equal distribution and used the average of the two.

Crash costs depend on traffic volumes, crash rates, crash distribution by severity level, and the cost associated with each level. This study used the Abbreviated Injury Scale (AIS), National Highway Traffic Safety Administration guidance for the distribution of injuries to the different injury levels, the value of property damage only crashes (AIS 0), and the Value of a Statistical Life (VSL) to calculate the cost of a non-fatal crash, Table 3.5 (USDOT 2012, USDOT 2013b).

User Cost Calculations

In order to calculate user costs it is necessary to estimate traffic volumes, travel delays, additional travel distance, crash rate, and fatality rate. The value of time (VOT), traffic volumes, and vehicle operating costs (VOC) were then used with the estimated amount of delay and vehicle occupancy rates to calculate additional user costs. The vehicle occupancy rates used are from AASHTO (2010b). Traffic volumes, additional travel distance, and crash and fatality rates were used to calculate crash costs. The nine combinations of initial traffic volumes on and under the bridge, average daily traffic (ADT) cases, are shown in Table 3.6. The rates for total crashes and fatalities are from the Kentucky Strategic Highway Safety Plan, 2011-2014 (KYTC 2011). The rates used are for the year 2011 which was the latest year for which rates were given.

This study used the following assumptions in calculating user costs:

- User costs under normal operating conditions are the same for existing and replacement bridges, no delays or additional travel distance
- User costs for identical activities under work zone conditions may be the same (lane closures, delays, or detours, additional travel time and distance) but generally occur at different times
- Crash and fatality rates under normal operating conditions are the same for existing and replacement bridges
- Crash and fatality rates in work zones are the statewide rates due to lack of work zone specific data

The vehicle operating costs (VOC) were calculated using:

$$C_{VOC} = [(ADT)(VOC_C) + (ADTT)(VOC_T)](\Delta D) \quad (3.10)$$

where:

C_{VOC} = total vehicle operating cost per day, \$

VOC_C = vehicle operating cost for cars, \$/vehicle

VOC_T = vehicle operating cost for trucks, \$/vehicle

ADT = average daily traffic, vehicles per day

$ADTT$ = average daily truck traffic, vehicles per day

ΔD = additional distance travelled, mi (km)

The value of time (VOT) costs were calculated using:

$$C_{VOT} = [(ADT)(VOT_C) + (ADTT)(VOT_T)](\Delta T) \quad (3.11)$$

where:

C_{VOC} = total value of time cost per day, \$

VOT_C = value of time for cars, \$/hr

VOT_T = value of time for trucks, \$/hr

ADT = average daily traffic, vehicles per day

$ADTT$ = average daily truck traffic, vehicles per day

ΔT = time delay per vehicle

The crash costs were calculated using:

$$C_{crash} = [(CR)(cost/crash) + (FR)(cost/fatality)](ADT)(D)/1,000,000 \quad (3.12)$$

where:

C_{crash} = total crash cost per day, \$

CR = crash rate, number of crashes per million vehicle-miles (crashes per million vehicle-kilometers)

FR = fatality rate, number of fatalities per million vehicle-miles (crashes per million vehicle-kilometers)

ADT = average daily traffic, vehicles per day

D = distance travelled, mi (km)

Table 3.1-Bridge activity timing

Activity	Timing (year)	Duration (days)	Detour
Replacement Alternative			
Construct new bridge	0	240	Yes
Place deck overlay	20	30	No
Replace deck	40	45	Yes
Place deck overlay	60	30	No
End service life	75	--	--
Rehabilitation Alternative			
Apply FRP, place deck overlay, retrofit bridge rail	0	30	No
Construct new bridge	20	240	Yes
Place deck overlay	40	30	No
Replace deck	60	45	Yes
Remaining service life new bridge	75	--	--

Table 3.2-Agency cost parameters

Parameter	Value
Prestressed concrete girder bridge, \$/ft ² (\$/m ²)	107.52 (1,157.33)
Deck overlay-new bridge, \$/ft ² (\$/m ²)	16.54 (178.03)
Deck overlay-old bridge, \$/ft ² (\$/m ²)	16.54 (178.03)
Bridge overlay approach pavement-new bridge, \$/yd ² (\$/m ²)	40.01 (47.85)
Bridge overlay approach pavement-old bridge, \$/yd ² (\$/m ²)	54.83 (65.58)
Deck replacement, \$/ft ² (\$/m ²)	38.17 (410.86)
CFRP wrap (one layer), \$/ft ² (\$/m ²)	54.39 (585.45)
Bridge rail retrofit with thrie beam, \$/ft (\$/m)	76.99 (252.59)
Bridge removal, \$/ft ² (\$/m ²)	14.13 (152.09)
Deck removal, \$/ft ² (\$/m ²)	4.87 (52.42)
Bridge annual maintenance-new bridge, \$/ft ² (\$/m ²)	0.10 (1.08)
Bridge annual maintenance-old bridge, \$/ft ² (\$/m ²)	0.15 (1.61)
Maintenance of traffic-replacement, percent	3.41
Maintenance of traffic-rehabilitation, percent	15.12
Preliminary Engineering, percent	10

CHAPTER FOUR: DETERMINISTIC ANALYSIS

In this study deterministic analyses were carried out to determine the life-cycle costs of the replacement and rehabilitation alternatives and which had the lower life-cycle cost. Analyses were carried out for 1) a bridge over a highway, 2) a bridge over a highway with modified bridge construction time and cost, 3) a bridge over a waterway, and 4) a bridge over a waterway with modified bridge construction time and cost. Each analysis used the agency and user cost parameters shown in Table 3.1, Table 3.2 and Table 3.3. Each analysis used a range of initial traffic volumes, both on and under the bridge.

Bridge over Highway

Deterministic analyses were carried out for each of the nine ADT cases (Table 3.6). The agency, user, and total life-cycle costs for the replacement and rehabilitation alternatives of the bridge over a highway are summarized in Table 4.1.

In all the traffic cases the rehabilitation alternative had the lower life-cycle cost. Although the agency costs for both alternatives were almost equal the user costs were not. For this example the agency cost for the replacement alternative is only 1.6 percent more than the rehabilitation. Since agency costs do not depend on traffic volumes they were the same for all traffic cases and the increases in life-cycle costs were primarily due to user costs. The user costs for lower traffic volumes were relatively close and the difference dramatically increased as the traffic volumes increased. The impact of traffic

volume on user costs was especially significant for traffic under the bridge for the estimated delays, i.e. ADT cases 3, 6, and 9 (Table 3.6).

As the traffic volume increased, both on and under the bridge, the difference in total life-cycle cost between the alternatives also increased. The differences in total life-cycle costs are summarized in Table 4.2. The smallest difference was for case 1, 100 vehicles per day (vpd) on the bridge and 5,000 vpd under the bridge. The second smallest difference was for case 2, 100 vpd on the bridge and 10,000 vpd under the bridge. This is followed by cases 4 and 5 with 1,000 vpd on the bridge and 5,000 to 10,000 vpd under the bridge. These are followed by cases 3 and 6 with 25,000 vpd under the bridge and 100 to 1,000 vpd on the bridge. The next two are cases 7 and 8 with 5,000 vpd on the bridge and 5,000 to 10,000 vpd under the bridge. The largest difference was for case 9, 5,000 vpd on the bridge and 25,000 vpd under the bridge.

Agency, user, and total life-cycle costs for all the activities and for each traffic case are summarized in Table 4.3 for the replacement alternative and Table 4.4 for the rehabilitation alternative. Agency costs for the replacement alternative are the same for each of the traffic cases. Agency costs for the rehabilitation alternative are the same for each of the traffic cases.

User life-cycle costs for the replacement alternative is summarized in Table 4.5 and for the rehabilitation alternative is summarized in Table 4.6. Two activities had no impact on traffic under the bridge: deck replacement and deck overlay. For these activities the user costs are the same for those traffic cases where traffic on the bridge is the same. For the remaining activities, user costs increase as traffic on and under the bridge increases.

Bridge over Highway with Modified Bridge Construction Time and Cost

The deterministic analysis of the bridge over a highway showed that user costs were frequently high and also a significant portion of the life-cycle costs, Table 4.7. The percentage of life-cycle costs that were due to user costs for the two alternatives did not differ by much, about three percent or less. For low traffic volumes the user costs ranged from 68.7 to 91.3 percent of total life-cycle costs for the replacement alternative and from 65.8 to 90.3 percent of total life-cycle costs for the rehabilitation alternative. For medium traffic volumes the user costs ranged from 76.9 to 92.1 percent of total life-cycle costs for the replacement alternative and from 73.0 to 90.9 percent of total life-cycle costs for the rehabilitation alternative. For high traffic volumes the user costs ranged from 89.4 to 94.3 percent of total life-cycle costs for the replacement alternative and from 86.0 to 93.1 percent of total life-cycle costs for the rehabilitation alternative. The percentage of life-cycle costs due to user costs increased as traffic volumes increased.

The sensitivity analysis showed that the time to construct the new bridge was one of the four parameters that had the most influence on life-cycle costs. Therefore, two modifications to the bridge construction time were investigated. In the first modification the most likely time to construct the bridge was decreased by 25 percent. In the second modification it was decreased by 50 percent. The times used are summarized in Table 4.8.

Since decreases in construction time would most likely increase the cost three cost variations were used with each time modification. For the first time modification the unit cost to construct the bridge was increased by zero, five, and ten percent. For the second

time modification they were increased by zero, ten, and twenty percent. The unit costs used are summarized in Table 4.9.

The combinations of modified times and costs used are summarized in Table 4.10. Even though no increase in cost is likely to occur it was included as a base line or limiting value.

Six additional deterministic analyses using the modified bridge construction times and costs were carried out for each of the nine traffic cases. The agency, user, and total life-cycle costs for the six modifications are summarized in Tables 4.11 to 4.16. Although the decrease in construction time reduced the difference in life-cycle costs between the replacement and rehabilitation alternative, the rehabilitation alternative still had the lower life-cycle cost. The decrease in construction time had the larger influence on life-cycle costs than subsequent increases in unit costs.

Bridge over Waterway

Since a large number of bridges cross waterways the effect of no vehicular traffic under the bridge was investigated. This reduced the number of traffic cases to just three: low (100 vpd), medium (1,000 vpd), and high (5,000 vpd) traffic volumes on the bridge.

Three additional deterministic analyses were carried out. The agency, user, and total life-cycle costs for the three cases are summarized in Table 4.17. The rehabilitation alternative still had the lower life-cycle cost. However the difference for the low traffic case was only 5.3 percent. This cost difference maybe small enough for some decision makers to choose the replacement alternative. Although the difference in total life-cycle costs between the alternatives decreased, there was a significant decrease for some traffic cases.

Bridge over Waterway with Modified Bridge Construction Time and Cost

The effect of reducing bridge construction time on bridge with no vehicular traffic under the bridge was investigated. Six additional deterministic analyses were carried out for each three traffic volume cases. The agency, user, and total life-cycle costs for the six modifications are summarized in Tables 4.18 to 4.23.

Although the decrease in construction time reduced the difference in life-cycle costs between the replacement and rehabilitation alternative, the rehabilitation alternative still had the lower life-cycle cost. For the lower traffic cases the difference is small enough for one to consider using accelerated bridge technologies for bridge construction as long as any increases in construction costs are minimal. A five percent increase in the bridge construction unit cost, however, resulted in an increase in the difference. The reduced construction time had an adverse effect on the difference.

Deterministic Analysis Summary

Deterministic analyses were carried out for a highway bridge, a highway bridge with modified bridge construction time and cost, a waterway bridge, and a waterway bridge with modified bridge construction time and cost. The percent difference in total life-cycle costs from all the analyses are summarized in Table 4.24.

The rehabilitation alternative had the lower life-cycle cost in all analyses. However there were instances where the difference in life-cycle cost has been reduced enough for a decision maker to consider accelerated bridge construction technologies for low and medium traffic volumes. If it were possible to obtain a 50 percent decrease in

bridge construction time without any increase in cost the life-cycle costs are almost the same, 0.8 percent difference.

When the bridge is over a waterway the differences in life-cycle costs are all reduced. For 100 vpd the difference was 5.3 percent or less. When combined with accelerated bridge construction technologies a further decrease in the difference was possible. For the low traffic volumes the difference was less than five percent for some combinations of decreased construction time and increased cost. However, increases in bridge construction cost negated any decrease in the difference and in some cases increased the difference.

CHAPTER FIVE: SENSITIVITY ANALYSIS

A sensitivity analysis can be used to improve the results of a deterministic analysis (FHWA 2002) by providing a limited measure of the effects of input parameter variability on life-cycle costs. The sensitivity analysis is used to determine which input parameters the life-cycle costs are the most sensitive to. This can assist decision-makers in understanding any variability in the analysis results of the design alternatives. It can also be used to identify which input values need a more refined estimate and which do not. Changes in only one input parameter are made while all the others are held constant. The life-cycle cost is sensitive to an input parameter when a small change in that parameter results in a relatively large change in the life-cycle cost (Trejo and Reinschmidt 2007a). However, since only one input parameter is changed at a time the analysis cannot measure the impact of simultaneous changes in more than one parameter. It also does not give any indication of risk (Pittenger et al. 2012).

The sensitivity analysis in this study used the 26 parameters presented in Table 5.1. Each parameter was changed by plus and minus ten percent from the mean input values. An analysis was done for each of the nine ADT cases. Changes in life-cycle costs were converted to a percentage of the mean life-cycle cost for each ADT case. Except for changes in the service life of the CFRP rehabilitation, both plus and minus changes in parameter mean values of ten percent resulted in the same magnitude, but different sign, of change in life-cycle costs. All parameters had changes less than ten percent.

Although the ranking of parameters varied depending on the alternative and the ADT case, the same four parameters had the most impact on life-cycle cost, user costs in

particular, for both alternatives. They were bridge replacement duration, ADT under bridge, VOT cars, and delay time under the bridge during bridge replacement.

Three summaries of the analysis results are presented. The first one is for the replacement alternative, the second one is for the rehabilitation alternative, and the third one is for both alternatives combined.

The degree of sensitivity depended on the initial traffic volume. Some parameters had changes greater than one percent for all ADT cases. For other parameters some ADT cases had changes less than one percent and other ADT cases had changes greater than one percent. Four categories of changes in life-cycle cost, as a function of initial ADT, were found. Categories A, B, C, and D are described as follows:

- Category A: percent change in life-cycle cost increased as ADT on bridge increased (ADT under bridge constant) and as ADT under bridge increased (ADT on bridge constant)
- Category B: percent change in life-cycle cost decreased as ADT on bridge increased (ADT under bridge constant) and increased as ADT under bridge increased (ADT on bridge constant)
- Category C: percent change in life-cycle cost increased as ADT on bridge increased (ADT under bridge constant) and decreased as ADT under bridge increased (ADT on bridge constant)
- Category D: percent change in life-cycle cost decreased as ADT on bridge increased (ADT under bridge constant) and as ADT under bridge increased (ADT on bridge constant)

The categories of each input parameter for the replacement and rehabilitation alternatives are summarized in Table 5.2

Replacement Alternative

The results of the sensitivity analysis for the replacement alternative are summarized in Table 5.3.

Nine parameters had changes greater than one percent for at least two ADT cases. Four of these had changes greater than one percent for all nine ADT cases: bridge replacement duration (Category A), ADT under bridge (Category B), delay time under the bridge during bridge replacement (Category B), and VOT cars (Category A). Two of these had the same impact on life-cycle cost: ADT under bridge and delay time under the bridge during bridge replacement. The remaining five parameters had changes greater than one percent for the number of ADT cases shown. Category B included one parameter: VOT trucks (3 cases). Category C included three parameters: ADT on bridge (6 cases), delay time on the bridge during bridge replacement (5 cases), and detour length during replacement (2 cases). Category D included one parameter: bridge replacement cost (4 cases).

The remaining 17 parameters had changes less than one percent for all nine ADT cases. Two parameters had the same impact on life-cycle cost: deck overlay duration and delay time on the bridge during deck overlay. Category C included six parameters: VOC cars, deck replacement duration, delay time on the bridge during deck replacement, deck overlay duration, delay time on the bridge during deck overlay, and VOC trucks. Category D included four parameters: deck overlay cost for the new bridge, deck

replacement cost, MOT during replacement, and MOT during rehabilitation. The seven rehabilitation specific parameters had no impact on the life-cycle cost of the replacement alternative.

Rehabilitation Alternative

The results of the sensitivity analysis for the rehabilitation alternative are summarized in Table 5.4.

Fifteen parameters had changes greater than one percent for at least one ADT case. Five of these had changes greater than one percent for all nine ADT cases: ADT under bridge (Category B), VOT cars (Category A), bridge replacement duration (Category A), delay time under the bridge during bridge replacement (Category B) and service life of the CFRP rehabilitation (Category C). The remaining ten parameters had changes greater than one percent for the number of ADT cases shown. Category B included four parameters: deck overlay duration (5 cases), bridge rehabilitation duration (5 cases), delay time under the bridge during bridge rehabilitation (3 cases), and VOT trucks (3 cases). Category C included three parameters: ADT on bridge (5 cases), delay time on the bridge during bridge replacement (4 cases), and detour length during replacement (2 cases). Category D included three parameters: Bridge replacement cost (1 case), FRP strengthening cost (1 case), and quantity of CFRP (1 case). Two parameters had the same impact on LCC: FRP strengthening cost and the quantity of CFRP.

The remaining 11 parameters had changes less than one percent for all nine ADT cases. Category C included six parameters: deck replacement duration, VOC cars, delay time on the bridge during deck replacement, delay time on the bridge during bridge

rehabilitation, delay time on the bridge during deck overlay, and VOC trucks. Category D included five parameters: deck overlay cost for the old bridge, MOT during rehabilitation, deck replacement cost, deck overlay cost for the new bridge, and MOT during replacement.

Replacement and Rehabilitation Alternatives

A comparison of the sensitivity analysis results for both alternatives show some similarities in which parameters have the most influence on the life-cycle cost for each of the nine ADT cases. The same four parameters had the most impact on life-cycle cost, user costs in particular. They were bridge replacement duration, ADT under bridge, VOT cars, and delay time under bridge-bridge replacement. In addition, two of these parameters had changes in life-cycle cost greater than five percent for all nine ADT cases: bridge replacement duration and VOT cars. The other two parameters had changes greater than five percent in six of the nine ADT cases. The ADT on bridge parameter also had changes greater than five percent but only for two ADT cases with the replacement alternative and only one ADT case with the rehabilitation alternative.

The 11 parameters that had changes less than one percent for all ADT cases for the rehabilitation alternative also had changes less than one percent for all ADT cases for the replacement alternative. The deck overlay duration parameter had changes less than one percent for all ADT cases for the replacement alternative but not for the rehabilitation alternative.

The five parameters that had changes greater than one percent for some ADT cases for the replacement alternative also had changes greater than one percent for some

ADT cases for the rehabilitation alternative. Four other parameters had changes greater than one percent for some ADT cases for only the rehabilitation alternative: bridge rehabilitation duration, delay time under bridge-bridge rehabilitation, FRP strengthening cost, and quantity of CFRP. The service life of the CFRP rehabilitation had changes greater than one percent for all ADT cases for the rehabilitation alternative.

Sensitivity Analysis Summary

Although only one parameter at a time is varied in a sensitivity analysis multiple parameters can vary simultaneously in a probabilistic analysis. Individually some parameters had a positive effect on life-cycle costs, an increase in the value of the parameter resulted in an increase in life-cycle costs. Other parameters had a negative effect, an increase in the value of the parameter resulted in a decrease in life-cycle costs. When the individual changes are combined and applied simultaneously the overall effect may be positive, negative, or about neutral.

Four parameters had the most influence on life-cycle costs: bridge replacement duration, ADT under the bridge, VOT cars, and delay time under the bridge during bridge replacement. Two of these were Category A: bridge replacement duration and VOT cars. The other two were Category B: ADT under the bridge and delay time under the bridge during bridge replacement. For increases in traffic volume on the bridge the two categories had the opposite effect on the percent change in life-cycle costs. For increases in traffic volume under the bridge they had the same effect.

For the high traffic volume on the bridge cases the influence was similar to the four parameters that had the most influence, i.e. for high traffic volumes there were five parameters with the most influence on life-cycle costs. It was a Category C parameter:

ADT on the bridge. Increases in traffic volume on the bridge increased the percent change in life-cycle costs and increases in traffic volume under the bridge decreased the percent change in life-cycle costs. Traffic volume under the bridge had the opposite effect. When combined the influence of one of the parameters offset the influence of the other, especially for high traffic volumes.

CHAPTER SIX: PROBABILISTIC ANALYSIS

In a probabilistic analysis multiple parameters are varied at the same time to account for variability and uncertainty. The Monte Carlo simulation is commonly used to perform the probabilistic analysis. The two main parameters with uncertainties are related to costs and service life (Pittenger et al. 2012). Probability distribution functions and random sampling were used to select a discrete value for inputs that varied. The process was repeated and a range of life-cycle costs was generated for each alternative. A statistical analysis of the results was performed to determine the cumulative probability of the life-cycle costs for each alternative (Reigle and Zaniewski 2002).

Two common probability distributions were used in this study to represent the variability of some input parameters (Walls III and Smith 1998, Pittenger et al. 2012). Agency unit costs represented by a normal distribution with mean and standard deviation values are summarized in Table 6.1. In order to avoid the possibility of low or negative unit costs minimum values were included. Parameters represented by a triangular distribution with minimum, most likely, and maximum values, are summarized in Table 6.2. Minimum traffic volumes were assumed to be 80% of the most likely traffic volume and maximum traffic volumes were 110% of the most likely traffic volume. The Palisades @Risk software (Palisades Corporation) was used within spreadsheets to calculate life-cycle costs using the ranges and distributions of input values.

Each life-cycle cost analysis consisted of 100,000 iterations of the life-cycle cost model. Latin Hypercube sampling was used when generating random number as it has quicker convergence (Walls III and Smith, 1998). Each analysis used the same initial

seed number for each ADT case in order to be able to compare the impact of traffic volume on the results.

The risk profile basic statistics from each probabilistic analysis included the minimum life-cycle cost, maximum life-cycle cost, mean life-cycle cost, median life-cycle cost, standard deviation of the life-cycle costs, and distribution of life-cycle costs by percentile. Cumulative probability curves for each alternative were then developed using the distribution of life-cycle costs. The decision-maker can use this information to select an alternative based on the level of risk that they are most comfortable with and not rely only on mean life-cycle costs (FHWA 2002).

In this study probabilistic analyses were carried out to determine the probability when rehabilitation had the lower life-cycle cost. Analyses were carried out for 1) a bridge over a highway, 2) a bridge over a highway with limited random variables, 3) a bridge over a highway with modified bridge construction time and cost, 4) a bridge over a waterway, and 5) a bridge over a waterway with modified bridge construction time and cost. Each analysis used the agency and user cost parameters shown in Table 3.1, Table 3.2 and Table 3.3. Each analysis used a different initial traffic volume, both on and under the bridge.

Bridge over Highway

Nine probabilistic analyses were carried out. The risk profile statistics from the probabilistic analyses and the cumulative probability curves are contained in Appendix E for each of the nine ADT cases.

The typical results of a simulation, ADT case 1, presented as ascending cumulative probability curves for each alternative are shown in Figure 6.1. Each curve shows the cumulative probability of life-cycle cost, i.e. the probability that the life-cycle cost is less than or equal to any given value. Although the curves for the other ADT cases are similar there are two main differences. The first one is the range of life-cycle costs. The second is the point where the two curves intersect, when they do intersect. This is the point at which the alternative with the lower life-cycle cost changes from replacement to rehabilitation.

The minimum, maximum, and range of life-cycle costs are summarized in Table 6.3. As the traffic volumes increased the minimum life-cycle cost, maximum life-cycle cost, and the range in life-cycle costs all increased. For a fixed traffic volume on the bridge the increases in maximum values was larger than the increases in minimum values. For a fixed traffic volume under the bridge the increases in minimum values was larger than the increases in maximum values. This holds for both the replacement and rehabilitation alternatives.

Changes in traffic volumes for the replacement alternative resulted in different percent changes in the minimum and maximum life-cycle costs. Two analyses were done. In the first one the traffic on the bridge was held constant and traffic under the bridge was increased, Table 6.4. For 100 vpd on the bridge, traffic under the bridge was increased first from 5,000 to 10,000 vpd and then from 10,000 to 25,000 vpd. Increasing traffic under the bridge from 5,000 to 10,000 vpd increased the minimum value 8.74 percent and the maximum value 82.70 percent. Increasing traffic under bridge from 10,000 to 25,000 vpd increased the minimum value 11.73 percent and the maximum value 135.79 percent.

For 1,000 vpd on the bridge, traffic under the bridge was also increased first from 5,000 to 10,000 vpd and then from 10,000 to 25,000 vpd. Increasing traffic under bridge from 5,000 to 10,000 vpd increased the minimum value 6.83 percent and the maximum value 62.39 percent. Increasing traffic under bridge from 10,000 to 25,000 vpd increased the minimum value 4.75 percent and the maximum value 115.26 percent. For 5,000 vpd on the bridge, traffic under the bridge was also increased first from 5,000 to 10,000 vpd and then from 10,000 to 25,000 vpd. Increasing traffic under bridge from 5,000 to 10,000 vpd increased the minimum value 3.07 percent and the maximum value 22.97 percent. Increasing traffic under bridge from 10,000 to 25,000 vpd increased the minimum value 8.92 percent and the maximum value 68.94 percent.

In the second analysis for the replacement alternative the traffic under the bridge was held constant and traffic on the bridge was increased, Table 6.5. For 5,000 vpd under the bridge increasing traffic on bridge from 100 to 1,000 vpd increased the minimum value 72.85 percent and the maximum value 32.54 percent. Increasing traffic on the bridge from 1,000 to 5,000 vpd increased the minimum value 131.73 percent and the maximum value 120.79 percent. For 10,000 vpd under the bridge increasing traffic on the bridge from 100 to 1,000 vpd increased the minimum value 69.81 percent and the maximum value 17.81 percent. Increasing traffic on the bridge from 1,000 to 5,000 vpd increased the minimum value 123.57 percent and the maximum value 67.19 percent. For 25,000 vpd under the bridge, increasing traffic on the bridge from 100 to 1,000 vpd increased the minimum value 59.21 percent and the maximum value 7.55 percent. Increasing traffic on the bridge from 1,000 to 5,000 vpd increased the minimum value 132.47 percent and the maximum value 31.21 percent.

Changes in traffic volumes for the rehabilitation alternative also resulted in different percent changes in the minimum and maximum life-cycle costs. Two same two analyses were done. In the first analysis the traffic on the bridge was held constant and traffic under the bridge was increased, Table 6.4. For 100 vpd on the bridge increasing traffic under the bridge from 5,000 to 10,000 vpd increased the minimum value 24.11 percent and the maximum value 81.43 percent. Increasing traffic under the bridge from 10,000 to 25,000 vpd increased the minimum value 52.35 percent and the maximum value 134.65 percent. For 1,000 vpd on the bridge increasing traffic under the bridge from 5,000 to 10,000 vpd increased the minimum value 22.41 percent and the maximum value 66.70 percent. Increasing traffic under the bridge from 10,000 to 25,000 vpd increased the minimum value 39.36 percent and the maximum value 120.04 percent. For 5,000 vpd on the bridge increasing traffic under the bridge from 5,000 to 10,000 vpd increased the minimum value 9.09 to 23.65 percent. Increasing traffic under the bridge from 10,000 to 25,000 vpd increased the minimum value 23.19 percent and the maximum value 71.80 percent.

In the second analysis for the rehabilitation alternative the traffic under the bridge was held constant and traffic on the bridge was increased, Table 6.5. For low traffic under the bridge increasing traffic on the bridge from 100 to 1,000 vpd increased the minimum value 37.47 percent and the maximum value 22.09 percent. Increasing traffic on the bridge from 1,000 to 5,000 vpd increased the minimum value 100.07 percent and the maximum value 110.51 percent. For 10,000 vpd under the bridge increasing traffic on the bridge from 100 to 1,000 vpd increased the minimum value 35.59 percent and the maximum value 12.17 percent. Increasing traffic on the bridge from 1,000 to 5,000 vpd

increased the minimum value 78.30 percent and the maximum value 56.15 percent. For 25,000 vpd under the bridge increasing traffic on the bridge from 100 to 1,000 vpd increased the minimum value 24.03 percent and the maximum value 5.19 percent. Increasing traffic on the bridge from 1,000 to 5,000 vpd increased the minimum value 57.61 percent and the maximum value 21.92 percent.

The point where the cumulative probability curves intersect indicates the life-cycle cost and probability at which the alternative with the lower life-cycle cost changes from one alternative to the other. At this point the probabilities that either replacement or rehabilitation will have the lower life-cycle cost are the same. For the highway bridge and life-cycle costs less than this value there is a higher probability that replacement will have the lower life-cycle cost. For life-cycle costs greater than this value there is a higher probability that rehabilitation will have the lower life-cycle cost. The life-cycle costs and probabilities where the curves intersect were estimated using the risk profile statistics and straight line interpolation.

The point where the two curves intersect varied depending on the traffic volume. For ADT case 1 (Table 3.6) this point is at 17.02 percent and 2.54 million dollars. For ADT case 2 (Table 3.6) this point is at 17.85 percent and 3.80 million dollars. For ADT case 3 (Table 3.6) this point is at 17.99 percent and 7.52 million dollars. For ADT case 4 (Table 3.6) this point is at 0.23 percent and 2.00 million dollars. For ADT case 5 (Table 3.6) this point is at 2.52 percent and 3.37 million dollars. For ADT case 6 (Table 3.6) this point is at 9.34 percent and 7.07 million dollars. For ADT case 9 (Table 3.6) this point is at 0.30 percent and 5.86 million dollars. For ADT cases 7 and 8 (Table 3.6) the curves

did not intersect. For these ranges of traffic there is a zero percent probability that the replacement life-cycle cost is lower.

The agency, user, and total life-cycle costs from the deterministic analysis and the mean and median values from the probabilistic analyses are compared in Table 6.6. Some values are close to the deterministic values but never equal. This shows that deterministic life-cycle costs are mean values. In some cases the deterministic values are lower and in the others they are higher. The deterministic values tended to be higher with low traffic volumes and lower with increased traffic volume. For the replacement alternative the deterministic values ranged from 7.2 percent lower to 5.3 percent higher than mean values and from 5.2 percent lower to 9.9 percent higher than the median values. For the rehabilitation alternative the deterministic values ranged from 8.8 percent lower to 2.4 percent higher than mean values and from 6.7 percent lower to 5.3 percent higher than the median values.

The results of the probabilistic analysis show some trends with respect to increases in traffic volumes. As the traffic volumes on the bridge increased, with traffic volume under the bridge constant, the probability that replacement has the lower life-cycle cost decreased. As the traffic volume under bridge increased, with traffic volume on the bridge constant, the probability that replacement has the lower life-cycle cost increased. This increase in probability became more significant with increases in traffic volumes on the bridge. These opposing trends can make it difficult to predict the effect of different combinations of traffic volume on and under the bridge.

Bridge over Highway with Limited Random Variables

The probabilistic analyses for the highway bridge used either normal distributions or triangular distributions of more variables than what the sensitivity analysis indicated are necessary. The sensitivity analysis showed that four variables had the most influence on life-cycle costs: bridge replacement duration, traffic under the bridge, VOT cars, and delay time under the bridge during bridge replacement. Therefore, nine probabilistic analyses were carried out using probability distributions for only these four variables. The risk profile statistics and cumulative probability curves for the highway bridge with limited random variables are contained in Appendix E. The estimated probabilities at which replacement has the lower life-cycle cost are compared with the highway bridge analysis that used more random variables in Table 6.7. The associated estimated life-cycle costs are compared in Table 6.8.

The effect of using the limited random variables on probabilities depended on traffic volumes. For the low traffic volumes on the bridge the probabilities that replacement had the lower life-cycle cost all decreased. The decrease was more significant for ADT case 1 (Table 3.6). For the medium traffic volumes the effect was mixed. ADT cases 4 and 5 (Table 3.6) showed a slight increase in probability while ADT case 6 (Table 3.6) showed a slight decrease. For the high traffic volumes the results were also mixed. For ADT cases 7 and 8 (Table 3.6) there was no change. For ADT case 9 (Table 3.6) there was a slight increase. Although the other random variables individually had a small influence on life-cycle costs collectively they had more influence.

The effect of using the limited random variables on the associated life-cycle cost also depended on traffic volumes. For the low traffic volumes on the bridge the life-cycle

costs all decreased. For the medium traffic volumes the effect was mixed. ADT cases 4 and 6 (Table 3.6) showed an increase while ADT case 5 (Table 3.6) showed a decrease. For the high traffic volumes the results were also mixed. For ADT cases 7 and 8 (Table 3.6) there was no change. For ADT case 9 (Table 3.6) there was an increase.

These changes in probabilities and costs mostly likely would not change which alternative is selected. If the decision maker was not going to select the replacement alternative at 17 to 18 percent probability, for low traffic volume on the bridge, they would most likely not select the replacement alternative at lower probability.

Bridge over Highway with Modified Bridge Construction Time and Cost

As done in the deterministic analysis two modifications to the bridge construction time were investigated. In the first modification the initial value of the most likely time to construct the bridge was decreased by 25 percent. In the second modification it was decreased by 50 percent. The maximum times were adjusted by about the same percentages. Since minimum times would most likely not decrease as much as the other two times a nominal decrease of five and ten days was selected. The times used are summarized in Table 6.9.

Three variations of the unit bridge construction cost were used with each modification. For the first time modification the initial mean and minimum values of unit cost to construct the bridge was increased by zero, five, and ten percent. For the second time modification they were increased by zero, ten, and twenty percent. The value of the standard deviation was not changed. The unit costs used are summarized in Table 6.10.

The combinations of modified times and costs are summarized in Table 6.11. Even though no increase in cost is likely to occur it was also included in the probabilistic analyses as a base line or limiting value.

Six additional probabilistic analyses using the modified bridge construction times and costs were done for each of the nine traffic cases. The estimated probabilities at which replacement had the lower life-cycle cost are summarized in Table 6.12. The associated estimated life-cycle costs are summarized in Table 6.13. The risk profile statistics and cumulative probability curves for the highway bridge with modified construction time and costs are contained in Appendix E.

Decreasing the time to construct the new bridge generally increased the probability at which the replacement alternative had the lower life-cycle cost. However, for the higher traffic volumes the decrease in time had no effect, ADT cases 7 and 8 (Table 3.6), or little effect, ADT case 9 (Table 3.6). It also had little effect on ADT case 4 (Table 3.6). Decreasing the construction time without any increase in the unit cost had the most effect. For the low traffic volume on the bridge cases the probability increased to more than 50 percent. Although subsequent increases in unit cost negated most of the increase in probability, the resulting probabilities were still more than those for the corresponding highway bridge. The associated life-cycle costs changed very little.

Bridge over Waterway

Three additional probabilistic analyses using no vehicular traffic under the bridge were carried out. The risk profile statistics and cumulative probability curves for the bridge over waterway are contained in Appendix E. The estimated probabilities at which

replacement has the lower life-cycle cost are compared with the highway bridge in Table 6.14. The associated estimated life-cycle costs are compared in Table 6.15.

Changing the traffic volume under the bridge to zero resulted in two significant changes in probabilities. For medium and high traffic volumes there was now a zero percent probability that the replacement alternative had the lower life-cycle cost. For the low traffic volume case the relative positions of the two cumulative probability curves was reversed, Figure 6.2. Below the intersection point of the curves the rehabilitation alternative now had the lower life-cycle cost instead of the replacement alternative. The intersection point also shifted upwards to about 74 percent, i.e. the probability that the rehabilitation alternative had the lower life-cycle cost was about 74 percent. The associated life-cycle cost was also reduced. The amount it decreased was relatively small for ADT case 1 (Table 3.6) but was more significant for ADT case 3 (Table 3.6). This was due to the removal of more traffic from under the bridge in case 3 (Table 3.6) and the subsequent reduction in user costs.

Bridge over Waterway with Modified Bridge Construction Time and Cost

Six additional probabilistic analyses using no vehicular traffic under the bridge together with the modified bridge construction times and costs were carried out for the same three traffic volume cases used for a bridge over a waterway. The risk profile statistics and cumulative probability curves for the bridge over waterway with modified construction time and cost are contained in Appendix E. The estimated probabilities at which replacement has the lower life-cycle cost are compared with the highway bridge and the waterway bridge in Table 6.16. The associated estimated life-cycle costs are compared in Table 6.17.

Modifying the bridge construction time and cost for a bridge over a waterway only had an impact for the low traffic volume case. As with the bridge over water analysis the relative position of the two cumulative probability curves was reversed. It also raised the point where the two cumulative probability curves intersect. The probability that the rehabilitation alternative had the lower life-cycle cost increased to about 81 percent with modification 1b to as much as 96 percent for modification 2c. There was a corresponding increase in the associated life-cycle cost.

This was not the case for modifications 1a and 2a, Figures 6.3 and 6.4. The two curves were close enough for them to intersect in three places. For modification 1a the curves intersected at 0.82, 6.12, and 59.03 percent. The associated life-cycle costs were 0.97, 1.09, and 1.37 million dollars. For modification 2a the curves intersected at 0.59, 18.18, and 32.59 percent. The associated life-cycle costs were 0.92, 1.15, and 1.23 million dollars. The difference in life-cycle costs were generally less than five percent.

Modifying the bridge construction time and cost for a bridge over a waterway made no difference in which alternative had the lower life-cycle cost for the medium and high traffic volume cases. The rehabilitation alternative continued to have the lower life-cycle cost. It did however increase the difference in life-cycle costs for all probabilities, i.e. increased the distance between the two curves.

Probabilistic Analysis Summary

Probabilistic analyses were carried out for a highway bridge, a highway bridge with limited random variables, a highway bridge with modified bridge construction time and cost, a waterway bridge, and a waterway bridge with modified bridge construction

time and cost. The estimated probabilities at which replacement has the lower life-cycle cost are compared for all the analyses in Table 6.18. The associated estimated life-cycle costs are compared in Table 6.19.

The rehabilitation alternative generally had the higher probability of having the lower life-cycle cost. However there were instances where the difference between the two alternatives had been reduced enough for a decision maker to consider using accelerated bridge construction technologies. This was for a bridge over a waterway with low traffic volumes. If it were possible to obtain a 50 percent decrease in bridge construction time without any increase in bridge construction cost the life-cycle costs are close. However this may not be likely to occur.

The effect of the different bridge options on life-cycle costs and the difference in life-cycle costs between the two alternatives depended on the traffic volumes. They had the most effect on the low traffic volume cases. For the low traffic volume cases modification of bridge construction time and cost had a wide range of effect on probabilities. Some of these probabilities may be high enough for a decision maker to choose replacement instead of rehabilitation. For bridges over a waterway the results favored the rehabilitation alternative. As the traffic volumes increased the probability that the replacement alternative had the lower life-cycle cost decreased and eventually went to zero.

Table 6.1-Probabilistic analysis input-normal distribution

Parameter	Mean	Std. Dev.	Minimum
Prestressed concrete girder bridge, \$/ft ² (\$/m ²)	107.52 (1,157.33)	18.28 (196.76)	72.00 (775.00)

CHAPTER SEVEN: SUMMARY AND CONCLUSIONS

This dissertation presents the results of a study to identify the parameters that had the most influence on life-cycle costs for reinforced concrete bridges rehabilitated with fiber reinforced polymer composites and how those parameters interacted. The use of LCCA was extended to bridge rehabilitation and lower traffic volumes. The study also introduced the use of time declining discount rates for longer analysis periods. The methodology was then used to determine and compare the life-cycle cost of a reinforced concrete tee-beam bridge rehabilitated with CFRP and a bridge replacement. Both a deterministic and probabilistic analysis was used to determine when the life-cycle cost of the replacement alternative is less than the rehabilitation alternative. Nine combinations of traffic volumes on and under the bridge were used to determine the effect of traffic volumes on life-cycle costs.

Sensitivity Analysis

The sensitivity analysis showed which parameters had the most influence on life-cycle costs. Most parameters had a small influence. Four parameters had the most influence: time to construct the new bridge, traffic volume under bridge, value of time for cars, and delay time under bridge during new bridge construction. By using a limited number of variations in these four parameters a “simulated” probabilistic analysis can be done with less effort than that needed to do a probabilistic analysis.

These four parameters individually had different influences on life-cycle costs. For the time to construct the new bridge and the value of time for cars the change in life-

cycle costs increased as traffic volumes on and under the bridge increased. For the other two parameters the change in life-cycle costs decreased as traffic volume on the bridge increased and increased as traffic volume under the bridge increased. Although traffic volume on the bridge did not have as much influence on life-cycle costs it increased life-cycle costs as traffic volumes on the bridge increased and decreased life-cycle costs as traffic volumes under the bridge increased. Taken individually traffic volume under the bridge had a larger influence on life-cycle costs. However, when both are varied at the same time the traffic volume on the bridge had more of an influence. For high traffic volumes on the bridge the change in life-cycle costs did not vary much even though traffic volume under the bridge increased from 5,000 to 25,000 vehicles per day.

Bridge over Highway

For bridges over a highway the deterministic analysis showed that the rehabilitation alternative life-cycle cost is always less than the replacement alternative. This occurred for all traffic combinations. The analysis also showed that increases in traffic volumes, both on and under a bridge, significantly increased life-cycle costs for both alternatives as well as the difference in life-cycle costs.

Although life-cycle costs always increased as traffic volumes increased the percent difference in life-cycle costs between the replacement and rehabilitation alternatives did not. For low traffic volume on the bridge the percent increased slightly as traffic volume under the bridge increased. For medium and high traffic volume on the bridge the percent difference decreased as traffic volume under the bridge increased. For a constant traffic volume under the bridge the percent difference significantly increased

as traffic volume on the bridge increased. This would indicate that traffic volumes on the bridge had more influence on life-cycle costs than traffic volume under the bridge.

The probabilistic analysis for a bridge over a highway showed that there is a small probability that the replacement alternative life-cycle cost is less than the rehabilitation alternative. The probability varied and depended on the traffic volume. The life-cycle costs were primarily driven by the traffic volume on the bridge. For low traffic volume on the bridge, the probability that the replacement life-cycle cost is lower ranged from 17.02 to 17.99 percent. For medium traffic volume on the bridge, the probability that the replacement life-cycle cost is lower ranged from 0.23 to 9.34 percent. For high traffic volume on the bridge, the probability that the replacement life-cycle cost is lower ranged from zero to 0.30 percent.

The probabilistic analysis showed different trends in the influence of traffic volumes than from the deterministic analysis. For low and high traffic volumes on the bridge the probability that replacement had the lower life-cycle costs varied very little, the range was one percent or less. For medium traffic volumes on the bridge the probability that replacement had the lower life-cycle cost increased significantly as traffic under the bridge increased. However, for a constant traffic volume under the bridge the probability that replacement had the lower life-cycle cost decreased significantly as traffic volume on the bridge decreased. This occurred for all levels of traffic.

Bridge over Highway with Limited Random Variables

Using more random variables than the four that had the most influence on life-cycle costs did not have a consistent impact on the results. This only applies to the

probabilistic analysis. In some ADT cases the probabilities increased and in others they decreased. For low traffic volumes on the bridge the probabilities decreased. For medium traffic volumes on the bridge the probabilities increased slightly for ADT cases 4 and 5 (Table 3.6) but decreased for the ADT case 6 (Table 3.6). For high traffic volume on the bridge there was no change in probability for ADT cases 7 and 8 (Table 3.6) and a slightly increased probability for ADT case 9 (Table 3.6). The changes in probability transitioned from a decrease at low traffic volumes to no or slight increases at high traffic volumes.

Bridge over Highway with Modified Bridge Construction Time and Cost

Since user costs are a significant portion of the life-cycle costs and the time to construct the new bridge was one of the four parameters with the most influence on life-cycle costs the use of an accelerated bridge construction technology to reduce the time to construct the bridge may be considered. Any additional costs to construct the bridge (agency costs) would have to be weighed against the time savings and decreases in user costs.

For bridges over a highway with modified bridge construction time and cost the results were similar to those for the bridge over a highway. The only differences were the values of the life-cycle costs and the percent differences between the alternatives. The amount of reduction depended on traffic volume. If the bridge construction time can be reduced by 50 percent the percent difference in life-cycle costs can be significantly reduced. The reduction was largest for low traffic volumes on the bridge. For a constant traffic volume on the bridge the amount of reduction increased as traffic under the bridge

increased. For a constant traffic volume under the bridge the amount of reduction decreased as traffic on the bridge increased.

Bridge over Waterway

For bridges over waterways the deterministic analysis results are both similar to the bridge over a highway and different. Since there is no vehicular traffic under the bridge all life-cycle costs are reduced. Like the bridge over a highway the percent difference in life-cycle costs also increased as traffic on the bridge increased. When compared to the bridge over highway the percent difference in life-cycle costs decreased significantly for the low traffic volume case. However, for the medium and high traffic volume cases the difference increased.

When compared to the bridge over a highway the probability distribution curves reversed position. The probability that rehabilitation, instead of replacement, had the lower life-cycle cost was about 74 percent for the low traffic volume on the bridge cases. For the other traffic cases the curves did not intersect and the rehabilitation alternative had the lower life-cycle cost. This is different than the bridge over highway where the curves did intersect for ADT cases 4, 5, 6, and 9 (Table 3.6) but at a low probability.

Bridge over Waterway with Modified Bridge Construction Time and Cost

For the bridge over a waterway with modifications to the bridge construction time and cost the deterministic analysis results are similar and different than other results. Like the bridge over waterway the percent difference in life-cycle costs increased as the traffic volume on the bridge increased. Like the modified bridge over highway the percent

differences decreased when compared to the waterway bridge. However, unlike the modified bridge over highway the percent difference increased enough with the increased construction cost to be larger than the bridge over waterway. This shows that using accelerated bridge techniques had an adverse effect on life-cycle costs.

For the bridge over a waterway with modifications to the bridge construction time and cost the probability distribution curves also reversed position. The probability that rehabilitation, instead of replacement, had the lower life-cycle cost increased to about 81 to 96 percent for the low traffic volume on the bridge cases. The actual probability depended on the amount the bridge construction time was reduced and the amount the bridge construction cost increased. For the unlikely case where there is no increase in bridge construction cost the curves were close enough to have two or three intersection points and it was not possible to make any definitive conclusions. For the other traffic cases the curves also did not intersect and the rehabilitation alternative had the lower life-cycle cost.

Conclusions and Recommendations

LCCA is another tool that can be used to evaluate alternatives of equal utility to help select the preferred alternative for implementation. The results provide the decision maker with additional economic information to help in selecting the preferred alternative. However there may be other considerations that may cause a decision maker to not select the alternative with the lower life-cycle cost.

The sensitivity analysis showed that it is possible to simulate a probabilistic analysis using the deterministic approach if the right variables are chosen. Using

minimum and maximum values for these variables a range of life-cycle costs can be obtained with a reduced number of iterations of the life-cycle cost model. A methodology to automate this analysis would make this approach viable.

Additional research to make the methodology used in this study more of an assessment tool is recommended. Such an extended methodology would fit in with the ever growing field of sustainability.

APPENDIX A: KYTC PROJECTS

Appendix A contains listings of KYTC projects that were used to determine the construction unit costs for the following:

- Prestressed concrete beam bridge
- Reinforced concrete deck
- Reinforced concrete bridge deck restoration
- Bridge removal
- Bridge deck removal
- Bridge rail retrofit

It also contains listings of KYTC projects that were used to determine the maintenance of traffic costs during the following:

- Bridge construction
- Bridge deck restoration

It also contains listings of KYTC projects that were used to determine the construction time for the following:

- Bridge construction
- Bridge deck restoration

The following items are used in the project listings:

- Date Let: The date the contractor's bids are opened
- Call: Identifies the project during project advertising and bid opening
- Contract ID: Identifies the project during construction for contract administration
- County: Identifies the county where the project is located
- District: Identifies the State highway district where the project is located
- SYP: Identifies the project in the State's six year improvement plan
- Proposal Description: Usually the State or Federal project number

A summary of which projects were used in each analysis is shown in Table A.1.

APPENDIX B: CONSTRUCTION TIME

Appendix E contains summaries of construction times for the following:

- Prestressed concrete beam bridge
- Reinforced concrete bridge deck restoration

Bridge Construction Time

An analysis of the contract time for completion of prestressed concrete beam bridge projects was done for projects with a calendar completion date, Table B.1, and one for projects with a specified number of working days for completion, Table B.2.

Table B.1-Projects with calendar date completion

Date Let	Call	County	District	Date Let	Completion Date	Time (days)
Jan 2013	103	Hopkins	2	1/25/2013	10/30/2013	278
Feb 2013	104	Floyd	12	2/22/2013	10/31/2013	251
Jun 2013	200	Washington	4	6/14/2013	10/31/2013	139
Jul 2013	366	Clay	11	7/12/2013	7/30/2014	383
Aug 2013	106	Pulaski	8	8/16/2013	11/30/2013	106
Nov 2013	106	Ohio	2	11/22/2013	9/1/2014	283
Nov 2013	111	Bell	11	11/22/2013	7/1/2014	221
Dec 2013	106	Owen	6	12/13/2013	8/30/2014	260
Dec 2013	300	Logan	3	12/13/2013	11/1/2014	323
Jan 2014	313	Logan	3	1/24/2014	11/1/2014	281
Apr 2014	104	Jefferson	5	4/25/2014	10/1/2014	159
Sep 2014	104	Clay	11	9/26/2014	7/30/2015	307
Oct 2014	302	Knott	12	10/24/2014	8/31/2015	311

The average time from bid opening to completion date is 254 days. Assuming two weeks used to award contract and issue a notice to proceed, the average completion time is 240 calendar days. The time from bid opening to completion date ranges from 106 to 383 days or from 92 to 369 days adjusted.

Table B.2-Projects with working days completion

Date Let	Call	County	District	Date Let	Time (days)
Sep 2013	105	Perry	10	9/27/2013	135
Sep 2013	317	Lyon	1	9/27/2013	150
Nov 2013	104	Powell	10	11/22/2013	85
Nov 2013	108	Perry	10	11/22/2013	220
Dec 2013	306	Metcalfe	3	12/13/2013	270
Jun 2014	109	Menifee	10	6/27/2014	150
Jul 2014	108	Magoffin	10	7/11/2014	50
Jul 2014	113	Perry	10	7/11/2014	240
Aug 2014	313	Marion	4	8/22/2014	170
Sep 2014	112	Owsley	10	9/26/2014	165
Sep 2014	113	Breathitt	10	9/26/2014	220

The average completion time is 168.6 working days. Assuming five working days per week, the average completion time is 236.1 calendar days. The completion time ranges from 50 to 270 working days or from 70 to 378 working days adjusted.

Bridge Deck Overlay Construction Time

An analysis of the contract time for completion of concrete deck restoration projects was done. The completion dates were working days, calendar days, weekends, or not specified. Bridges without a specified completion date were usually part of a larger project where the overall completion date controlled. The completion dates are summarized in Table B.3. The completion dates specified in the project proposals are summarized in Tables B.4, B.5, and B.6. The most common completion date was 30 calendar days, for 65 percent of the bridges where a date was specified and 77 percent of the bridges where calendar days were specified. The average calendar day completion date was 30.8 days. The study used 30 calendar days.

Table B.3-Bridge deck restoration completion date summary

Completion Date	Number Times Used
20 working days	2
30 working days	2
40 working days	1
2 weekends	9
14 calendar days	1
20 calendar days	8
25 calendar days	1
30 calendar days	60
40 calendar days	1
45 calendar days	4
60 calendar days	3
Sub total	92
None specified	16
Total	108

APPENDIX C: CONSTRUCTION UNIT COSTS

Appendix C contains summaries of bid items and construction unit costs for the following:

- Prestressed concrete beam bridge
- Reinforced concrete deck
- Reinforced concrete bridge deck restoration
- Bridge removal
- Bridge deck removal
- Bridge rail retrofit

Precast Prestressed Concrete I-Beam Bridges

The cost analysis for the construction of precast prestressed concrete I-beam bridges included the following bid items:

- Approach Slab
- Armored Edge for Concrete
- Bridge Chain Link Fence-4 ft
- Bridge Chain Link Fence-6 ft
- Bridge Chain Link Fence-8 ft
- Bridge Chain Link Fence-9 ft
- Concrete-Class A
- Concrete-Class AA
- Crushed Aggregate Slope Protection
- Cyclopean Stone Rip Rap
- Deck Drain
- Drilled Shaft-Common 54 in
- Drilled Shaft-Rock 48 in
- Expansion Dam-4 in Neoprene
- Fabric-Geotextile Type IV
- Guardrail-Steel W Beam-S Face Br
- High Strength Geotextile Fabric
- Masonry Coating
- Mechanical Reinforcement Coupler #5
- Mechanical Reinforcement Coupler #7
- Mechanical Reinforcement Coupler #8
- Mechanical Reinforcement Coupler #9
- Mechanical Reinforcement Coupler #10
- Mechanical Reinforcement Coupler #11
- Mechanical Reinforcement Coupler-#5 Epoxy Coated
- Mechanical Reinforcement Coupler-#6 Epoxy Coated
- Mechanical Reinforcement Coupler-#8 Epoxy Coated
- Pile Points-12 in
- Pile Points-14 in
- Piles-Steel HP12X53
- Piles-Steel HP14X73
- Piles-Steel HP14X89
- Precast PC I-Beam Type 3
- Precast PC I-Beam Type 4
- Precast PC I-Beam Type 5
- Precast PC I-Beam Type 6
- Precast PC I-Beam Type 7
- Precast PC I-Beam Type 8
- Precast PC I-Beam Type 9
- Precast PC I-Beam Type HN 42-49
- Precast PC I-Beam Type HN 54-49

- Precast PC I-Beam Type HN 60-49
- Precast PC I-Beam Type NH 66-61 Hybrid
- Precast PC I-Beam Type HN 72-49
- Pre-drilling For Piles
- Protective Fence
- Rail System Type III
- Reinforced Concrete Slope Wall-6 in
- Steel Reinforcement
- Steel Reinforcement-Epoxy Coated
- Structural Steel
- Structure Excavation-Common
- Structure Excavation-Solid Rock
- Structure Excavation-Unclassified
- Structure Granular Backfill
- Test Piles

All the items were not used with every bridge. The results of the analysis are summarized in Table C.1.

Table C.1-Bridge construction unit costs analysis summary

Cost Analysis Case	n	Unit Cost, \$/ft ² (\$/m ²)	
		Mean	Standard Deviation
Excluding costs greater than \$160.00/ft ² (\$1,722.22/m ²)	116	107.52 (1,157.33)	18.28 (196.76)
Excluding costs greater than \$200.00/ft ² (\$2,152.77/m ²)	129	115.00 (1,237.84)	28.55 (307.31)
Excluding costs greater than \$300.00/ft ² (\$3,229.16/m ²)	139	122.20 (1,315.34)	38.00 (409.03)
All costs included	140	123.61 (1,330.52)	41.35 (445.09)

The following are summaries of unit costs for each project used in the analysis.

Bridge with Grade, Drain & Surface Brown Badgett Loop (CR 1092)

Date Let: 01-25-13 Call: 103 County: Hopkins District: 02
 Precast PC I Beam Type: HN42-49 Bridge Area: 7,754 ft² (720.4 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	983,665.96	126.86 (1,365.50)
Bidder 2	981,309.92	126.56 (1,362.28)
Bidder 3	977,545.41	126.07 (1,357.00)
Bidder 4	1,017,754.23	131.26 (1,412.87)
Bidder 5	1,221,990.50	157.59 (1,696.28)
Bidder 6	1,545,127.00	199.27 (2,144.92)

Bridge with Grade, Drain & Surface KY 1428

Date Let: 02-22-13 Call: 104 County: Floyd District: 12
 Precast PC I Beam Type: HN 54 49 Bridge Area: 4,247 ft² (394.6 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	540,809.24	127.34 (1,370.67)
Bidder 2	660,500.16	155.52 (1,674.00)

Grade, Drain & Surface with Bridge Georgetown Northwest Bypass

Date Let: 04-19-13 Call: 101 County: Scott District: 07
 Precast PC I Beam Type: 7 Bridge Area: 23,005 ft² (2,137.2 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	2,593,598.05	112.74 (1,213.52)
Bidder 2	2,363,143.85	102.72 (1,105.66)
Bidder 3	2,566,733.50	111.57 (1,200.92)
Bidder 4	2,363,143.85	102.72 (1,105.66)
Bidder 5	2,666,685.96	115.92 (1,247.75)
Bidder 6	2,531,536.50	110.04 (1,184.46)

Grade, Drain & Surface with Bridge Hooker Branch Road (CR 1276)

Date Let: 07-12-13 Call: 366 County: Clay District: 11
 Precast PC I Beam Type: HN60-49 Bridge Area: 4,394 ft² (408.2 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	409,850.90	93.28 (1,004.05)
Bidder 2	468,446.40	106.61 (1,147.54)
Bidder 3	528,910.00	120.37 (1,295.65)
Bidder 4	468,446.40	106.61 (1,147.54)
Bidder 5	610,850.80	139.02 (1,496.39)

Bridge with Grade, Drain & Surface Dahl Road (KY 1677)

Date Let: 08-16-13 Call: 106 County: Pulaski District: 08
 Precast PC I Beam Type: 4 Bridge Area: 3,033 ft² (281.8 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	388,415.12	128.06 (1,378.42)
Bidder 2	378,227.30	124.70 (1,342.25)
Bidder 3	377,942.10	124.61 (1,341.29)
Bidder 4	467,270.30	154.06 (1,658.28)
Bidder 5	461,502.81	152.16 (1,637.83)

Bridge with Grade, Drain & Surface KY 476

Date Let: 09-27-13 Call: 105 County: Perry District: 10
 Precast PC I Beam Type: HN42-49 Bridge Area: 9,131 ft² (848.3 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	953,767.85	104.45 (1,124.29)
Bidder 2	1,073,528.50	117.57 (1,265.51)
Bidder 3	1,207,156.65	132.20 (1,422.98)
Bidder 4	1,228,610.40	134.55 (1,448.28)
Bidder 5	1,197,482.40	131.14 (1,411.57)

Grade, Drain & Surface with Bridge Kuttawa-Princeton Road (US 62)

Date Let: 09-27-13 Call: 317 County: Lyon District: 01
 Precast PC I Beam Type: HN42-49 Bridge Area: 21,250 ft² (1,974.2 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	2,656,685.48	125.02 (1,345.70)
Bidder 2	3,136,758.70	147.61 (1,588.85)

Bridge Replacement Stanton-Slade Road (KY 11)

Date Let: 11-22-13 Call: 104 County: Powell District: 10
 Precast PC I Beam Type: HN42-49 Bridge Area: 3,094 ft² (287.4 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	314,411.95	101.62 (1,093.82)
Bidder 2	350,178.40	113.18 (1,218.25)
Bidder 3	346,511.15	111.99 (1,205.45)
Bidder 4	425,193.50	137.43 (1,479.28)

Bridge with Grade, Drain & Surface Beaver Dam - Leitchfield Road (US 62)

Date Let: 11-22-13 Call: 106 County: Ohio District: 02
 Precast PC I Beam Type: HN 54 49 Bridge Area: 5,891 ft² (547.3 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	592,289.20	100.54 (1,082.20)
Bidder 2	677,616.50	115.03 (1,238.17)
Bidder 3	681,994.58	115.77 (1,246.13)
Bidder 4	740,171.61	125.64 (1,352.37)
Bidder 5	733,344.00	124.49 (1,339.99)

Bridge with Grade, Drain & Surface Glomawr to Hazard Road (KY 451)

Date Let: 11-22-13 Call: 108 County: Perry District: 10
 Precast PC I Beam Type: 8 Bridge Area: 14,457 ft² (1,343.1 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	1,408,871.81	97.45 (1,048.94)
Bidder 2	1,556,763.50	107.68 (1,159.05)
Bidder 3	1,688,817.80	116.82 (1,257.44)
Bidder 4	1,730,651.40	119.71 (1,288.54)

Bridge with Grade, Drain & Surface Tennessee State Line to E-Town Road (I-65)

Date Let: 11-22-13 Call: 109 County: Hart District: 04
 I 65 over CSX
 Precast PC I Beam Type: HN60-49 Bridge Area: 17,868 ft² (1,660.0 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	1,662,428.24	93.04 (1,001.47)
Bidder 2	1,918,818.37	107.39 (1,155.93)
Bidder 3	1,785,208.22	99.91 (1,075.42)

Bridge with Grade, Drain & Surface Tennessee State Line to E-Town Road (I-65)
 Date Let: 11-22-13 Call: 109 County: Hart District: 04
 KY 88 over I 65

Precast PC I Beam Type: HN60-49 Bridge Area: 12,450 ft² (1,156.6 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	1,057,793.56	84.96 (914.50)
Bidder 2	1,229,649.65	98.77 (1,063.15)
Bidder 3	1,070,577.12	85.99 (925.59)

Bridge with Grade, Drain & Surface Buffalo Branch Road (CR-1327)
 Date Let: 11-22-13 Call: 111 County: Bell District: 11
 Precast PC I Beam Type: 3 Bridge Area: 1,560 ft² (144.9 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	281,673.40	180.56 (1,943.52)
Bidder 2	318,622.80	204.25 (2,198.52)
Bidder 3	353,081.80	226.33 (2,436.19)
Bidder 4	381,694.47	244.68 (2,633.70)

Grade, Drain & Surface with Bridge Gratz-Moxley Road (KY-355)
 Date Let: 12-13-13 Call: 106 County: Owen District: 06
 Precast PC I Beam Type: 3 Bridge Area: 5,946 ft² (552.4 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	992,004.30	166.84 (1,795.84)
Bidder 2	1,068,053.04	179.63 (1,933.51)
Bidder 3	1,123,253.00	188.91 (2,033.40)
Bidder 4	1,027,904.07	172.87 (1,860.75)
Bidder 5	1,073,563.91	180.55 (1,943.42)
Bidder 6	1,193,574.50	200.74 (2,160.74)
Bidder 7	1,082,909.97	182.12 (1,960.32)
Bidder 8	1,059,069.04	178.11 (1,917.15)
Bidder 9	1,227,857.03	206.50 (2,222.74)

Grade & Drain with Bridge Partridge to Oven Fork Road (US 119, Section 3B)
 Date Let: 12-13-13 Call: 113 County: Letcher District: 12
 Precast PC I Beam Type: 5 Bridge Area: 19,487 ft² (1,810.4 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	1,793,854.84	92.05 (990.81)
Bidder 2	1,722,941.60	88.41 (951.63)
Bidder 3	1,725,437.71	88.54 (953.03)
Bidder 4	1,736,084.00	89.09 (958.95)

Grade, Drain & Surface with Bridge US-68 and Louie B. Nunn Parkway
 Date Let: 12-13-13 Call: 306 County: Metcalfe District: 03
 Precast PC I Beam Type: NH 66 61-hybrid Bridge Area: 10,833 ft² (1,006.4 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	1,109,589.75	102.43 (1,102.54)
Bidder 2	1,207,097.72	111.43 (1,199.42)
Bidder 3	1,192,771.23	110.11 (1,185.21)

Grade, Drain & Surface with Bridge New Moody Lane-Commerce Parkway (New Route)
 Date Let: 12-13-13 Call: 307 County: Oldham District: 05
 Precast PC I Beam Type: 9 Bridge Area: 70,013 ft² (6,504.4 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	5,027,348.20	71.81 (772.95)
Bidder 2	5,023,597.00	71.75 (772.31)
Bidder 3	4,931,802.20	70.44 (758.21)
Bidder 4	5,726,496.80	81.79 (880.38)
Bidder 5	5,319,013.65	75.97 (817.73)
Bidder 6	4,911,871.39	70.16 (755.19)
Bidder 7	5,900,494.25	84.28 (907.18)
Bidder 8	6,201,200.45	88.57 (953.36)

Grade, Drain & Surface with Bridge Morgantown Road (KY 79)
 Date Let: 01-24-14 Call: 313 County: Logan District: 03
 Precast PC I Beam Type: 4 Bridge Area: 10,101 ft² (938.4 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	1,068,699.60	105.80 (1,138.82)
Bidder 2	1,157,056.51	114.55 (1,233.00)
Bidder 3	1,070,175.60	105.95 (1,140.43)

Bridge with Grade & Drain I-65 to US 31W Connector (KY 3145)
 Date Let: 05-30-14 Call: 100 County: Warren District: 03
 US 31W Connector over Commonwealth
 Precast PC I Beam Type: HN 7249 Bridge Area: 6,956 ft² (646.2 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	601,307.18	86.44 (930.43)
Bidder 2	631,882.20	90.84 (977.79)
Bidder 3	430,103.74	61.83 (665.53)
Bidder 4	750,060.00	107.83 (1,160.67)
Bidder 5	631,765.00	90.82 (977.57)

Bridge with Grade & Drain I-65 to US 31W Connector (KY 3145)
 Date Let: 05-30-14 Call: 100 County: Warren District: 03
 US 31W Connector over US 68 / KY80 / RR
 Precast PC I Beam Type: 3 and 5 Bridge Area: 21,549 ft² (2,002.0 m²)

	Total Bridge Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	1,940,838.98	90.07 (969.50)
Bidder 2	1,883,527.05	87.41 (940.87)
Bidder 3	2,014,000.83	93.46 (1,005.99)

Reinforced Concrete Decks

The cost analysis for the construction of a cast in place reinforced concrete bridge deck used the bid data for the precast prestressed concrete I-beam bridges but included only the following bid items:

- Armored Edge for Concrete
- Concrete-Class AA
- Guardrail-Steel W Beam-S Face Br
- Masonry Coating
- Mechanical Reinforcement Coupler-#5 Epoxy Coated
- Mechanical Reinforcement Coupler-#6 Epoxy Coated
- Mechanical Reinforcement Coupler-#8 Epoxy Coated
- Rail System Type III
- Steel Reinforcement-Epoxy Coated
- Structural Steel

These are the items used to construct a reinforced concrete bridge deck and rails. All the items were not used with every bridge. The results of the analysis are summarized in Table C.2.

Table C.2-Bridge deck construction unit costs analysis summary

Cost Analysis Case	n	Unit Cost, \$/ft ² (\$/m ²)	
		Mean	Standard Deviation
Excluding costs greater than \$60.00/ft ² (\$645.8/m ²)	117	38.17 (410.86)	7.19 (77.39)
Excluding costs greater than \$70.00/ft ² (\$753.47/m ²)	133	41.46 (446.27)	11.25 (121.09)
Excluding costs greater than \$90.00/ft ² (\$968.75/m ²)	139	43.16 (464.57)	13.65 (146.93)
All costs included	140	43.55 (468.77)	14.35 (154.46)

The following are summaries of unit costs for each project used in the analysis.

Bridge with Grade, Drain & Surface Brown Badgett Loop (CR 1092)

Bidder 3	192,216.07	42.54 (457.89)

Bridge Deck Restorations

The cost analysis for bridge deck restoration work included the following bid items:

- Armored Edge For Concrete
- Blast Cleaning
- Concrete Class M Full Depth Patch
- Concrete Overlay-Latex
- Epoxy Sand Slurry
- Hydrodemolition
- Machine Preparation Of Slab
- Partial Depth Patching

These are the items that KYTC used to prepare and apply a latex modified concrete overlay to an existing bridge deck that does not have an existing overlay. Hydrodemolition was not used with most of the bridges included in the analysis. The calculated unit costs are per unit of overlay area and are summarized in Table C.3. In the statistical analysis the bridges were grouped by overlay area. As the overlay area increased the mean unit cost decreased. The standard deviation also decreased.

Table C.3-Bridge deck restoration unit costs summary

Overlay Area, A, ft ² (m ²)	Number bridges	n	Unit Costs, \$/ft ² (\$/m ²)	
			Mean	Standard Deviation
A < 1,000 (A < 92.9)	2	13	41.75 (449.39)	7.93 (85.36)
1,000 ≤ A < 3,000 (92.9 ≤ A < 278.7)	16	83	31.55 (339.60)	7.80 (83.96)
3,000 ≤ A < 5,000 (278.7 ≤ A < 464.5)	24	146	22.24 (239.39)	6.55 (70.50)
5,000 ≤ A < 10,000 (464.5 ≤ A < 929.0)	47	250	16.54 (178.03)	4.79 (51.56)
10,000 ≤ A < 20,000 (929.0 ≤ A < 1,858.1)	14	72	13.47 (144.99)	3.11 (33.48)
20,000 ≤ A < 30,000 (1,858.1 ≤ A < 2,787.1)	3	18	12.33 (132.72)	2.12 (22.82)
54,578 (5,070.5)	1	8	10.17 (109.47)	1.25 (13.45)
242,904 (22,566.6)	1	5	9.04 (97.31)	1.17 (12.59)

The following are summaries of unit costs for each project used in the analysis.

Bridge Deck Overlay Butler County (WN 9007)

Date Let: 01-25-13 Call: 317 County: Butler District: 03
 Bridge Number: 016B00061N, NB only Overlay Area: 24,115 ft² (2,240.4 m²)

	Total Deck Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	226,110.00	9.38 (100.97)

Asphalt Rehab with Bridge(s) Louie B. Nunn Cumberland Parkway (9008)
 Date Let: 10-24-14 Call: 306 County: Barren District: 03
 Bridge Number: 005B00068R, EB only Overlay Area: 8,558 ft² (795.1 m²)

	Total Deck Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	122,270.00	14.29 (153.82)

Bridge Removals

The cost analysis for structure removal included the following bid items:

- Remove structure
- Remove exist superstructure and abutment

The length and width of the structures used to calculate the area of the structures that were removed were taken from the National Bridge Inventory (NBI) database for Kentucky. The calculated unit costs are summarized in Table C.4.

Table C.4-Bridge removal costs summary

Structure type-main	Number of bridges	n	Unit Costs, \$/ft ² (\$/m ²)	
			Mean	Standard Deviation
101	4	14	28.75 (310.46)	21.83 (235.74)
104	17	69	28.37 (306.36)	15.83 (170.94)
204	10	23	14.13 (152.59)	4.03 (43.52)
122	4	15	22.20 (218.13)	12.20 (131.74)
119	1	4	10.66 (115.11)	6.35 (68.57)
505	8	19	24.51 (264.68)	18.76 (202.58)
302	12	32	19.45 (210.04)	9.29 (100.32)
402	3	10	23.36 (252.26)	17.64 (190.49)
403	2	6	25.39 (274.18)	7.69 (83.04)
310	6	23	23.95 (258.63)	12.84 (138.66)
702	1	6	26.52 (286.38)	11.00 (119.22)
All	68	221	23.73 (256.25)	14.69 (158.63)

Structure Type Codes

- 101 = concrete slab
- 104 = concrete tee beam
- 204 = continuous concrete tee beam
- 122 = concrete channel beam
- 119 = concrete culvert
- 505 = prestressed concrete box beam or girders - multiple
- 302 = steel stringer/multi-beam or girder
- 402 = continuous steel stringer/multi-beam or girder
- 403 = continuous steel girder and floorbeam system
- 310 = steel thru truss
- 702 = timber stringer/multi-beam or girder

The following are summaries of unit costs for each project used in the analysis. Unit costs marked with an asterisk were not used in the cost analysis.

Concrete Slab Bridges (NBI Item 43=101)

Bridge Replacement East Union-Carlisle Road (KY-1285)

Date Let: 09-27-13 Call: 102 County: Nicholas District: 09
 NBI Structure Number: 091B00005N Bridge Area: 417 ft² (38.7 m²)

	Total Removal Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	9,000.00	21.57 (232.18)
Bidder 2	5,000.00	11.98 (128.95)
Bidder 3	5,000.00	11.98 (128.95)
Bidder 4	50,000.00	119.84 (1,289.94) *
Bidder 5	10,000.00	23.97 (258.01)
Bidder 6	28,500.00	68.31 (735.28)

Bridge with Grade, Drain & Surface Bent Branch Road (KY-1426)

Date Let: 06-27-14 Call: 101 County: Pike District: 12
 NBI Structure Number: 098B00015N Bridge Area: 841 ft² (78.1 m²)

	Total Removal Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	70,000.00	83.27 (896.31)

Bridge with Grade, Drain & Surface Wildie Road (CR-1071)

Date Let: 09-26-14 Call: 117 County: Rockcastle District: 08
 NBI Structure Number: 102C00009N Bridge Area: 1,024 ft² (95.1 m²)

	Total Removal Items, \$	Unit Cost, \$/ft ² (\$/m ²)

Bridge Deck Removals

The cost analysis for deck removal included the following bid item:

- Remove existing deck

The calculated unit costs are summarized in Table C.5.

Table C.5-Bridge deck removal costs summary

Structure Type	n	Unit Costs, \$/ft ² (\$/m ²)	
		Mean	Standard Deviation
402	3	4.87 (52.42)	2.61 (28.09)
505	7	12.69 (136.59)	5.77 (62.11)

The following is a summary of unit costs for the project used in the analysis.

Asphalt Rehab with Bridge (s) Martha Layne Collins Parkway (BG 9002)

Date Let: 04-19-13 Call: 425 County: Various District: 04

NBI Structure Number: 115B00041L and 115B00041R

Existing structure type-main: continuous steel stringer/multi-beam or girder (NBI Item 43=402)

Area each bridge: 18,123 ft² (1,683.7 m²)

	Total Removal Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	250,000.00	6.90 (74.27)
Bidder 2	210,000.00	5.79 (62.32)
Bidder 3	70,000.00	1.93 (20.77)

The following project was not used in the cost analysis for deck removal because the structure type is adjacent prestressed concrete box beams. The different structural configuration results in removal conditions that are different than a slab on beam structure. Therefore these costs were not considered to be appropriate for this study.

Bridge Deck Restoration & Waterproofing Robertson County KY 165 and KY 616

Date Let: 08-16-13 Call: 410 County: Robertson District: 06

NBI Structure Number: 101B00018N

Existing structure type-main: prestressed concrete box beam or girders - multiple (NBI Item 43=505)

Area: 5,910 ft² (549.1 m²)

	Total Removal Items, \$	Unit Cost, \$/ft ² (\$/m ²)
Bidder 1	20,000.00	3.38 (36.36)
Bidder 2	55,000.00	9.31 (100.21)
Bidder 3	50,000.00	8.46 (91.06)
Bidder 4	86,000.00	14.55 (156.61)
Bidder 5	100,000.00	16.92 (182.12)
Bidder 6	115,000.00	19.46 (209.46)
Bidder 7	99,168.81	16.78 (177.39)

Bridge Rail Retrofits

The cost analysis for bridge rail retrofit with thrie beam included the following bid items:

- Guardrail Thrie Beam
- Thrie Beam to W Beam Connector

The calculated unit costs are summarized in Table C.6.

Table C.6-Thrie beam retrofit costs summary

Cost Analysis Case	n	Unit Costs, \$/ft (\$/m)	
		Mean	Standard Deviation
Excluding \$180.00/ft (\$590.55/m) unit cost	5	76.99 (252.59)	14.52 (47.64)
All costs included	6	94.16 (308.92)	44.01 (144.39)

The following are summaries of unit costs for the projects used in the analysis.

Guardrail Russell - Greenup (US 23)

Date Let: 06-14-13 Call: 202 County: Greenup District: 09

Unit Cost-Thrie Beam Retrofit		
Item	Bidder 1	Bidder 2
Guardrail Thrie Beam, \$/ft (\$/m)	28.75 (94.32)	100.00 (328.08)
Thrie Beam to W Beam Connector, \$/each	400.00	500.00

Divide the cost of one connector by its length, 6.25 feet (1.91 m) to get an equivalent cost per length and add to the thrie beam cost. These costs were used in the analysis.

Unit Cost-Thrie Beam Retrofit, \$/ft (\$/m)	
Bidder 1	Bidder 2
100.75 (330.54)	180.00 (590.55)

Asphalt Rehab with Bridge(s) Louisville-Cincinnati Road (1-71)

Date Let: 09-27-13 Call: 200 County: Henry District: 05

Unit Cost-Thrie Beam Retrofit, \$/ft (\$/m)*			
Bidder 1	Bidder 2	Bidder 3	Bidder 4
65.00 (213.25)	80.71 (264.80)	70.00 (229.66)	68.50 (224.74)

*Includes connectors to W beam rail

APPENDIX D: MAINTENANCE OF TRAFFIC COSTS

Appendix D contains summaries of bid items and costs for maintenance of traffic (MOT) during the following:

- Bridge construction
- Bridge deck restoration

Maintenance of Traffic-Bridge Construction

The analysis of maintenance of traffic (MOT) costs calculated the percentage of the total contract amount that was bid for MOT items. The analysis included the following MOT bid items:

- Arrow Panel
- Barricade-Type III
- Concrete Median Barrier Type 9C2
- Concrete Barrier Wall Type 9T
- Crash Cushion TY VI Class B TL2
- Crash Cushion TY VI Class B TL3
- Crash Cushion TY VI Class BT TL2
- Crash Cushion TY VI Class BT TL3
- Crash Cushion Type IX-A
- Creek Crossing
- Diversions (By-Pass Detours)
- Install Temp Concrete Med Barrier
- Lane Closure
- Law Enforcement Officer
- Maintain & Control Traffic
- Pave Mark Temp Paint Stop Bar-24 in
- Pave Striping-Temp Paint-12 in
- Pave Striping-Temp Paint-4 in
- Pave Striping-Temp Paint-6 in
- Pave Striping-Temp Rem Tape-B
- Pave Striping-Temp Rem Tape-W
- Pave Striping-Temp Rem Tape-Y
- Pavement Marker Type IVA-BY Temp
- Pavement Marker Type IVA-MY Temp
- Portable Changeable Message Sign
- Relocate Concrete Barrier Wall
- Relocate Crash Cushion
- Relocate Temp Concrete Barrier
- Signs
- Temp Concrete Med Barrier
- Temp Crash Cushion
- Temp Guardrail
- Temp Median Crossover
- Temp Signal
- Temp Signal 2 Phase
- Temporary Signs
- Tubular Markers

Not all items were used on every project. The results of the analysis are summarized in Table D1.

Table D1-Maintenance of traffic analysis summary bridge replacement

Analysis Case	n	Mean	Standard Deviation
Precast PC I beams	114	3.41%	2.77%
Precast PC box beams	133	3.12%	3.55%
RC culvert	3	16.27%	2.23%
All types	250	3.41%	3.50%

The following are summaries of MOT percentages for each project used in the analysis.

Bridge with Grade, Drain & Surface Brown Badgett Loop (CR 1092)

Date Let: 01-25-13 Call: 103 County: Hopkins District: 02

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	9,543.62	1,805,945.22	0.53
Bidder 2	7,601.00	1,899,850.23	0.40
Bidder 3	12,684.00	1,944,512.77	0.65
Bidder 4	12,453.00	1,988,759.09	0.63
Bidder 5	12,684.00	2,146,221.90	0.59
Bidder 6	111,060.00	2,656,235.33	4.18

Grade, Drain & Surface with Bridge Georgetown Northwest Bypass

Date Let: 04-19-13 Call: 101 County: Scott District: 07

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	153,547.81	12,989,572.70	1.18
Bidder 2	221,160.49	13,527,266.37	1.63
Bidder 3	177,774.40	13,566,463.38	1.31
Bidder 4	186,733.20	13,665,008.63	1.37
Bidder 5	177,984.10	13,782,220.09	1.29
Bidder 6	133,770.00	14,225,780.57	0.94

Grade, Drain & Surface with Bridge Hooker Branch Road (CR 1276)

Date Let: 07-12-13 Call: 366 County: Clay District: 11

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	32,661.60	1,905,366.71	1.71
Bidder 2	26,871.20	2,021,640.81	1.33
Bidder 3	20,575.20	2,068,642.54	0.99
Bidder 4	40,527.20	2,238,985.14	1.81
Bidder 5	80,670.00	2,822,095.55	2.86

Bridge with Grade, Drain & Surface Dahl Road (KY 1677)

Date Let: 08-16-13 Call: 106 County: Pulaski District: 08

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	9,044.00	796,767.60	1.14
Bidder 2	9,908.00	839,199.35	1.18
Bidder 3	38,568.00	875,900.00	4.40
Bidder 4	12,552.00	909,134.52	1.38
Bidder 5	6,650.00	932,078.86	0.71

Bridge with Grade, Drain & Surface KY 476

Date Let: 09-27-13 Call: 105 County: Perry District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	100,277.50	1,422,535.50	7.05
Bidder 2	53,736.50	1,575,056.78	3.41
Bidder 3	173,204.50	1,854,347.34	9.34
Bidder 4	149,230.50	1,915,908.17	7.79
Bidder 5	189,861.71	1,952,550.75	9.72

Grade, Drain & Surface with Bridge Kuttawa-Princeton Road (US 62)

Date Let: 09-27-13 Call: 317 County: Lyon District: 01

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	301,754.84	14,869,588.01	2.03
Bidder 2	389,724.40	17,448,243.17	2.23

Bridge Replacement Stanton-Slade Road (KY 11)

Date Let: 11-22-13 Call: 104 County: Powell District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	75,300.80	895,095.49	8.41
Bidder 2	72,917.00	982,594.15	7.42
Bidder 3	92,366.80	997,701.81	9.26
Bidder 4	188,700.80	1,332,867.48	14.16

Bridge with Grade, Drain & Surface Beaver Dam - Leitchfield Road (US 62)

Date Let: 11-22-13 Call: 106 County: Ohio District: 02

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	2,724.00	849,506.11	0.32
Bidder 2	4,724.00	979,852.08	0.48
Bidder 3	2,116.00	986,670.88	0.21
Bidder 4	2,944.00	998,489.59	0.29
Bidder 5	10,344.00	1,071,853.80	0.97

Bridge with Grade, Drain & Surface Glomawr to Hazard Road (KY 451)

Date Let: 11-22-13 Call: 108 County: Perry District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	23,360.62	2,535,118.11	0.92
Bidder 2	23,142.70	2,670,259.63	0.87
Bidder 3	28,673.50	3,005,043.64	0.95
Bidder 4	50,820.70	3,775,000.00	1.35

Bridge with Grade, Drain & Surface Buffalo Branch Road (CR-1327)

Date Let: 11-22-13 Call: 111 County: Bell District: 11

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	15,100.00	475,850.00	3.17
Bidder 2	8,500.00	504,497.78	1.68
Bidder 3	7,600.00	534,380.10	1.42
Bidder 4	33,300.00	613,600.97	5.43

Grade, Drain & Surface with Bridge Gratz-Moxley Road (KY-355)

Date Let: 12-13-13 Call: 106 County: Owen District: 06

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	89,514.50	1,546,652.16	5.79
Bidder 2	94,190.50	1,623,700.00	5.80
Bidder 3	87,014.50	1,625,648.35	5.35
Bidder 4	111,085.50	1,750,662.02	6.35
Bidder 5	154,514.50	1,769,334.22	8.73
Bidder 6	120,926.50	1,839,724.00	6.57
Bidder 7	110,006.56	1,860,657.00	5.91
Bidder 8	189,014.50	1,870,341.94	10.11
Bidder 9	185,400.00	2,045,723.25	9.06

Grade & Drain with Bridge Partridge to Oven Fork Road (US 119, Section 3B)

Date Let: 12-13-13 Call: 113 County: Letcher District: 12

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	4,420.00	7,578,221.53	0.06
Bidder 2	3,294.00	7,754,235.24	0.04
Bidder 3	9,548.96	7,880,422.72	0.12
Bidder 4	12,780.00	9,192,686.00	0.14

Grade, Drain & Surface with Bridge US-68 and Louie B. Nunn Parkway

Date Let: 12-13-13 Call: 306 County: Metcalfe District: 03

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	391,503.25	9,682,936.69	4.04
Bidder 2	358,121.89	10,053,930.28	3.56
Bidder 3	614,784.71	10,074,064.58	6.10

Grade, Drain & Surface with Bridge New Moody Lane-Commerce Parkway (New Route)

Date Let: 12-13-13 Call: 307 County: Oldham District: 05

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	62,870.56	9,129,000.00	0.69
Bidder 2	142,196.00	9,484,979.49	1.50
Bidder 3	191,239.56	9,500,000.00	2.01
Bidder 4	152,561.80	9,550,564.42	1.60
Bidder 5	135,333.60	9,569,595.94	1.41
Bidder 6	120,497.35	9,916,269.92	1.22
Bidder 7	198,691.03	10,272,238.97	1.93
Bidder 8	188,126.78	10,838,290.31	1.74

Grade, Drain & Surface with Bridge Morgantown Road (KY 79)

Date Let: 01-24-14 Call: 313 County: Logan District: 03

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	226,205.00	3,698,030.22	6.12
Bidder 2	242,151.00	4,129,147.14	5.86
Bidder 3	251,134.56	4,184,763.00	6.00

Bridge with Grade, Drain & Surface Frenchburg to Owingsville Road (KY 36)

Date Let: 06-27-14 Call: 109 County: Menifee District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	37,210.00	1,030,975.29	3.61
Bidder 2	54,188.00	1,135,135.26	4.77
Bidder 3	38,613.00	1,252,303.33	3.08
Bidder 4	78,624.14	1,261,739.43	6.23
Bidder 5	49,520.00	1,269,226.50	3.90
Bidder 6	122,342.00	1,296,794.87	9.43
Bidder 7	70,970.00	1,556,668.07	4.56

Bridge Replacement Rye Branch Road (CR 1756)

Date Let: 07-11-14 Call: 108 County: Magoffin District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	11,960.00	353,862.26	3.38
Bidder 2	13,424.00	360,631.06	3.72
Bidder 3	13,080.00	401,434.99	3.26

Bridge with Grade, Drain & Surface Hazard-Hyden Road (KY-80)

Date Let: 07-11-14 Call: 113 County: Perry District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	135,085.80	4,277,564.72	3.16
Bidder 2	219,865.80	4,863,809.42	4.52
Bidder 3	134,235.80	5,457,242.25	2.46
Bidder 4	188,169.80	5,509,665.31	3.42

Bridge with Grade, Drain & Surface Tennessee State Line-Elizabethtown Road (I-65)

Date Let: 08-22-14 Call: 200 County: Hart District: 04

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	5,022,849.79	138,485,749.39	3.63
Bidder 2	7,612,965.54	144,700,000.00	5.26

Bridge with Grade, Drain & Surface KY-49

Date Let: 08-22-14 Call: 313 County: Marion District: 04

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	253,032.00	6,563,341.37	3.86
Bidder 2	227,647.00	7,142,390.72	3.19
Bidder 3	227,212.00	7,625,000.00	2.98

The following prestressed I-beam projects were included in the analysis of MOT costs but not in the analysis of replacement costs because bridge area data was not available.

Grade, Drain & Surface with Bridge Morgantown Road (KY 79)

Date Let: 12-13-13 Call: 300 County: Logan District: 03

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	272,151.00	4,198,460.80	6.48
Bidder 2	303,197.00	4,240,001.19	7.15

Bridge with Grade, Drain & Surface Oscar Bowling Road (CR 1113A)

Date Let: 09-26-14 Call: 104 County: Clay District: 11

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	90,225.00	1,345,000.00	6.71
Bidder 2	90,534.86	1,429,391.95	6.33

Grade, Drain & Surface with Bridge Kenneth Barrett Road (KY 30)

Date Let: 09-26-14 Call: 112 County: Owsley District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	70,995.84	3,916,594.89	1.81
Bidder 2	51,745.84	4,103,166.10	1.26
Bidder 3	112,645.84	4,359,000.00	2.58
Bidder 4	67,090.12	4,363,986.66	1.54
Bidder 5	108,455.74	4,553,738.21	2.38

Bridge with Grade, Drain & Surface Booneville-Jackson Road (KY 30)

Date Let: 09-26-14 Call: 113 County: Breathitt District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	100,055.30	3,141,110.54	3.19
Bidder 2	117,229.20	3,898,353.71	3.01
Bidder 3	182,311.30	4,373,538.22	4.17
Bidder 4	257,401.30	5,045,000.00	5.10

Grade & Drain with Bridge Simpsonville - Buck Creek Road (KY 1848)

Date Let: 10-24-14 Call: 118 County: Shelby District: 05

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	145,595.72	7,964,000.00	1.83
Bidder 2	135,013.72	8,193,500.00	1.65
Bidder 3	203,235.72	8,400,000.00	2.42
Bidder 4	90,504.82	8,443,035.77	1.07
Bidder 5	159,505.72	8,982,600.00	1.78

Bridge Replacement Hemp Patch Branch Road (CR-1002)

Date Let: 10-24-14 Call: 302 County: Knott District: 12

Proposal Description: FD04 SPP 060 1002 000-001

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	13,876.00	578,922.34	2.40
Bidder 2	19,232.50	582,948.64	3.30
Bidder 3	19,311.00	652,000.00	2.96
Bidder 4	13,826.00	687,400.70	2.01

The following projects were included in the analysis of MOT costs but not in the analysis of replacement costs because the bridge type was prestressed concrete box beam.

Bridge with Grade, Drain & Surface Fulton-Fulgham Road (KY 307)

Date Let: 03-22-13 Call: 104 County: Hickman District: 01

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	180,652.00	4,785,770.00	3.77
Bidder 2	675,325.10	7,999,354.11	8.44

Asphalt Rehab with Bridge(s) Martha Layne Collins Parkway (BG 9002)

Date Let: 04-19-13 Call: 425 County: Various District: 04

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	1,052,014.43	15,274,318.78	6.89
Bidder 2	870,315.75	16,440,000.00	5.29
Bidder 3	562,969.98	16,645,000.00	3.38

Bridge with Grade, Drain & Surface Low Water Drive (CR 1336)

Date Let: 05-24-13 Call: 352 County: Harlan District: 11

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	23,529.00	1,099,520.97	2.14
Bidder 2	25,453.00	1,115,808.16	2.28
Bidder 3	26,786.00	1,303,490.78	2.05
Bidder 4	37,464.00	1,393,334.07	2.69

Bridge with Grade, Drain & Surface Ray Road (CR 1060)

Date Let: 07-12-13 Call: 200 County: Daviess District: 02

	MOT Items (\$)	Total Bid, \$	MOT Percent

Grade & Drain with Asphalt Surface Chalybeate School Road (KY 743)

Date Let: 10-24-14 Call: 304 County: Edmonson District: 03

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	96,199.09	3,297,310.97	2.92

The following project was included in the analysis of MOT costs but not in the analysis of replacement costs because the bridge type was reinforced concrete box culvert.

Grade & Drain with Bridge KY 343

Date Let: 09-26-14 Call: 119 County: Letcher District: 12

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	70,714.00	504,849.77	14.01
Bidder 2	85,769.00	524,724.15	16.35
Bidder 3	110,456.00	598,309.85	18.46

Maintenance of Traffic-Bridge Deck Restoration

The analysis of maintenance of traffic (MOT) costs calculated the percentage of the total contract amount that was bid for MOT items. The analysis included the following MOT bid items:

- Arrow Panel
- Barricade-Type III
- Concrete Barrier Wall Type 9T
- Crash Cushion Type VI Class B TL2
- Crash Cushion Type VI Class B TL3
- Crash Cushion Type VI Class BT TL3
- Install Temp Crash Cushion
- Lane Closure
- Law Enforcement Officer
- Maintain & Control Traffic
- Pave Striping-Temp Paint-4 in
- Pave Striping-Temp Paint -6 in
- Pave Striping-Temp Rem Tape -B
- Pave Striping-Temp Rem Tape -W
- Pave Striping-Temp Rem Tape-Y
- Pavement Marker Type IVA-MW Temp
- Pavement Marker Type IVA-MY Temp
- Pavement Marker Type V-B W/R
- Police Officer with Vehicle
- Portable Changeable Message Sign
- Relocate Crash Cushion
- Relocate Temp Concrete Barrier
- Relocate Water-Filled Barriers
- Remove Pavement Marker Type V
- Signs
- Temp Concrete Median Barrier
- Temp Crash Cushion
- Temp Signal 2 Phase
- Temp Signal Multi Phase
- Temporary Signs
- Truck Mounted Attenuator
- Water-Filled Barriers

Not all items were used on every project. The results of the analysis are summarized in Table D2.

Table D2-Maintenance of traffic analysis summary bridge deck restoration

Analysis Case	n	Mean	Standard Deviation
MOT < 30%	270	14.19%	6.10%
MOT < 35%	276	14.46%	6.46%
MOT < 40%	280	14.75%	6.87%
All	283	15.12%	7.73%

The following are summaries of MOT percentages for each project used in the analysis.

Bridge Deck Overlay Butler County (WN 9007)

Date Let: 01-25-13 Call: 317 County: Butler District: 03

	MOT Items (\$)	Total Bid, \$	MOT Percent

Bidder 6	159,584.00	851,503.81	18.74

Bridge Deck Restoration & Waterproofing Bridge over Tygarts Creek

Date Let: 10-24-14 Call: 319 County: Carter District: 09

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	47,300.00	459,533.45	10.29
Bidder 2	38,800.00	497,414.50	7.80
Bidder 3	1,200.00	509,889.52	0.24
Bidder 4	51,300.00	512,384.40	10.01
Bidder 5	4,000.00	562,184.75	0.71
Bidder 6	15,050.00	609,471.66	2.47
Bidder 7	8,300.00	662,378.40	1.25

Bridge Deck Restoration & Waterproofing Bridge Overlays in Wayne County

Date Let: 10-24-14 Call: 403 County: Wayne District: 08

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	87,705.00	389,939.80	22.49
Bidder 2	76,182.00	404,524.40	18.83
Bidder 3	96,049.95	505,884.71	18.99
Bidder 4	62,829.00	514,635.59	12.21
Bidder 5	108,435.00	533,264.15	20.33

The following projects were included in the analysis of MOT costs but not in the analysis of overlay costs because they did not include a latex-modified concrete overlay.

Bridge Deck Restoration & Waterproofing Bridges over Mountain Parkway

Date Let: 06-14-13 Call: 405 County: Wolfe District: 10

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	38,243.00	181,435.80	21.08
Bidder 2	12,245.00	188,366.34	6.50
Bidder 3	49,745.00	240,826.30	20.66
Bidder 4	21,543.00	253,716.31	8.49
Bidder 5	30,170.00	264,780.20	11.39
Bidder 6	32,537.00	313,454.13	10.38
Bidder 7	82,840.00	408,254.16	20.29

Bridge Deck Restoration & Waterproofing Bridge over Harrods Creek

Date Let: 03-28-14 Call: 300 County: Oldham District: 05

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	4,248.00	57,753.20	7.36
Bidder 2	7,246.80	62,622.76	11.57
Bidder 3	10,947.20	83,917.12	13.05

Bridge Deck Restoration & Waterproofing Anderson County US 62 Tyron Bridge

Date Let: 08-22-14 Call: 319 County: Anderson District: 07

	MOT Items (\$)	Total Bid, \$	MOT Percent
Bidder 1	19,500.00	42,500.00	45.88
Bidder 2	13,500.00	44,500.00	30.34
Bidder 3	9,950.00	53,755.00	18.51
Bidder 4	25,000.00	99,472.18	25.13

APPENDIX E: PROBABILISTIC ANALYSIS

Appendix E contains the risk profile statistics and ascending cumulative probability plots for the following probabilistic analyses:

- Bridge over highway
- Bridge over highway with modified bridge construction time and cost
- Bridge over highway with limited variables
- Bridge over waterway
- Bridge over waterway with modified bridge construction time and cost

APPENDIX F: SPREADSHEET INPUT

Appendix F contains a summary of the required spreadsheet input.

Analysis Period (years)	75
-------------------------	----

Discount Rates	
Short term	0.035
Long term	0.025

Agency Costs	
Preliminary Engineering (%)	10
Construction Engineering (%)	11
Maintenance of Traffic - replacement (%)	3.41
Maintenance of Traffic - rehabilitation (%)	15.12
Bridge replacement (\$/SF)	107.52
Deck overlay - new bridge (\$/SF)	16.54
Deck overlay - old bridge (\$/SF)	16.54
Overlay approach pavement - new bridge (\$/SY)	40.01
Overlay approach pavement - old bridge (\$/SY)	54.83
Deck replacement (\$/SF)	38.17
FRP wrap - 1 layer (\$/SF)	54.39
Bridge rail retrofit with thrie beam (\$/LF)	76.99
Bridge removal (\$/SF)	14.13
Deck removal (\$/SF)	4.87
Routine annual maintenance - new bridge (\$/SF)	0.10
Routine annual maintenance - old bridge (\$/SF)	0.15

Bridge Replacement	
New Bridge	
Roadway width (ft)	28
Total width (ft)	31
Length (ft)	204
Approach roadway (%)	5
Overlay approach pavement area (SY)	355

Bridge Rehabilitation	
Existing bridge	
Roadway width (ft)	25
Total width (ft)	28
Length (ft)	204
Area of applied FRP - 1 layer (SF)	5700
Overlay approach pavement area (SY)	278

Activity - Replacement Alternative	Duration (d)	Timing (yr)
Bridge replacement	240	0
Deck overlay	30	20
Deck replacement	45	40
Deck overlay	30	60

Activity - Rehabilitation Alternative	Duration (d)	Timing (yr)
Bridge rehabilitation	30	0
Bridge replacement	240	20
Deck overlay	30	40
Deck replacement	45	60

User Costs	
Length of detour (miles)	
Replacement	2.00
Rehabilitation	0.00
Average daily traffic, ADT, initial	
On bridge	100
Under bridge	5000
Truck traffic, ADTT (%)	
On bridge	5
Under bridge	12
Annual traffic growth rate (%)	
On bridge	1
Under bridge	2
Value of time, VOT (\$/hr)	
Cars	16.28
Trucks	25.30
Vehicle Operating Cost, VOC (\$/mile)	
Cars	0.27
Trucks	0.74
Vehicle occupancy rate (persons/vehicle)	
Cars	1.5
Trucks	1.05
User Time Delay (min)	
Bridge replacement-on bridge	10
Bridge replacement-under bridge	5
Bridge rehabilitation-on bridge	5
Bridge rehabilitation-under bridge	5
Deck overlay-on bridge	5
Deck overlay-under bridge	0
Deck replacement-on bridge	10
Deck replacement-under bridge	0
Cost per crash (\$)	
Non-fatal	126,870
Fatal	9,100,000
Crash and fatality rates (per million vehicle-miles)	
Non-fatal crashes	2.65
Fatalities	0.015

Benefit-Cost Methodology for Moses Wheeler Bridge TIGER Application

The methodology and assumptions underlying the benefit-cost analysis are described herein.

Time Horizon

All benefits and costs were based on a forecast horizon of 35 years, from 2009 through 2043. Bridge construction was assumed to be eight years in duration, beginning in 2009 and completing in 2016. User benefits were assumed to begin in January 2017, immediately after the completion of the bridge, and last through the end of the forecast horizon.

Discount Rate

Consistent with USDOT guidelines, the benefits and costs in this analysis were discounted at a rate of 7 percent.

Project Costs

The bridge was assumed to cost \$299 million in 2009 dollars to design and construct. Construction would begin in 2009 and complete in 2016. The annual construction expenditures expected per year is shown in Exhibit A-1.

Exhibit A-1: Breakdown of Contract E Construction Costs by Scenario (Million 2009 Dollars)

2009	2010	2011	2012	2013	2014	2015	2016	TOTAL
\$4.1	\$23.1	\$51.9	\$68.3	\$68.0	\$38.5	\$35.0	\$10.2	\$299.1

Source: STV Incorporated, Connecticut Department of Transportation

In the no-build scenario, the following capital expenditures would be needed to keep the bridge at a minimum level of functionality:

Exhibit A-2: Breakdown of Moses Wheeler Bridge No-Build Capital Costs

Year	Capital Cost Description	Estimated Cost (2009 \$)
2010	Bridge drainage, fender system repairs	\$6.5 million
2020 - 2023	Full deck & bearing replacement, steel repairs, substructure repairs, superstructure painting	\$82 million
2035 - 2041	Full bridge replacement	\$299 million
Total No-Build Capital Costs		\$387.5 million

Source: STV Incorporated, Connecticut Department of Transportation

With major repairs scheduled in 2010 and again in 2020, the useful life of the bridge could be extended to 2035, but would need to be completely replaced at that time. Thus, the same annual construction costs in the build scenario from 2009 to 2016 also appear in the no-build scenario from 2035 to 2042.

The total capital costs in the build scenario are estimated to be \$230 million in discounted 2009 dollars (using the 7 percent discount rate), and the capital costs in the no-build scenario are estimated to be \$77 million in discounted 2009 dollars.

Operations & Maintenance Costs

In the build scenario, the annual bridge operations & maintenance (O & M) costs were estimated to be \$115,000 throughout the forecast horizon (see Exhibit A-3 below). No-build operation and maintenance costs were estimated to be \$670,000 from 2009 to 2020, and \$190,000 from 2021 until the bridge replacement construction begins in 2035. From 2035 to 2045, no-build O & M costs were estimated to be \$115,000, equivalent to the O & M costs in the build scenario. When discounted at a 7 percent rate, the total differential O & M costs between the build and no-build scenarios would carry a \$4 million benefit to the state throughout the forecast period in the form of lower relative costs.

Exhibit A-3: Breakdown of Moses Wheeler Bridge Operations & Maintenance Costs

O & M Cost Description	Estimated Cost (2009 \$)			
	Build Scenario	No-Build Scenario (2010 to 2020)	No-Build Scenario (2021 to 2035)	No-Build Scenario (2036 to 2045)
Drainage	40,000	40,000	40,000	40,000
Crack Sealing	20,000	40,000	20,000	20,000
Bridge Collision Repairs	5,000	10,000	10,000	5,000
Joint Repairs	-	50,000	20,000	-
Added Inspections	-	100,000	-	-
Deck Patching	-	150,000	-	-
Loose Concrete Removal	-	40,000	-	-
Substructure Patching	-	40,000	25,000	-
Minor Steel Repairs	-	100,000	25,000	-
Spot Painting	50,000	100,000	50,000	50,000
Total O & M Costs	\$ 115,000	\$ 670,000	\$ 190,000	\$ 115,000

Source: STV Incorporated, Connecticut Department of Transportation

Residual Value of Bridge – Negative Cost

The useful life of the replaced Moses Wheeler Bridge is estimated to be 75 years. At the end of the forecast horizon in 2045, the bridge will have approximately 46 years remaining before major rehabilitation and replacement would be necessary. Therefore, the bridge will carry a residual value past the forecast horizon that has been estimated as a negative cost for this analysis.

The residual value has been estimated at \$16 million in discounted 2009 dollars. Underlying this estimate is the assumption that the bridge will depreciate on a straight-line basis, with the residual value of the bridge equal to the real value of its construction cost multiplied by the share of its useful life remaining at the end of the forecast period.

User Benefits

Construction-Related Vehicle Travel Time Benefits

The major quantifiable benefit of the bridge replacement project is the elimination of future travel time delays that would occur if the bridge was not replaced today. These delays would be caused by the future capital replacement projects needed just to maintain the Bridge at its current state

of good repair rating, which would require lane closures for significant periods of time and cause major delays on I-95 for most of the day.

In particular, the current deck would need to be completely replaced in 2020 if the replacement project was not implemented. Such a replacement would require at least one lane of traffic to be closed in both directions at all times for roughly three years, which would cause severe delays on a daily basis and likely draw heavy opposition from the trucking industry and the residents of Connecticut.

In order to determine the impact of the lane closures during this deck replacement project several methodologies were used to determine the average delay time over the 24 hour period. The peak hourly demand at the bridge has been estimated at 6,600 vehicles in each direction. A lane closure would reduce the capacity to 3,300 veh./hr. in each direction. Based on manual calculations for the daily demand volume across the Moses Wheeler Bridge, the following data was determined:

- 1) The northbound direction of the bridge would experience a maximum queue of approximately 8,200 vehicles from 2-7 PM, the period when vehicle demand exceeds roadway capacity (total two-lane capacity = 3,330 veh/hr). Given a per vehicle spacing of 30 feet over 3 lanes, the queue length would be approximately 82,000 feet (15.5 miles).
- 2) The southbound direction of the bridge would experience a maximum queue of approximately 2,730 vehicles from 6:30-9 AM, the period when demand exceeds roadway capacity. Given a per vehicle spacing of 30 feet over 3 lanes, the queue length would be approximately 27,300 feet (5.2 miles).

This information was then analyzed using the Highway Capacity Manual and VISSIM simulation models to develop average delay times over the 24 hour period. The two methods revealed peak period delays ranging from 40 minutes to an hour with average hourly delays over the 24 hour period of 22 minutes in the northbound direction and 15 minutes in the southbound direction. Using weighted averages based on the volumes, an average delay time of 18.3 minutes was estimated over the 24 hour period.

This average delay per vehicle per day on the Moses Wheeler Bridge in the no-build scenario was applied to the forecasted ADT volumes from 2020 to 2022 to arrive at annual travel time savings over the forecast period. Annual ADT projections were based on a study by CTDOT in 2001 that computed historical volumes on the bridge in 1999 and projected volumes in 2025. Applying the compound annual growth rate used in the study to 1999 volumes allowed for an annual ADT forecast to be created from 2009 to 2043.

Applying the projected volumes from 2020 to 2022 to the computed per-vehicle delays during this period led to the computation of total daily vehicle travel time savings. These benefits were then converted to total daily passenger travel time savings (see Exhibit A-4) using a vehicle-occupancy rate of 1.0 for commercial vehicles, estimated to be 13 percent of total ADT, along with a passenger vehicle occupancy rate of 1.424 for the 87 percent passenger share of total ADT¹.

Exhibit A-4: Annual Hours of Passenger Travel Time Savings in Build Scenario, 2009 Dollars

Benefit Description	2020	2021	2022	TOTAL
Passenger Trips	16,185,111	16,290,800	16,397,179	48,873,090
Commercial Trips	1,698,360	1,709,450	1,720,613	5,128,424
TOTAL	17,883,471	18,000,250	18,117,792	54,001,514

Source: Parsons Brinckerhoff

The estimated travel time savings in the build scenario were converted into dollar benefits for commercial vehicles, passenger work trips, and passenger non-work trips. Commercial vehicle travel time savings were valued at 100 percent of the hourly truck driver wages plus fringe benefits, according to USDOT guidelines. Truck driver wage data was obtained by inflating the 2008 Bureau of Labor Statistics (BLS) wage data for truck drivers in Connecticut to 2009 dollars, and using a fringe benefits factor of 33 percent of hourly wages. Total hourly 2009 commercial vehicle compensation was estimated to be \$32.22.

Passenger work trips, defined by USDOT as non-commute work trips occurring for business purposes, was assumed to represent 5.6 percent of total passenger vehicle travel time savings. This estimate was taken from USDOT estimates of the share of local passenger travel comprising business trips in its 2003 publication “Revised Departmental Guidance: Valuation of Travel Time in Economic Analysis.” These trips were valued at 100 percent of hourly passenger wages plus fringe benefits, which was estimated to be \$37.50. Passenger wage data was obtained by inflating the 2008 average wage for all Connecticut employees from the BLS to 2009 dollars, and using a fringe benefits factor of 33 percent of hourly wages.

Passenger non-work trips, defined as all “off-the-clock” commute or leisure trips, represent the remainder of total passenger vehicle travel time savings. These trips were valued at 50 percent of hourly passenger wages, which were estimated to be \$28.20. Passenger wage data was obtained by inflating the 2008 average wage for all Connecticut employees from the BLS to 2009 dollars.

The total travel time benefits in discounted 2009 dollars are shown in selected years in Exhibit A-5. When discounted at a 7 percent annual rate, such benefits total \$73 million for commercial vehicles, \$41 million for passenger work trips, and \$291 million for passenger non-work trips.

Exhibit A-5: Total Annual Travel Time Benefits, Discounted 2009 Dollars

Benefit Description	2020	2021	2022	TOTAL
Passenger Work Trips	\$ 14,419,988	\$ 13,564,626	\$ 12,760,003	\$ 40,744,617
Passenger Non-Work Trips	\$ 102,999,911	\$ 96,890,187	\$ 91,142,879	\$ 291,032,977
Commercial Trips	\$ 25,997,026	\$ 24,454,941	\$ 23,004,328	\$ 73,456,295
TOTAL	\$ 143,416,924	\$ 134,909,754	\$ 126,907,210	\$ 405,233,889

Source: Parsons Brinckerhoff

Accident-Related Vehicle Travel Time Benefits

Users of the bridge would also benefit from reduced delays caused by vehicle accidents, since the replaced bridge will have much wider shoulders to efficiently move damaged vehicles. As previously mentioned, the current bridge does not have adequate shoulders, which leads to major backups and travel time delays during accidents due to damaged vehicles remaining in one or more lanes. This problem will be resolved by the new design of the replacement bridge.

To estimate the benefits associated with more efficient accident management on the bridge, historical bridge vehicle accident data from 2003 to 2007 was analyzed and used to derive an annual estimate (65) of accidents. It was assumed that this historical average number of accidents would increase throughout the forecast horizon at the projected annual growth rate of vehicle traffic.

For each projected accident, it was assumed that the accident would create, on average, a 45 minute travel time delay for all vehicles during a two hour window of the day, after which the damaged vehicles would presumably be cleared from the roadway. The costs of this delay were quantified using the same approach and data described in the previous section.

The replaced bridge was assumed to reduce average travel delays from 45 minutes to 15 minutes during accidents, though the bridge is not expected to reduce the overall number of accidents in the future.

ANN ARBOR'S LED STREETLIGHT PROGRAM

SUMMARY

The City of Ann Arbor is installing LED streetlights in order to reduce lighting costs and greenhouse gas emissions. After successfully piloting an LED replacement for our downtown "globe" lights, the City received a \$630,000 grant from the Ann Arbor Downtown Development Authority to fund retrofits for over 1,000 downtown lights. This initial installation will save the City over \$100,000 per year, reducing annual greenhouse gas emissions by 267 tonnes CO_{2e}. In addition, testing will continue on LED replacements for neighborhood streetlights, with the eventual goal of replacing all of our public lighting with LEDs. Full implementation of LEDs would cut Ann Arbor's public lighting energy use in half and reduce greenhouse gas emissions by 2,200 tonnes CO_{2e} annually.

PROJECT HISTORY

Funding for public lighting is increasingly difficult as electric costs rise and available municipal funds get tighter. In its 2005-2006 budget, the City of Ann Arbor established a moratorium on new street lighting to help keep costs under control. City staff were tasked with finding ways to reduce public lighting costs. Like other cities, Ann Arbor had already replaced all its incandescent traffic signals with LEDs (light-emitting diodes). As with the traffic signals, LED streetlights, if the technology was sufficiently developed, could create significant energy and maintenance savings since LEDs reduce lighting energy requirements by one-half or more and last five times longer than conventional outdoor lighting technologies. In 2005, Ann Arbor committed to investigate LEDs for outdoor public lighting purposes as part of the ICLEI Great Lakes Climate Policy Project.

Initial research into past efforts with LED outdoor lighting in other municipalities like Honolulu and San Diego revealed failed efforts. These tests found that LED products had high costs and poor light output. To assess the current LED technologies, the city invited numerous LED manufacturers to provide test lights, which the City then installed at its own expense to evaluate the performance. Early lighting tests in 2006 were performed in the City Hall parking lot and showed improvement over the older LED technologies. Over the next two years, more successful technologies were demonstrated on city streets in the downtown area and in neighborhoods. Over the last two years of testing, city staff has seen a tremendous improvement in light output and color rendition from LED lighting manufacturers. While lighting distribution and uniformity remain a problem for the highly directional LEDs, we have found applications where the LED technology is ready to replace existing public lighting today.

Tests on LED replacements for our downtown pedestrian "globe" lights have been very successful. This retrofit globe from Lumecon houses LEDs on four panels that face down and out, directing the light toward the street and away from the sky. Each fixture draws 56 watts and is expected to last ten years, replacing fixtures that use 120 watts and only last two years. These globe lights are mounted on ten-foot poles. As a test, 25 of these LED globes, purchased

with help from our Downtown Development Authority (DDA), were installed to light one complete block in the Ann Arbor downtown.

With five times the lifetime and less than half the energy use, the lights have a 4.4 year payback. We are now planning to retrofit all of these downtown lights over the next two years. Funding for the downtown light conversions is being provided by a \$630,000 grant from the DDA. The downtown LED project will reduce annual greenhouse gas emissions by 267 tonnes CO₂e and save the city over \$100,000 annually. The DDA grant will be administered through the Ann Arbor Municipal Energy Fund, which ensures that a portion of the savings from the retrofits is paid back to the fund to pay for future retrofits.

Meanwhile, Ann Arbor will continue to test possible LED replacements for the remainder of our streetlights. If the project succeeds in retrofitting all of the streetlights in Ann Arbor, the annual greenhouse gas emissions reduction is expected to be around 2,200 tonnes CO₂e annually. All of the test installations have signs requesting public input, and the response from the community has been overwhelmingly positive. There seems to be agreement that Ann Arbor's LED streetlight future will indeed be bright.

MORE INFORMATION: BENEFITS OF LEDS

The primary benefits of LEDs are their reduced energy consumption, longer lifetime, directionality and controllability. The energy savings are 50% or more and the lifetime is estimated at 5 times longer which yields the excellent payback time of 4.4 years. The "instant-on" and dimming ability of LEDs will offer additional energy savings through control strategies that can brighten and dim based on time of day, ambient light, or any other control parameters desired. Motion sensors can turn LEDs on or off instantly, allowing lighting to be used only when needed. Typical outdoor lighting (MH or HPS) has a re-strike time of a few minutes before they can turn on and therefore cannot be used with motion sensors. The City of Ann Arbor is partnering with lighting control companies to explore these new possibilities with LED lights. Finally, because LEDs emit directional light, we have more control over what we light (streets and sidewalks) and what we don't (the night sky). This makes for easier compliance with the Dark Skies Initiative, which aims to reduce light pollution and its associated wildlife impacts.

Our test globe LED fixtures use half the energy of the bulbs they replace and cobrahead fixtures use 50 to 80 percent less energy than our current cobraheads. This reduces emissions of mercury from coal power plants which leads directly to reduced CO₂ emissions. Full implementation of LED streetlights could cut Ann Arbor's greenhouse gas emissions by over 2,200 tonnes CO₂-equivalent emissions.

One of the greatest advantages of LED fixtures is their lifetime, which reduces maintenance costs. At a ten-year lifetime (compared to two years for a metal halide bulb), city staff will need

to change far fewer bulbs, ballasts, and igniters. In fact, maintenance savings alone are sufficient to make LED fixtures cheaper on a lifecycle basis than conventional fixtures.

MORE INFORMATION: LIFE-CYCLE COST ANALYSIS

Continue with existing bulbs (2 year life)

	<u>Number</u>	<u>Cost</u>	
Bulb replacements	5	\$37	\$186
Bulb labor & equip	5	\$211	\$1,056
Ballast (10 yr life)	1	\$59	\$59
Igniter (10 yr life)	1	\$35	\$35
Energy cost (4,380 kWh)			\$325
			\$1,661

Change to LED bulb (10 year life)

	<u>Number</u>	<u>Cost</u>	
Bulb replacements	1	\$460	\$460
Bulb labor & equip	1	\$56	\$56
Energy cost (2,100 kWh)			\$182
			\$698

10-year Maintenance saving	\$819
10-year Energy saving	\$143
Total	\$962

Each LED replacement bulb saves \$962 in energy and maintenance costs over its ten-year lifetime. At this savings rate, the new bulb pays for itself in 4.4 years (\$423 / \$96). This analysis is based on our downtown globe lights, but initial inquiries into cobrahead fixtures suggest that the results will be even better.

MORE INFORMATION: TEST INSTALLATIONS

The first test fixtures that the City received and installed in our City Hall parking lot in the summer of 2005 were unimpressive. We got the sense that LED lighting manufacturers were not quite ready to meet our public lighting needs. Over the following year, however, the test fixtures we received from manufacturers increased markedly in quality and today Ann Arbor is seriously considering moving to LEDs for public lighting.

The second test installation consists of a series of overhead streetlights (called "cobraheads" because of their shape) in a residential neighborhood. These fixtures have not been purchased yet as the block of downtown globes have,

Holophane cobrahead

but are instead on loan from the manufacturers. Wattages vary from 50 to 80 watts for fixtures that replace 250-watt fixtures. Manufacturers of cobrahead replacements currently installed for testing include **Holophane, IntenCity, Leotek, Lumecon, and Millenia Technologies.**

Lumecon globes

To evaluate these fixtures, Ann Arbor is employing a four-part test process, with lights being assessed on light output, heat management (which affects lifetime), and general public input.

Light Output: The cobrahead replacements are installed on a residential street where the spacing allows for each fixture's light output to be judged independent of adjacent fixtures but where different fixtures can be easily compared. City staff is measuring light output and plans are in the works for a more involved public input process to evaluate the fixtures' aesthetics.

Heat Management: One of the most attractive characteristics of LEDs is their long lifetime, but this lifetime depends directly on the fixture's operating temperature. As a result, heat management testing is vital to identifying fixtures that achieve our goal of a ten-year life. City staff is measuring the operating temperature of fixtures to project the useful life of different test fixtures.

Energy Consumption: Each light is tested for electricity use in watts to verify energy savings.

Public Input: All the test installations have signs requesting public input, and the response from the community has been overwhelmingly positive (81 of 83 responses). The 81 positive responses emphasized the lack of light spilling out onto yards and house faces ("light trespass"). One negative response commented that the light was too harsh. The other negative comment reflects a minority opinion about the purpose of public lighting, objecting that the LED cobrahead no longer lit up their garage and yard and that the globe LEDs were creating a "dark cavern" through the downtown.

Test light public input sign

City of La Palma

Agenda Item No. 6

MEETING DATE: May 20, 2014

TO: CITY COUNCIL

FROM: CITY MANAGER

SUBMITTED BY: Mike Belknap, Community Services Director

AGENDA TITLE: First Amendment to the Agreement with Computer Service Company (CSC) for Traffic Signal Maintenance Services

PURPOSE:

The purpose of this report is to seek City Council approval for an amendment to the Agreement with Computer Service Company of Corona, California, for the Citywide Traffic Signal Maintenance Services, extending the term of the agreement through June 5, 2016.

BACKGROUND:

On June 5, 2011, the City entered into a three-year contract with Computer Service Company (CSC) of Corona, California for Citywide traffic signal maintenance with an optional two-year extension. CSC performs monthly signal maintenance services in addition to the extraordinary maintenance on as as-needed basis.

SUMMARY:

Computer Service Company has expressed their willingness to extend the contract for an additional two (2) year term, extending their agreement through June 5, 2016, and has requested a rate increase for the extension period. Following a cost analysis staff has determined the increase is justified and, according to the current agreement, would like to excise our option for a two (2) year extension. The table below is a comparison of the current rates and the proposed rates:

ROUTINE MAINTENANCE RATES

	Current Unit Price	Current Monthly Total	Proposed Unit Price	Proposed Monthly Total
Full Traffic Signal Maintenance per intersection (21) per month	\$53	\$1113	\$60	\$1260

**Samples of Extraordinary Maintenance Costs
Labor and Equipment Rates**

Labor Position / Equipment	Current Rate	Proposed Rate
Bench Technician	\$72	\$90
Transportation Maintainer Level 1	\$65	\$76
Transportation Maintainer Level 2	\$55	\$68
Boom Truck/Crane	\$220	\$240
Bucket Truck	\$30	\$32
Service Truck	\$15	\$17
Compressor	\$25	\$27
Arrow Board	\$10	\$12
Replace 8" LED Red Indication	\$65	\$70
Replace 8" LED Green Indication	\$90	\$95
Replace 12" LED Red Indication	\$85	\$100
Replace 12" LED Green Indication	\$117	\$121
Replace LED Pedestrian Head Nodule	\$215	\$225

The cost for routine maintenance would increase by \$147 monthly for a total annual increase of \$1,764. Extraordinary maintenance costs are undetermined as repairs are performed on an emergency basis. It should be noted that CSC has not requested a rate increase since the commencement of the Agreement.

Computer Service Company has been performing the City's traffic signal maintenance since June 2006. They currently perform traffic signal maintenance for several cities in Southern California and their performance and response time has been excellent.

ALTERNATIVE:

The alternative to this Agreement Amendment would be to issue a Request for Proposals for the Citywide Traffic Signal Maintenance.

FISCAL IMPACT:

Sufficient funds for the Traffic Signal Maintenance contract are budgeted accordingly each Fiscal Year in account numbers 011-324-600 and 011-324-709.

RECOMMENDED ACTION:

It is recommended that the City Council amend the Agreement with Computer Service Company of Corona, California, for the Citywide Traffic Signal Maintenance Services, increasing the monthly routine maintenance costs and extraordinary maintenance costs, and extending the term of the agreement through June 5, 2016.

APPROVED:

Department Director

Administrative Services
Director

City Manager

Attachment: 1. Proposed Agreement and Attachments

FIRST AMENDMENT
AGREEMENT FOR MAINTENANCE OF TRAFFIC SIGNALS

COMPUTER SERVICE COMPANY

THIS FIRST AMENDMENT TO THE AGREEMENT FOR MAINTENANCE SERVICES (hereinafter, the “Agreement”), entered into as of **June 5, 2014**, by and between the CITY OF LA PALMA, a municipal corporation (hereinafter, the “City”), and **Computer Service Company**, a corporation (hereinafter, the “Consultant”). The Consultants and the City are hereafter together referred to as the “Parties” and each individually as a “Party.”

RECITALS

- A. The parties hereto have previously entered into an Agreement for Maintenance of Traffic Signals, dated June 5, 2011, for services providing routine monthly maintenance and extraordinary maintenance of the traffic signals. A true and correct copy of this Agreement is attached hereto, marked “Exhibit B” and incorporated herein by this reference.
- B. The City desires to extend the Agreement with the Contractor for a period of two (2) years through June 5, 2016 for the Maintenance of Traffic Signals.

WHEREFORE, the parties desire to amend said Agreement as follows:

- 1. **Period Covered by Agreement.** Said service of Maintenance of Traffic Signals shall continue through June 5, 2016.
- 2. **Consideration.** For services rendered, the following amount of \$1260 for monthly routine maintenance costs, and fees or extraordinary maintenance shall apply as specified in “Exhibit A”.
- 2. **Status of Agreement.** Except as noted in Section 1 above, all other terms of the Agreement dated June 5, 2011, shall remain in full force and effect.

IN WITNESS WHEREOF, this Agreement has been executed as of the date first written above.

RE: Extension of the Traffic Signal Maintenance Agreement

Dear Mr. Baldwin,

Pursuant to the terms of our current agreement, Computer Service Company would like to express its willingness to extend your contract for an additional two year period for traffic signal maintenance from June 6, 2014 through June 5, 2016.

At this time, we would also like to request an across the board modest rate increase that will be in effect for the remainder of the contract extension period. If you should have any questions regarding this matter, please feel free to contact our office. We look forward to another two years of service with the City of La Palma.

Very Truly Yours,

Jeff Telander

AGREEMENT FOR MAINTENANCE OF TRAFFIC SIGNALS

THIS AGREEMENT, made and entered into this 5th day of June, 2011, by and between the CITY OF LA PALMA (“City”), and Computer Service Company (“Contractor”).

WITNESSETH:

The parties hereto do agree as follows:

1. RECITALS: This AGREEMENT is made and entered into with respect to the following facts:

(a) That CITY, pursuant to Section 37103 of the Government Code of the State of California, desires to obtain certain services available through Contractor, specifically special engineering and maintenance skills relative to traffic signaling devices.

(b) That the principals of Contractor are well qualified to perform such services by reason of their special training and experience relating to the repair and maintenance of traffic signaling devices.

(c) That the public interest, convenience and necessity requires that City obtain such services upon the terms and conditions hereinafter set forth.

2. DEFINITIONS:

(a) “City Engineer” shall mean and refer to the City Engineer of the City of La Palma, acting personally or through his/her duly authorized agents, each agent acting only within the scope of authority delegated to him/her.

(b) “Police Chief” shall mean and refer to the Senior Management employee of the Police Department of the City of La Palma, acting personally or through his/her duly authorized agents, each agent acting only within the scope of authority delegated to him/her.

(c) The word “Contractor” shall mean and refer to Computer Service Company.

3. AUTHORITY OF THE CITY ENGINEER:

(a) The City Engineer shall decide any and all questions which may arise as to the quality or acceptability of materials furnished and work performed, and as to the manner of performance and rate of progress of the work. The City Engineer shall further decide all questions which arise as to the acceptable fulfillment of the agreement on the part of the Contractor; and all questions as to claims and compensations.

(b) The City Engineer’s decision shall be final and he shall have authority to enforce and make effective such decisions and orders that the Contractor shall carry out promptly.

(c) At no time will any changes in timing or progression of the signals be made except with the approval and under the direct supervision of the City Engineer.

4. SERVICES:

(a) Traffic Signals: Contractor shall, during the term of this Agreement, service, maintain and overhaul, as set forth in detail below, traffic signal devices (i.e. time, semi-actuated and fully actuated traffic signals) at the locations set forth on EXHIBIT "A," attached hereto and incorporated herein by this reference, and at such other locations where such devices may from time to time be installed within the City. It is understood and agreed that all said labor, services, materials and equipment shall be furnished and said work performed and completed by the Contractor as an independent Contractor, subject to the inspection and approval of the City, the City Engineer's office, or inspectors or their representatives. When City desires to add traffic signal devices, to be served and maintained pursuant to this Agreement, it shall notify Contractor of such added signal devices at least ten (10) days in advance of the time such service shall commence. In the event any signals are installed, which are a more complicated type than those shown on Exhibit "A," these signals may be added to the maintenance contract at a price mutually satisfactory to the Contractor and the City.

The services to be performed by Contractor hereinunder shall consist of a maintenance program including, but not limited to the following:

i) The inspection, cleaning and adjustment of each controller unit, and the repair and replacement of any and all defective parts; such inspection, cleaning and adjustment shall take place as to each unit at least once per calendar month.

ii) The Contractor shall relamp on a group relamping basis. The relamping period shall be based on an 80% depletion curve, not to exceed twelve (12) months. Lamps shall be General Electric, Sylvania, Westinghouse, or City-approved equal.

iii) The replacement and/or repair of any and all defective parts of the controller mechanisms of any unit, or any part thereof, as may be necessary for the operation thereof.

iv) The cleaning, polishing, and inspection of all lenses and reflectors in each unit at the time the signal is relamped. All broken or deteriorated parts will be replaced or changed as necessary.

v) The maintenance of a patrol to insure the prompt replacement of burned out lamps and repair of controller malfunctions, and to ensure the traffic signal progression of all units according to timing relationships determined by the City Engineer.

vi) The servicing of the signal systems on an emergency basis in the event of malfunction of the controller or signal systems.

vii) Painting of Equipment. At the request of the City, the Contractor shall furnish a written estimate for the painting of the equipment. The painting of the equipment shall commence thirty (30) days after approval and be completed within sixty (60) days of commencement. Equipment that shall be painted shall include signal heads, pedestrian heads, back plates, service cabinets, pedestrian buttons, and controller cabinets.

5. ANSWERING SERVICE CALLS: The Contractor shall maintain a 24-hour emergency service so that it may be contacted at any hour of the day or night and will be required to answer different types calls, as specified below, within certain time limits. The Contractor shall supply the City Engineer and the Police Chief with a telephone number from which its radio operator may be contacted at all hours.

(a) Light out calls. Two separate signal head indications will be required for each direction of traffic at all times. When this number falls below two, the Contractor shall answer the light out call as soon as possible, not to exceed two hours, day or night. In the event a light out call is received with the report that two indications are still remaining, the Contractor shall answer the call within 24 hours. It shall be the responsibility of the Contractor to determine the number of indications in operation.

(b) Emergency calls. Except as set forth in Paragraph (a) above, if the signal is malfunctioning in any manner, the Contractor shall answer the call immediately, regardless of the fact that the controller may have been switched to flashing operation by the Police Department. The word "immediately" is construed to mean with all possible haste, and shall not exceed one hour.

(c) Equipment required. The Contractor shall be equipped with spare parts sufficient to place the signal back in operation for ordinary trouble calls. In those cases where a complex controller or component has to be repaired, the Contractor shall be required to furnish and install a substitute controller or component until the defective controller or component is repaired or replaced to its original condition as originally installed.

6. EXTRAORDINARY MAINTENANCE: Whenever during the course of this Agreement any part of the signal system is damaged by collision, Acts of God or malicious mischief, excepting damage resulting from the negligence of the Contractor, the repair of such damage will be paid for as extraordinary maintenance according to the terms set forth in EXHIBIT "A," attached hereto and incorporated herein by this reference. In addition to this, the replacement of vehicle detectors, pedestrian signal neon tubes and transformers, fluorescent street name signs, or any revision work the City may request the Contractor to perform will be paid for as extraordinary maintenance. All non-emergency extraordinary maintenance will be subject to prior approval of the Director of Public Works/City Engineer. Emergency extraordinary maintenance shall be considered as damage resulting from collision, Acts of God or malicious mischief. Under an extraordinary emergency situation, the Contractor shall use reasonable judgment as to the extent of the hazard present and perform whatever work is necessary to put the signal system back into service. If permanent repairs are not immediately possible, Contractor shall put the signal in temporary operating condition. If service cannot be reestablished, temporary four-way Stop signs (36" size minimum) and advance warning signs ("Stop Ahead") shall be placed to control the traffic. On arterial streets, a minimum of two (2) Stop signs shall be required for each direction of traffic.

7. COMPENSATION: City shall pay to Contractor the sum in accordance with the proposals in EXHIBIT "B" per month for each intersection as listed in EXHIBIT "C", for the traffic signal maintenance program set forth in Section 4 (a) of this Agreement.

Contractor shall be entitled to additional compensation for extraordinary maintenance. Billing for extraordinary maintenance shall include only the following:

- (a) Labor and equipment as listed in EXHIBITS "B" and "C".
- (b) Cost of materials plus 15 percent.

On a monthly basis, the Contractor and the City Engineer or his representative will meet for approximately one hour at a mutually agreed upon time and place. The Contractor shall deliver to the City Engineer or his representative at this meeting, not to be held later than the 10th of the month, a complete written record of all work that was performed on the City's traffic signal equipment during the previous month. Such record shall include the location of each separate service, the day and approximate time, and the reason for the service, whether routine, emergency, or extraordinary, and the number of hours spent.

Upon receipt of each monthly invoice and certification by the City Engineer, the City will, within thirty (30) days after receipt of such invoice, pay to the Contractor all certified sums.

8. EXTENSION OF AGREEMENT: Sixty (60) days prior to the end of the agreement period, the City Engineer will contact the Contractor and determine if Contractor desires the City to extend the Agreement. In the event the Contractor is willing to extend the agreement the City will determine if justification exists for increase or decrease in the monthly service cost per intersection and whether extraordinary maintenance charges for labor and equipment (service type) is applicable. Following this cost analysis, the City Engineer will present the cost increase and/or decrease to the City Council for approval, and ask the Council to extend the basic contract for an additional two-year period. The provisions of the balance of the Agreement will remain applicable. To the extent that they are modified, the monthly maintenance per intersection costs and EXHIBITS "B" and "C" shall be attached as applicable to this Agreement, and signed by the City and the Contractor.

9. LICENSE: The Contractor shall take out and maintain during the life of this Agreement a City Business License.

10. INSURANCE AND LIABILITY: The Contractor shall not commence work under this Agreement until it has secured all types and amounts of insurance required under this section, nor shall it allow any Subcontractor to commence work on any subcontract until all similar insurance required of the Subcontractor has been obtained. Without limiting Contractor's indemnification obligations, Contractor shall procure and maintain, at its sole cost and for the duration of this Agreement, insurance coverage as provided below, against all claims for injuries against persons or damages to property which may arise from or in connection with the performance of the work hereunder by Contractor, its agents, representatives, employees, and/or subcontractors. In the event that Contractor subcontracts any portion of the work, the contract between the Contractor and such subcontractor shall require the subcontractor to maintain the same policies of insurance that the contractor is required to maintain pursuant to this Section 10.

(a) Insurance Coverage Required. The policies and amounts of insurance required hereunder shall be as follows:

i) General Liability (including premises and operations, contractual liability, personal injury, independent contractor's liability): Three Million Dollars (\$3,000,000.00) per occurrence.

ii) Automobile Liability (including owned, non-owned, leased, and hired autos): One Million Dollars (\$1,000,000.00), single limit, per occurrence for bodily injury and property damage.

iii) Workers Compensation and Employer's Liability Workers Compensation Insurance (if Contractor is required to have) in an amount required by the laws of the State of California and Employer's Liability Insurance in the amount of One Million Dollars (\$1,000,000.00) per occurrence for injuries incurred in providing services under this Agreement.

iv) Professional Liability (covering errors and omissions): One Million Dollars (\$1,000,000.00) per claims made.

(b) General Requirements. Contractor's insurance:

i) Shall be issued by an insurance company which is an admitted carrier in the State of California and maintains a Secure Best's Ratings of "-A" or higher; unless otherwise approved by City;

ii) General Liability, Automobile Liability and Employer's Liability shall name the City, and its officers, officials, employees, agents, representatives and volunteers (collectively hereinafter "City and City Personnel") as additional insureds and contain no special limitations on the scope of protection afforded to City and City Personnel. All insurance provided hereunder shall include the appropriate endorsements.

iii) Shall be primary insurance and any insurance or self-insurance maintained by City or City Personnel shall be in excess of Contractor's insurance and shall not contribute with it;

iv) Shall be "occurrence" rather than "claims made" insurance, excluding Professional Liability;

v) Shall apply separately to each insured against whom claim is made or suit is brought, except with respect to the limits of the insurer's liability;

vi) Shall be endorsed to state that the insurer shall waive all rights of subrogation against City and City Personnel, excluding Professional Liability;

vii) Shall be written by good and solvent insurer(s) admitted to do business in the State of California and approved in writing by City; and

viii) Shall be endorsed to state that coverage shall not be suspended, voided, cancelled, reduced in coverage or in limits, non-renewed, or materially changed for any reason, without thirty (30) days prior written notice thereof given by the insurer to City by U.S. mail, or

by personal delivery, except for nonpayment of premiums, in which case ten (10) days prior notice shall be provided.

(c) Deductibles. Any deductibles or self-insured retentions must be declared to and approved by City prior to the execution of this Agreement by City.

(d) Evidence of Coverage. Contractor shall furnish City with certificates of insurance demonstrating the coverage required by this Agreement which shall be received and approved by City not less than five (5) working days before work commences.

(e) Workers Compensation Insurance. If Contractor is required to provide Workers' Compensation Insurance, Contractor shall file with City the following signed certification:

"I am aware of, and will comply with, Divisions 4 and 5 of the California Labor Code by securing, paying for, and maintaining in full force and effect for the duration of the contract, complete Workers' Compensation Insurance, and shall furnish a Certificate of Insurance to City before execution of the Agreement."

In the event Contractor has no employees requiring Contractor to provide Workers' Compensation Insurance, Contractor shall so certify to City in writing prior to City's execution of this Agreement. City and City Personnel shall not be responsible for any claims in law or equity occasioned by failure of the Contractor to comply with this section or with the provisions of law relating to Workers' Compensation.

11. INDEMNIFICATION: Contractor shall indemnify, defend, and hold the City and City Personnel harmless from and against any and all actions, suits, claims, demands, judgments, attorney's fees, costs, damages to persons or property, losses, penalties, obligations, expenses or liabilities (herein "claims" or "liabilities") that may be asserted or claimed by any person or entity arising out of the willful or negligent acts, errors or omissions of Contractor, its employees, agents, representatives or subcontractors in the performance of any tasks or services for or on behalf of City, whether or not there is concurrent active or passive negligence on the part of City and/or City Personnel, but excluding such claims or liabilities arising from the sole active negligence or willful misconduct of the City or City Personnel. In connection therewith:

(a) Contractor shall defend any action or actions filed in connection with any such claims or liabilities, and shall pay all costs and expenses, including attorney's fees incurred in connection therewith.

(b) Contractor shall promptly pay any judgment rendered against City or any City Personnel for any such claims or liabilities.

(c) In the event City and/or any City Personnel is made a party to any action or proceeding filed or prosecuted for any such damages or other claims arising out of or in connection with the negligent performance or a failure to perform the work or activities of Contractor, Contractor shall pay to City any and all costs and expenses incurred by City or City Personnel in such action or proceeding, together with reasonable attorney's fees and expert witness fees.

12. OBSERVING LAWS AND ORDINANCES: The Contractor shall keep itself fully informed of all existing and future state and federal laws and all county and city ordinances and regulations which in any manner affect the conduct of the work, and of all such orders and decrees of bodies or tribunals having any jurisdiction or authority over same. If any discrepancy or inconsistency is discovered in the Contract Documents in relation to any such law, ordinance, regulation, order or decree, the Contractor shall forthwith report the same to the City Engineer in writing. The Contractor shall at all times observe and comply with and shall cause all its agents and employees to observe and comply with all such existing and future laws, ordinances, regulations, orders and decrees, and shall protect, indemnify and defend the City, the City Engineer, and all of their respective officers, employees, and representatives against any claim or assertion of liability, or liability arising from or based on the violation of any such law, ordinance, regulation, order or decree, whether by the Contractor or its employees.

(a) Labor Code of California. The Contractor's attention is directed to Division 2, Part 7, Chapter 1 of the Labor Code of the State of California and especially to Article 2 (Wages), and Article 3 (Working Hours), thereof.

i) In accordance with Section 1773 of the Labor Code, the City Council of the City of La Palma has found and determined the general prevailing rates of wages in the locality in which the public work is to be performed are those contained in that certain document entitled PREVAILING WAGE SCALE, copies of which are maintained at City Hall, and are available to any interested party on request. Contractor shall post a copy of said document at each job site.

ii) In accordance with Section 1773.1 of the Labor Code the Contractor shall pay travel and subsistence payments to each worker needed to execute the Work, as such travel and subsistence payments are defined in the applicable collective bargaining assurances filed with the Department of Industrial Relations.

iii) The Contractor is aware of and will comply with the provisions of Labor Code Section 1776, including the keeping of payroll records and furnishing certified copies thereof in accordance with said section. The Contractor shall submit certified payrolls to the City Engineer, including certified payrolls for all Subcontractors, at any tier, performing work on the site, regardless of the dollar amount or type of subcontract, on a weekly basis. If by the 15th of the month, the Contractor has not submitted satisfactory payrolls for all work performed during the monthly period ending on or before the 1st of that month, the City will retain an amount equal to ten (10%) percent of the estimated value of the work performed during the month from the next monthly estimate. Retention for failure to submit satisfactory payrolls shall be additional to all other retention provided for in the Contract.

iv) Pursuant to Labor Code Section 1810 it is stipulated hereby that eight (8) hours labor constitutes a legal day's work hereunder.

v) Pursuant to Labor Code Section 1813, it is stipulated hereby that the Contractor shall, as a penalty to the City, forfeit \$25 for each worker employed in the execution of this Contract by the Contractor or by any subcontractor hereunder for each calendar day during which such worker is required or permitted to work more than eight (8) hours in any one

calendar day and forty (40) hours in any one (1) calendar week in violation of the provisions of Article 3 (commencing with Section 1810), Chapter 1, Part 7, Division 2 of the Labor Code.

vi) The Contractor is aware of and will comply with the provisions of Labor Code Sections 1777.5 and 1777.6 with respect to the employment of apprentices. Pursuant to Section 1777.5 it is hereby stipulated that the Contractor will be responsible for obtaining compliance therewith on the part of any and all subcontractors employed by him or her in connection with this Contract.

vii) Pursuant to Labor Code Section 1775, it is hereby stipulated that the Contractor shall, as a penalty to City, forfeit not more than \$50 for each calendar day, or portion thereof, for each worker paid less than the prevailing rates as determined by the Director of the Department of Industrial Relations for the work or craft in which the worker is employed for the Work under the contract by Contractor or by any subcontractor under the Contractor.

13. ASSIGNMENT: The Contractor shall not assign this Agreement or any portion hereof, without first obtaining the written consent of City. If such assignment is made or attempted by Contractor, City, at its sole option, may terminate this Agreement upon the giving of a 24-hour written notice to Contractor of such termination.

14. TERM OF CONTRACT: This Agreement shall be in full force and effect for a period of three years through June 5, 2014. However, either, party, at its discretion, shall have the right to terminate this Agreement at anytime by giving sixty (60) days advance written notice.

15. PERFORMANCE: If the Contractor should neglect to prosecute the work properly, or fail to perform any provisions of this Agreement, the City, after five (5) days written notice to the Contractor, may, without prejudice to any other remedy it may have, make good such deficiencies and may deduct the cost thereof from the payment then or thereafter due the Contractor, provided, however, that the Director of Public Works/City Engineer shall approve such action and certify the amount thereof to be charged to the Contractor.

16. NOT AN AGENT OF CITY: It is expressly understood and agreed that the Contractor herein named in the furnishing of all labor, services, materials and equipment, and performing the work as provided in this contract, is acting as an independent contractor and not as an agent, servant or employee of the City.

17. WARRANTIES: Except for the manufacturer's factory warranty, the Contractor disclaims all warranties with respect to materials supplied hereunder, and further disclaims any and all liability for failure to perform or delay in performance hereunder where the same is due in whole or in part to any cause beyond Contractor's reasonable control, such as, but not limited to, fire, flood, earthquake, lightning strike, or other labor difficulty.

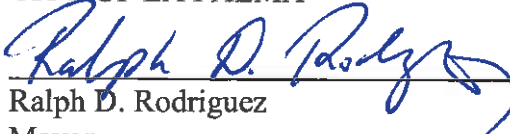

18. ENTIRE AGREEMENT; CONSTRUCTION; AMENDMENT: This Agreement full, complete and final agreement between the parties relating to the subject matter hereof, and no prior oral or written agreement or understanding shall have any force or effect. This Agreement shall be construed in accordance with the laws of the State of California. This Agreement may not be modified or amended except by a written instrument signed by authorized representatives of the City and Contractor.

not be modified or amended except by a written instrument signed by authorized representatives of the City and Contractor.

IN WITNESS WHEREOF, the City Council of the City of La Palma caused the Agreement to be subscribed by its Mayor and City Clerk and said Contractor has executed or caused this Agreement to be executed by its duly authorized officer(s).

EXHIBIT "A"

SCOPE OF SERVICES

SCOPE OF SERVICES:

1. General

During the term of this Agreement, the Contractor shall furnish all tools, equipment, apparatus, facilities, labor, services and material to perform all work necessary to maintain in good and workmanlike manner the traffic signal facilities and City owned street lighting, in accordance with this defined scope of work.

The Contractor shall be equipped with spare parts sufficient to return a defective traffic signal to operation following ordinary trouble calls. Since the primary traffic signal controllers/equipment used in the City of La Palma is manufactured by Econolite Products, the Contractor shall have on hand at least two spare Econolite ASC/2-2000 controllers and one ASC/2M-1000 Master for use in the City of La Palma. In addition, other spare equipment shall include bus interface units (BIU's), power supply units, and malfunction management units (MMU's).

The Contractor shall provide a Maintenance Transportation Technician with a minimum certification from the International Municipal Signal Association (IMSA) Level II Technician. Transportation Maintainers, Levels 1 and 2, may also be used to perform the scope of work as allowed by the Department of Industrial Relations. The City reserves the right at all times to concur with the Contractor's assignment of personnel to the City. If necessary, the Contractor shall replace any personnel assigned to the City whose performance is considered unacceptable by the City, or the standards established per this scope of services.

2. Specifications

All signal work shall be performed in accordance with the current Standard Plans and Section 86 of the Standard Specifications for the State of California, Department of Transportation, and the current City of La Palma Standard Plans. All work performed or equipment/parts supplied by the Contractor shall be subject to the inspection and approval of the City. Failure to pass inspection on any maintenance, repair, or service item will result in non-payment for that item until such time as the Contractor can upgrade the item to an acceptable condition.

3. Additions to System

The Contractor shall maintain, at the same unit price, additional traffic signals as they are added to the list of locations to be maintained. In the event notification is made at other than the beginning of the month, payment for that month shall be prorated from the day the Contractor is notified.

4. Maintenance Records

The Contractor shall maintain a record of all service calls and work performed upon the traffic signal facilities listing dates, hour of day, and description of the work performed. A copy of this record shall be maintained at all times within the traffic signal controller cabinet at each traffic signal location.

A summary log sheet giving a brief description of all routine and extraordinary maintenance activities shall be attached to each associated monthly invoice. Invoices will not be paid until the summary has been received.

5. Notification

The Contractor shall notify one of the City's designated representatives by telephone within twenty-four hours or the next business day regarding alterations to the operation of any traffic signal or the installation/removal of any substitute controller or component.

6. Types of Traffic Signal Equipment

The bid prices for both the routine and extraordinary maintenance shall apply to the types of traffic signal controllers, accessories, and systems as may exist in the City now or that may be installed during the life of the contract.

7. Public Convenience and Safety

The Contractor shall so conduct his operation as to cause the least possible obstruction and inconvenience to the public.

The Contractor shall furnish, erect, and maintain such fences, barriers, lights, warning devices, and signs in compliance with the current Work Area Traffic Control Handbook (WATCH), or as may deemed necessary by the Director of Public Works or his designated representative to give adequate warning to the public at all times.

8. Routine Maintenance

A. Traffic Signals

The Contractor shall provide a continuing, comprehensive, routine maintenance program designed to eliminate or reduce the incidents of malfunctions, operations complaints, and extend the useful life of the traffic signal equipment at the locations noted on Exhibit "C".

The services to be performed on the traffic signals/flashing beacons by the Contractor shall consist of a preventative maintenance program, including but not limited to the following:

- To inspect, clean, and adjust each controller unit and controller cabinet and make a routine inspection once per calendar month. All controller settings shall

be checked using the cabinet timing sheets to ensure that all settings are correct. Any discrepancies shall be reported to the designated City representative. The Contractor agrees to maintain a record in each controller cabinet showing the date and time checked. Controllers which are replaced for repair must be reported to the City within 24 hours of the replacement.

- The replacement or repair of any and all defective parts of the traffic signal system which may cause a signal malfunction or failure, as the occasion arises per routine maintenance, such as the signal controller, flashers, vehicle detectors, etc.
- The Contractor shall replace the air filter elements in all traffic signal cabinets every six months. The replacement date shall be noted on the maintenance log kept in the cabinet.

B. Safety Lighting/Internally Illuminated Street Name Signs

The routine maintenance bid price for traffic signals shall include one night-time inspection each calendar month to check the safety lighting and internally illuminated street name signs (IISNS) at each signalized intersection noted on Exhibit "C". The price for this monthly night-time inspection shall be included as part of the routine maintenance of the intersection. Replacements of burned-out lamps shall be at the rates noted on Exhibit "B" compensation rates. All other repairs to the safety lighting and IISNS shall be billed under extraordinary maintenance.

C. Conflict Monitors/MMU's

The Contractor shall test the conflict monitors or MMU's using the MT-180 conflict monitor tester or other approved tester on an annual basis. The Contractor shall supply a report for each test conducted. The testing of conflict monitors shall be included in the lump sum bid for routine maintenance of the intersection. Any conflict monitor that does not pass the required test shall be repaired or replaced and billed as extraordinary maintenance.

E. Traffic Signal Master/Interconnect

The Contractor shall provide trained technicians/personnel qualified in the field testing of an Econolite ASC/2M-1000 traffic signal master and the related closed-loop traffic signal interconnect system. Technicians assigned to the installation or repair of the City's traffic signal interconnect system shall have training or be directly supervised by a technician with experience in the installation and handling of twisted pair hardwire interconnect cable. The repair or replacement of traffic signal interconnect system shall be billed as extraordinary maintenance.

F. Payment for Routine Maintenance

The Contractor shall submit monthly billings for routine maintenance at the lump sum price per traffic signal location and for the monthly safety light survey. Said compensations shall include all labor, materials, equipment, overhead and profits for routine services in the price bid per intersection or location as detailed in the scope of services and no extra compensation will be allowed.

9. Emergency Service

The Contractor shall maintain a 24-hour emergency service for contact at any hour of the day or night and will be required to answer different types of calls, as specified below, within certain time limits.

A. Light Out Calls

Two separate indications, one of which must be the mast arm indication, will be required for each direction of traffic at all times. When this number falls below two, or the mast arm indication is out, the Contractor shall answer the light out call as soon as possible, not to exceed two hours, day or night. If a light out call is received with the report that two indications are remaining, one of which must be the mast arm indication, the Contractor shall answer the call within 24 hours. Light out calls for safety lighting will be answered within 24 hours.

B. Emergency Calls

Whenever a traffic signal is malfunctioning in any manner, the Contractor shall answer the call immediately, regardless of the fact that the controller may have been switched to flashing operation by the Police Department. The word "immediately" is construed to mean "with all possible haste", and shall not exceed one hour under normal circumstances.

The Contractor shall be equipped with spare parts sufficient to place the traffic signal back in ordinary operation. In those cases where a complex component has to be repaired, the Contractor shall be required to furnish and install a substitute component until the defective component is repaired. In the case of a controller, the substitute controller must be capable of operating with the City's Econolite closed loop traffic signal interconnect system, if the existing controller had that same capability.

The Contractor shall make the required repairs to restore or maintain the traffic signal in good working condition. The Contractor shall supply the Director of Public Works and the Police Department with a telephone number from which his radio operator may be contacted at all hours.

10. Extraordinary Maintenance

Extraordinary maintenance shall be defined as:

- Repair/services of damages resulting from collisions which have caused dislocation of poles or equipment, vandalism, street rehab/construction related projects, or natural or civil disasters.
- Additional extraordinary maintenance will include modifications to traffic signal equipment such as, but not limited to, upgrades of controller cabinets and controller components, LED signal indication replacements, LED pedestrian indication replacements, painting of traffic signal cabinets and signal heads, installation of new signal indications, lenses or framework, installation of signal loop detectors, installation of traffic signal interconnect cable or components or replacement of obsolete equipment.
- The Contractor may be required to assist in the final inspection of new installation of traffic signals, traffic signal interconnect, loop detectors or other traffic related type projects.

A. Notifications

The Contractor shall report to the Director of Public Works or his authorized representative the said conditions and provide satisfactory evidence that replacement is necessary per terms of extraordinary work. The Contractor shall provide cost estimates, including labor, equipment, and all incidentals to perform said work. No work shall proceed without the Director of Public Works or his authorized representative's authorization except in emergencies where injury or property damage may result without prompt response.

B. Payment for Extraordinary Maintenance

Upon the receipt of an itemized invoice within thirty days of completion of the work, the City shall compensate the Contractor for such repairs required beyond the scope of routine maintenance as follows:

Materials

The City shall pay the Contractor for materials used in extraordinary maintenance the Contractor's cost from the supplier plus the percentage mark-up, which shall in no case be greater than 15%. All materials and parts shall be new or have the approval of the Director of Public Works or his designated representative if otherwise. The City has the right to inspect the Contractor's records to verify any material costs used in extraordinary maintenance.

Direct Labor

The Contractor shall present with his monthly invoice a record of hours spent in extraordinary maintenance of traffic signals and appurtenances per intersection or location. The City shall pay the Contractor for such hours of extraordinary maintenance at the hourly rates specified in Exhibit "B". Said hourly rates shall be the total cost to the City. The rates shall include all compensation for wages, profit, overhead, and any fringe benefits.

Equipment

The City shall pay the Contractor for equipment used in extraordinary maintenance on a per hour basis as specified in Exhibit "B" and per the appropriate required equipment to complete the work.

The Contractor's listing of per-hour equipment rates shall constitute total rates to be paid by the City when specified equipment is used. No additional payment of any kind shall be paid for equipment except as specified on Exhibit "B" for per hour rates.

Any other equipment that may be needed to be rented in order to perform the extraordinary maintenance that is not listed shall be billed at the local rental rate plus the percentage mark-up, which in no case shall be greater than 15%. Documentation of the rented equipment with the applicable rental rates must be submitted with any invoices.

No additional compensation shall be paid for transporting the equipment to or from the job site.

21. Valley View & Centerpointe

The previous SUC of \$2940.62 was based upon competitive contracts awarded by cities during 2001 through 2007 for city wide maintenance.

Since that time the Energy Independence and Security Act of 2007 has impacted the manufacture of light bulbs by requiring energy efficiency, phasing out traditional incandescent bulbs and ushering in LEDs for many uses, including traffic signals. This switch and the increased reliability of signal mechanisms have resulted in significant decreases in the cost of operating and maintaining traffic signals. For example, cost reductions in maintenance of 75% and 61% have been reported by the cities of Portland, Oregon and Ann Arbor, Michigan.

A competitive award for signal maintenance of 21 intersections utilizing LED based signals for the City of La Palma CA was for \$60/month/intersection (\$720/yr/intersection). (2014)

A competitive award for signal maintenance by the Morris County (NJ) Cooperative Pricing Council was for \$440 per year per intersection. (July 2016)

A competitive award by Glendale, CA to Siemens was for \$89.14/mo/intersection (\$1069.70/yr/intersection). (2013)

This table lists the annual cost per intersection, provides an area adjustment and inflation adjustment, and averages the three competitive prices:

Entity	Year Awarded	Award Price	Area Cost Factor	Inflation Adjustment	FY18v19 Price
La Palma CA	2014	\$ 720.00	1.20	1.0708	\$ 925.19
Morris County NJ	2016	\$ 440.00	1.30	1.0257	\$ 586.72
Glendale CA	2013	\$ 1,070.00	1.20	1.0947	\$ 1,405.64
Average Cost per Intersection					\$ 972.51

RECOMMENDATION

Staff respectfully recommends City Council's approval of the attached motion authorizing the City Manager, or his designee, to execute a five-year agreement with Siemens Industry, Inc. to provide maintenance services for the City's traffic signals and other traffic-related electrical devices.

BACKGROUND/ANALYSIS

In Glendale, traffic signals are maintained by a private contractor because staff believes it is more economical than for the City to employ its own signal maintenance crew. Since July of 2008, Siemens Industry Inc. (formerly Republic ITS) has been maintaining the City's traffic signals and other traffic-related electrical devices. These devices currently consist of 232 traffic signals, 15 hard-wired flashing beacon systems, 23 solar-powered wireless flashing beacon systems, 13 in-roadway warning light (IRWL) systems, and other miscellaneous electrical devices.

The current contract with Siemens will expire on June 30, 2013. In March 2013, staff issued a request for proposals (RFP) for the maintenance of traffic signals and other traffic-related electrical devices. Proposals were received from three contractors: Siemens Industry Inc., Wescorp, and Aegis ITS. An evaluation committee consisting of Glendale's Public Works Engineering Division staff and a representative from the City of Pasadena reviewed all the proposals and conducted an interview with each contractor on April 17, 2013. The contractors were evaluated based on the following criteria:

1. Overall understanding of the project and quality of the proposal;
2. Firm's qualifications and similar project experience;
3. Key project personnel's qualifications, experiences and time commitment; and
4. Information obtained from references.

Siemens Industry was ranked number one by the evaluation committee. A summary of the ranking of the three contractors is listed below.

<u>Contractor</u>	<u>Average Points(100 max)</u>	<u>Ranking</u>
Siemens Industry, Inc.	92	1
Aegis ITS	86	2
Wescorp	75	3

Siemens was ranked the highest for its high quality maintenance program, key personnel to be assigned to Glendale, financial stability of the firm, and availability of additional resources to be assigned to Glendale in case of emergencies. Siemens has the largest team of traffic signal maintenance technicians in the nation and maintains traffic signals in over 200 communities in California. Due to the presence of Siemens personnel in many other cities in Los Angeles County, such as Alhambra, South Pasadena, San Marino and Acadia, it has the unique ability to promptly deploy extra crew members to handle emergency situations. In addition, Siemens is a licensed electrical construction contractor and is fully capable of performing various signal repairs and modification works based on pre-determined unit prices. Over the past 5 years, the City's experience with the services of Siemens has been very positive.

Due to price competition, staff was successful in negotiating a contract with Siemens that is comparable in cost with the other contractors. A summary of the cost proposals from the three contractors is listed in Exhibit 1. Even though Siemens' fees for monthly preventive maintenance is higher than the costs proposed by the other two contractors, Siemens' fees for labor and

services are substantially lower. Thus Siemens' fee for extraordinary maintenance services are much lower than those proposed by Aegis ITS and Wescorp.

Because of the reasons stated above and to reduce staff's effort in conducting another contractor selection process in the near future, staff respectfully recommends City Council to approve a five-year service contract with Siemens Industry, Inc. for the maintenance of traffic signals and other traffic-related electrical devices. The City retains the right to exercise the option of terminating the contract at any time upon giving a ten-day prior written notice should any problems arise.

FISCAL IMPACT

The estimated costs of the maintenance program for fiscal years 2013-14 to 2017-18 are shown in the table below and are grouped into three categories.

1. Routine preventive maintenance: Costs are calculated based on unit prices provided by Siemens multiplied by the number of traffic signals and other traffic-related electrical devices currently in the City. These costs could increase slightly as new devices are added in the future.
2. Extraordinary maintenance services: Costs are for repairing malfunctioned or damaged traffic equipment, responses to emergency knockdowns, markings for underground facilities, and miscellaneous services. These costs are estimated based on historical maintenance records and the average frequency of occurrence for various types of malfunctions and damages in the past.
3. Installation and modification of traffic-related electrical devices: When requested by the City, Siemens will perform traffic signal modifications and installations of new traffic-related electrical devices for small scale projects such as installing yellow flashing beacons or adding protected left-turn phasings for traffic signals.

	Year 1 FY 13-14	Year 2 FY 14-15	Year 3 FY 15-16	Year 4 FY 16-17	Year 5 FY 17-18	Total
Estimated Routine Preventive Maintenance	\$233,856	\$238,533	\$243,304	\$248,170	\$253,133	\$1,216,996
Estimated Extraordinary Maintenance Services	\$410,000	\$418,200	\$426,564	\$435,095	\$443,797	\$2,133,656
Installation & Modification of Devices	\$147,000	\$149,940	\$152,939	\$155,998	\$159,118	\$764,994
Total Costs	\$790,856	\$806,673	\$822,807	\$839,263	\$856,048	\$4,115,647

The increase in costs for each one-year period were estimated based on the assumption of a 2% annual increase in the Consumer Price Index of Los Angeles County, as published by the U.S. Department of Labor.

Funding for this maintenance program will be covered under the General Funds in Account No. 43110-101-553 (Traffic Signals Contractual Services).

Funding will be requested through the annual budgetary process for the respective fiscal years. Grant funding is not associated with this maintenance services agreement. There is no revenue offsets associated with this agenda item. In addition, there are no additional staffing costs or personnel associated with this item.

ALTERNATIVES

Alternative 1: Award a service contract to Siemens Industry, Inc. for the maintenance of traffic signals and other traffic related electrical devices as recommended by staff.

Alternative 2: Create City of Glendale's own traffic signal maintenance crew. This alternative involves extensive initial capital investment including purchasing new service vehicles, tools, signal equipment, and spare parts as well as hiring new staff. In addition, a warehouse for storage and laboratory for testing equipment will be required.

Alternative 3: Contract with other public agencies such as the City of Burbank or County of Los Angeles to maintain Glendale's traffic signals and other traffic-related electrical devices. Glendale's traffic signals were previously maintained by the City of Burbank from 2000 to 2008. However, the costs were much higher and the service frequency was lower. In addition, the City has little control over other public agencies' staffing arrangement and personnel issues.

Alternative 4: The City Council may consider any other alternatives not proposed by staff.

CAMPAIGN DISCLOSURE

In accordance with the City Campaign Finance Ordinance No. 5744, the following are the names and business addresses of the members of the board of directors, the chairperson, CEO, COO, CFO, Subcontractors and any person or entity with more than 10% interest in the company proposed for contract in this Agenda Item Report:

Full Name	Title	Business Address	City	State	Zip
N/A	Chairperson	N/A	N/A	N/A	N/A

NOTICE TO BIDDERS
MORRIS COUNTY COOPERATIVE PRICING COUNCIL (6MOCCP)

NOTICE IS HEREBY GIVEN that separate sealed bids will be received by the Purchasing Agent, Township of Randolph, on behalf of the Morris County Cooperative Pricing Council (MCCPC), in the Municipal Courtroom, 502 Millbrook Avenue, Randolph, New Jersey, on **Wednesday, April 6, 2016, at 11:00 a.m.** (prevailing time) and at that time will be publicly opened and read for:

SPRING CONTRACTS:

- #10: Lumber, Insulation, Hardware, Paint & Paint Supplies
- #13-A: Fire Equipment Services
- #20-B: Sporting Goods
- #25: Janitorial Supplies
- #29: Pest Control Services (Buildings)
- #30: Office Paper Supplies
- #34: Tree Spraying
- #35: Light Bulbs
- #37: Traffic Signal Maintenance & Repairs
- #40: Personal Protection Items & Equipment for Emergency Personnel
- #42: Landscaping Materials & Supplies
- #44: Welding Supplies
- #47: Water Meters/Data Recorders/Radio Frequency Meter Interface Units
- #48: Equipment Parts for Turf Care
- #50: Fire Department Uniforms (Purchase)
- #51: Deer Carcass Removal & Disposal

Technical bid specifications **ONLY** are available for review on the MCCPC website (www.mccpc.org). If after a review of the technical bid specifications bidders are interested in the entire bid package, it may be **picked up** for no cost from the Township Manager's Office, 502 Millbrook Avenue, Randolph, NJ 07869 after leaving necessary contact information **OR** by sending an email to jlambert@randolphnj.org with all of the following **REQUIRED** information: (1) Contract #(s), (2) Company Name, (3) Complete Company Address, (4) Company Phone #, (5) Company Fax #, (6) Contact Person Name, (7) email address. Upon receipt of **ALL** required information, the full bid package will be **emailed**. Only those bidders picking up packages or contacting the MCCPC directly and providing the necessary information will be provided with any addenda that are issued in accordance with N.J.S.A. 40A:11-23c. Failure to acknowledge receipt of any addenda that may be issued may result in the rejection of the bid.

Bids shall be submitted in a sealed envelope bearing the name and address of the bidder and plainly marked to indicate the subject of the bid and addressed to the Purchasing Agent, Township Manager's Office, Municipal Building, 502 Millbrook Avenue, Randolph, NJ 07869-

3799. **Any envelope that is received that is not properly marked causing it to be opened prior to the bid will be invalidated.** Bids may be received before the hour designated in this office if they are mailed or hand-delivered in person. The Township of Randolph will not be responsible for any bid that is sent by mail or other form of carrier which is lost or which arrives after the bid deadline date and time.

All bids must be submitted on the Bid Proposal Form and must conform to the specifications, terms and conditions for a fair and open contract, all of which are contained therein.

Bidders must review the bid specifications for any applicable bonding requirements. Where required, bids must be accompanied by a certified check, bid bond or cashier's check payable to the Township of Randolph in the amount specified in the bid documents. Bids for contracts that require a Performance Bond must also contain a Consent of Surety.

Bidders must have any and all required approvals, qualifications, certifications, and/or licenses necessary to perform the services or provide the products as contained in the bid specifications.

Bidders are required to comply with the requirements of N.J.S.A. 10:5-31 et. seq., and N.J.A.C. 17:27. Other requirements as well as these described above are fully detailed in the bid document.

The Morris County Cooperative Pricing Council reserves the right to reject any or all bids, or any part thereof, waive informalities herein, and to award the bid in the best interest of its members.

BID SPECIFICATIONS

CONTRACT #37: TRAFFIC SIGNAL MAINTENANCE & REPAIRS

Contract Period – One Year: July 1, 2016 - June 30, 2017
Contract Period – Two Years: July 1, 2016 - June 30, 2018

THE FOLLOWING ARE MINIMUM SPECIFICATIONS WHICH MUST BE MET OR EXCEEDED.

All quantities may be more or less than estimated. No minimum order requirements are allowed.

Prices are to remain firm for the term of the contract with no exceptions.

It is the intent of the Morris County Cooperative Pricing Council (MCCPC) to seek bids for the repair of traffic signals located within the agencies of the MCCPC. Requests for locations to be serviced are noted in the specifications.

The contract will be based on time and materials. The successful bidder shall be available **twenty-four (24) hours a day, seven (7) days a week, including holidays**, and shall be responsible to acquire all necessary materials. Repairs shall be on an as needed basis as notified by the Chief of Police or his designated representative of the member municipalities.

The **annual Preventative Maintenance** and certification shall be performed as directed by the individual member of the MCCPC. Work to be performed in accordance with the Preventative Maintenance checklist is shown in **Attachment I**.

LED Modules: The determination as to whether or not to include the testing of existing LED Modules as part of the preventative maintenance contract will be made by the individual members. The individual members shall also have the option of having the contractor test the existing LED modules without performing any preventative maintenance.

For annual Preventative Maintenance, the contractor shall bid a flat rate on a **per intersection** basis and shall include all costs for labor, equipment, vehicles and material to complete checklist in **Attachment I**.

A currently licensed New Jersey Professional Engineer who may also be a certified Professional Traffic Operations Engineer shall certify (sign & seal) the Annual Preventative Maintenance & Inspection Report including: conflict monitor test results, controller timings, pedestrian clearance and yellow and red clearance intervals.

Aside from the contract, the individual member of the MCCPC will provide minor maintenance on its own to the traffic signals, including but not limited to the replacement of bulbs and other minor repairs.

After award of contract, any questions concerning the traffic signals or requests for an inspection of the signals may be directed to the Chief of Police of the member municipality who is requiring the service.

Duration of Contract

The contract will be for a period of one (1) year or two (2) years. Bidders are not required to bid on the two-year contract. The MCCPC has the right to cancel this contract at any time by giving thirty (30) days written notice to the contractor. In the event of such cancellation, the contractor shall be entitled to receive payment for services, work performed and materials, and equipment furnished under the terms of the contract prior to the

effective date of cancellation, but shall not be entitled to receive any damages on account of such cancellation or any further payment whatsoever. One reason for such a cancellation may be the takeover of the maintenance and repair of these traffic signals by the county or state.

Professional Qualifications

To qualify as a bidder for this contract, the contractor shall meet the following conditions:

- A. At least one principal of the firm or corporation shall have a minimum of two (2) years of formal education in electrical engineering, electronics or a related field.
- B. The firm or corporation shall have a minimum of five (5) years full time experience in the maintenance of traffic control signals or devices.
- C. The contractor shall be a licensed electrical contractor in the State of New Jersey with the capability of doing commercial and industrial wiring.
- D. The contractor shall be required to employ and maintain full time at least one IMSA Level II traffic signal electrician and one IMSA Level I traffic signal technician with a minimum of two years of verifiable experience, in servicing signal and/or control equipment, in order that diagnosis of system failures may be made quickly and accurately. **Personnel and contractor qualifications must be submitted with bid proposal.**
- E. The contractor shall promptly respond to service calls on a twenty-four (24) hour basis.

Maintenance and Protection of Traffic

The contractor will be required to maintain traffic in all directions at all times during the fulfilling of the contract. He shall erect and maintain suitable barricades, signs, and warning lights in accordance with the "Manual on Uniform Traffic Control Devices for Streets and Highways", latest edition, at all work sites where any danger to motorists or pedestrians may occur. Transverse openings shall be secured at the end of the workday to permit traffic.

Roadway Excavation, Curb and Sidewalk

Where the service of the roadway, the curb or sidewalk is to be disturbed, the contractor shall obtain a road opening permit from the member agency or the county in which the member is located. He shall remove all broken material; replacement shall be in kind and in strict conformance with the requirements of the county for county roads and of the municipality for municipal roads. The contractor shall also comply with all applicable laws and statutes of the New Jersey One Call System.

REPAIR OF TRAFFIC SIGNALS

Damaged Equipment

The contractor shall respond to emergency calls within **TWO (2) HOURS** of the time that the contractor's communications center receives the call. He shall proceed without delay or the intervention of other acts to the location of the damaged or inoperative equipment and shall affect emergency temporary repairs.

If the emergency repairs at a signalized intersection require that the controller be disconnected, the contractor shall place "STOP" signs on such approaches to the intersection as the engineer shall designate as a temporary means of traffic regulation. If power is available, the contractor shall also install a flasher, operating as the engineer shall designate. The member shall furnish the contractor a sufficient number of signs. The contractor shall notify the police department charged with traffic safety at the intersection of any disconnected controller, and shall keep them informed of his progress should repairs require more than 24 hours.

The contractor shall, after making emergency temporary repairs, proceed at his earliest possible convenience, to restore the signal to its original operating condition. No written authorization is required for this work. However, the Chief of Police or the Engineer may authorize additional work, intended to change or upgrade the operation of the signal, to proceed concurrently with the repairs, should such arrangement be in the best interests of the member.

Extra Work

Whenever any major equipment in the system is damaged or deteriorated so as to require extensive repairs to, or complete replacement of such equipment, or whenever the Chief of Police or the Engineer deems it necessary to make alterations to existing equipment, they shall authorize the contractor to make such repairs, replacement or alteration.

The scope of extra work is as follows:

- A. Repair and/or replacement of major equipment including controllers, detectors, posts, heads, cabinets and foundations.
- B. Repair and/or replacement of conduit, ground wiring, or signal cable beyond this post.
- C. Relocation of any major component of the system.
- D. Installation of new signals and devices.
- E. Any other non-emergency work that the engineer may designate.
- F. Major deficiencies found during annual Preventative Maintenance.

Authorization of extra work shall be given by the Chief of Police or the Engineer in writing. Claims for extra work which have not been authorized in such a manner shall be rejected. Any extra work resulting from the negligence of the contractor or his agents shall be done by the contractor at no cost to the member.

Methods and Workmanship

The contractor shall at all times maintain a force of qualified workmen sufficient to perform the work required and described herein. The workforce shall be sufficient to perform routine repairs in a timely fashion and to respond promptly to emergency calls at any time. The workforce shall include qualified persons experienced in the electrical and mechanical fields associated with the specialized equipment.

Records

The contractor shall maintain comprehensive records of his services. These shall include invoices, bills of lading, receipts, payroll records and other documents relating to or verifying his bills. He shall also maintain a file showing all types of service he has performed on each signal. He shall keep a careful inventory of all material and equipment in his possession in order to advise the member of the best method of repairing these signals. Records shall also be kept concerning the date, time and the name of the inspector for the monthly inspections.

Copies of all records including monthly and annual re-inspections, etc. should be sent to the member municipality (police department – Traffic Safety Bureau) for their files.

Communications

The contractor shall have or establish a twenty-four (24) hour-a-day telephone answering service or recorder to insure compliance with the response times specified above.

Transportation

The contractor shall provide his own transportation from his place of employment to the job sites. He shall have access at all times to a ladder or bucket truck capable of reaching the appropriate height while supporting a load of 350 lbs.

Tools

The contractor shall furnish all tools and instruments necessary to test and repair the equipment covered in this bid.

1. Conflict Monitor Tester ATSI Model #PCMT 2600 or equivalent with the most current software revision, and cable harnesses for 3, 6, 12, and 16 channel conflict monitor and malfunction management units.
2. Automated Loop System Analyzer ASTI Model #ALSA-1250/HILT9000 or equivalent.
3. Calibrated Spectra Candela III Traffic Signal Light Tester, Model #ST-TSL-2000 or equivalent, six channels, for testing LED signal modules, including arrows.

Note: All specialty testing equipment shall be calibrated annually, or as required by the respective manufacturer for the duration of this contract. Copies of calibration and testing of equipment shall be produced by the contractor if requested by any member agency.

Method of Payment

On or about the first day of each month, or as required, the contractor shall submit invoices to the Chief of Police for all work performed during the preceding month. The invoice shall be accompanied by itemized statements showing in detail the labor, material and equipment used for each job, and specifying the unit and total cost for each. Invoices must reflect detailed list of parts used and list price of each part before discount/markup.

Materials

All traffic lights presently consist of components and materials that are in conformance with New Jersey Department of Transportation specifications and standards. Any materials used as replacement parts shall also conform to New Jersey Department of Transportation standards and specifications.

Hourly Rate and Materials

Bidders shall indicate an hourly charge as well as a percentage mark-up above wholesale on all parts necessary for all repairs described herein. Bidder shall also indicate the monthly and annual costs for inspections. There will be no charge for "travel time" to job sites.

Equipment Costs

Bidders shall indicate an hourly cost for equipment such as a reach bucket truck and a weekly rental cost for temporary traffic controllers.

Warranties

All equipment installed shall be subject to equipment manufacturer warranties.

Award of Contract :

The MCCPC will award one contract to one vendor to service all of the agencies in the 8 counties served by the MCCPC. The award will be made to the lowest responsive, responsible bidder based on the lowest aggregate total of all Maintenance/Repairs of Traffic Signals costs and equipment costs (percentage markup above wholesale cost of parts used for repairs will not factor into the award of the contract).

An award will be made at the discretion of the Morris County Cooperative Pricing Council for a one- or two-year contract. Bidders are not required to bid on both years.

See attached list of locations of traffic signals of MCCPC members.

BONDING REQUIREMENTS

Bid Guarantee: Each bid must be accompanied by (i) an acceptable certified check or cashier's check payable to the Township of Randolph or (ii) a bid bond issued by a surety authorized to transact business in New Jersey and acceptable to the Township of Randolph in the amount of **\$500.00**. A properly dated and executed Power of Attorney in full force and effect must accompany the bid bond. Failure to submit said bid guarantee shall be cause for rejection of the bid.

Consent of Surety: Each bid must also be accompanied by a Consent of Surety issued by a surety authorized to transact business in New Jersey and acceptable to the Township of Randolph. The Consent of Surety shall serve as a guarantee that the surety company will provide the appropriate performance bond within ten (10) business days of the date of Notification of Award letter. A properly dated and executed Power of Attorney in full force and effect must accompany the Consent of Surety. Failure to submit the Consent of Surety or Power of Attorney shall be cause for rejection of the bid.

Performance Bond: Within ten (10) business days of the date of Notification of Award letter, the successful bidder shall furnish a performance bond in the amount of **\$5,000.00**.

The performance bond shall be in the form of either (i) an acceptable certified check or cashier's check payable to the Township or (ii) a performance bond issued by a surety authorized to transact business in New Jersey and acceptable to the Township of Randolph. The bonds shall be issued by a surety company licensed to transact business in New Jersey, and pursuant to New Jersey law, holding sufficient financial resources to issue said bonds. The performance bond shall bear a date on or subsequent to the date of the contract. Each signature of an attorney-in-fact shall be accompanied by a properly dated, executed and certified Power of Attorney in full force and effect. Said bonds shall assure fulfillment of the contract and all of its provisions, including any additions, deductions, or other modifications, or full reimbursement to the Township for all expenses incurred in making good any default. A current statement of financial condition must also be provided with each bond to certify that the total amount of the bonds required will be within the maximum amount specified for that company pursuant to N.J.S.A. 17:18-9. In addition, each surety must provide a Surety Disclosure Statement in proper form pursuant to N.J.S.A. 2A:44-143. The performance bond shall contain a Waiver of Notice being required of alterations, additions, deductions, extension of time, or other modifications of the contract as ordered. Failure to deliver the performance bond with the executed contract shall be cause for declaring the contract null and void.

Note: If a certified or cashier's check is submitted at the time of bid for the Bid Bond, the Bid Bond form is not required. If the bidder is planning on submitting a certified or cashier's check for its Performance Bond, it **MUST** be submitted with its bid proposal. In that instance the Consent of Surety would not be required. If the bidder is NOT planning on submitting a certified check or cashier's check for its Performance Bond with its bid proposal, the Consent of Surety will be required with the bid proposal. If the bidder is planning on providing a certified or cashier's check as their Bid Bond and Performance Bond with their bid proposal, they **MUST** provide two separate checks.

If the bidder submits a certified /cashier's check for its Performance Bond with its bid proposal, the Performance Bond form would not need to be filled out after award of contract.

ATTACHMENT 1

ANNUAL INSPECTION CHECKLIST FOR PREVENTATIVE MAINTENANCE CONTRACT

The following preventative maintenance items will be performed on an annual basis for each intersection.

Vehicular & Pedestrian Signal Heads

1. Clean and inspect all visors & lenses.
2. Inspect traffic signal housing for cracks or damage.
3. Check terminal block connections.
4. Check gaskets and mounting hardware; re-tighten as necessary.
5. Check head alignment relative to lanes they serve.
6. Check safety chains.
7. Re-lamp all incandescent bulbs.

Pedestrian Pushbuttons

1. Check for tightness.
2. Verify operation.

3. Check accompanying sign; repair or replace as necessary.

Signal Poles and Arms

1. Check anchorage and all connection hardware.
2. Check tightness of all mounting and connection hardware.
3. Re-tighten bolt covers.

Span Wire Signal Installations

1. Check condition of strain vises, if applicable.
2. Visually inspect each upper and lower tether span wire for damage or deterioration.
3. Visually inspect each upper and lower tether span wire for excess sag. Inspect all connecting span wire hardware; tighten as necessary.
4. Inspect guy anchors for proper attachment and/or damage.
5. Visually inspect pole condition for cracks and/or checks (wood poles); note any deficiencies.

Conduit System and Junction Boxes

1. Check grounding bushings on rigid metallic conduit.
2. Inspect junction box covers for cracks or misalignment.
3. Check proper seating of junction and splice box covers.
4. Check grounding; secure all straps and rod connections.

Vehicle Detection – Loops

1. Verify operation of areas of detection.
2. Visually inspect all visual loops: photograph and document damaged areas of detection.
3. Check loop detector splices.
4. Check and retune detector amplifiers as needed to obtain proper operation. Perform testing at the cabinet using ASTI Model #ALSA-1250 or HILT-9000 tester or equivalent; record test results.

Vehicle Detection – Microwave

1. Verify position of detector for area(s) of detection; re-position if necessary.
2. Remove any branches or obstructions from field of view.
3. Check and re-tighten all mounting hardware.
4. Check wiring connections.
5. Verify operation of the central unit at the cabinet.

Vehicle Detection – Cameras

1. Verify operation of areas of detection.
2. Check video camera positioning.
3. Check video camera mounting hardware.
4. Verify operation of video processor at cabinet.

Traffic Signal Cable

1. Check all splices in each traffic signal transformer base; re-splice as necessary to provide a waterproof connection. **STANDARD WIRENUT WITH TAPE SPLICES ARE NOT ACCEPTABLE.**
2. Visually check the condition of the traffic signal cable for dry rot, nicks, cuts or other damage to the outer jacket insulation.
3. Check all overhead cables and connections

Overhead Street Name Signs

1. Clean sign faces.
2. Check mounting hardware; tighten as necessary.

Uninterruptible Power Source (Battery Back-Up), if Installed

1. Verify automatic transfer switch operation.
2. Verify incoming line voltage.
3. Verify DC output to batteries.

4. Verify AC output to inverter.
5. Check electrical connections.
6. Test system via simulated power outage at cabinet.

Controller and Meter Cabinets

1. Vacuum cabinet interior.
2. Change cabinet filter.
3. Check operation of fan and thermostat.
4. Check and tighten all terminal connections including line filter, surge protector and mercury switch.
5. Verify operation of detector panel relays.
6. Check police functions.
7. Lubricate and adjust hinges and locks.
8. Check cabinet door gaskets for tight seal.
9. Check and tighten neutral and grounding bus.
10. Check conditioning of incoming line voltage.
11. Test circuit breakers.
12. Check GFCI receptacle on power distribution panel.
13. Seal all conduits.

Controller Assembly

1. Check all conflict monitors by actual conflict. The contractor shall utilize an ATSI Model #PCMT 2600 conflict monitor tester or equivalent to certify proper operation of the conflict monitor (to be performed only by an IMSA Level II or higher signal electrician). Provide documentation of all tests performed that include the make, model and serial unit of each unit tested.
2. Run internal diagnostics on the controller, if unit capable.
3. Verify input timing versus approved timing.
4. Note and record controller timing and parameters. Check Yellow, all-Red and Pedestrian Clearances and compare to required duration per chapter 4D of the current MUTCD.
5. Verify vehicle and pedestrian calls on detector panel.
6. Check pre-emption function for firehouses.
7. Check programming and operation of time clocks (school zone flashers only).
8. Verify correct date, time and DST function for controller (intersections only).
9. Verify existing cycles, splits and offsets for coordinated signals, if programmed.
10. Verify existing day and week plans, if programmed.

LED Testing for Existing Vehicular Signal Modules (If and Where directed)

1. Inspect LED modules for cracks or other visible signs of damage.
2. Test all existing LED signal full ball and arrow modules for luminous intensity and photometric brightness using handheld Spectra Candela III Traffic Signal. Light Tester or equivalent.
3. Note and record results of field testing.
4. Compare field readings with ITE Specification, Vehicle Traffic Control Signal Heads: Light Emitting Diode (LED) Circular Signal Supplement.

A report signed and sealed by an Engineer meeting the qualifications at the beginning of this section shall be submitted to the member agency containing an itemized list of all work and materials performed, conflict monitor test results, controller timing printouts, results of red and yellow intervals, results of pedestrian clearance intervals. Report shall also include a list of deficiencies found (if any), which indicates any signals, signs and pavement markings that are missing or do not conform to the currently approved drawings and/or design standards.

The price quoted per location in the proposal shall include all labor, equipment, vehicles and material necessary to complete the above maintenance items. In addition, the price quoted shall include all expendable items such as bulbs, cabinet filters, fans, thermostats, miscellaneous connectors, grounding lugs and duct seal.

Various Locations of Traffic Signals of MCCPC Members

This list of MCCPC members specifying locations of traffic signals does not exclude the remaining or new members from utilizing the services once the contract has been awarded.

BELLEVILLE (ESSEX COUNTY)

1. Joralemon Street and Passaic Avenue

ENERGY EFFICIENCY SUCCESS STORY

LED Traffic Signals = Energy Savings

for the City of Portland, Oregon

In 2001, the City of Portland replaced nearly all its red and green incandescent traffic signal lights with new signal lights featuring highly efficient light-emitting diodes (LEDs).

The right timing and carefully arranged financing resulted in a successful energy-efficiency project, with annual energy and maintenance savings totalling \$400,000 and net payback in less than three years.

A Project Whose Time Had Come

In 1995, when the City of Portland first looked at the LED option, green LEDs were not available and red LEDs were quite expensive. In 2001, they found that prices had dropped dramatically.

“When we investigated last year, I thought the sales rep was pulling my leg. The new LED prices were less than half of what they had been...The cost of technology had come down while power prices were going up and utilities were offering aggressive rebates for energy efficiency.

It was—and still is—an ideal time to act.”

—Curt Nichols, Senior Energy Manager for the City of Portland.

Portland seized the opportunity and met the project's budgeting and timing challenges. By the end of the year, 6,900 red and 6,400 green incandescent signal lamps had been replaced with LED lamps, and the savings had begun.

The City
Portland, Oregon

The Project
Retrofit traffic signals with LED lamps

The Utilities
PGE and Pacific Power

The Cost
\$2.2 Million (total)
\$900,000 (net)

The Challenge
Fund the project with no capital budget

The Achievement
In three months more than 13,300 signals retrofitted to LED

The Benefits
Annual Energy Savings of \$335,000

Annual Maintenance Savings of \$45,000

Net Return on Investment:
37% (energy only)
44% (total)

“It’s a good thing when City Government can help protect the environment and save taxpayer money at the same time. These LED lamps are clearly superior to traditional incandescent lights in terms of energy efficiency, and that translates directly into reduced impacts on wildlife habitat and global warming emissions. With \$335,000 in annual utility bill savings, this investment will pay back multiple benefits for the City for years to come.”

— Dan Saltzman
Portland City Commissioner

Paul Zebell, signal operations specialist, holds an incandescent bulb and an LED replacement module.

A Challenge and a Solution

Three factors brought a sense of urgency to the LED project:

- The energy crisis facing the Western states.
- Significant electric rate increases in October 2001.
- Special incentives that two local electric utilities, PGE and Pacific Power, were offering for energy efficiency projects completed before 2002.

Leasing + Incentives + Tax Credit Benefits = Major Savings for the City

Even at the new lower LED prices, retrofitting Portland’s traffic signals would cost about \$2.2 million. The City didn’t have capital allocated for a project of that size. A leasing arrangement provided the solution.

First, leasing spread the capital costs out to more closely match the energy and maintenance savings of the retrofit.

Second, the terms of the lease allowed the City to use contract labor to complete the project before the end of 2001, and thus claim rebates from PGE and Pacific Power totalling \$715,000.

Third, the lease option also allowed the City to benefit from Oregon’s Business Energy Tax Credit (BETC). Although the City doesn’t pay income taxes, it can still benefit from tax credits through an arrangement where the tax credit taken by the leasing company can be shared with the other party. The BETC tax credit—worth 35 percent of an energy project’s total cost—made the lease option even more attractive. In Portland’s LED project, the leasing company gets a 35 percent tax credit over time, reducing the cost of the City’s lease by about 22 percent, saving the City nearly \$500,000.

“The LEDs have reduced transportation maintenance costs by \$45,000 a year in off-hour call out costs and replacement bulbs. LED modules have a life of six years or more while the current bulbs have only a two-year life.

In addition, we’ve been able to save 1,400 hours of valuable staff time per year previously used for group relamping and apply that time to other maintenance needs.”

— Bill Kloos
Portland Signals and
Streetlighting Manager

Note:

Since the completion of this project, the State of Oregon has revised its administrative rules to allow the sharing of tax credits without a lease arrangement. Today, any equipment supplier or installation contractor can provide a tax credit “pass-through” equal to 27 percent of the project’s cost.

A City-bired contractor installs one of more than 13,000 LED lamps during the fall of 2001.

Portland's LED retrofit

- 6,900 red and 6,400 green signal lamps (a mix of 12" balls, 8" balls, and turn arrows in both colors.)
- 140 flashing amber beacons
- several light rail transit signals

...and its benefits
