Adjust the wire rope tension of [single line][multi-line] hoists to ensure that they share load equally. Submit the proposed field tensioning methodin the work plan. [For each multi-line hoist rope drum, final tension values for each rope must be no more than plus or minus 5 percent from the average of the individual rope tension values. For two multi-line hoists on a gate, the total wire rope load on each hoist is computed by summing the measured tension values for all wire ropes on a hoist.] The total wire rope load on each hoist must be within a range less than or equal to 0.5 percent of the average of the two total wire rope loads. Measure and adjust wire rope tensions while keeping the gate properly positioned and aligned[ in the slot]. After "break-in/testing" test the ropes to determine if they share load equally, and if not, re-tension.

3.8 BREAK-IN/TESTING

After installation is complete, run the gate-operating device through [one] [two] [three] [four] [____] complete cycles, fully open to fully closed.

3.9 ORDERLY WORK AREA/SITE CLEANUP

Maintain neat and orderly storage and work areas. The Contract will not be considered complete until all the tools, equipment and property have been removed from the site, and the storage and work areas have been restored. Remove all dirt, debris, litter etc. from project and dispose of in a proper manner.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for hydraulic power systems to operate gates and other mechanisms at civil works structures. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Ensure products used in this section comply with Federal procurement preference under Section 9002 of the Farm Security and Rural Investment Act of 2002. Refer to Section 01 33 29 SUSTAINABILITY REPORTING for requirements associated with EPA designated products.

1.1 SUMMARY

The work covered by this section consists of detailed requirements for the [design,] fabrication, shop assembly, testing, delivery, and installation of the hydraulic power systems for operation of the [intake gates] [slide gates] [control gates] [Tainter gates] [miter gates] [butterfly valves] [hoisting equipment] [_____] as specified and as shown.
1.2 PRODUCTS INSTALLED BUT NOT SUPPLIED

NOTE: List all property which will be furnished to the Contractor for installation. Delete materials and equipment which are purchased by supply Contract by the Government to be furnished to the Contractor from other portions of this specification.

Pursuant to Contract Clause GOVERNMENT-FURNISHED PROPERTY (SHORT FORM), the Government will furnish to the Contractor the following property, if required, to be incorporated or installed in the work. Such property will be furnished at the project site for delivery acceptance. Install or incorporate all such property into the work. Verify the quantity and condition of such Government-furnished property when delivered, acknowledge receipt thereof in writing and in case of damage to or shortage of such property, report within 24 hours, in writing, such damage or shortage.

1.3 MEASUREMENT AND PAYMENT

NOTE: If Section 01 22 00 00 10 MEASUREMENT AND PAYMENT is included in the project specifications, move this paragraph and its subparagraphs from this section and insert in Section 01 22 00 00 10.

1.3.1 Payment

Payment will be made for costs associated with the hydraulic power system(s) as specified.

1.3.2 Unit of Measure

Unit of measure: Job

1.4 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.5 DESIGN AND PERFORMANCE REQUIREMENTS

**************************************************************************
NOTE: Include this paragraph in the specifications when the Contractor is required to furnish the detailed design of the system.

List all items for which the Contractor must furnish design computations. If Contractor designed, also provide a reference to have the Contractor follow requirements in USACE EM 1110-2-2610 for hydraulic power systems.

**************************************************************************

The Contract drawings indicate the general arrangement of the hydraulic power system for operation of the [intake gates] [slide gates] [control gates] [Tainter gates] [miter gates] [butterfly valves] [hoisting equipment] [______], clearances necessitated by the structure or other equipment, maximum overall dimensions, and other pertinent features. Furnish the detailed design in accordance with the following design criteria. Furnish the detailed design in accordance with ISO 4413, and the following design criteria. Identify design and dimensional changes necessary to satisfy the principal design parameters identified in the paragraph "Design Parameters" as variations in the submittals. Dimensions submitted that differ from those indicated and not otherwise constrained by the Design Parameters and physical limitations of installation are subject to approval. Also submit design computations for all extension of design items.

1.5.1 Design Parameters

**************************************************************************
NOTE: List all design parameters or criteria required by the Contractor to design the hydraulic power system. Possible design criteria to consider
are:

a. Maximum system pressure.
b. Working system pressure.
c. Rated raising or retracting force.
d. Rated lowering or extending force.
e. Maximum raising or retracting time.
f. Maximum lowering or extending time.
g. Hoist stroke.
h. Critical or limiting dimensions.
i. Operating temperature range.
j. Duty cycles.
k. Accumulator performance characteristics.
l. Corrosivity category
m. Any other unusual features.

The principal design parameters for the hydraulic power system are as follows and were developed at the minimum operating temperature and utilizing the hydraulic fluid as specified:

1.5.2 Allowable Stresses

1.5.2.1 Structural Items

Design structural items associated with the hydraulic power system, such as support beams, to withstand the maximum force exerted by the hydraulic cylinder plus any dead loads with a factor of safety of 2 based on the yield strength of the materials involved.

1.5.2.2 Hydraulic Cylinders

NOTE: Use telescopic hydraulic cylinders only for special retrofit applications where regular single or double acting cylinders cannot be used or where the physical constraints of the installation leave no other alternative. Utilize Euler formula or other analytical methods to determine buckling strength of cylinder rod. Designer will need to determine how the cylinder is fixed and connected to determine buckling strength.

Design all hydraulic cylinders to withstand a maximum operating pressure of 21[___] MPa 3000[___] psi with a factor of safety of 5 based on the ultimate strength of the material or 2 based on the yield strength of the material. Apply a factor of safety of 3 to the compression load when designing the hydraulic cylinders to resist buckling. End fixity coefficients for determining the effective buckling length for each hydraulic cylinder are [1.0] [___].

1.5.2.3 Stress Concentration Factors

Use stress concentration factors where applicable. Reduction of allowable stresses to compensate for repeated cycles of loading is not required.
1.5.3 Corrosivity Environment Category

Design hydraulic cylinders, cylinder rods and components to meet the corrosivity category [_____] in accordance with ISO 9223 to meet anticipated atmospheric environment the cylinders and piston rods will be operating within.

**************************************************************************
NOTE: Select a Corrosivity Category (C1-C5, or CX) to meet the measured corrosion rates of 1 year tests conducted in the actual intended environment for the hydraulic cylinder in accordance with ISO 9223 and ISO 9226 OR to meet the anticipated atmospheric environment in accordance with the Table 1 furnished below. The hydraulic cylinder manufacturer may already have test data which can be requested in a shop drawing submittal. It is important to work with the cylinder manufacturer on the selected corrosivity category. The corrosivity category impacts the selection of the piston rod and the type of rod coating and rod material. Submerged cylinders and piston rods should be selected for CX Extreme category. In environments with expected "CX category" classification, it is recommended that the atmospheric corrosivity classification be verified from one-year or three year corrosion loss analysis such as salt water droplet corrosion test to ensure correct classification if possible or from existing test data. Collection and analysis of water quality data in advance of the installation may also be beneficial for environments subject to immersion. When crossover between categories occurs the designer should select the category with the more severe environment. Additional factors that may influence the selected corrosivity category include salt spray, humidity, airborne pollutants, waterborne pollutants, anticipated cylinder rod retraction operation, frequency of immersion, frequency of movement, time spent extended, presence of sheltering, and inspection/maintenance accessibility.

**************************************************************************

Table 1: Description of Corrosivity Categories

<table>
<thead>
<tr>
<th>Corrosivity Category</th>
<th>Typical Environments - Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><strong>INDOOR</strong></td>

<tr>
<td>C5 Very High</td>
<td>Spaces with very high frequency of condensation and/or with high pollution from production process, e.g. mines, caverns for industrial purposes, unventilated sheds in subtropical and tropical zones.</td>
</tr>
<tr>
<td></td>
<td>Temperate and subtropical zone, atmospheric environment with very high pollution (SO2: 90 micro grams/cubic meter to 250 micro grams/cubic meter) and/or significant effect of chlorides, e.g. industrial areas, coastal areas, sheltered positions on coastline.</td>
</tr>
<tr>
<td>CX Extreme</td>
<td>Spaces with almost permanent condensation or extensive periods of exposure to extreme humidity effects and/or with high pollution from production process, e.g. unventilated sheds in humid tropical zones with penetration of outdoor pollution including airborne chlorides and corrosion-stimulating particulate matter. Submerged cylinders and piston rods.</td>
</tr>
<tr>
<td></td>
<td>Subtropical and tropical zone (very high time of wetness), atmospheric environment with very high SO2 pollution (higher than 250 micro grams/cubic meter) including accompanying and production factors and/or strong effect of chlorides, e.g. extreme industrial areas, coastal and offshore areas, occasional contact with salt spray.</td>
</tr>
</tbody>
</table>

**NOTE:** Water Quality Sampling may be required in advance of the design project to collect sufficient data to assess pollution levels for determination of Corrosivity Category.

Applications with frequent submergence for extended periods (> 24 hours).

1.5.4 Connections

1.5.4.1 Pinned Connections

Design pinned hydraulic cylinder connections for field assembly [as manufacture designed] [as shown].

1.5.4.2 Shop Connections

Design shop connections for assembly by means of welding or by bolting.
1.5.4.3 Welded Connections

NOTE: If the need exists for more stringent requirements for weldments, delete this first bracketed paragraph and use the second paragraph. The designer should also consider whether a U-Stamp per ASME BPVC SEC VIII code is necessary since custom produced hydraulic cylinders are generally exempt. Note specifically in paragraph below the exemption of the U-stamp requirement. All other requirements of the ASME BPVSC SEC VIII code should still be enforced.

- Design welded connections in accordance with AWS D1.1/D1.1M except that provisions for repeated stress is not required. Weld hydraulic cylinders in accordance with ASME BPVC SEC VIII D1, [ISO 15614-1]. Weld piping in accordance with ASME B31.1. Qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by another employer may be accepted as permitted by ASME B31.1. [U-stamp requirements per ASME BPVC are waived.]
- Notify the Contracting Officer within 24 hours in advance of tests and perform the tests at the work site if practicable. Apply the welder's or welding operator's assigned symbol near each weld made as a permanent record. Submit a copy of qualified procedures and a list of names and identification symbols of qualified welders and welding operators.

Welding and nondestructive testing procedures for piping are specified in Section 40 05 13.96 WELDING PROCESS PIPING.

1.5.4.4 Structural Bolted Connections

Make structural bolted connections carrying primary loads with ASTM F3125/F3125M, Grade [A325][A490] bolts [or ISO equivalent standards as approved].

1.6 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident
Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.7 SCHEMATIC DRAWINGS AND DATA

1.7.1 Shop Drawings

Include fabrication, shop assembly, delivery, and field installation drawings in the detailed shop drawings. Detail any component part of fabricated items omitted on the shop drawings. If departures from the Contract drawings are deemed necessary by the Contractor, submit details of such departures, including changes in related portions of the project and reasons, with the shop drawings. Provide fabrication and assembly drawings to 1:8 or 1-1/2 inch = 1 foot-0 inch or larger scale.

1.7.2 Fabrication Drawings and Assembly Details

Provide fabrication drawings for all mechanical and structural parts and components, except those of standard design and manufacture. Include in fabrication drawings complete detailing, materials of construction, tolerances, machined surface finishes, connections, and weld details with annotation to differentiate shop welds from field welds. Provide detailed
drawings of the manifolds including required drilled passages. Provide details and dimensions of the hydraulic cylinder and piston rod as applicable. Provide details of the cylinder rod measuring system as applicable [magneto resistive system] [magnetorestrictive system]. Provide details of the proposed coating system for the cylinder rod to meet the required corrosivity category and provide data for any coating system.

1.7.3 Hydraulic Power Unit Drawings

Provide drawings for hydraulic power units showing general arrangement of components and outline dimensions of unit. Identify all components on the drawings and provide sufficient information to determine whether the components proposed conform to the specifications.

1.7.4 Manifold Drawings

Provide fabrication drawings for all manifolds showing general arrangements outline dimensions, and drilling dimensions. Identify all components on the drawings and provide sufficient information to determine whether the components proposed conform to the specifications. Identify all port configurations and connections.

1.7.5 Piping Drawings

Provide piping drawings showing the complete hydraulic system in schematic format identifying all items of equipment incorporated in the system. Include details of all pipe supports including those for manifolds and on the hydraulic power unit.

1.7.6 Electrical Drawings

Provide electrical drawings of all electrical equipment. On electrical drawings include complete schematic diagrams and connection diagrams. On connection diagrams show electrical connections (by lines) for each conductor between terminal points. Identify terminal points.

1.7.7 Shop Assembly Drawings

Provide shop assembly drawings with details for connecting the adjoining fabricated components in the shop to ensure satisfactory field installation.

1.7.8 Hydraulic Schematic

Provide a complete hydraulic schematic in accordance with ISO 1219-1 and ISO 1219-2. Schematic shall include schematic piping, hoses and other component layouts symbolically indicating, using standard system symbols, all system piping, and other components, including their sizes, materials, heights, spacing, and locations. Both new and refurbished components shall be shown on the schematic with any interfaces to existing equipment noted. All set point and size parameters shall be indicated for each component. Component support types and locations, anchor points versus sliding supports, flex joints, and seismic supports shall also be shown. Include proposed pertinent installation details. Required capacities and system pressures as well as direction of system flow or motion shall be indicated. Each drawing shall include a legend of symbols and bill of materials (BOM). BOM to include name of component, component drawing number or reference drawing, and part number. If hydraulic schematic is split between drawings or connect to a sub-contractor supplier drawing the connection points must be clearly outlined on both the schematic and other
1.7.9 Product Data

Include performance data and curves for pumps, [electric; hydraulic] motors and valves. Provide catalog cuts and outline dimensions for the pumps, [electric; hydraulic] motors, filters, heaters, thermostats, float switches, pressure transducer, switches, breathers, and all valves, valve controls and other accessories.

1.7.10 Delivery Drawings

Provide delivery [drawings] [details] [sketches] with descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damage.

1.7.11 Field Installation Procedures

Provide field installation [drawings] [sketches] [manuals] with a detailed description of the field installation procedures. Include the location and method of support of installation and handling equipment, the provisions to be taken to protect concrete and other work during installation, the method of maintaining components in correct alignment, and the methods for installing other appurtenant items. Include dates and schedule of work. Submit methods and procedures to accelerate the sequence of work.

1.7.12 Design and Performance Requirements

Provide design computations for all items which are designed by the Contractor. [Include computerized simulations of the complete and proposed hydraulic system.]

1.7.13 Cleaning and Flushing Procedures and Results

Submit detailed procedure for the cleaning and flushing of hydraulic cylinders, piping, and power unit as outlined in paragraph "CLEANING AND FLUSHING," not less than 30 calendar days before start of operations. Provide test reports of the results of the flushing and of the oil used to fill the system.

1.7.14 Erecting Engineer Qualifications

Provide a resume for the on-site erecting engineer with details on experience and background in similar installations.

[1.8 WARRANTY

**************************************************************************

NOTE:

1) Warranty for supply or construction contracts is covered by FAR clauses and is typically set at 1 year. This paragraph should only be used if a warranty longer than 1 year is desired. Any modifications to the standard warranty clauses need to be coordinated with the Contracting Officer and/or Contract Specialist. Additional costs for a longer warranty should be considered against the benefits, probability of failure and consequences of
equipment failure.

2) Consider adding minimum warranty claim response times based on the criticality of the system. For example, failures resulting in delays to navigation or the inoperability of systems integral to flood protection equipment should require faster response times.

Guarantee all equipment for a period of 2 years from the date of acceptance. Guarantee replacement parts for 2 years from date of replacement. Provide warranty against defective materials, design, and workmanship. In cases where the equipment manufacturer's advertised minimum guarantee is in excess of 2 years, it remains in force for its full period. Upon receipt of notice from the Government of failure of any of the parts during the warranty period, provide new replacement parts promptly at no additional cost to the Government.

1.9 QUALITY CONTROL

Establish and maintain quality control for operations to assure compliance with Contract requirements and maintain records of quality control for all materials, fabricated parts, equipment, and construction operations. In addition, establish and maintain surveillance for quality control over sub-contractors, suppliers, or manufacturers. Include a minimum of two shop inspections during manufacture and assembly of the hydraulic cylinder assemblies' power units and manifolds. The quality control includes, but is not limited to, the following:

a. Materials and workmanship.

b. Manufacture and installation of the piping, hydraulic cylinder assemblies power units and manifolds, complete.

c. Cleaning and flushing.

d. Shop assembly and tests.

e. Field erection and tests.

f. Damage and defects.

Submit a copy of these records and tests, as well as the records of corrective action taken, to the Government.

PART 2 PRODUCTS

2.1 MATERIALS AND MECHANICAL EQUIPMENT

******************************************************************************************
NOTE: The contents of the following paragraphs are dependent on design requirements which may necessitate revision or expansion to cover different conditions and standards.
******************************************************************************************
2.1.1 General

Provide materials and mechanical equipment in accordance with the requirements as indicated or specified, and if not specified, furnish materials and mechanical equipment of the best commercial grade quality suited to the intended use and as approved. All electric motors, hydraulic motors, hydraulic pumps, hydraulic cylinders, valves and similar items and/or accessories, of the same type and size, to be the products of the same manufacturer, unless otherwise approved. Permanently display the manufacturer's name, address, and catalog number on a nameplate securely attached to each major item of equipment.

Submit data specifications [product manuals] and assembly drawings showing sizes, ratings, parts and material lists, overall dimensions, and mounting dimensions with the product data.

2.1.2 Standard Products

Where items are referred to hereinafter as "similar and equal to" a particular manufacturer's product, such references have been made merely as a convenient method of indicating the type of material or equipment required, with no intention of asserting superiority thereof. The standard product of any reputable manufacturer regularly engaged in the commercial production for at least 2 years prior to this solicitation of the type and quality of material or equipment referred to will not be excluded on the basis of minor differences, provided essential requirements of the specifications relative to materials, capacity, and performance are met. Furnish performance capacities and other pertinent information concerning the manufacturer's "equal to" standard products intended for incorporation in the work. "Equal to" standard products installed or used without such approval are at the risk of subsequent rejection.

2.2 HYDRAULIC CYLINDERS

2.2.1 Hydraulic Cylinders (Standard Design)

**************************************************************************
NOTE: Use this Alternate 1 when hydraulic cylinders of standard design and manufacture are required and available as standard catalogue items. These are typically tie rod type cylinders and will generally be available as standard catalogue items. Cylinder parts and components are generally standardized.
**************************************************************************

Provide [single end][double end] rod hydraulic cylinders that are a standard catalog item. Provide one of the hydraulic cylinder types listed in ISO 5598 as specified or indicated, of tie rod design, [square head standard construction]. Cylinders must meet the following requirements:

a. Select cylinders with the bore, stroke, rod diameter, and mounting style of the cylinder as indicated.

b. The manufacturer specified pressure rating of the cylinder must be less than the maximum system pressure indicated.

c. Equip the cylinder rods with the manufacturers rod coating system.
d. Equip cylinders with dynamic seals are suitable for both frequent and infrequent operation and are capable of not less than [manufacturer defined and rated number of operations] [500,000 cycles of operation] in systems properly maintained.

e. Equip the cylinders with the manufacturer's standard position measuring system.

f. Equip cylinders with [SAE straight thread O-ring][SAE 4 bolt hydraulic flanges] [_____] piping ports.

g. Provide the hydraulic cylinder with [adjustable] [nonadjustable] cushions on [the cap end only] [the rod end only] [both ends]. [Cushions to have free reverse flow check valves.]

h. Provide evidence that each cylinder was hydrostatically tested by the manufacturer to [ASME BPVC SEC VIII D1 requirements] [200% of working load][150% working load] for the severest service rating

2.2.1.1 Cylinder Tubes (Standard Design)

Cylinder tubes for standard design cylinders must meet the following requirements:

a. Machine the cylinder tube from [ASTM A519/A519M, Grade 1018][heavy wall seamless steel tubing] [or materials meeting ISO standard equivalent as approved]

b. Hone the bore to a surface finish compatible with the seals being used so as to result in zero net leakage past the seals.

2.2.1.2 Cylinder Heads and Caps (Standard Design)

Cylinder heads and caps for standard design cylinders must meet the following requirements:

a. Fabricate the cylinder head and cap from [ASTM A576, Grade 1018, steel bar stock][ASTM A516/A516M, Grade 60 plate][or materials meeting ISO equivalent standards as approved]

b. Provide a machine finish on all surfaces.

c. Equip the cylinder head with a rod seal and external dirt wiper, [ice scraper,] and a rod bushing piloted into the head to ensure concentricity. [Rod bushings must be removable without the use of special tools and without removing the tie rods or cylinder head.]

d. Attach the cylinder tube to the head and cap by tie rods [bolts] having a minimum yield strength of 690 MPa or 100,000 psi.

e. Removable attachments to have the cylinder tube end seals arranged to seal with pressure and be designed to prevent shearing and extrusion and to provide axial metal backup.

2.2.1.3 Pistons (Standard Design)

Pistons for standard design cylinders must meet the following requirements:

a. Fabricate the piston from [fine-grained cast iron][____].
b. Precision fit the piston to the cylinder body bore.

c. Provide a suitable method for locking piston to the rod.

d. Equip pistons with [zero net leakage cup-type seals][bronze-filled polytetrafluoroethylene seals with phenolic wear rings][contractor furnished design].

e. The design must protect the piston rings from blow-out and over squeezing.

2.2.1.4 Piston Rods (Standard Design)

Piston rods for standard design cylinders must meet the following requirements

a. Fabricate the rods from [medium carbon steel with a yield strength of 620 to 690 MPa or 90,000 to 100,000 psi for rods 16 through 100 mm or 5/8 through 4 inches in diameter][620 to 760 MPa or 90,000 to 110,000 psi high tensile strength steel using ASTM A108, Type C 1045, for rods 16 to 63 mm or 5/8 to 2 1/2 inches in diameter, and ASTM A108, Type CR 4140, for rods 75 to 250 mm or 3 to 10 inches in diameter][materials and coatings as recommended by the manufacturer to meet the specified design requirements for operation, strength, durability, corrosivity and operating environment].

b. [Provide the rod case hardened to 50-54 Rockwell C, polished to a 0.25 micrometer 10 microinch Ra surface finish or better, and nickel and hard-chrome plated to 75 micrometer or 0.003 inch minimum thickness.][Provide rod coating system per manufacturer standard design and standard surface finish to meet required corrosivity rating.]

2.2.2 Hydraulic Cylinders (Custom Design by Manufacturer)

**************************************************************************

NOTES: Use this Alternate 2 when the hydraulic cylinders are to be custom designed by the manufacturer specifically for this project in accordance with the design parameters.

Telescopic hydraulic cylinders may be used only for special retrofit applications where regular single or double acting cylinders cannot be used.

Unless the designer needs to make the choices because of unique criteria situations, the selection of materials and configurations should remain as Contractor's options. Mill type cylinders are preferable over tie rod cylinders and should be specified and utilized. Mill type cylinders generally are rated for the higher pressures than the other designs. The cylinder heads generally are mounted with bolts or cap screws.

**************************************************************************

Utilize mill type cylinders. Provide cylinder of [single][double] acting[, telescopic] type designed and manufactured [to be used under water and] to meet the criteria as stated in paragraph "Design Parameters."
cylinders and integrated appurtenances including position sensing systems to be submerged [and operate] under [_____] meters [_____] feet of water for up to [_____] days per year.] [Telescopic cylinders may be either single or double wall as necessary to provide the best operating characteristics.] Provide cylinder measuring systems as approved. Material for the hydraulic cylinder to be a high strength carbon or alloy steel. Stress relief heat treat cylinder tubes which have been welded and [radiograph all welds including those on the end mounts] [radiograph designated welds as indicated]. Material for the piston rod to be a high strength [carbon or alloy steel with chrome plating per ASTM B650] [stainless steel with chrome plating per ASTM B177/B177M and ASTM B254] [manufacturer standard thermal sprayed system with nickel chromium based alloy on stainless steel substrate] [laser cladding metal alloy on carbon steel or stainless steel substrates] [______]. [Nickel plate the exterior of the extending rods and tubes on a telescopic cylinder.] [The nickel plating to be a minimum of 75 micrometers or 0.003 inch thick and a [high] [mid] phosphorous, electroless nickel process designed for corrosion protection.] Fabricate rings, bearings, packing, packing rings, retaining rings, seals, wiper-scrapers, and any other fabricated items from sufficiently qualified materials as recommended and approved to provide net zero leakage. Where a cylinder head is used as a positive-position stop, the stop head to incorporate an adjustable cushion, or an external deceleration control provided to minimize detrimental mechanical impact. [End mounts [for pinned connections] as indicated.] [Provide bronze bushings in accordance with ASTM B505/B505M, Alloy [C92200], in the pin holes.] [Fabricate connection pins from ASTM A564/A564M, Type 630, Condition H-1150, stainless steel.] [Mount the hydraulic cylinder as indicated.] Drill, tap, and surface ports to receive [SAE Code 61 flanges] [______] in the positions indicated or as otherwise approved. Locate the manifold and pipe supports, as indicated, to be an integral part of the machinery. Provide both ends of all the cylinders with convenient bleed ports. Tap each cylinder port to receive the 7/16-20-SAE bleed valves. Provide diagnostic connectors rated at least 31 MPa 4500 psi and consisting of a stainless steel body with internal ball check and spring, male SAE O-ring connection and protective cap as bleed valves. Integrated position indication systems mounted to the cylinders to be designed for minimal leakage [leakage free] and equipped with a pressureless leakage monitoring port collection system. [Cylinders to have ports on both sides and provisions for mounting piping in either left or right hand configuration so that the cylinders for both positions are interchangeable.]

2.2.3 Hydraulic Cylinders (USACE Custom Design)

******************************************************************************************************************************************************************************************************** Note: Use this Alternate 3 when the hydraulic cylinders have been designed or by the Corps of Engineers or have specific and unique requirements and they are detailed on the contract drawings. Mill type cylinders to be utilized in accordance with EM 1110-2-2610. Mill type cylinders generally are rated for the higher pressures than the other designs. The cylinder heads generally are mounted with bolts or cap screws. Most main operating systems to be designed for this type of cylinder.

Position sensing systems are a critical feature and are either integral with the cylinder or external to the cylinder and sense either the cylinder or the gate or valve directly. An advantage of a position
sensing system connected to the gate (not the
cylinder) is the gate position is known if the
actuator becomes disconnected or damaged. Systems
integral with the cylinder can be provided by the
manufacturer and require no external mechanisms or
linkages.

Integral systems include the magneto resistive
systems. Notches are etched or machined into the
base material of the cylinder rod and a surface
coating is applied over this. These systems,
however, only work with carbon steel rods and
non-magnetic coatings. Located in the rod seal gland
housing is a sensor, which is positioned to receive
signals from the etched or machined notch embedded
below the polished surface. Signal pulses are
counted and computed to provide an output
positioning signal.

Magnetorestrictive systems require drilling the
cylinder rod from the piston end for a sensor rod.
This system provides an absolute indication of
position but is limited in stroke because of the
length of the unsupported rod in the cylinder when
extended.

**************************************************************************

2.2.3.1 General Requirements (USACE Design)

Utilize mill type cylinders. The hydraulic cylinder to be of the
[single][double] acting type designed and manufactured [to be used under
water and] to meet the criteria stated in paragraph "Design Parameters." [Design cylinders and integrated appurtenances including position sensing
systems to be submerged [and operate] under [_____] meters[_____] feet of
water for up to [_____] days per year.] [Cylinder design arrangement must
allow for field serviceability of cylinders, where rod wiper/scraper seals
and static o-rings can be serviced without specialty jig or offsite
facility.]

2.2.3.2 Cylinders (USACE Design)

Cylinders for USACE Design hydraulic cylinders must meet the following
requirements:

a. Make cylinders out of steel meeting one of the following options:

1) Option A: Rolled steel plate in accordance with ASTM A516/A516M,
Grade 70 or equivalent material as approved, and welded flanges in
accordance with ASTM A181/A181M, Class 70 or equivalent material
as approved.

2) Option B: Provide centrifugal cast steel shell in accordance with
ASTM A216/A216M, Grade WWC or equivalent material as approved, and
welded flanges in accordance with ASTM A181/A181M, Class 70 or
equivalent material as approved, or cast from ASTM A216/A216M,
Grade WWC steel or equivalent material as approved.

3) Option C: The shell and flanges a solid trepanned forging in
accordance with ASTM A266/A266M, Class 1 or equivalent material as
b. The interior of the finished cylinder must honed to the dimensions, tolerances and surface finish shown.

c. The finished wall thickness must not be less than that shown.

d. Weld flanges to the cylinder parallel with each other and perpendicular to the cylinder center line.

e. Stress relief heat treat the cylinder after completion of all welding.

f. Fabricate cylinder to the tolerances as shown. The assembled cylinder to be of such straightness that the piston and rod move smoothly without any indication of binding or tight spots.

g. [Radiograph all welds including those on the end mounts.][ Radiograph designated welds as indicated.]

2.2.3.3 Piston Rods (USACE Design)

**************************************************************************
NOTE: Choose one or more options depending on the unique requirements and life-cycle costs of the project. Carbon steel piston rods with chrome plating is noted but should be avoided if possible due to potential corrosion of the piston rod especially in high corrosivity environments.

The designer needs to reference and select the appropriate corrosivity category in Table 1 for the piston rod.

The designer should be aware that cylinder rod ends specified with carbon steel substrates have an increased likelihood of corrosion between the mating surfaces/threads of the cylinder rod and connected components. The cylinder rod ends are typically machined threads for adjustability and are not protected by the specified rod coating system. Standard o-ring type seal designs may not be enough to withstand environmental conditions. Designers should provide provisions in the design to seal, protect or coat mating surfaces to minimize the chance of seizing and corrosion for future maintenance and serviceability.

**************************************************************************

Piston rods for USACE Design hydraulic cylinders must meet the following requirements:

a. Rod and road coating system must be in accordance with one of the following options. All rod coatings must meet or exceed the minimum test criterion as stated in the following tables (Tables 2,3,4). [Submit Rod Coating Data that includes details on the coating materials, corrosivity testing, application method, and quality inspection methods and metrics.]:

[ 1) Carbon steel rods with [chrome][nickel plus chrome] plating:
Fabricate rods from carbon steel that meets the requirements of ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. Case harden to 50-54 Rockwell C. The chrome plating thickness must be a minimum of 76 micrometers or 0.003 inch. Apply plating in accordance with ASTM B177/B177M or ASTM B650 [ASTM B546.]

2) Stainless steel rods with chrome plating: Fabricate rods from stainless steel that meets the requirements ASTM A564/A564M or ASTM A705/A705M, Type 630 or Type XM-12 or equivalent material as approved. The chrome plating thickness must be a minimum of 76 micrometers or 0.003 inch. Apply plating in accordance with ASTM B177/B177M and ASTM B254.

3) Carbon steel rods with welded overlay: Fabricate rods from carbon steel that meets the requirements of ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. The coating material must be certified and formulated to consist of a metal alloy to meet corrosivity category and designed and applied by the cylinder manufacturer and submitted for approval. The minimum coating thickness must be [600] micrometers or [0.0236] inches.[400 micrometers]

4) Carbon steel rods with high velocity oxygen fuel (HVOF) coating: Fabricate the rods from carbon steel that meets the requirements of ASTM A108, Type C 1045 or Type CR 4140 or equivalent material as approved. Case harden to 50-54 Rockwell C. Apply thermal sprayed coatings with HVOF method and have the applied material composition certified and submitted for approval. HVOF application per ASTM E1920 and ASTM C633[manufacturer standard application process] and submitted for approval. Applied coating materials to consist of Nickel-Chromium based alloys as approved applied in multiple layers to achieve a total coating thickness greater or equal to [250] micrometers or [0.0089] inches for the first layer and not less than [440] micrometers or [0.0173] inches for two layers.

b. If rods are made from two or more pieces, joints must be made with full penetration welds. Perform radiograph testing on 100% of welds.

c. [The final rod surface to have a roughness height of not more than [0.20][____] micrometers[8][____] microinches Ra.]

d. Quantify the final rod surface roughness using the Rpk-Rk-Rvk in accordance with ISO 13565. Other parameters such as Ra, Rz or Rmax value can only be used indicative. Roughness to be determined by Cylinder manufacturer and Seal manufacturer for the intended cylinder operating environment as specified.

e. Submit certified test reports for both the rod material and performance requirements as specified.

**************************************************************************
NOTE: ASTM G48 testing is not a suitable test for porous coatings, e.g. hard chromium, thermal sprayed.

2.2.3.4 Pistons (USACE Design)

Provide pistons for USACE Design that are made from cast iron that meets the requirements of ASTM A536, Grade 80-55-06 or 10-50-05 or equivalent material as approved.

******************************************************************************
NOTE: The designer may allow the cylinder manufacturer to recommend and provide the seals, o-rings and bearing materials per their recommendations and coordination with the seal, o-ring and bearing suppliers and compatibility requirements for the selected hydraulic fluids or the designer may specify the requirements of the seals, o-rings and bearing materials using the tables below.
******************************************************************************

[2.2.3.5 Position Indication]

Equip hydraulic cylinders with a position indication system of the [magnetoresistive type] [magnetorestrictive type].

[2.2.3.6 Seals, O-rings and Bearing Materials (USACE Design)]

Provide seals, o-rings, and bearing materials for USACE design hydraulic cylinders in accordance with the following paragraphs.

Design and provide seals, O-rings, and bearing materials to be compatible with the specified hydraulic fluid. Each material in use with the hydraulic cylinder to be tested to verify the chemical resistance and hydraulic fluid compatibility. Conduct testing in accordance with ISO 1817 to measure changes in hardness, tensile strength, and elongation to satisfy the requirements of [the cylinder and seal manufacturers] [Table 5] [Table 6]. Submit for Government approval seals, O-rings and bearing materials.

[Table 5: Allowable deviations in seal material properties after ISO 1817 testing.]

2.2.3.6.1 Piston Wear Rings

Provide composite [cast iron] piston wear rings with a compressive and tensile strength of not less than 165 MPa or 24,000 psi and an embedability capability to prevent scoring of the cylinder.

2.2.3.6.2 O-Ring Seals

Use O-ring seals made from Buna N [Viton] and designed for [_____] kPa psi service.

2.2.3.6.3 Rod Wiper/Scraper

NOTE: Use option for metal scraper ring for environment subject to ice or other materials adhering to the rod.

Provide a [high-strength polyurethane scraper ring] [spring reinforced brass scraper ring] which will withstand the impact and the abrasion of materials adhering to the piston rod and have a minimum tear resistance of 120 N/mm or 685.2 pounds per inch. Split and retain the scrapers with split, bolted retainer to facilitate replacement without removal of the rod end clevis.

2.2.3.6.4 Piston and Piston Rod Seals

Provide low leakage V-ring, nonadjustable gland type [piston and] piston rod seals, designed for [_____] kPa[_____] psi service. [Provide bronze-filled polytetrafluoroethylene piston seals.]

2.2.3.7 Rod Seal Gland and Locking Device Flange

Fabricate the rod seal gland and locking device flange from bronze in accordance with ASTM B505/B505M, Alloy No. C95400 or C93200. The ice
scraper, attached to the gland, bronze-filled polytetrafluoroethylene in accordance with ASTM B584, Alloy No. C86300.

******************************************************************************

NOTE: The designer should work with the cylinder manufacturer to determine if a mechanical cylinder rod locking device can be provided for gate lifting applications. These are mechanical locking devices as opposed to valves in the hydraulic circuit for holding the load in place. These should be designed by the cylinder manufacturer and submitted for approval.  

******************************************************************************

[2.2.3.8 Hoist Locking Device]

Fabricate the hoist locking device from stainless steel in accordance with ASTM A564/A564M or ASTM A705/A705M, Type 630 or XM-12, Condition H-1150.

2.3 HYDRAULIC POWER UNIT (HPU)

2.3.1 HPU - General

Provide a self-contained hydraulic power unit. Design the packaged unit to operate the hydraulic cylinders in accordance with the criteria stated in paragraph "Design Parameters." Design the power unit to meet the space limitations shown and configure essentially as indicated. The structure of the unit both internally and externally will be adequate for the unit to be free standing and capable of being lifted or moved without structural damage. Securely attach all components including piping, motors, pumps, and manifolds to the power unit in a manner to be free of damaging vibration during operation. [Design and provide each unit with forklift tubes and lifting eyes to facilitate lifting or moving the unit, including the reservoir when full of oil.]

******************************************************************************

NOTE: If due to install assess limitations the assembly may need to be modular. The HPU must be designed to be modular by having flanged or fitting connection points. Split skids will need to have connection that allows either field sealing or other method for leak proof oil containment.

******************************************************************************

[2.3.2 Oil Containment Skid]

The entire HPU, including the reservoir, pumps, all piping, valves and routing shall be within an oil containment skid, that is able to hold 1.5 times the total system volume without loss of fluid. Provide threaded SAE fitting with O-ring for drainage with normally closed manual ball valve with installed. Design and provide the skid with forklift tubes and lifting eyes to facilitate lifting or moving the entire assembly, including the reservoir when full of oil.

[2.3.3 Pumps]

******************************************************************************

NOTE: Only use the submerged pump option where space is restricted so that the pump cannot be mounted on the exterior of the reservoir with the
pump suction flooded.

If the designer elects to select the particular type of pump to be used, consider the following factors: displacement, pressure rating, prime-mover speed, rated pump life, initial cost, mountings available, serviceability, porting connections, availability, compatibility, product history, efficiencies, and size and weight. Fixed displacement pumps are usually lower in cost, on a component basis. However, weigh the lower initial cost of the pump against the cost of the control components needed to make the system work. Variable displacement pumps, conversely, are generally higher in cost, but less control equipment may be needed to achieve the same result. The reduced control costs may more than offset the higher initial pump cost. As a general rule, gear pumps are usually least costly, vane pumps intermediate, and piston pumps most costly. However, on the basis of cost per watt (horsepower), there is no clear-cut rule. Evaluate each application individually.

Provide pumps in accordance with the following general requirements below and in the paragraphs that follow:

a. Pumps must be [submersible,] electric motor-driven, [variable] [fixed] displacement, [gear] [vane] [piston] type pump[s].

b. Equip pumps with constant wattage horsepower control to regulate flow rate and pressure.

c. Pumps must be rated to [rated to deliver a nominal [_____] L/s at [_____] kPa [_____] gpm at [_____] psi] while operating with the specified oil in the specified temperature range.

d. The pumps must be rated for continuous operation at a discharge pressure equal to or greater than the system design pressure.

d. Maximum rotating speed must be no greater than 1800 rpm.

e. Equip the pumps with safety guards for all exposed rotation parts.

f. Mount the pumps [in] [on] the reservoir in a manner similar to that indicated so that the pump suction is flooded.

g. Pump ports to be [NPT] [tapped NPTF] [tapped for straight pipe threads] [drilled and faced for flange connections] [socket weld][SAE with O-ring]. Use of fitting adapters does not constitute compliance with these fitting requirements.

h. Operate the pumps on [_____] volts, 60 Hz, three phase power.

2.3.3.1 Gear Pumps

Provide [fixed] [variable] [or] [_____] type gear pumps that meet the following requirements:
a. Make Covers and center section from [high strength aluminum alloy die castings] [steel] [cast iron].

b. Make thrust and wear plates from [heavy-duty bronze coated steel] [bronze] [or] [______].

c. Use manufacturer's [standard] [or] [_____] shaft seals for rotary pumps.

d. Seals, wear plates and other wearing parts must be replaceable and suitable for the application, duty, and temperatures involved.

2.3.3.2 Vane Pumps

2.3.3.2.1 Fixed Displacement Vane Pumps

Fixed displacement vane pumps must meet the following requirements:

a. Pumps must be of the hydraulically balanced type.

b. Make pump and components from the following materials:

   1) Housing - [high tensile strength ductile iron] [cast iron] [______]
   2) Vanes - [heat treated high-speed tool steel] [______]
   3) Shaft and rotor - [case hardened steel] [_____]
   4) Cam ring - [high carbon chromium steel] [_____]
   5) Seals - [Buna N] [nitrile rubber] [fluoroelastomer] [_____]

[ c. Provide double vane pumps when indicated]

2.3.3.2.2 Variable Displacement Vane Pumps

Variable displacement vane pumps must meet the following requirements:

a. Incorporate means for varying the pump displacement from zero to the maximum rated quantity while the pump is operating against the system pressure indicated.

b. Materials as specified for fixed displacement vane pumps.

c. Arrange pumps for adjustment of discharge volume by [mechanical] [electrical] [hydraulic] [pneumatic] means.

  d. Control the pump displacement by [integral automatic pressure compensation] [adjustment screw] control.

e. Provide the pump casing with a tapped outlet for connection of an external drain line.

2.3.3.3 Piston Pumps

Piston pumps must meet the following requirements:

a. Provide [cylinder block in-line] [axial fixed] [axial variable] [or] [_____] type piston pumps.
In-line type must be capable of reversing flow direction and flow rate by means of external valve bank. Axial variable type must be capable of providing reversed flow with constant direction of input shaft rotation. Axial variable type to be suitable for control of displacement and direction of flow by manual mechanical hydraulic electric pneumatic devices.

c. Provide manually adjustable maximum and minimum limits of displacement in each direction of flow.

2.3.4 Filters

----------------------------------------------------------------------------------------------------------------------------------------

NOTE: Use duplex filters only if continuous operation is necessary without shutting down the system for replacement of the filter element.

To ensure maximum reliability of the system and reduce repairs to or replacement of the system components, specify the filtration level for the system by the Beta ratio, the ratio of the number of particles in a certain size range upstream of the filter to the number of particles in that size range downstream of the filter. This will however increase initial costs and filter maintenance.

Filter media type and filtration level should be coordinated with the supplier of the hydraulic hydraulic fluid to ensure that the fluid is compatible with the chosen filter and that the filter does not inadvertently remove additives.

----------------------------------------------------------------------------------------------------------------------------------------

Locate the filter[s] in the return line to the reservoir [and in the pump discharge line] [in the indicated location]. Provide the [spin-on type with a bypass and an indicator to show the condition of the filter element] [duplex type with a differential pressure device to indicate the need for filter element service]. Provide filter housing and cover of steel or cast iron construction. Bolt the cover to the main housing. Locate filters so that they can be changed without removal of hydraulic system components. Shutoff valves to be easily accessible. Equip the filter with a relief valve which protects the filter against excessive pressures. Equip the filter unit with a gauge or gauges indicating the pressure loss or a cartridge replacement indicator. Equip the filter unit with a pressure switch to signal excessive pressure loss across the filter. Each filter to have a minimum capacity of [_____] L/s [_____]gpm at a pressure drop not exceeding 69 kPa or 10 psi when filtering hydraulic fluid having a viscosity of 389 SSU at 38 degrees C or 100 degrees F. The filter cartridges will not remove additives from the hydraulic fluid. [The filter element to have a rating of [_____] μm absolute [10 μm absolute unless a smaller mesh is recommended by the manufacturer of the component with the highest cleanliness requirement].] [The filter element to have a minimum silt control rating as approved and Beta rating of 200 [] at 400 kPa or 60 psi differential pressure in accordance with [ISO 16889].] The filter to be rated for use with hydraulic oil and the pressure drop not to exceed 40 kPa or 6 psi in the clean condition. [The return filter to be pressure rated for 1400 kPa or 200 psi and a flow rate of [_____] L/s gpm.] [The discharge line filter to be pressure rated for [_____] kPa psi and a flow
rate of [_____] L/s gpm. [Determine the pressure and flow rating of the filters to be compatible with the design of the power units.] [Filters and strainers are not to be located in the reservoir, where drainage of the reservoir is necessary to inspect or service the element.] [Pump suction lines are to not have a filter or strainer][Pump suction lines are to not have a filter or strainer unless a bypass circuit is provided to prevent starving of the pump and settings confirmed with pump supplier, and the filter or strainer element's status is clearly displayed and the element is accessible without system drainage.]

2.3.5 HPU Nameplate and Labeling

Provide nameplates for each gauge, port and device of the HPU, and submit for approval. Nameplates to clearly indicate the function of each device and, in the case of manually operated items, indicate the condition established for each position. Machine engrave [print] lettering on nameplates on [steel plate] [plastic laminate with white characters on a black background]. Mount instruction plates on a rigid backing and covered with clear, rigid plastic sheeting. Use metal wire to secure the nameplate when a panel or flat surface is not available.

2.4 OIL RESERVOIRS

**************************************************************************
NOTE: Remove requirement for painting if reservoir is to be stainless steel. The design and sizing of the hydraulic reservoir is a critical feature. The designer should utilize EM 1110-2-2610 for sizing the reservoir or allow the manufacturer to determine the final size.
**************************************************************************

Size the oil reservoir [as indicated][to meet the space limitations indicated][in accordance with the manufacturer requirements as approved]. Fabricate the reservoir of [steel][stainless steel] with welded joints and conform to the requirements as shown. Fabricate the reservoirs in accordance with ISO 4413. Provide a bolt-on mounting base along side of the reservoir which supports the motor-driven hydraulic pumps, associated valves and accessories for design loads and speeds. The bottom of the reservoir to have a minimum clearance from the floor of not less than 0.3 m or 12 inches. Shape and slope the reservoir bottom to facilitate emptying and cleaning. A foot valve or check suction lines to provide flooded inlets to the pumps. Provide each side of the reservoir with a cleanout opening of not less than 0.26 square meters or 400 square inches clearance with a bolted, gasketed cover. Provide each reservoir with a drain with shut-off valve [threaded for an SAE fitting]; a magnetic trap; low oil float level switches; and other appurtenances as indicated and as specified herein. Equip the reservoir with a fluid level indicator and filler with built-in strainer [that can be inspected and cleaned without need to drain the reservoir or access to the inside of the reservoir]. Provide a baffle between the intake and return lines to facilitate the separation of air and foreign matter from the hydraulic fluid. The connection between the two chambers of the reservoir to connect high enough from the bottom to form a settling chamber. Bring both the intake and return pipes down to a distance of 1-1/2 pipe diameters above the tank bottom.[ Clean interior surfaces of the reservoir down to bright metal and coated with an epoxy-based urethane finish or an approved alternate that is compatible with oil and water.] Finish the welded joints of the reservoir smooth and free from irregularities. Do not grind welds to an extent that weakens the
reservoir. Until final installation of the hydraulic equipment, seal all openings with plastic closures. The capacity of each reservoir not to be less than [_____] liters [_____] gallons [and include capacity for all accumulators discharged to 0 psig]. Anchor the reservoirs to the concrete by suitable anchor bolts. Furnish all piping, fittings, hose, manifold blocks, fasteners and appurtenances required to connect equipment to the reservoir. [After painting, insulate the exterior of the reservoir with a polystyrene, polyurethane, or foamglass type insulation. The insulation to be compatible with oil and not retain moisture. The insulation thickness to be 50 mm or 2 inches on all surfaces other than the top.]

2.4.1 Reservoir Heater

******************************************************************************
** NOTE: Proper selection of the hydraulic fluid may eliminate the need for a reservoir heater.**
******************************************************************************

Provide the reservoir with one or more screw plug type immersion heaters with a watt density not to exceed 17 kW/square meter or 11 watts per square inch and a [built-in][remote] thermostat set to maintain the hydraulic oil at 5 degrees C or 40 degrees F. Fabricate the heater sheath and screw plug from stainless steel. Total heating output to be [_____] watts] at [_____] volts AC. Supply the heater with a watertight, stainless steel, NEMA 4X terminal housing as a minimum. Provide a weatherproof junction box with a single phase, [120][_____] volt, control transformer for the thermostat and high temperature circuit. Install the heater in a location on the reservoir vessel to maintain complete submergence of the heating element during all operating level fluctuations within the reservoir.

2.4.1.1 Heater Switch

Provide a thermostat to sense the oil temperature in the tank and close its contacts when the temperature drops below [10] [_____] degrees C [50] [_____] degrees F as indicated. Provide a bulb and capillary type thermostat and provided with a protective well which extends into the tank. The temperature adjustment range to be 10 degrees to 38 degrees C or 50 degrees to 100 degrees F with plus or minus 1 degree C or 2 degrees F differential switch. Fit the switch with an external calibrated adjustment knob. The thermostat to be rated for 15 amperes at 120 volts. Provide weatherproof junction box.

2.4.1.2 High Temperature Switch

Provide a thermostat to sense the oil temperature in the tank and close its contacts when the temperature exceeds [50][_____] degrees C [122][_____] degrees F as indicated. The thermostat to be of the bulb and capillary type and provided with a protective well which extends into the tank. The temperature adjustment range to be 10 to 149 degrees C or 50 to 300 degrees F with plus or minus 1 degree C or plus or minus 2 degrees F differential switch. Fit the switch with an external calibrated adjustment knob. The thermostat to be rated for 15 amperes at 120 volts. Provide weatherproof junction box.

2.4.2 Magnetic Separators

Provide the manufacturer's standard magnetic separator in the reservoir. The magnetic separator consists of a high-strength permanent magnet.
arranged for rigid mounting with the poles of the magnet exposed to the fluid in the reservoir. The magnet to be [combined in the construction of the fill strainer] [mounted on a removable rod assembly installed through the top of the reservoir] [incorporated in the bottom drain plug]. [The drain plug type installation to incorporate an automatic valve arranged to permit removal of the magnetic separator for inspection without loss of fluid from the reservoir.] [The drain plug type installation to include provisions for automatic chip detection without removal of the plug.]

2.4.3 Low Level Float Switches

Provide each power unit with two float switches. Provide flanged switches and install inside a 125 mm or 5-inch nominal diameter pipe to eliminate surge effects. The thermostat mercury type switches to have a narrow differential and be rated for 13 amperes at 120 volts. Set switches to close when oil level rises above or drops below those recommended by the manufacturer and observed during operational tests. Provide a NEMA 4X junction box.

******************************************************************************
NOTE: If a flow meter is necessary, the designer should select an electronic flow meter or visual flow meter. The detailed design should be provided by the hydraulic power system manufacturer and fabricator.
******************************************************************************

2.4.4 Air Breather

******************************************************************************
NOTE: Where space allows, flexible reservoir breathers are the preferred method of preventing or controlling the introduction of outside air into the reservoir. Delete either of two paragraphs which are not needed.
******************************************************************************

Provide the reservoir with an air breather which removes dirt and moisture from the incoming air. The incoming air to first pass through a desiccant bed to remove the moisture, and then pass through a filter to eliminate the solid contaminants before entering the reservoir. Outgoing air to pass directly to the atmosphere through a check valve. The breather to also provide visual indication of the desiccant and filter condition.

2.4.5 Flexible Reservoir Breathers

Provide each hydraulic power unit with flexible reservoir breather units to eliminate the introduction of outside air into the reservoir during normal operation of the system and to accommodate expansion and contraction of the air inside the reservoir. The breather units to be of sufficient capacity to accommodate the differential volume of the reservoir. The flexible reservoir breathers to have a bladder compatible with the system hydraulic fluid. Equip the reservoir breathers with pressure vacuum breakers. The shell to be free standing and of rugged construction made of steel, fiberglass or other material as approved. Construct and mount the breather in a manner to facilitate bladder replacement. Provide piping to the breather with adequate pipe unions and screwed fittings to facilitate repair or replacement of the vent bladder. Install, securely attach and
support the units as shown on the hydraulic power unit.

2.4.5.1 Pressure Relief and Emergency Venting

Provide a pressure relief system consisting of inline check valves and breathers in the breather piping, as indicated, to prevent collapse or "oil canning" of the tank. The check valve in-line with the breather to be removable to permit venting the reservoir during setup. Direct the air in the tank to the flexible breather during normal operations. The breathers to be of the threaded type with steel shell and nylon strainer and guard and rated for \([127][_____] \text{cubic meters per hour} [75][_____] \text{cubic foot per minute}]. The inline free flow check valves to be the threaded type with a 13.8 kPa or 2 psi cracking pressure.

2.4.6 Oil Level Gauge (Sight Glass)

Provide an [a continuous] oil level gauge with an indicating length of not less than 300 mm 12 inches on each unit and position to give a visual indication of the oil level in the tank including the "low level", "add oil", "nor. min. level", and "max. level" marks. After the system is operational and all tests complete, permanently mark the levels on the tank in a manner approved by the Contracting Officer. Gauge material to be compatible with hydraulic fluid and acceptable for use over full range of system fluid temperatures without staining or distortion. [Oil level gauge material to be shatter-proof.] [Oil gauge housing design to provide protection to the gauge glass.] [Gauge to be located so that it not susceptible casual damage.]

2.5 ACCUMULATORS

Provide bladder type suitable for charging with nitrogen. [Provide the indicated number of accumulators with the fluid capacity not less than [_____] [L] [gallons]]. [Provide a tee with a [_____]L gallon accumulator in the pressure line at each cylinder.] Design the accumulators in accordance with ASME BPVC SEC VIII D1 for a rated working pressure of not less than [_____] kPa psi. [Accumulators should be stamped and certified per ASME standards.] Equip accumulators with a safety device to release excessive pressure before the burst pressure is reached. Arrange accumulators so that pressures can be checked and bladders can be easily changed without the removal of other components. Provide a ball type shutoff valve for each accumulator. [Lever (Handle) of shut-off valve to be located and oriented such that its position and access for use is not impeded by other components.] [Valve lever to be lockable with a locking tab eye sized for a common pad lock diameter.]

2.6 PIPE, TUBE, HOSE, AND APPURTENANCES

**************************************************************************
NOTE: Tubing is recommended for indoor and or protected environments where damage due to flooding, ice, debris, vibration or personnel traffic is not likely to occur. Use caution when specifying tubing applications in larger diameters as the available working pressures of the tubing may be lower than anticipated operating pressures of the hydraulic system.

Recommend providing an Engineering Consideration for In Field Personnel to have QA performed on the
installation, assembly and testing of any threaded piping connections specified to ensure a leak free design.

Tube and tube fittings are readily commercially available in sizes up 1 inch nominal size. Tube fittings above 1 inch in size are less common and it is preferred to use pipe at sizes 1 inch and above.

2.6.1 Piping

2.6.1.1 Pipe - General

Design piping, tubing, and hose for a working pressure of [_____] kPa psi. [Use pipe when a 25 mm or 1 inch or larger diameter is required. Use tubing when less than 25 mm or 1 inch diameter is required.] [Provide external cylinder piping as indicated.] Weld pipe as indicated. Provide pipe, tube, and fittings in accordance with ASME B31.1 and subsequent addenda unless otherwise specified or indicated.

2.6.1.2 Pipe

Use seamless [steel conforming to in accordance with ASTM A106/A106M, Grade B] [stainless steel in accordance with ASME B36.19M and ASTM A312/A312M, Grade TP304]. Supply carbon steel pipe in the pickled and oiled condition. The piping weight class to be Schedule 80 [40].

2.6.1.3 Pipe Fittings

Use socket welding type pipe fittings in accordance with ASME B16.11 and made of [steel in accordance with ASTM A234/A234M, Grade WPB] [stainless steel in accordance with ASTM A182/A182M, Grade F304]. Provide pressure class [_____] kg pounds. Flanges in accordance with ASTM A182/A182M with the grade suitable for the pipe to which attached. Also conform threaded fittings to the above, but use only where absolutely necessary for the application.

2.6.1.4 Unions

Provide O-ring type unions, made of stainless steel with socket-welding ends. The Contractor may, as an option, substitute four bolt split flanges with [Buna N] [Viton] O-rings for the unions.

2.6.2 Tubing

2.6.2.1 Hydraulic Tubing

Stainless steel tubing used for hydraulic circuits in accordance with ASTM A269/A269M for Grade TP 304, Seamless.

2.6.2.2 Tube Fittings

Provide flareless type with SAE straight threads and [Buna N] [Viton] O-ring seals. Each fitting to hold the tubing with a chucking action and provide a firm flat grip on the tubing without penetration of the tubing wall. Fittings not to twist the tubing during assembly. Provide a leak-proof seal at the rated working pressure of the tubing. Each fitting connection to be capable of no less than 30 connect – disconnect -
reconnect cycles without galling, leakage or any other damage. Provide all tube fittings without special adaptors or custom-designed assemblies. Provide Type 304 stainless steel fittings that conform to SAE J514.

2.6.3 Hose

**************************************************************************
NOTE: Carbon steel hose fittings can be evaluated by the designer for use depending on the application. Any applications that are submerged should utilize stainless steel fittings.
**************************************************************************

2.6.3.1 Flexible Hose

All flexible hoses to have an inside diameter to match the line size to which it is to be connected to. A minimum working pressure of the hose to be rated not lower than the system operating pressure indicated with a factor of safety of 4. Provide hose in accordance with SAE J517, 100R9. The hose used for general industrial use in hydraulic systems provided with petroleum base hydraulic fluids. Provide a synthetic rubber tube with four spiral wire reinforcements and a synthetic rubber cover. Each end of the hose to have a straight split stainless steel flange fitting in accordance with SAE J518-1, Code [61][__]. Design fittings specifically for use with the hose selected and as recommended by the hose manufacturer. Install the fittings using the internal skive crimp method. Make fittings of [stainless steel][carbon steel] and of the reusable type. Fit the hose with a nylon sleeve to protect and prevent abrasion of the hose cover. Maintain minimum bending radii. Use hydraulic hose in locations where system pressure fluctuation is subject to occur, such as the hydraulic pump pressure, return and case lines, and system solenoid control valves. Install hoses with uniform and neat routing such that they are not-overlaying one another and are without kinks, sharp bends, binding, or rubbing throughout the entire motion of the hydraulic actuator. Protect the finished surfaces prior to installation of the flanges.

2.6.4 Manifolds

Provide pre-drilled manifold blocks for connection of control valve assemblies. Construct each manifold block of [aluminum per ASTM B209][stainless steel per ASTM A240/A240M][ductile iron per ASTM A536]. Machine ports and passages smooth and free of burrs and sharp edges. Arrange manifold block interconnecting passages and valving so as to provide the system connections and functions as indicated. Manifold block interconnecting passages and valving to be of ample proportions to minimize internal pressure losses. Machine surfaces and recesses where valving and other components are installed to the specifications of the applicable valve or component manufacturer. Make provisions for attaching the hydraulic piping to the manifolds by the use of flanges as specified in paragraph "Pipe Fittings" and as indicated. Adapters are not to be used to make the manifold port comply with the fitting requirements. The manifold in accordance with the valve manufacturers' recommendations to provide for installation of valves, flanges, and accessories. Make hydraulic interconnections between the manifold and piping with 4 bolt flanges. Design the manifold for a minimum pressure rating of not less than [_____]kpa [_____] psi at 66 degrees C or 150 degrees F except as specified. Locate components on the manifold in positions as indicated. All components as specified by their model numbers and mounted to the manifold in accordance with mounting details indicated and in the
manufacturer's catalogs.} [ Supply manifolds with manifold enclosures rated for submergence to [_____] m [_____] feet.] [ The manifolds and all attached valves, equipment, and electrical devices to be rated for submergence to [_____] m [_____] feet.] [Provide test ports as shown on the schematics and fitted with diagnostic connectors with stainless steel quick coupling nipple and accessory stainless steel metal dust cap.] Piping and hose layout is to not cause radial loading of manifold ports.

2.6.5 Valves

Provide a minimum pressure rating of [_____] kPa psi unless stated otherwise. Where possible, manifold mount valves. Manifold mounted valves to be either cartridge type or subplate mounted. Provide socket-welded piping connections on non-manifold mounted valves 25mm or 1-inch or larger. Provide valves less than 25 mm or 1 inch with SAE straight thread ends and [Buna N] [Viton] O-rings with tube fittings. Valves to be specifically designed and rated for hydraulic system applications. Provide nameplates for for all valves and submit for approval. Nameplates to clearly indicate the function of each device and indicate the condition established for each. Machine engrave [print] lettering on nameplates on [steel plate] [plastic laminate with white characters on a black background. Secure to valve with metal wire.]

2.6.5.1 Shut-Off Valves

Provide in-line mounted, stainless steel, lever operated, ball type. Shut-off valves at piping manifolds of each cylinder at the upstream and downstream locations for the main supply and return lines to be [50] [_____] mm [2][_____] -inch line size, rated for a working pressure of [21][_____] MPa [3000][_____] psi, with socket-welded ends, double acting ball type. Shut-off valves for all other lines to be ball type, match the line size, and have a maximum allowable working pressure of [21] [_____] MPa [3000] [_____] psi. The valve ends to have socket-weld pipe connections and drilled to receive SAE Code [61][_____] flanges. Provide a removable operating lever for each valve. Valves to be specifically designed and rated for hydraulic system applications. Provide with stainless steel valve trim including handles. The valves to have replaceable seats and be repairable without disturbing the welded connections. [Valves must have a lever that is lockable with a locking tab eye sized for a common pad lock diameter.]

2.6.5.2 Needle Valves

Supply needle valves of stainless steel construction and designed for fine flow regulation. Use [Buna N] [Viton] stem sealing O-rings.

2.6.5.3 Manual Control Valves

2.6.5.3.1 Flow

Flow control valves to be [subplate mounted for socket-welded piping] [line mounted] [manifold mounted cartridge valves]. The valves to be pressure-compensating, free flowing in one direction, and adjustable. The valves to be capable of being locked in position to prevent an unintentional adjustment. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].["
2.6.5.3.2 Manual Four-Way Directional Control Valves

The rotary shear seal type, open or closed center, and detent or spring centered as indicated. The valve to be three position, [subplate mounted with socket-welded piping connections] [line mounted]. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"]["].

2.6.5.4 Solenoid Operated Control Valves

**************************************************************************
NOTE: Solenoid operated control valves can be configured many ways. Two specific types are specified below as they are commonly used in USACE hydraulic systems. Designers should add additional valve types/configurations as needed.
**************************************************************************

Solenoids to be rated for continuous operation without damage or malfunction. Solenoids to operate the valves within a 10 percent fluctuation range. Totally enclose all moving parts and windings of the solenoids to prevent entrance of dirt and moisture. Pilot fluid supply to be internally supplied and externally drained from the power circuit. Vent both end cap chambers as necessary to achieve spring centering. [Equip the valve with manual [push detent] [lever] weather protected overrides.]

2.6.5.4.1 Pilot-Operated, Solenoid-Controlled Four-Way Directional Control Directional

Pilot-operated, solenoid-controlled four-way directional control valves to be [two] [three] position and [open] [closed] centered as indicated. Provide pilot operated valves with [a single] [two] solenoid[s], subplate mounted with [socket-welded piping] [tubing] connections. The valve's amplifier to be of the same manufacturer as the throttle valve. Provide a power supply for the valve and amplifier with an input of 120 volts AC. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].

2.6.5.4.2 Solenoid Operated Proportional Throttle Valve

Hydraulically control the rate of oil flow into the manifold by an electrohydraulic proportional throttle valve with electrical feedback setting. The throttle valve’s amplifier to be of the same manufacturer as the throttle valve. Provide a power supply for the throttle valve and amplifier with an input of 120 volts AC. The flow rating to be [a minimum of [_____] L/s gpm] [determined by the Contractor in accordance with the design criteria stated in paragraph "Design Parameters"].

2.6.5.5 Pressure Relief Valves

Provide adjustable pressure relief valves with a body designed for a set pressure of [_____] kPa psi. Relief pressure to be adjustable between [_____] kPa psi and [_____] kPa psi. [The valve to have the capacity to pass [_____] L/s gpm.][Determine the flow capacity in accordance with the design criteria stated in paragraph "Design Parameters"]["]. Provide balanced piston type relief valves. Valve bodies to be of close grain
alloy cast iron, "cast steel or forged steel. Valve pistons to be hardened, alloy steel. Finish grind valve pistons to provide an interchangeable fit. Valve springs to be alloy steel or music wire. All relief valves to be field adjustable within the specified relief pressure adjustment range with a [key-lockable] adjustment handle. Final factory settings as indicated, unless otherwise approved in writing by the Contracting Officer. [Provide manifold mounted type valves.]

2.6.5.6 Unloading Valves

****************************************************************************************************************************************
NOTE: Unloading valves provide free passage through a low pressure area when a signal is applied to a pilot connection. An unloading valve is normally located in the pump discharge line so that the pump can unload to the tank at a preset pressure. In a typical application, unloading valves may be arranged to accept a signal from an accumulator. At a predetermined pressure value, when the accumulator is charged to the preferred level, the pump unloads to the tank.
****************************************************************************************************************************************

Provide adjustable unloading valves designed for [_____] kPa psi service. Set the pressure as shown and determine the flow capacity so that the valve operates without cavitation.

2.6.5.7 Supply Spring Loaded Check Valves

Provide supply spring loaded check valves of stainless steel construction, the ball or poppet type with a body designed for high shock and [_____] kPa psi service.

2.6.5.8 Return Spring Loaded Check Valves

Construct the return spring loaded check valves of stainless steel, the ball or poppet type with a body designed for [_____] kPa psi service. Cracking pressure to be [_____] kPa psi.

2.6.5.9 Bleeder Valves

Provide 6 mm or 1/4 inch, stainless steel construction, wrench operated bleeder valves.

2.6.5.10 Pressure Snubbers

Provide stainless steel pressure snubbers for all pressure gauges and pressure switches to protect against shock and provide more stable instrument operation.

2.6.5.11 Counterbalance Valve

****************************************************************************************************************************************
NOTE: For hydraulic cylinders with attached flexible hoses, a counterbalance valve should be installed directly on the cylinder so that the lower hose is not subjected to a static load.
****************************************************************************************************************************************
Install in the oil line to the bottom side of the hoist piston as indicated to balance the load being held by the cylinder. The valve to be directly operated, internally drained, and adjustable for operating over a pressure range of [_____] to [_____] kPa psi. Design the valve for a system operating pressure of [_____] kPa psi. Provide the valve capacity rating of not less than [_____] L/s gpm. Permit unrestrained flow to the underside of the hoist piston and retain pressure in the hoist cylinder in the amount of the valve's pressure adjustment. [Each valve to be remote pilot operated with a check valve.] [Each valve to have an adjustable flow control valve in the pilot pressure line.] The counterbalance valve to be factory set in accordance with the settings as indicated.

2.6.6 Pipe and Tube Hangers and Supports

Locate all pipe support devices at intervals no greater than 2 m or 6 feet between centerlines of adjacent supports, except as modified as specified. Install support devices on both sides of a bend within four nominal pipe or tube diameters of the bend location. Furnish all supports, hangers, sleeves and brackets complete with compatible mounting hardware and appurtenances. Conventional pipe hangers and support in accordance with MSS SP-58 type as required. Provide stainless steel pipe supports and hangers. Provide special hangers and anchors as indicated. Construct tube supports of stainless steel hardware with polypropylene support halves. Provide each tube support with all mounting hardware required to connect with the appropriate anchorage system.

2.6.7 Sleeves and Wall Brackets

Fabricate sleeves and wall brackets of stainless steel as indicated.

2.6.8 Pipe Penetration Seals

Provide modular mechanical type pipe penetration seals, consisting of interlocking synthetic rubber links shaped to continuously fill the annular space between the pipe and opening. Assemble links to form a continuous rubber belt around the pipe with a pressure plate under each bolt head and nut. Tightening of the bolts to cause the rubber sealing elements to expand and provide a watertight seal.

2.7 INSTRUMENTS AND APPURTEANCES

2.7.1 Pressure Gauges

**************************************************************************
NOTE: Panel mounted pressure gauges and other sensors and or valves connected to the manifolds are recommended to avoid loose connections or items that can be bumped or disturbed. Avoid stem mountings.
**************************************************************************

Provide in accordance with ASME B40.100, with a black enameled metal case, a 115 mm or 4-1/2 inch dial, and a stainless steel Bourdon tube. The scale range of the gauge to be approximately 150 percent of the maximum pressure of the line in which installed. Provide safety type gauges with solid fronts and blowout backs. Provide each gauge with a pressure snubber. [Mount gauge as indicated.] [Panel mount the pressure gauges and make them readable from the front of the power unit after opening the doors of the enclosure.] Provide bottom tap gauges and gauge lines in horizontal pressure lines.
2.7.2 Pressure Transducers

Install pressure transducer as indicated to permit measurement and remote reading of the pressure in the system. Provide a transducer of the bonded strain gauge design with a pressure range of 0-21 MPa 0-3000 psi. The electrical output to be 4-20 mA with an accuracy of plus or minus 1 percent. The transducer to have a shielded electrical conductor cable of sufficient length to extend to the terminal strip in the junction box. Provide stainless steel housing construction with SAE hydraulic connections. Equip the pressure transducer with two adjustable setpoint switches that are integral to the unit to provide protection control. Alternatively, provide standard 4-20mA pressure transducers as approved.

2.7.3 Pressure Switches

Provide a minimum pressure rating of [_____] kPa [_____] psi with set point operating as shown. Enclose the switches in watertight, [galvanized] [stainless] steel, NEMA 4X housings. Provide the switches with a normally open, normally closed contact having a minimum rating of 5 amps, 125/250 volts AC.

2.7.4 Thermometers

Provide a direct indicating thermometer to indicate fluid temperature in the reservoir. Do not use Mercury in thermometers. [Provide a bimetallic type thermometer [mounted directly on the reservoir] [and panel mounted as for the pressure gauges].] [Provide a remote reading, capillary tube-and-bulb type thermometer, panel mounted.] Provide a minimum 75 mm or 3 inch dial with black markings on a white background, with scale range of minus 5 to plus 115 degrees C or 20 to 240 degrees F. Provide a corrosion resistant case and stem, and stainless steel wetted components. Provide thermometer wells of the separable socket type for each thermometer with a direct type bulb.

2.7.5 Flow Meter

2.7.5.1 Electronic Flow Meter

The flow meter to accurately measure the volumetric flow rate of fluids in the hydraulic system. The unit to be capable of directly measuring flow and constructed to be compatible with the hydraulic operating system. Convert the flow rate into a 4 to 20 mA signal. The mounting to be in-line with threaded connections and the unit capable of measuring flow rates up to [4.7][_____] L/s [75][_____] gpm with an accuracy of less than or equal to 2 percent of the measured value.

2.7.5.2 Visual Flow Meter

Provide an in-line flow meter with a spring loaded variable area annular orifice metering disk for measuring hydraulic fluid flow with a minimum pressure rating of 21 MPa or 3000 psi. Provide visual indication of the flow rate in the range of [0.32 to 3.2 L/s] [_____] [5 to 50 gpm] [____]. The viewing window to be graduated to the flow range and of sealed glass construction.

2.7.6 Flow Switch

Provide thermal dispersion type flow detection switches with no moving
parts and temperature sensors utilized to monitor flow or "no-flow" condition and be field adjustable with SPDT relays to detect flow in the range of \([0-3.2][\ldots]\) L/s \([0-50][\ldots]\) gpm. Provide with powder coated steel or aluminum housing, splash-proof construction. Make the sensors of stainless steel construction. Operating temperature to be \(-29\) to \(177\) degrees C or \(-20\) to \(350\) degrees F and the operating pressure \(0-28\) MPa or \(0-4,000\) psig. Use either threaded or flanged connections. Electrical requirements are \(120\)V, \(60\)Hz, \(4\) watts. The relay output to be SPDT 3 amps resistive. Electronics associated with the sensor may be either integrally mounted of weather-proof construction or remotely located within NEMA 4 rated junction box at the cylinder manifold or located within the machinery rooms with extended cabling.

2.8 HYDRAULIC MOTORS

Provide [gear; vane; in-line piston; bent-axis piston; and radial piston] [high speed, low torque (HSLT) or low speed, high torque (LSHT)] Hydraulic Motor having a displacement of not less than \([\ldots]\) cubic inches per revolution and rated for a system pressure of not less than \([\ldots]\) psi. The maximum rated speed must be not less than \([\ldots]\) rpm. Transmit the motor torque to \([\ldots]\) via a \([\ldots]\) connection. Provide \([\ldots]\) ports. The case drain leakage rate at rated system pressure must not exceed \([\ldots]\) gpm. Motor to be mounted [horizontally; vertically; as shown on drawings]. The motors will be used to provide \([\ldots]\).

********************************************************************
NOTE: If motor is to operate in a reverse capacity, then the displacement and speed in the reverse direction must also be specified in same manner as primary direction.

NOTE: If motor use is "non-standard", specifier should consider requiring a submittal from motor manufacturer certifying acceptable use of their motor in the prescribed manner.
********************************************************************

2.9 HYDRAULIC FLUID

********************************************************************
NOTE: The designer should consult with the fluid supplier to ensure the hydraulic fluid is compatible with the filtration system used and that the filtration does not inadvertently remove portions of the additive package.

********************************************************************

2.9.1 Petroleum Based

********************************************************************
NOTE: Specify the hydraulic fluid by brand name only if it is necessary for the fluid to be compatible with the fluid in an existing hydraulic system.

********************************************************************
Mineral oil hydraulic fluids are the most common within USACE and will work for a majority of applications. They are refined with the addition of additives, which range from anti-wear (AW), rust and oxidation inhibitors (RO), anti-foaming, and viscosity index (VI) improvers. These fluids offer a lower cost alternative to synthetics and can be very comparable in performance when certain additive packages are included.

Viscosity should be determined by the pump type. ISO Grade 32 and 46 and 68 are the most common. Not having the correct viscosity for the application will dramatically reduce the average life of the pump and system, thereby directly reducing its reliability and production. When selecting the appropriate viscosity grade, look for the optimum viscosity required by the pump. This can be determined by collecting data from the pump original equipment manufacturer, actual operating temperature of the pump, and the lubricant properties referenced to the ISO grading system at 40 and 100 °C (104 and 212 °F).

NOTE: A minimum requirement of the Kinematic Viscosity at 40°C = 22 mm²/s (1 mm²/s = 1 cSt = 0.01 St). Lower values, for example 15 mm²/s at 40°C, can be allowed but special seals (similar to low friction seals) are advised. Chevron seals or U-cup seals at 15 mm²/s at 40°C can give friction problems and high wear. Of course, this is also depending on the viscosity index. The absolute minimum viscosity at maximum operation temperature should be no lower than 10 mm²/s.

The designer needs to carefully consider any applications of EA hydraulic fluid to insure proper system performance. Types of EA fluids generally considered to have acceptable properties in the variety of conditions found on civil works projects include synthetic esters and polyglycols (PAG's). Biobased fluids can also be considered, depending on the application, but the designer needs to carefully consider their performance. Some polyalphaolefins (PAOs) can also be considered EA fluids. Grade of filter to introduce hydraulic into the system through depends on the final target cleanliness of the system and the cleanliness requirements of individual components.

**************************************************************************

Use the hydraulic fluid during shop testing, [to fill the cylinders before shipment,] flush the system after installation, and to fill the complete hydraulic system to be [_____] Petroleum Corporation's [_____] hydraulic oil which has a high viscosity index, low pour point, and antifoam properties,] [an all-weather type hydraulic oil which has a high viscosity index, low pour point, rust and oxidation inhibitors, and antifoam properties]. The oil to have an ISO viscosity grade of [_____] and a pour point of minus [_____] degrees C degrees F. [Formulate the oil to separate
quickly from water to prevent formation of emulsions.] Provide hydraulic fluid certified by the manufacturer as fire resistant in accordance with NFLPA T2.13.1. Filter fresh hydraulic fluid through a [10 µm] filter before it is added to the system. Introduce clean and fresh hydraulic fluid [5] [_____] µm filter before it is added to the system. Provide letters of assurance from the hose, pump, motor, valve, and cylinder manufacturers that the oil provided is satisfactory for use in their equipment in this application. Supply all oil and furnish two [210][_____] L [55][_____] gallon containers to the Government for a reserve supply.

2.9.2 Environmentally Acceptable

**************************************************************************

NOTE: The designer should reference EM 1110-2-1424 for further discussion on EA hydraulic fluid. ISO 15380 identifies four categories of biodegradable hydraulic oil: These four categories of EA hydraulic fluids include:

* Synthetic Esters (SE) - ISO Classification HEES
* Polyglycols (particularly Polyalkylene Glycols (PAG)) - ISO Classification HEPG
* Triglycerides (vegetable oils and biobased oils) - ISO Classification HETG
* Polyalphaolefins (PAO) and related hydrocarbon products - ISO Classification HEPR.

USACE has also adopted a two-tiered approach for selecting EA fluids. Tier 1 is more stringent from an environmental perspective but the selection of fluids may be less available. Tier 2 is less stringent environmentally and more fluids may be available to meet Tier 2 requirements. USACE would prefer a Tier 1 fluid if available and it meets the performance requirements of the system.

A Tier 1 USACE EAL is one that conforms to a strict interpretation of the United States Environmental Protection Agency (USEPA) definition and will either:
* Be a product labeled by European Eco-label, and/or Ospar (other product labeling could be considered by an Environmental Officer), or
* Be a product classified as USEPA VGP document Appendix A compliant, or
* Have test data as specified in USEPA 800-R11-002 or in USEPA VGP document Appendix A. Test reports to indicate that it meets all requirements for bioaccumulation, toxicity, and biodegradability. Such data may be presented as test reports or reported on product specification sheets.

A Tier 2 USACE EAL is a product that does not meet the criteria of a Tier 1 EAL, but:
* It is labeled by one or more of the following: Blue Angel, Nordic Swan, or Swedish Standard and/or,
* It contains a manufacturer's statement that it meets one or more of the test criteria (bioaccumulation, toxicity, and biodegradability) in accordance with USEPA 800-R11-002 definition or
USEPA VGP document Appendix A definition, with appropriate test data to confirm the other criteria, and/or

* Its base oil indicates that it meets one or more of the test criteria (see USEPA 800-R11-002, Section 4, Table 3 for biodegradability, Table 5 for toxicity, and Table 6 for bioaccumulation), with test data to support the other criteria.

**************************************************************************
Use nontoxic and biodegradable hydraulic fluid during shop testing, [to fill the cylinders before shipment,] flush the system after installation, and to fill the complete hydraulic system. Biodegradability is defined as 60 percent or more of the fluid carbon is converted to CO2 in 28 days, using test method in accordance with ASTM D5864. Nontoxicity is defined as concentrations greater than 1000 ppm of the fluid are necessary to kill 50 percent of the test organisms in 96 hours using test method EPA 560/6-82-002. Provide [synthetic ester] [poly glycol] type hydraulic fluid. The fluid to have a high viscosity index, low pour point, oxidation inhibitors, and antifoam properties. The oil to have an ISO viscosity grade of [___], a viscosity index of [___], and a pour point of minus [___] degrees C [degrees F]. [Formulate the oil to separate quickly from water to prevent formation of emulsions.] [Provide hydraulic fluid certified by the manufacturer as fire resistant in accordance with NFLPA T2.13.1.] Introduce clean and fresh hydraulic fluid through a [10] [___] µm filter before it is added to the system. Provide letters of assurance from the hose, pump, valve and cylinder manufacturers that the oil provided is satisfactory for use in their equipment in this application.[ Supply all oil plus furnish [two] [___] [210] [_____] L [55][_____] gallon containers to the Government for a reserve supply.]

2.10 FASTENERS

2.10.1 Carbon Steel Bolts and Nuts

Provide in accordance with ASTM A354, Grade BC, with ASTM A194/A194M, Grade 2H nuts. Make structural bolted connections carrying primary loads with ASTM F3125/F3125M, Grade [325][490] bolts.

2.10.2 Stainless Steel Bolts and Nuts

Provide in accordance with ASTM A193/A193M, Grade B8, with ASTM A194/A194M, Grade 8 nuts.

2.10.3 Flat Washers

Provide in accordance with ASTM F844.

2.11 ELECTRICAL EQUIPMENT

**************************************************************************
NOTE: The contents of the following paragraphs are dependent on design requirements which may necessitate revision or expansion to cover different conditions and standards.
**************************************************************************
Provide electrical equipment for the hydraulic power systems as indicated and as specified. Other electrical materials and equipment required for
the installation of the hydraulic power systems is specified in Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Furnish standard catalog item electrical equipment under regular manufacture with preexisting catalog ratings equal to or better than the requirements of the Contract drawings and specifications. Accompany request for approval of equipment other than as specified or as indicated by technical and descriptive data and specifications sufficient for the Contracting Officer to determine its adequacy. Unless otherwise specified or indicated, electrical materials and equipment to meet the standards, specifications, and tests referenced.

Submit data specifications and assembly drawings showing sizes, ratings, parts and material lists, overall dimensions, and mounting dimensions with the product data.

2.11.1 Conduit, Duct, and Accessories

[_____]Threads on the following equipment to be American Standard. No metric threads will be accepted.

2.11.1.1 [Plastic Coated] Rigid Metal Conduit

Hot-dip galvanize the conduit, including the threads, in accordance with ANSI C80.1 and UL 6. [The plastic coating to be factory applied by the same manufacturer who produces the hot-dip galvanized conduit. The plastic coating to have a minimum thickness of 1 mm or 0.040 inch for the full length of the pipe except for the threads and a tensile strength of 24.1 MPa or 3500 psi. Furnish a coupling loose with each length of the conduit. The bond between metal and plastic to be equal to or greater than the tensile strength of the plastic coating. The coated conduit in accordance with NEMA RN 1, Type A.]

2.11.1.2 Conduit Fittings

Provide galvanized, high test, gray iron castings. [The fittings to be plastic coated in the same manner as outlined above for the conduit.]
Furnish gaskets for all covers.

2.11.1.3 Conduit and Cabinet Supports

Support conduit and cabinets as required by IEEE C57.12.70. The supports to be galvanized [and plastic coated in the same manner as outlined above for the conduit].

**************************************************************************
NOTE: The designer should consider the use of “Subsea” junction boxes, pin connectors and instrumentation components where flooding or submergence is likely to occur. All potential water ingress points of connection must be considered for possible failure risk of the operating system.
**************************************************************************

2.11.2 Cabinets and Boxes

Provide watertight, [galvanized] [stainless] steel, NEMA 4X housings sized as required. The cabinet and box hubs to be consistent with the NEMA 4X rating of the box. Mount cabinets and boxes such that the NEMA 4X rating is not compromised. Match threads on the hubs with the threads on the
conduit [_____] and to be American Standard. Metric threads will not be accepted. The cabinets and boxes in accordance with UL 50.

2.11.3 Pump Motors

**************************************************************************
NOTE: Where motor starters are provided in motor control centers, delete the reference to motor starters.
**************************************************************************

Provide in accordance with NEMA MG 1, except as specified, and designed to withstand full voltage starting. Provide a totally enclosed frame, fan cooled construction for the pump. Provide a stainless steel drain-breather similar and equal to Crouse-Hinds type "ECD Universal" and locate so that any water present can be drained from inside the motor. [Encapsulate the motors windings.] [Provide motor starters complete with properly sized thermal overload protection and other appurtenances necessary for the motors specified.] Provide manual or automatic control and protective or signal devices required for the operation, and any control wiring required for controls and devices but not shown on the electrical drawings.

2.11.3.1 Rating

The motors to operate on [_____] volts, 60 Hz, 3 phase power and sized to operate the pumps specified in paragraph "Pumps." Design the motor to operate continuously without exceeding the temperature rise permitted by the applicable NEMA standards for the class of insulation and frame construction used.

2.11.3.2 Winding Insulation

Provide winding insulation of either class F or H [with special moisture, fungus, and oil-proof treatment]. Provide winding insulation of the type designed and constructed to withstand the severe moisture conditions and the wide range in ambient temperature to which the motors will be subjected.

2.11.3.3 Winding Heaters

Install heater[s] in the motor frame or end bells or wrapped around the winding end turns. The heater to automatically turn on when the motor is not running. The heater to be capable of withstanding the same temperature extremes as the motor. Provide heaters that when energized the temperature of the motor winding will be held approximately 10 degrees C or 18 degrees F above ambient. Design them for [_____] volts AC continuous operation. The heaters to withstand 10 percent overvoltage continuously. Terminals of the heaters, including the leads, to be watertight. Terminate the leads in the motor lead terminal box.

2.11.3.4 Terminal Leads

Extend the motor leads outside the frame, have insulation equivalent to that of the motor winding, and terminate in a two-piece, four-position, watertight, [galvanized] [stainless] steel, NEMA 4X, terminal box secured rigidly to the motor frame. Position and seal the leads where they pass through the frame with a water-resistant seal of a synthetic rubber material or else with a synthetic rubber gasket. Thread conduit entrances to the terminal box.
2.11.4 Control Components

**************************************************************************
NOTES: Where it is desired to control, coordinate, and program components of a hydraulic fluid power system to achieve synchronization of cylinders or components or to achieve a sequence of operations in several modes, tailor system requirements and specifications for the job.

a. The programmed controller is used in modern fluid power systems where a series of operations is to be performed in a sequential order on each cycle. It can be programmed to cause a number of hydraulic cylinders or motors to follow a sequential order of operations, extending and retracting, starting and stopping, during each cycle.

b. The controller can be programmable, consisting of a console plugged into a Central Processing Unit (CPU), or a specialized microcomputer system that can be custom programmed to control a wide variety of electronic and electrohydraulic systems and components, and has the capability to interface with other controls and transducers.

c. The designer should consider the use of "Subsea" rated components where there is a possible risk of flooding or submergence.

Other types of position measurement and control equipment may be used instead of the electronic limit switch and transducer combination indicated. Many other methods of position measurement are available including some which are entirely mechanical. Select the best type for the application.

**************************************************************************

2.11.4.1 Control Devices and Wiring

Provide manual or automatic control protective or signal devices required for the specified operation and all control wiring for these controls and devices whether indicated or not. Electrical control devices to have a minimum current and voltage ratings in accordance with NEMA ICS 2 contact rating designation A 300, as applicable, unless larger ratings are indicated or are required. Provide control devices with the number and arrangement of contacts required to perform the specified control functions. Provide devices with or installed in NEMA 4X enclosures.

2.11.4.2 Electronic Limit Switches

Provide solid-state, thumbwheel, programmable limits with a count/revolution range of 0000 to 3599; four decades of limit programming; set point switch function selection; initial power supply that provides four AC power levels (plus 5 V, plus 15 V, plus 24 V) from standard 120 or 240 VAC sources; and outputs for read-outs on two [digital] [analog] displays (one remote digital read-out in the control room and one at the hydraulic power unit). The operating temperature range of the electronic
limit switches to be [0] [minus 20 degrees C [32] [minus 4] degrees F to
plus 65 degrees C or 150 degrees F. Locate and mount the limit switches as
indicated.

2.11.4.3 Transducer (Electromagnetic Position Sensor)

Provide a single turn, heavy duty, and enclosed in a water-resistant NEMA
13 enclosure with an operating range of minus 20 degrees C or 4 degrees F
to plus 85 degrees C or 185 degrees F.

2.11.4.4 Remote Read-Out [Digital] [Analog] Display

Provide a remote [digital] [analog] display which is to be connected to the
BCD output from the limit switch.

2.11.4.5 Manual Switches

Manually operated switches, including push-button switches, selector
switches, and key-operated switches, heavy-duty, oil-tight type in
accordance with NEMA ICS 1. Switches to be the [momentary contact type
with standard operators] [maintained contact type with [mushroom head]
[illuminated button] [latching button]].

2.11.4.6 Relays

Relays used in control circuits to be industrial magnetic control relays in
accordance with NEMA ICS 2 contact rating designation A 300, except where
other ratings are indicated. Apply relays in control circuits in such a
manner that proper control functions is obtained regardless of whether the
contacts are overlapping or non-overlapping.

2.11.4.7 Indicating Lights

Indicating light assemblies to be the switchboard type, insulated for 120
volt AC service, with appropriate colored caps as indicated and integrally
mounted resistors for 120 volt AC service. Make color caps of a material
which will not be softened by the heat from the lamp. Lamps to be
replaceable from the front of the panel. Furnish any special tools
required for lamp replacement. The indicating light assemblies to be the
same product line as compatible push buttons and switches.

2.11.5 Control Consoles and Valve and Gauge Panels

2.11.5.1 Control Console Construction

The control console to include a basic frame with metal panels fully custom
fabricated or may consist of custom modules using standardized components
where available to meet the dimensional and functional characteristics
shown and specified. Construct the console of steel in accordance with
NEMA ICS 6. Steel sheet in accordance with ASTM A659/A659M. Secure
removable panels in place using captive, spring-loaded, self-locking spring
nuts and hardened sheet metal screws. Use stainless steel screws and
nuts. Secure access panels with spring-loaded, quarter-turn fasteners with
studs held captive in the removable panel. Equip the console with adequate
louvered panels to ventilate the interior and dissipate the heat generated
within the console. Provide special equipment supports and guides as
required to support the equipment and other components within the console.
[Finish the interior and exterior surfaces with one coat of primer and two
coats of the manufacturer's standard baked-on white enamel finish.]
2.11.5.2 Valve and Gauge Panel Construction

Construct valve and gauge panels of stainless steel plate thick enough to provide rigid support for the valves and other components mounted thereon. Terminate all piping with bulkhead type connections in a position convenient for the connection of external lines. [Primer and finish to be the manufacturer's standard coating.]

**************************************************************************
NOTE: For accumulators and other pressure vessels ASME stamps and certification are often necessary.
**************************************************************************

2.11.5.3 Nameplates and Instruction Plates

Provide nameplates for each device on the control console, valve panels, and gauge panels and submit for approval. Nameplates to clearly indicate the function of each device and, in the case of manually operated controls, indicate the condition established for each position of the control. Instruction plates to clearly indicate the proper procedures and sequences of operations to activate the system, to operate the system, and to secure the system after completion of operation. Machine engrave [print] lettering on nameplates on [steel plate] [plastic laminate with white characters on a black background]. Mount instruction plates on a rigid backing and covered with clear, rigid plastic sheeting. Mount instruction plates in a location easily visible to an operator stationed at the console or panel.

2.11.5.4 Security Provisions

Construct and install control consoles to prevent unauthorized or accidental operation of the system. [The main power control switch mounted on the control console to be a key-operated type with provision for removal of the key only when the switch is in the "OFF" position.] [Provide the control console with a hinged cover with a key-operated lock arranged to automatically lock the cover in the closed position.]

2.11.5.5 Weather Protection

Control consoles and valve and gauge panels exposed to the weather or subjected to water or dirt in the atmosphere to be NEMA Type 4 for exterior nonhazardous applications. Enclosures to have hinged and latched covers. Hinges to be the separable type to permit complete removal of the cover for maintenance. Construct hinges and latches of stainless steel.

2.12 SPECIAL TOOLS

**************************************************************************
NOTE: The designer must identify and list all special tool requirements as needed for operation and maintenance of the operating system and any spare equipment requiring periodic cycling. Items to consider may include such items as; filtering carts, portable HPU, diagnostic pressure gauges, cylinder disassembly/tightening tools, spanner wrenches, oil monitoring/analysis or testing
**************************************************************************
Provide all special tools necessary for the proper operation, maintenance, assembly and disassembly of the machinery in a location and in a manner as directed. Special tools include those indicated and the following:

### PART 3 EXECUTION

#### 3.1 EXAMINATION

After visiting the site and becoming thoroughly familiar with all details of the work and working conditions, verify dimensions in the field, and then advise the Contracting Officer of any discrepancies prior to performing any work. The Contractor is specifically responsible for the coordination and proper relation of the contracted work to the structure and work of all trades.

#### 3.2 SHOP FABRICATION

3.2.1 Painting

Shop prime and coat all exposed exterior surfaces of assemblies and equipment except stainless steel, synthetic rubber, and plastic, as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES unless the equipment is given a standard factory finish as specified. Insofar as is practicable, apply the complete coating system to individual components and items before assembly to ensure complete coverage and maximum protection against corrosion. Paint shop assembled equipment prior to any storage or shipment. Do not paint aluminum, stainless steel, non-ferrous surfaces, or machined surfaces requiring field assembly, except as approved. Paint standard manufactured equipment, such as motors, pumps, hydraulic cylinders, valves, in accordance with the manufacturer's standard practice for high humidity service, subject to approval. Repair chips, scratches, and other damage to shop-applied painted surfaces in the field.

#### 3.3 SHOP ASSEMBLY

3.3.1 General - Shop Assembly

Completely assemble all hydraulic cylinders and the hydraulic power unit in the shop. Upon satisfactory completion and verification of the shop assembly and testing, preliminary acceptance will be made by the Government and parts/components may be shipped to site.

3.3.2 Protection During Assembly

During cylinder and HPU assembly securely cover all openings to avoid the entrance of abrasives, dirt, metal chips, and other foreign materials into the hydraulic system through open ends of piping, tubing, and ports of the components.
3.3.3 Cleaning and Protection During Assembly

During assembly, ensure all components are free of abrasives, dirt, metal chips and other foreign materials. Clean components as needed to remove foreign materials. Securely cover openings to prevent recontamination.

3.3.4 Flushing

After completing assembly, flush each cylinder and HPU. Use the same hydraulic fluid for flushing as approved for the final filling. Filter oil using a [10 µm] filter. Perform flushing until the contamination level is [_____] in accordance with ISO 4406.

[Take three 500 milliliter samples at approved locations in accordance with ISO 4021. Perform particle counting on each sample in accordance with ISO 11500 or ISO 4407 by an approved independent test laboratory. Water content of each sample to be below 200 ppm. Reclean if any sample does not comply with the permissible contamination limits, and reinspect. Submit shop oil testing reports.]

3.4 SHOP TESTING

3.4.1 General - Shop Testing

Perform the shop testing listed in the following paragraphs. Provide all personnel, tools, hydraulic fluid as well as temporary piping, hoses, oil reservoirs, wiring, and other appurtenances and accessories as needed to complete testing. The designated Government Witness must be present for the entirety of each test unless previously waived in writing.

3.4.2 Notification of Shop Testing

Provide notification to the Government [45] days prior to the planned start of testing. Include in the notification an identification of what equipment is being tested.

3.4.3 Hydraulic Cylinder Tests

**************************************************************************
NOTE: This paragraph does not apply for cylinders of standard manufacture and design.
**************************************************************************

Perform a shop test on each hydraulic cylinder. [Group the testing of cylinders with a minimum of [5] cylinders being tested as a group.] If at any point there is a cause for rejection or failed test, immediately stop the test, perform any required adjustments or repairs, and repeat the test from the beginning.

The shop test must consist of the following operations and tests:

a. Fill each cylinder with the hydraulic fluid specified in [this SECTION]. Fluid must be filtered through a [10 micron][8 micron] filter. Purge or bleed all air from filled cylinder.

b. Perform a hydrostatic test [per ASME BPVSC code standards] and the following requirements:

1) Perform the test for a minimum of [1][_____] hour[s].
2) Use a test pressure of [_____] kPapsi.

3) Perform the test in each direction.

4) With the rod and piston fully retracted, and the pressure applied to the lower side of the piston, observe the upper end for leakage past the piston.

5) With the telescopic cylinder fully retracted and under pressure, check the cylinder for leakage past the seals.

6) Observe for leakage past the steals. Any leakage past the steals is cause for rejection and a failed test.

c. Perform an operational test by extending and retracting the [cylinder rod and piston] [telescopic cylinder] through its full stroke. Support and orient the cylinder in a manner to avoid any damage to the cylinder or any of its parts. Provide a means of controlling the speed to the maximum allowable speed specified in this SECTION. Any operational problems or leakage to the outside of the cylinder is cause for rejection and a failed test. Perform [one] complete extension-retraction cycles.

d. At the conclusion of a successful test [drain][leave] oil in the cylinder and prepare for shipping in accordance with PARAGRAPH: SHIPPING, HANDLING, DELIVERY, AND STORAGE.

3.4.4 Hydraulic Power Unit Tests

Perform a shop test on the hydraulic power unit. Provide all temporary oil, piping, hoses, oil reservoirs, wiring, and other appurtenances and accessories as needed. During testing the temperature of oil during test not to be more than [21][_____] degrees C [70] [_____] degrees F.

If at any time during any of the testing a deficiency is found or failure occurs, immediately stop the test, correct the issue, and restart that portion of the test from the start.

The shop test must consist of the following operations and tests:

a. Perform a hydrostatic test of all piping on the HPU. [Use the specified hydraulic fluid as the test fluid.] Use a test pressure of [21][_____] MPa [3000] [_____] psi for [30 minutes]. Check all joints for leakage. Any leakage found is cause for rejection and a failed test.

b. Perform a [hydrostatic][pneumatic] test of the storage tank. [Use the specified hydraulic fluid as the test fluid.] Use a test pressure of [21][_____] kPa [3][_____] psi for [30 minutes]. Check all joints and seals for leakage. Any leakage found is cause for rejection and a failed test.

c. Perform a functionality and controls test. During the test:

1) Verify the correct function of each [switch][, indicating light], [and][, outputs/alarms][, and [____]].

2) Verify the correct function of each measurement instrument and
3) Verify the correct function and operation of each valve and valve operator.

4) [___]

c. Perform an operational test of the HPU consisting of the following:

1) Operate each pump individually for [15] minutes at the [specified operating pressure and flow rate] [_____] MPa psi and [_____] L/s gpm. Measure pressure, flow rate, motor voltage, and motor amperage using calibrated instrumentation and data collection equipment. Collect a data at a minimum of [10 samples per second].

2) Operate all pumps simultaneously for [15] minutes at the specified operating pressure. Measure pressure, flow rate, motor voltage, and motor amperage using calibrated instrumentation and data collection equipment. Collect a data at a minimum of [10 samples per second].

3) Test the function of each unloader circuit. Record the pressure at which the unloading valve opens and closes. Record flow rate through the unloading circuit with calibrated instrumentation. Collect a data at a minimum of [10 samples per second].

4) Test the function of each pressure relief valve. Record the pressure at which the pressure relief valve opens and closes. Perform the test 3 times.

5) Operate each pump as lead pump and test the lag functionality of the remaining pumps. Manually jumper, actuate, or otherwise trigger the required devices to initiate lag pumps starting.

3.4.5 Draining of Fluid

Upon successful completion of flushing and testing operation, drain the flushing fluid from the equipment.

3.4.6 Shop Testing Plan and Procedures

Prepare and submit a shop testing plan and procedure prior to the start of testing. Shop testing activities are not allowed until the testing plan is approved. Submit the testing plan a minimum of [45] days prior to the start of testing. Include the following elements, as a minimum, in the testing plan:

a. Address of testing location and contact information for the designated point of contact.

b. A step-by-step, repeatable procedure for each test to be performed, including but not limited the tests detailed above.

c. Diagrams or drawings of test setups showing orientation of equipment during testing and installation of instrumentation.

d. List of instrumentation that will be used to take measurements.
e. Sample data collection sheets, clearly identifying what is to be recorded, to what accuracy, and the planned outcome (such as value range, threshold, or condition).

3.4.7 Shop Testing Report

After completion of each test or group of tests, submit a test report. Include the following elements, as a minimum, in the testing plan:

a. Date(s) testing occurred

b. Identification of which equipment was tested

c. Completed data collection sheets.

d. Provide records of all adjustments and final settings for all hydraulic components in the system. This includes pump flow rates, operating times, relief settings, counterbalance valve adjustments, operating pressures at both the hydraulic power units and cylinder manifolds, flow level adjustments, filter differential switch settings, and other parameters.

d. Post-processed output from any data collection equipment

e. Identification of a successful test. If any test stoppages or failures occurred, identify them and the measures taken to correct the deficiencies.

f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

3.5 SHIPPING, HANDLING, DELIVERY, AND STORAGE

3.5.1 Packaging

Do not prepare the hydraulic power systems for shipment until they have been inspected and accepted for shipment at origin by the Contracting Officer, unless inspection has been waived in writing. Ship each hydraulic power system or subassembly completely assembled as feasible. [Any separate delivery of components must be coordinated by the Contractor and noted in a submittal.] The subassemblies are defined as the following:

a. Hydraulic cylinders. Each hydraulic cylinder subassembly consists of the hydraulic cylinder, [trunnion,] [cardanic ring,] [pillow block bearings,] [bushings,] [cylinder support platform,] [manifold,] and [piping].

b. Hydraulic power units.

c. Piping assemblies.

d. Control consoles.

Provide all subassemblies and spare equipment and parts with adequate protective pads, supports, and blocking, and securely restrained to prevent distortion or damage to the painted surfaces in transit. Any loss or damage during shipment, including damage to the painted surfaces, will be the Contractor's responsibility; replace or repair without any cost to the Government. Pack all accessories and spare parts separately in containers
plainly marked "ACCESSORIES ONLY" or "SPARE PARTS ONLY." Place a packing list, listing the contents of each container, in a moisture-proof envelope and securely fasten to the outside of the container. Standard commercial packaging in accordance with ASTM D3951 will be acceptable except where a different method or standard of packaging is specified.

3.5.2 Shipping, Preservation, and Storage

------------------------------------------------------------------------------------
NOTE: For very long cylinders, deflection of the rod during shipment may cause damage to the rod and/or bore of the cylinder. It is best to avoid the use of internal rod support blocks. One solution to this problem is to extend the rod a short distance, provide a bracket so that the rod cannot be retracted, and then pressurize the underside of the piston so that the rod is in tension. Also, shipping the cylinder filled with oil may help dampen the movement of the rod.
------------------------------------------------------------------------------------

Packing, crating, cradles, and other packing materials necessary to ensure safe shipment are the responsibility of the Contractor and become the property of the Government upon delivery of the equipment. The hydraulic cylinders to be [filled with the specified hydraulic fluid, and to account for expansion and contraction of the oil during shipping and storage by installation of a bladder type accumulator to the rod end bleed port.][drained and purged with nitrogen.] Then securely cap remaining ports with blank flanges to prevent the entrance of foreign matter. [Make provisions with external shipping devices to prevent damage to the cylinder and piston rod resulting from the rod flexing up and down in the cylinder during transport. Submit a proposal for controlling movement of the piston rod for approval.] [Provide internal rod supports to prevent the rod from deflecting and damaging the rod and cylinder bore during handling and shipping.] Adequately protect machined surfaces from corrosion and physical damage. Protect equipment delivered and placed in storage from the weather, humidity, temperature variation, dirt and dust, or other contaminants. [Furnish spare cylinders with a portable pump, hose and connections to stroke the cylinder in and out a short distance during storage to lubricate seals and prevent damage.]

3.5.3 Manufacturer Preparation Before Shipment

3.5.3.1 Flushing Hydraulic Cylinders

Clean, flush, and fill hydraulic cylinders with specified oil, filtered through a [10 µm] filter, taking precautions to exclude all air, before leaving the manufacturing facility. Clean and flush per Paragraph "Cleaning and Flushing." Submit oil for use in the system for approval. Make suitable provisions to allow for expansion and contraction of the hydraulic fluid. Accumulators connected to the cylinder ports are acceptable.

3.5.3.2 Flushing Hydraulic Power Unit

After cleaning and prior to shipment, flush each hydraulic power unit and manifold. Manifolds not to be installed until cleaned and flushed. Fill the hydraulic tank with hydraulic fluid as specified and actuate the oil filtration system with a [10 µm] element in the filter. Circulate the fluid and change filters as become clogged. After flushing of the fluid in
the tank is complete, install a by-pass loop with filter on the pressure and tank lines of the unit and the run pumps alternately until the returning oil meets the requirement for system cleanliness.

[3.6 ON-SITE DEMOLITION]

Remove the existing hydraulic power systems equipment specified and as shown, including but not limited to [operators, HPU with reservoir, and all hydraulic tubing and hoses]. All equipment not specified to be salvaged is the property of the Contractor, removed from the Project site, and disposed of in a legal manner. Materials that cannot be removed daily may be temporarily stored on-site at an approved area. Salvaged materials shall not be sold on the project site.

3.6.1 Existing Equipment Removal Plan and Procedures

Submit an Existing Equipment Removal Plan and Procedures detailing the sequence and procedures for all systems and components to be removed or affected by the removal. Procedure is to include but not be limited to a detailing of:

(1) Items to be removed.
(2) Temporary arrangement or storage of items.
(3) Special containment and disposal procedures.
(4) Protection procedures for open routing.
(5) Spill Prevention Measures.
(6) Lifting Plans

3.6.2 Existing Hydraulic Oil Removal

The Contractor is responsible for the extraction, containment, transportation, and disposal of all the existing hydraulic fluid in the [operators, system routing, HPU components, HPU reservoir] involved with onsite demolition and equipment removal activities. Include the details in the submitted Existing Equipment Removal Plan and Procedures.

[3.7 ON-SITE INSTALLATION]

Install the equipment specified and as shown to complete the hydraulic power systems for operation of the [intake gates][slide gates][control gates][Tainter gates][mitter gates][butterfly valves][hoisting equipment][______]. Install hydraulic components in accordance with the manufacturer's written instructions and under the direction of the erection engineer or manufacturer's representative. Install complete units or assemblies without disassembly. Provide necessary supports for all appurtenances, pumps, motors, and other equipment or components as indicated. Anchor floor-mounted equipment to concrete pads by anchor bolts or expansion anchors as shown. Installation in accordance with Section 05 50 14 STRUCTURAL METAL FABRICATIONS and Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM. Submit an installation plan and procedures.

3.7.1 Erection Engineer

Obtain the services of an experienced erection engineer who is regularly
employed by the hydraulic cylinder/power unit manufacturer to supervise the installation, start-up, adjustment and operation, and testing of the equipment provided. The erection engineer to furnish a signed statement stating that the final installation and start-up of the hydraulic power system has been inspected, witnessed, and complies fully with the manufacturer's warranty requirements. Following completion of the work the erecting engineer to instruct the Contracting Officer in the operation and maintenance of the system. These field instructions to cover all items contained in the bound instructions. Do not conduct instruction until Operation and Maintenance Manuals are approved.

3.7.2 Filling And Bleeding The System

With all hydraulic equipment installed and all cleaning and flushing complete filling of the system may begin. The cleanliness of the oil used to fill the system in accordance with the requirements for system cleanliness. Open the by-pass ball valves at the cylinders. Fill each hydraulic power unit and pump oil into the system through a [10 µm] filter and keep adding oil as long as the level continues to drop. Cease pumping when the oil level no longer drops. Install by-pass piping and repeat the procedure to fill the drain/siphon line. Take care to expel as much air as possible from the piping and cylinders during the initial filling. Utilize piping vents and drains as much as possible to expel air from the system. Each power circuit pipe for the [Tainter valves] [and] [miter gate] to have this procedure performed to fill the respective piping. Actuate cylinders by shifting spool on the four-way valve back and forth and bleeding air from ports provided on cylinders. Continue procedure for all hydraulic power units until all cylinders have been bled. Ball valves in tank lines may be closed during bleeding to prevent introduction of air into tank lines. After all the cylinders for the machinery have been filled and bled of air, fill the hydraulic power unit tanks with oil. The oil level with the [miter gate] open and all [Tainter valves] closed to be above the "low level" shut-off. The system, once filled, to be bled of air, operated, and periodically bled during the first week of operation to remove any air entrained in the system.

3.7.3 Used Hydraulic Oil

Contractor is responsible for the containment, transfer, removal, and disposal of all used hydraulic oil. Used hydraulic oil includes any oil in existing components being removed or refurbished, and any generated used oil from flushing, draining, or bleeding activities as identified in this section. Containment, transfer, removal, and disposal procedures for the used oil must be detailed in the applicable removal and installation procedures.

3.7.4 Power Piping and Hoses

The general arrangement of the hydraulic piping and hoses is as indicated. Any changes to the arrangement necessary to facilitate the installation and proper functioning of the system may be made subject to the approval of the Contracting Officer. Arrange the piping such as to close and open the [miter gates, and to raise and lower the Tainter valves,] when the valve spools are positioned as indicated.

3.7.4.1 Piping Installation

Install the system complete including all necessary valves, fittings, and pipe accessories. All joints to be tight and successfully pass the test as
specified. Submit details of pipe supports and anchors not indicated. Adequately support all lines at intervals not greater than 3 m or 10 feet or as otherwise indicated. Install hangers and supports using machine bolts and masonry anchors caulked in drilled holes in the masonry or by using machine bolts and expansion shields. Power piping must not be used to support other equipment. Other equipment can use the same standoff or hanger mounting point as one to support the piping, but the pipe itself must not provide the support of the equipment's load. Spacers and guides can be used if no load is transferred. Ream and remove burrs from all cut ends of pipe. Remove metal particles from the reaming operations and thoroughly clean ends of pipe before proceeding with the work. Tightly plug all piping at all times except when work is being performed on a pipe. Clean the pipe sleeves, recesses and trenches of all debris and thoroughly wash with a high pressure stream of water before any piping is installed. Drilling, chipping, or grinding of concrete in close proximity of any piping being installed is not permitted. Repeat washing out of the sleeves, recesses and trenches from time to time as necessary. Store valves in a clean, dry place and protect against moisture. Do not install valves in the system prior to 4 months before the system is to be filled with hydraulic oil. Install pipes passing through masonry in pipe sleeves as indicated. Mitering of joints for elbows and notching of straight runs of pipe for tees is not permitted.

3.7.4.2 Piping Vents and Drains

Install plugged vent connections with high pressure globe or needle valves at all high points of piping. Provide plugged drain connections with valves in accessible locations at all low points of piping. Threads on valves and pipe plugs for vents and drains to be SAE Straight Thread with O-ring seals. Provide pipe plugs and other miscellaneous fittings required for the installation of the vents and drains of the same material as the pipe on which they are installed.

3.7.4.3 Mounting Support for Manifolds

Bolt the manifolds to a mounting base in such a manner that they can be removed by unbolting from flanges and mounting base and can be adapted for a left hand or right hand orientation of the cylinder mounted piping. Locate manifold and cylinder piping supports on the hydraulic power units or hydraulic cylinders as indicted and as recommended by the cylinder manufacturer to facilitate both left hand and right hand installations. All bolts and hardware used in the supports to be a minimum of 10 mm 3/8-inch. Provide all items in stainless steel [galvanized steel][painted steel].

3.7.4.4 Power Hose Installation

Install power hose with other power system components as above. Install hose such that it follows its natural lie, without being kinked or twisted. No hose is to be clamped. Hose guides and anti-chafe grommets many be used as long as they do not restrict any local expanding of the hose when pressurized. Hose installation is to adhere to the SAE J1273.

3.7.4.5 Support of Valves with Manual Operators

Valves that operate through a manual operator (such as a handwheel or handlever) connecting to hydraulic tubing must have a hanger or support on each side of the valve within 1 inch of the connection. Such valves include block, ball and needle valves. The hangers or supports must translate the
load from the use of the manual operator away from the connection of the valve and tubing. Valves used with hydraulic piping larger than 2 inches in diameter may not require this additional support if the manual operator can be used without induction detrimental induction of forces into the assembly.

3.7.4.6 Support of Cartridge Components

Components, such as filters, that require the periodic removal and installation of housings and cartridges, must not be supported by hydraulic tubing. The component's manifold or housing must be directly supported so that the forces used to perform the periodic removal and installation of the housing or cartridge element is not translated into its connection with the hydraulic tubing or piping.

3.7.4.7 Identification of Piping, Hoses, and Valves

Identify all pipe, tubing, valves, fittings, as required, and hydraulic power equipment, located within the trenches, machine rooms, and machinery recesses. Use No. 20 gauge brass tags for tagging, with the proper identification symbol stamped into the metal. Use piping symbols as indicated and stamp with 19 mm or 3/4-inch high lettering. Attach tags to piping and valving by means of No. 12 gauge copper wire. Install pipe markers at intervals of no greater than 5 m or 15 feet, except as approved.

a. Provide a numerical identification tag on each valve, coded such that no other valve in a connected hydraulic power system has the same number. Provide each power circuit valve with an additional tag, which indicates the valve's function.

b. Provide manifold-mounted valves with port identification markings on a part of the valve body that remains in view after mounting.

c. Identify all other valves at the port location, on the connecting piping.

d. Identify manifold assemblies with a tag indicating the manifold's function and the identity of the machine operated.

e. Identify all ball, bleed, and globe valves with a "normally closed" or "normally open" legend.

f. Identify all gauge mounts and pressure transducer mounts with numerical tags, as well as any working or instruction tags required for safe operation.

g. Provide a warning tag and an instruction tag, or tags as required, at each return filter assembly to indicate the safe, approved procedures for cartridge replacement and by-pass operation.

3.8 CLEANING AND FLUSHING

*********************************************************************************************
NOTES: The allowable limit of contamination in this paragraph is subject to the specific project design requirements which may necessitate revision or expansion to cover varying standards of acceptance. The amount and sizes of particles which any given component can tolerate is a function of the

SECTION 35 05 40.14 10 Page 68
clearances between moving parts, the frequency and speed of operation, and the materials of construction. Tolerances range from low pressure gear pumps which may give satisfactory performance with dirt levels typically found in new fluid (ISO 4406) to servo control valves which require oil much cleaner (ISO 4406 16/14/11). General guidelines are as follows:

<table>
<thead>
<tr>
<th>SYSTEM TYPE</th>
<th>CODE LEVEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low pressure - manual control</td>
<td>20/18/15 or better</td>
</tr>
<tr>
<td>Low to medium pressure - electrohydraulic controls</td>
<td>19/17/14 or better</td>
</tr>
<tr>
<td>Systems with servo or proportional control valves</td>
<td>17/15/12</td>
</tr>
<tr>
<td>High pressure - servo controlled</td>
<td>16/14/11 or better</td>
</tr>
</tbody>
</table>

Hydraulic fluid power equipment is rated according to maximum pressure. Generally low pressure is 0 to 4.1 MPa (0 to 600 psi), medium pressure to 20.7 MPa (3000 psi), and high pressure to 34.5 MPa (5000 psi).

Results of microscopic automatic particle counter particle count in accordance with ISO 4406 Higher code levels indicate higher particle counts per millimeter.

ISO 4406 is an internationally recognized standard that expresses the level of particulate contamination of a lubricating fluid. This is the preferred standard for particle counting and should be used in testing lubricants. ISO 4406 is a cleanliness rating system that is based on a number of contamination particles in a 1-milliliter (ml) fluid sample. Once the number and size of the particles are determined, the points are plotted on a standardized chart of ISO range numbers to convert the particle counts into an ISO 4406 rating. The ISO 4406 rating provides three range numbers that are separated by a slash, such as 16/14/12. All three values for applicable range numbers can be determined through the use of the ISO 4406 standardized chart based on the actual number of particles counted within the 1-ml sample for each size category. The first number in the ISO 4406 standard represents the number of particles present measuring greater than 4 micron, the second represents particles greater than 6 micron and the third represents those greater than 14 micron. As the range number increases by one value, the number of particles in a sample of oil will double. On the range code, each number is double the range below.

For example, an oil with a code of 19/17/14 should contain twice as many particles in each size category as the code of 17/15/12. For critical
components, particle counting and testing should be repeated to confirm the ISO rating.

Filter manufacturing firms can be the source of information regarding determination of contamination levels and analysis and have available portable kits for more general detection of contamination.

During assembly, securely cover all openings to avoid the entrance of abrasives, dirt, metal chips, and other foreign materials into the hydraulic system through open ends of piping, tubing, and ports of the components. Use the same hydraulic fluid for flushing as approved for final filling. Include a detailed description of the equipment, materials, hydraulic fluid, temperatures, and duration of each phase of the flushing in the procedures. Clean the system of particles so that the contamination level is below [_____] in accordance with ISO 4406. Take three 500 milliliter samples at approved locations in accordance with ISO 4021. Perform particle counting on each sample in accordance with ISO 11500 or ISO 4407 by an approved independent test laboratory. Water content of each sample to be below 200 ppm. Reclean if any sample does not comply with the permissible contamination limits, and reinspect. When flushing is completed, drain the system and then fill with the specified hydraulic fluid introduced through a 10 micron filter.

3.8.1 Flushing Piping

Flush all hydraulic piping before installation of the hydraulic power unit, cylinders, and manifolds. Install by-pass loops of piping in place of cylinders, manifolds and the power units. Circulate hydraulic fluid through each and every pipe unit until returning oil meets the requirement for system cleanliness. Sequence flushing so that all piping is flushed in both directions. The flow capacity of the flushing system to produce a minimum velocity of 4.6 meters per second or 15 feet per second in all piping. Provide means to verify the flow during the flushing operation.

3.8.2 Flushing Manifolds and Hoses

After cleaning and prior to installation, flush each valve manifold, pipe manifold, and hose by circulating hydraulic fluid through all ports until the returning fluid meets the requirement for system cleanliness.

3.9 FIELD TESTS AND INSPECTIONS

NOTE: Each system will have functional and operational testing requirements that are specific to that system and installation. Add/remove paragraphs to address specific areas of the system being tested.

It is recommended that the designer develop pre-functional and functional checklists for the Contractor to perform all testing requirements and have all concerned parties, including the customer, present to witness and sign-off on the completion of the checklists.
3.9.1 General Requirements - Field Testing

The following requirements apply to all testing activities:

a. Notify the Contracting Officer at least 14 calendar days before any field testing is to be conducted.

b. Conduct testing in the presence of the Contracting Officer unless waived in writing.

c. Conduct testing under the direction of the erection engineer or manufacturer's representative.

d. Constantly monitor details of all operations for signs of impending trouble or leakage and make corrections as necessary to prevent damage to the equipment.

e. Immediately correct any deficiency or maladjustment disclosed by the tests and repeat the test until satisfactory results are obtained. No subsequent tests will be permitted until all preceding tests have been completed satisfactorily.

f. No subsequent tests will be permitted until all preceding tests have been completed satisfactorily.

3.9.2 Field Pressure Testing

3.9.2.1 Pressure Testing Requirements

Perform a hydrostatic pressure test for all new installed[, rehabilitated] [and/or disturbed] piping and equipment. Pressure testing may be split up into distinct and separate portions as determined by the Contractor. Perform the pressure testing in accordance with the following requirements:

a. Use the hydraulic fluid specified in this SECTION as the test fluid.

b. Use a test pressure of [1.5 times the rated pressure of the system][____ psi].

c. Perform each test for a minimum of [1 hour] and additional time as needed to verify no leakage.

d. Inspect all joints, seals, packing, valves, and other areas that are possible leak points. Carefully examine welded, flanged, flared, and threaded connections and wipe for leakage, also inspect lines for evidence of deflection caused by inadequate anchorage.

e. The criteria for a successful test is zero leaks, zero drop in pressure, and no deflection of piping or equipment.

f. Take means to protect other portions of the system not being tested from becoming inadvertently pressurized during testing.

3.9.2.2 Field Pressure Testing Plan

Prepare and submit a pressure testing plan a minimum of [45] days prior to the start of testing. The plan must be approved prior to the start of testing. Include the following elements, at a minimum, in the plan:
a. A step-by-step, repeatable procedure for performing the pressure testing. [Address how challenging to reach portions of the equipment will be accessed for inspection during the test. [Address installation details of temporary instruments and measuring devices.]

b. List of equipment and instrumentation to be used during the test.

c. Spill protection, controls and counter measures plan to address plans and response to any leaking oil.

d. Sample data recording sheets.

3.9.2.3 Field Pressure Testing Report

For each pressure test performed, submit a test report. Include the following elements, at a minimum, in the report:

a. Date(s) testing took place

b. Identification of the equipment or systems of equipment tested and covered by the test report.

c. Completed data recording sheets with the results from testing.

d. Short narrative or statement confirming successful completion of the test.

e. If issues were discovered during testing and any testing had to be repeated, provide a narrative describing the issues and the measures taken to correct the issues.

f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

3.9.3 Field Functional Testing

3.9.3.1 HPU Functional Testing Requirements

Perform the following functional tests and inspections for the HPU:

a. Inspect the hydraulic reservoir to ensure that the fluid is at the proper level.

b. Start the hydraulic pumps from all control stations.

c. Pumps:

1) Inspect the pumps for proper operation and discharge pressure.

2) Verify proper operation of the pump controls [including lead-lag functions for all pumps.]

3) Read and record the discharge pressure and flow of [the][each] pump [with the pumps running individually and all possible combinations of multiple pumps running].

4) Monitor and record, using data collection equipment, the motor voltage and amperage during all motor operations.
d. Adjust the pressure relief [valve][valves] to limit the system pressure to the specified value. Record the set pressure and valve adjuster setting.

e. Adjust the unloading [valve][valves] to unload the pumps to the reservoir when the [accumulator has been charged] to the specified pressure or if the control valves are not actuated. Measure and record unloader settings, actuating pressure and flow rate during unloader operation.

[f. Inspect and adjust the accumulator precharge pressure to the specified value.]

3.9.3.2 Control Console Functional Testing Requirements

For [the][each] control console:

a. verify the correct operation of each devices on the control console, including but not limited to: [manual shut-off valves][, manual control valves][, manual flow control valves][, solenoid operated valves][, check valves][, pressure gauges][, and ____].

b. Test all automated control systems and devices.

c. [functional testing sequence specific to the system]

3.9.3.3 Field Functional Testing Plan

Prepare and submit a functional testing plan. Submit plan a minimum of [45 days] prior to the start of testing. Plan must be approved by the Government prior to the start of testing. Include the following elements in the plan at a minimum:

a. A step-by-step, repeatable procedure for performing the functional testing. The procedure must individually address testing of the controls and control consoles and the HPU.

b. List of equipment and instrumentation to be used during the test.

c. Spill protection, controls and counter measures plan to address plans and response to any leaking oil.

d. Sample data recording sheets.

3.9.3.4 Field Functional Testing Report

For each functional test performed, submit a test report. Include the following elements, at a minimum, in the report:

a. Date(s) testing took place

b. Identification of the equipment or systems of equipment tested and covered by the test report.

c. Completed data recording sheets with the results from testing.

d. Short narrative or statement confirming successful completion of the test.
e. If issues were discovered during testing and any testing had to be repeated, provide a narrative describing the issues and the measures taken to correct the issues.

f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

3.9.4 Acceptance Testing

3.9.4.1 General Requirements - Acceptance Testing

Upon completion of all pressure testing and functional testing, perform acceptance testing. Acceptance testing must prove that the complete system, as installed, meets all requirements of the contract. During acceptance testing perform the following:

a. Monitor and record the following during all acceptance testing.
   [Measurements must be recorded using continuous data logging equipment sampling at a minimum of 10 samples per second]:

   1) Hydraulic fluid temperature at HPU discharge[, and ___]
   2) Flow rate [at each cylinder][at HPU discharge][, and ___]
   3) Pressure in supply and return lines [, at HPU discharge][, and ___]
   4) Speed, temperature, voltage, and amperage of each motor
   5) Flow Control Valve Settings
   [5) ____]

b. During each test operation, inspect the hydraulic lines and components for evidence of leakage.

c. Check flow control valves and adjust as required to conform to indicated operating time requirements.

d. Inspect and adjust sequence valves as required to obtain the indicated sequence of operation.

e. Adjust chokes in pilot circuits of pilot-operated valves to obtain smooth, shock-free operation.

f. Adjust relief valves and counterbalance valves to the proper pressures as indicated, unless otherwise directed by the Contracting Officer.

g. [Adjust proportional control valves for the proper flows to achieve desired cylinder operating speeds as directed by the Contracting Officer.]

h. Inspect response of components to operation of applicable controls to confirm that all connections have been made properly.

g. Observe components and for excessive vibration, alignment and operating clearances.

h. Record observations regarding such events as unusual sounds, malfunctions or difficulties encountered, and adjustments required.
3.9.4.2 Field Acceptance Testing Requirements

Perform the following acceptance tests. Operating tests to cover a period of not less than [4] hours, and conduct all tests at such times as the Contracting Officer may direct. After installation and testing of the hydraulic system has been completed, install a complete set of new and unused filter cartridges:

a. After final assembly and installation of the machinery, equipment and piping, and prior to [flooding the lock], operate each assembly of operating machinery individually as nearly as practicable under its normal operating conditions for a minimum of [5] open/close cycles to demonstrate that each assembly is in proper working order and free from defects of materials, workmanship or alignment.

b. Upon satisfactory completion of the individual tests, and before final acceptance of the work, conduct, in the presence of the Contracting Officer, over-all testing through a minimum of [10] additional [locking operations with the lock flooded] operating cycles, to demonstrate that all machinery has been properly installed and that [lock] operation can be effected without interruption.

3.9.4.3 Field Acceptance Testing Plan

Prepare and submit an acceptance testing plan. Submit plan a minimum of [45 days] prior to the start of testing. Plan must be approved by the Government prior to the start of testing. Include the following elements in the plan at a minimum:

a. A step-by-step, repeatable procedure for performing the acceptance testing.

b. List of equipment and instrumentation to be used during the test.

c. Spill protection, controls and counter measures plan to address plans and response to any leaking oil.

d. Sample data recording sheets.

3.9.4.4 Field Acceptance Testing Report

For each functional test performed, submit a test report. Include the following elements, at a minimum, in the report:

a. Date(s) testing took place

b. Identification of the equipment or systems of equipment tested and covered by the test report.

c. Completed data recording sheets with the results from testing.

d. Short narrative or statement confirming successful completion of the test.

e. If issues were discovered during testing and any testing had to be repeated, provide a narrative describing the issues and the measures taken to correct the issues.
f. Current, non-expired calibration certificates for all instrumentation and measurement devices used during testing.

g. A written statement that the hydraulic power system has been field tested and meets all operational requirements.

3.9.5 Final Oil Testing

After all field testing is complete, take three 500 milliliter samples at approved locations in accordance with ISO 4021. Perform particle counting on each sample in accordance with ISO 11500 or ISO 4407 by an approved independent test laboratory. Water content of each sample to be below 200 ppm. Reclean if any sample does not comply with the permissible contamination limits, and reinspect. Submit field oil testing reports.

3.10 CLEAN-UP

Keep the work areas clean during installation of the hydraulic system and appurtenances. Upon completion of the installation of the hydraulic system and appurtenances, remove debris and surplus materials resulting from the work.

3.11 OPERATION AND MAINTENANCE

Submit Operation and Maintenance manuals as data packages in accordance with Section 01 78 23 OPERATION AND MAINTENANCE DATA. Supplemental requirements are as described in this paragraph. Furnish [_____] complete sets of instructions containing the manufacturer's operation and maintenance instructions for each piece of equipment to the Contracting Officer. Permanently bind each set with a hard cover. Furnish one complete set prior to field testing and furnish the remaining sets before the contract is completed. Inscribe the following identification on the covers: "OPERATING AND MAINTENANCE INSTRUCTIONS," title of the project, location of the project, the name of the Contractor, and the contract number. Place a flysheet before instructions covering each subject. The instruction sheets size to be 210 by 297 mm 8 1/2 by 11 inches, with large sheets of drawings folded in. The instructions include, but are not be limited to, the following:

a. A cross-section drawing of the hydraulic cylinder with parts list.

b. Detailed fabrication drawings for all custom fabricated components of the hydraulic cylinders.

c. A system layout drawing showing the piping, valves, and controls.

d. A system hydraulic schematic.

e. Manifold fabrication drawings with dimensions and locations of pre-drilled passages and cavities.

f. Electrical wiring and control diagrams.

g. Operating and maintenance instructions.

h. Manufacturer's bulletins, catalog cuts, and descriptive data.

i. A written control sequence describing startup, operation, and shutdown. Uniquely identify the control sequence and list the
individual components of the hydraulic system. Each component to have a narrative description as to the function, purpose, and limits of adjustment (if any) and method of adjustment for that component.

Provide the Operation and Maintenance (O&M) Manual with all information which may be needed or useful for operation, maintenance, repair, dismantling or assembling, and for identification of parts for ordering replacements. The manual is subject to approval. Provide a recommended spare parts list.

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated July 2020

SECTION 35 05 40.17
SELF-LUBRICATED MATERIALS, FABRICATION, HANDLING, AND ASSEMBLY
08/20

NOTE: This guide specification covers self-lubricated bearing materials for waterway and marine construction. These bearing materials are used for lock and dam applications ranging from critical bearing applications to light duty and electro-galvanic isolating applications. This spec has been developed for USACE Civil Works projects.

In accordance with ER 10-1-53, the USACE Hydroelectric Design Center (HDC) in Portland OR is designated as the Mandatory Center of Expertise (MCX) for hydropower engineering and design. HDC's policy is to use self-lubricating materials in hydroturbine applications. For applications involving turbines, consult HDC (Phone: 503-808-4250).

Sections have also been included on self-lubricated bearings used for product lubricated vertical shaft pumps. Product lubricated pump bearings are used for applications that require minimizing or eliminating the exposure to petroleum lubricants to be in compliance with environmental, biological, or other applicable regulations.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
NOTE: Use this guide specification in conjunction with EM 1110-2-1424 LUBRICANTS AND HYDRAULIC FLUIDS, EM 1110-2-2610 Mechanical and Electrical Design for Lock and Dam Operating Equipment, and EM 1110-2-3105 Mechanical and Electrical Design of Pumping Stations.

Users of this specification should understand that successful performance of self-lubricated materials relies on factors that are not covered under the scope of this specification. These factors include but are not limited to accurate estimation of applied loads, adequate alignment of self-lubricated parts including their housings and running surfaces, and adequate stiffness of housings and running surfaces to match the loading assumptions made.

Designers need to be aware that self-lubricated parts and materials have many differences in properties and behavior from traditional metallic supplied-lubricant bearings. Successful design of self-lubricated bearing systems relies on designers that understand these differences as well as acceptable design practices for self-lubricated materials. Designers unfamiliar with self-lubricated components, at a minimum, should have their designs and assumptions thoroughly checked by qualified individuals familiar with self-lubricated material systems.

It is common for minor design details, such as final tolerances and fits, to be left for the construction contractor to determine (in coordination with the self-lubricated material manufacturer). However, construction contractors typically are not qualified to perform the complete design for self-lubricated bearing systems. As discussed above successful design of self-lubricated bearing systems requires detailed knowledge of both the application and self-lubricated materials. Using construction contractors to perform the design of self-lubricated bearing systems is not recommended.

Designers are responsible to consult self-lubricated material manufacturers to verify that the products being used are appropriate for the application. Self-lubricated material manufacturers should also be consulted to verify the use of other appropriate design details such as bearing wall thicknesses, installation fits, mating materials, surface conditions, running clearance fits, edge chamfers.

Some self-lubricated components are susceptible to damage caused by edge loading. The test procedure outlined in CERL Technical Report 99/104, Greaseless Bushings for Hydropower Applications tests the edge
loading properties of materials with a tapered test sleeve. The slope of the tapered test sleeve is 0.229 degrees (0.004"/1.000"). Actual installations should be held to tighter alignment requirements than this procedure tests for. Define required alignment of self-lubricated components on the contract plans in accordance with an applicable code such as ASME Y14.5 - Dimensioning and Tolerancing.

Consider including self-lubricated material fabricator qualifications and self-lubricated material installation plans as evaluation criteria used to select a contractor.

Include in drawings a complete design indicating the character of the work to be performed and giving the dimensions, quantity, location, assembly details, and installation details of each self-lubricated component, housing, and associated running surface.

Information has been included in this specification for product lubricated pump bearings. This information has been included as many of the materials used to construct these bearings are the same as the materials covered in this specification for other lock and dam applications. This specification assumes the pump manufacturer will be responsible to select the appropriate product lubricated bearings. The information in this specification has been limited to the list of parameters that need to be specified to allow the pump manufacturer to select appropriate bearings. Product lubricated information in this specification should be copied to the applicable pump specification for use.

**************************************************************************
1.1 SUMMARY

This section specifies fabrication, handling, cleaning, and installation requirements for self-lubricated materials and their mating running surfaces.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature
References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

**ASTM INTERNATIONAL (ASTM)**

ASTM D149 (2020) Dielectric Breakdown Voltage and Dielectric Strength of Solid Electrical Insulating Materials at Commercial Power Frequencies

**U.S. ARMY CORPS OF ENGINEERS (USACE)**

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only]. [When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] [Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING.] Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals
   Assembly and Installation Plan; G

SD-02 Shop Drawings
   Shop Drawings; G
   [Field Installation Drawings]; G

SECTION 35 05 40.17  Page 5
1.4 MANUFACTURER'S QUALIFICATIONS

***********************************************************************
NOTE: This requirement doesn't add much value if only FCB materials are being specified because products are limited to a prequalified list. If only FCB materials are being specified removing this section is recommended.
***********************************************************************

Self-lubricated material manufacturer must have a minimum of 5 years experience in manufacturing self-lubricated materials. Submit a Manufacturer's Experience Record which details the number of years the manufacturer has been fabricating self-lubricated materials and a description of at least [five][three][one][_____] previous, separate, similar installations within the last 5 years.

]1.5 HANDLING

Handle self-lubricated components in a manner that does not damage or deform the self-lubricated material. Handle components that are the mating running surfaces of self-lubricated materials in a manner that does not damage or scratch the surface finish of the running surfaces. Do not allow self-lubricated components or their mating running surfaces to come into contact with chains, shackles, hooks, wire ropes, or other rigging that can damage them. Perform lifting, maneuvering, and securing of self-lubricated components and their mating running surfaces with fabric straps or other non-marring rigging. Replace self-lubricated components and components that are the mating running surfaces of self-lubricated components, at no cost to the Government, if they are scratched, nicked, chipped, marred, or otherwise damaged prior to the Government taking possession of the component.
1.6 SHIPPING AND TRANSPORT

Package self-lubricated components and components that are the mating running surfaces of self-lubricated components in a manner that protects them from damage during shipping and transport. Package self-lubricated components in crates or protective boxes with adequate padding prior to shipping or transport. If self-lubricated components are installed in a larger assembly that does not fit within a crate secure protective coverings over the self-lubricated components prior to shipping and transport.

1.7 SHOP DRAWINGS

Prepare and submit Shop Drawings for the self-lubricated components covered under this specification. Within the shop drawings show the complete fabrication dimensions and tolerances, installed dimensions and tolerances, component details, and material types of the self-lubricated components [and seals]. If the contract drawings only show a fit class or require the self-lubricated material manufacturer to determine the fit then detail the specific dimensions and tolerances of the fit in the shop drawings and indicate they are for Government approval. Show the same unit system on the shop drawings that was used in the contract drawings.

1.8 FIELD INSTALLATION DRAWINGS

**************************************************************************
NOTE: Removing this section if field installation drawings covering the self-lubricated components are required in a different specification section.
**************************************************************************

Prepare and submit Field Installation Drawings for the self-lubricated components covered under this specification. In the field installation drawings show the self-lubricated components in their installed configuration and show the post installation dimensions, tolerances, and alignment requirements.

1.9 WARRANTY

**************************************************************************
NOTE: Consider adding minimum warranty claim response times based on the criticality of the system. For example, failures resulting in delays to navigation or the inoperability of systems integral to flood protection equipment should require faster response times. Also consider basing the warranty period on how much time it will take for a system to operate to an extent where you're confident the bearing is working properly.
**************************************************************************

Guarantee self-lubricated components for a period of [2] years from the date of acceptance. Guarantee replacement parts for [2] years from date of replacement. Provide warranty against defective materials, design, and workmanship. In cases where the equipment manufacturer's advertised minimum guarantee is in excess of 2 years, it remains in force for its full period. Upon receipt of notice from the Government of failure of a self-lubricated components during the warranty period, provide new replacement self-lubricated components [promptly][within 4 weeks][_____] at
no additional cost to the Government. Submit the Self-Lubricated Material Manufacturer's Warranty.

[1.10 SELF-LUBRICATED COMPONENTS]

**************************************************************************
NOTE: This section can be used to identify the self-lubricated materials the Contractor must provide under this contract. Failure Critical Bearings (FCB) should be clearly identified especially where a mix of FCB and non-FCB applications are present. If self-lubricated materials are called out both in the specifications and contract drawings make sure to use verbatim language for the component names in each document.
**************************************************************************

Self-lubricated components covered under this specification are listed below or shown on the contract drawings. In addition, self-lubricated components that the Government has designated as a Failure Critical Bearing (FCB) are listed below or shown on the contract drawings. FCB requirements are outlined in sections below. Self-lubricated components that are not designated as FCB must meet the general self-lubricated material requirements detailed in section 2.1 below. Provide the following self-lubricated components:

<table>
<thead>
<tr>
<th>TABLE 1:</th>

<td>[_____]</td>
</tr>
</tbody>
</table>

PART 2 PRODUCTS

2.1 GENERAL SELF-LUBRICATED MATERIAL REQUIREMENTS

**************************************************************************
NOTE: The operating temperature range requirement is based on what would likely be seen in a typical lock and dam application. This range is commonly achievable for self-lubricated materials.

A self-lubricated material's water absorption and thermal expansion behavior should be accounted for by following the material manufacturer's recommendations on interference and clearance fits. Use the water absorption requirement if there's a special need for your application to limit the expansion behavior of a material. If the manufacturers recommendations are being followed for fits the water absorption language can be removed.
Dielectric strength is an important property of self-lubricated materials as galvanic corrosion can jeopardize the performance of the bearing. Supplied lubricant metallic bearings rely on the lubricant to prevent galvanic corrosion. Designers should consider the sensitivity of their application to galvanic corrosion and use the dielectric strength requirement below if prevention of galvanic corrosion is needed (a dielectric strength of 50V/mm should prevent galvanic corrosion for civil works applications). Remove the dielectric strength requirement if the self-lubricated material will have bronze surfaces in contact with the mating running surface of the bearing (such as a plugged bronze self-lubricated material).

Graphite is an electrically conductive material and can cause severe galvanic corrosion with other electrically conductive materials such as metals used for bearing running surfaces. However, if a self-lubricated material containing graphite meets the minimum dielectric strength requirement then it should prevent galvanic corrosion in a typical marine environment.

The requirement for self-lubrication to be continuous and without measurable gaps for the full self-lubricated surface in contact with the mating running surface may be needed for applications that regularly only have small ranges of movement. For these applications plugged bronze or other types of materials that don't meet this requirement may not be the best choice for successful performance. If the range of movement is large enough this requirement may not be relevant and can be removed.

**************************************************************************

Submit Self-Lubricated Material Product Data showing the material[s] selected for use are in compliance with the requirements of this specification. Self-lubricated materials must:

a. Be approved by the material manufacturer for use in [submerged and marine environments][environments exposed to all weather conditions][____].

b. Have an operating temperature range of [-34] [____] to [93] [____] degrees C [-30] [____] to [200] [____] degrees F.

c. Be approved by the material manufacturer for a dynamic bearing pressure of 69 MPa at least 10,000 psi.

[ d. Have a water absorption of less than [0.1][0.2][0.3] percent increase in weight for long term immersion as tested in accordance with ASTM D570.]

[ e. Have a minimum dielectric strength of 50V/mm, as tested in accordance with ASTM D149, for surfaces of the self-lubricated materials that come into contact with bearing running surfaces.]

SECTION 35 05 40.17  Page 9
2.1.1 Fabric or Fiber Reinforced Polymer Self-Lubricated Materials

In addition to the general self-lubricated material requirements in section 2.1 above fabric or fiber reinforced polymer self-lubricated materials must:

a. Be fabricated with isophthalic polyester, orthophthalic polyester, vinyl ester, or epoxy resin.

b. Have polyester reinforcement, or a combination of polyester and polytetrafluoroethylene (PTFE) sheet fabric or fiber strand.

c. Have a minimum compressive yield strength of \(103 \text{ MPa} = 15,000 \text{ psi}\) as tested in accordance with ASTM D695 with the load applied perpendicular to the fabric/fiber layers.

d. Have a minimum in-plane shear strength of \(69 \text{ MPa} = 10,000 \text{ psi}\) as tested in accordance with ASTM D3846.

2.1.2 Polymer Coating Self-Lubricated Materials

**************************************************************************
NOTE: Coating thickness and backer material selection vary with each application. Consult self-lubricated material manufacturers for appropriate selections for your application.
**************************************************************************

In addition to the general self-lubricated material requirements in section 2.1 above polymer coated self-lubricated materials must:

a. Have a minimum of \([0.38][0.51][0.64] \text{ mm} = [0.015][0.020][0.025] \text{ inches}\) self-lubricated coating thickness after final machining.

b. Have a minimum compressive strength at failure of \(241 \text{ MPa} = 20,000 \text{ psi}\) as tested by the material manufacturer.

c. Have a coating backer material fabricated from [copper nickel alloy in accordance with ASTM B929, UNS C72900][copper alloy in accordance with ASTM B584][stainless steel in accordance with ASTM A564/A564M, UNS S17400, Type 630, Condition [H1025] [H1075] [H1100]][glass fiber reinforced composite].

d. Have an mechanical bond strength developed between the self-lubricated coating and backer material as the primary method of securing the self-lubricated coating. Mechanical fasteners, keys, or other keepers are not acceptable to retain the self-lubricated coating or transfer load between the coating and backer.

2.1.3 Extruded Homogeneous Polymer Self-Lubricated Materials

In addition to the general self-lubricated material requirements in section 2.1 above extruded homogeneous self-lubricated materials must:

b. Have a minimum compressive yield strength of \(138 \text{ MPa} = 20,000 \text{ psi}\) as
tested in accordance with ASTM D695.

2.1.4 Plugged Bronze Self-Lubricated Materials

**************************************************************************

NOTE: Plugged bronze self-lubricated materials can result in galvanic corrosion in a marine or submerged environment when used against a dissimilar metal such as a stainless steel. Make sure that galvanic corrosion behavior is considered in the design if using a plugged bronze material.

The self-lubricated plugs used in plugged bronze materials are intermittently spaced and may not be ideal for applications with small ranges of movement. Discuss the required plug spacing with self-lubricated material manufacturers and require a plug spacing that accommodates the minimum range of movement for your application.

Optional requirements in section 2.1e (dielectric strength requirement) and 2.1f (requirement for self-lubricated material to be continuous and without measurable gaps for the full self-lubricated material surface) exclude the use of plugged bronze materials. Remove these sections if using a plugged bronze material.

The specific alloy selected for the base material will depend on a variety of factors, such as corrosion resistance, wear, velocity, hardness requirements, machineability. Consult with manufacturers to determine the specific recommended alloys for your application.

**************************************************************************

In addition to the general self-lubricated material requirements in section 2.1 above plugged bronze self-lubricated materials must:

a. Have a base material fabricated from [a copper alloy in accordance with ASTM B584] [an aluminum bronze in accordance with ASTM A148/A148M] [______].

b. Have self-lubricating plug recesses machined perpendicular to the bearing surface extending at least 0.25 inches deep.

c. Have a self-lubricating plug material appropriate for the application that provides the primary lubrication for the bearing.

d. Utilize a self-lubricating plug material that does not cause galvanic corrosion with the mating running surface material.

e. Have self-lubricating plugs arranged in a uniform overlapping pattern spaced no greater than 69 MPa [10° 15° 20° deg] [0.5° 0.75° 1.0° inches] apart in the direction of bearing movement and extending no further than 0.25 inches from the edge of the bearing surface.

f. Have a minimum compressive yield strength of 103 MPa 20,000 psi, as rated by the self-lubricated material manufacturer.
2.2 FAILURE CRITICAL BEARINGS (FCB)

**************************************************************************
NOTE: This section designates additional performance, testing, and QC requirements for critical bearings. These requirements come with additional cost and should be used for applications where the critical nature of the application justifies the additional cost. Remove this section if it does not apply.

Definition of a failure critical bearing can be tailored as necessary for a specific project.
**************************************************************************

Failure critical bearings are bearing or bushing applications where failure could potentially result in damage to critical systems or, applications where repair or replacement of a failed bearing or bushing would result in a loss of service or operation of a critical system. The designation FCB means failure critical bearing. FCB's are determined by the Government and are identified on the Contract drawings or in the Contract specifications.

2.2.1 FCB Material Qualifications

**************************************************************************
NOTE: CERL TR 99/104 is available through the Defense Technical Information Center (dtic.mil).
**************************************************************************

The following is required for a material to be considered acceptable for FCB applications:

a. The material must have been tested by the procedure defined in CERL TR 99/104.

b. The material must receive a performance score of 350 or above for both wet and dry testing as evaluated by the USACE Hydro Electric Design Center (HDC) in Portland, Oregon, using the bearing rating system in CERL TR 99/104 Appendix F.

c. The material manufacturer must sign a release agreement allowing public distribution of the material's test results.

2.2.2 Approved FCB Materials

**************************************************************************
NOTE: For an updated list of material performance scores contact the USACE Hydroelectric Design Center (HDC) (Phone: 503-808-4250).
**************************************************************************

The following list of materials meet FCB requirements:
TABLE 2:

Submit FCB Material Certifications from the material manufacturer stating that the chemical formulations, manufacturing processes and overall structure of the materials supplied are identical to those of the bearings that meet the approved FCB materials above.

### 2.3 VERIFICATION OF FABRICATION DETAILS

**NOTE:** The surface finish and hardness of the mating component of a self-lubricated material has a large effect on the successful operation of that self-lubricated material. Running surfaces typically need to be fabricated with a Rockwell hardness number between 30 and 40 on the Rockwell C scale (HRC 30 - HRC 40) in accordance with ASTM E18. Self-lubricated materials in applications with infrequent service typically require no rougher than a 0.8 µm 32 micro-inches surface finish. Surface finishes, typically no rougher than 0.4 µm 16 micro-inches are required for application that have frequent service. These requirements can often be
overlooked by contractors and sub-contractors that are not familiar with self-lubricated materials.

Verify that the fabrication and installation details shown meet the self-lubricated material manufacturer's recommendations. Specifically, verify that:

a. Surface finish and hardness requirements shown for self-lubricated material mating running surfaces are in compliance with the self-lubricated material manufacturer's recommendations.

b. Self-lubricated material clearance fits, interference fits, and tolerances shown comply with the self-lubricated material manufacturer's recommendations.

If these fabrication and installation details are outside of the self-lubricated material manufacturer's recommendations [notify the Government by submitting a Request for Information] [notify the Government by submitting a variance request on the shop drawings] [notify the Contracting Officer Representative].

2.4 Seals

NOTE: The use of physical seals for self-lubricated bushings/bearings is an important consideration for designers. Designers should remember that for a traditional greased bronze bearing the grease is not only lubricating but is also helping to seal the bearing. Self-lubricated materials provide their own lubrication but do not provide their own seal.

Adding a physical seal can help keep debris and contaminants out of the bearing which keeps friction low and minimizes the potential for abrasive wear.

In general, it's recommended that physical seals are used for critical bearings. However, other factors that should be considered when making this decision include the potential for debris or contaminants to enter the bushing/bearing, the bushing/bearing's natural tendency to evacuate debris or contaminants, and the abrasion resistance characteristics of the chosen material construction(s).

There are many acceptable materials and configurations that can be used for physical seals. The material choices presented here have been used in self-lubricated material bushing/bearing designs and are provided here as sample seal materials for consideration. Tailor this spec section to the types of seals selected for the design.

Elastomeric o-rings are commonly used for static joint seals. These are designed to be compressed with the assembly of the joint to provide positive contact to exclude debris, and other contaminants. Low friction polymer lip seals are commonly used for
dynamic joint seals. PTFE is a very common selection because of its low friction, ability to run without grease or oil, and chemically resistive properties. A bent metal spring or compressed o-ring is typically used to energize the lip seal (provide positive contact) when the joint is assembled. These types of seals are typically readily available from seal manufacturers as they are commonly used on mechanical shafts and cylinders.

Submit Seal Product Data showing the seals selected for use are in compliance with the requirements of this specification.

2.4.1 Static Seals

Static seals must be synthetic ethylene propylene elastomeric o-rings meeting the following material requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Durometer Hardness (Shore Type A)</td>

<td>150 percent minimum</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>200 percent Modulus</td>
<td>6 MPa 900 psi (minimum)</td>
<td>ASTM D412</td>
</tr>
</tbody>
</table>

2.4.2 Dynamic Seals

Dynamic seals must:

a. Be lip seals or face seals designed to exclude [rainwater][silt][heavy splash and mist][debris and contaminants] from the self-lubricated bearing.

b. Be suitable for use in a [submerged][high splash][outdoor]environment.

c. Be energized with springs fabricated from stainless steel or elastomeric o-rings to provide positive contact between the components being sealed.

d. Be molded or extruded from a polytetrafluoroethylene (PTFE) resin with appropriate fillers to achieve the performance requirements appropriate for the self-lubricated material seal application.

e. Be suitable for running without external lubrication.

[2.5 PRODUCT LUBRICATED PUMP BEARINGS

**************************************************************************

NOTE: If used, this section should be copied into an applicable pump specification. If pump bearings are not being used remove this section.
Submerged pump bearing must be [product lubricated][externally supplied water lubricated] and meet the following requirements:

a. Fabricated from an elastomeric material or polymer composite material and not require petroleum lubricants for operation.

b. Operate in [brackish][fresh] water that may contain [sand] [silt] [vegetative trash].

c. Does not require service or replacement for [50,000] [_____] operating hours.

PART 3 EXECUTION

3.1 FABRICATION

Fabricate self-lubricated components and their mating running surfaces to the materials, dimensions, tolerances, and qualities shown. Fabricate self-lubricated components in accordance with the self-lubricated material manufacturer's recommendations.

3.2 TEST FITTING

Test the fit of self-lubricated components with their mating surfaces [in the presence of the Contracting Officer Representative] prior to transporting components on site.

3.3 INTERFERENCE FITTING OF SELF-LUBRICATED MATERIALS

3.3.1 Preparation of Interference Fit Surfaces

Prior to interference fitting:

a. Remove coatings such as paint, galvanizing, and anodizing from the interference fit surfaces of the bushing/bearing housing.

b. Clean the interference fit surfaces of the bushing/bearing and housing of oil, grease, cutting fluids, or other substances.

c. Prepare the interference fit surfaces of the bushing/bearing in accordance with the self-lubricated material manufacturer's recommendations.

3.3.2 Press-Fitting

Press fit self-lubricated components in accordance with the material manufacturer's recommendations. Do not use hammer blows or other impact type loading to press fit self-lubricated components. Use a method to press fit self-lubricated components that provides a smooth and constant force such as a hydraulic or other style of press. Protect components from damage during the press fitting process.

3.3.3 Shrink-Fitting

Perform shrink fitting by lowering the temperature of the inner component to a point where the outside diameter shrinks adequately to avoid
interference with the outside part. Use a method to lower the temperature of self-lubricated materials that is approved by the self-lubricated material manufacturer and submitted with the Assembly and Installation Plan. Ensure shrink-fit components are fully seated and prevented from moving prior to allowing the parts to return to ambient temperature.

3.4 MECHANICAL FASTENING OF SELF-LUBRICATED COMPONENTS

Install self-lubricated components in accordance with the approved Assembly and Installation Plan. Use [300 series stainless steel fasteners] to install self-lubricated components unless otherwise noted. Install fasteners [with a thread locker and] to a torque value that does not damage or distort the self-lubricated materials. Determine the self-lubricated material manufacturer's maximum allowable amount of wear for the self-lubricated component. Install fasteners so that no part of the fastener extends beyond the fully worn running surface of the self-lubricated material.

3.5 BONDING INSTALLATION

**************************************************************************
NOTE: Installation of self-lubricated materials using bonding adhesives have had mixed results for previous installations. In general, bonded installations are much more challenging to perform successfully. Previous challenges have included difficulties with working with bonding adhesives, maintaining component alignment during bonding, and performing accelerated temperature curing of bonding adhesives without post-curing the self-lubricated materials. Overall, bonding installations require a high level of skill and craftsmanship to perform successfully and these qualifications are extremely difficult to specify in a contract. In addition, there's typically no advantage to a bonded installation over interference fitting or mechanical fastening. Therefore, bonded installations are not recommended.
**************************************************************************

Installing self-lubricated materials with a bonding adhesive is not permitted.

3.6 INSTALLATION PLAN

Submit an Assembly and Installation Plan showing the proposed method to assemble and install the self-lubricated components. Include pre-assembly fabrication dimensions, a description of the [interference fitting procedure][mechanical fastening procedure including installation torques], post-assembly dimensions, installation procedure,[seal installation procedure including any methods to temporarily support the seals during assembly,] method to measure and confirm the alignment requirements. Government approval of the plan does not relieve the requirement to provide a successful installation.
3.7 VERIFYING DIMENSIONS AFTER INSTALLATION

**************************************************************************
NOTE: The inner and outer diameter of self-lubricated bushings can change significantly after interference fitting. Consult the self-lubricated material manufacturer for pre-interference fit dimensions to achieve the desired post-interference fit dimensions. Manufacturer's can typically accurately predict the pre-interference fit dimensions required. However, sometimes post-interference fit machining is required to meet final dimensions.

Some self-lubricated materials are fabricated with a layer of premium grade material applied only at the running surface of the part. This is a common practice and can be used to significantly reduce material costs. If this practice is used an adequate thickness of premium grade material needs to be provided to allow post-interference fit machining.

**************************************************************************

After [shop assembly] [field installation], measure self-lubricated components to verify contract required dimensions and alignment requirements are met. If assembly dimensions are not met, machine or hone the self-lubricated materials to achieve the required dimensions. Perform machining and honing of self-lubricated components in accordance with the self-lubricated material manufacturer's recommendations. Some self-lubricated materials are fabricated with a layer of premium grade material applied only at the running surface of the part. Provide enough premium grade material at running surfaces to allow for post-assembly machining. After completing the installation photograph the [bearing/bushing][self-lubricated component] showing the installed condition. Submit a Post-Assembly QC Report detailing the measured dimensions and alignment tolerances after assembly and showing compliance with the approved Assembly and Installation Plan. [Include color photographs of the [bearing/bushing][self-lubricated component] showing the installed condition.]

3.8 ASSEMBLY OF MATING COMPONENTS

3.8.1 Cleaning

Prior to final installation, clean self-lubricated materials and their running surfaces of oil, dirt, and debris using a method recommended by the self-lubricated material manufacturer.

3.8.2 Seal Installation

**************************************************************************
NOTE: Delete this section if physical seals are not used.
**************************************************************************

Install seals in accordance with the approved Assembly and Installation Plan. [Temporary support of seals for assembly/installation may be performed with cyanoacrylate adhesive applied in small amounts at several
locations equally spaced around seal grooves.]

3.8.3 Final Installation

Do not force components together in a manner that causes binding of the running surfaces of the components. Do not use lubricants to assemble self-lubricated components unless otherwise specified.

3.9 ACCEPTANCE TESTING

**************************************************************************
NOTE: Remove if acceptance testing is covered under a different spec section. Tailor the acceptance testing to your specific application. It's recommended that the designer develop a checklists for all testing or verifications need to ensure the bearing system is functioning correctly. It's also recommended that acceptance testing is witnessed and signed off by all concerned parties such as the customer or stakeholders.
**************************************************************************

[Notify the Contracting Officer in writing at least [14] calendar days before performing acceptance testing. Perform acceptance testing in the presence of the Contracting Officer unless waived in writing.] Create an acceptance test report form to document the procedure to perform the test operation and monitoring required in this section. Verify the following requirements have been completed prior to starting acceptance testing:

[ a. Self-lubricated component installation is complete and components of the bearing system have been fully assembled.]

[ b. The self-lubricated component installed dimensions, tolerance, and alignments have been measured and found to comply with the installation requirements shown.]

[ c. The Post-Assembly QC Report has been finalized and approved by the Government.]

[ d. Fasteners and have been installed and torqued to their final values.]

3.9.1 Test Operation and Monitoring

**************************************************************************
NOTE: Use this section to describe the cycling that needs to be performed for the bearing system. Some general examples are provided but this section needs to be tailored to your specific application.
**************************************************************************

[In the presence of the Contracting Officer Representative] [operate the bearing system] through [5] [10] [_____] rotation cycles] [operate the bearing system] for [1 hour] [2 hours] [_____] [Perform test operation at [_____] load and [_____] speed]. During test operation monitor the bearing system for:

[ a. Evidence of bending, warping, permanent deformation, cracking, or malfunction of components.]
b. Abnormal noise, stick-slip movements, vibration, or overheating of the self-lubricated components.

c. Evidence of bearing movement or deformation.

Stop test operation immediately if any of these deficiencies are observed. Investigate and correct deficiencies prior to proceeding with test operations. After completing test operation the [Contracting Officer Representative] will examine the [bearing system] and, if found to comply with the contract requirements, it will be accepted [by signature by all parties]. [Signatures and acceptance will not occur until deficiencies have been corrected.]

3.9.2 Test Report

Upon successful completion [and signoff] of the acceptance tests submit an [Acceptance Test Report] documenting the test operations performed, the monitoring checks performed, deficiencies discovered and their resolution, [and showing final signoff by all parties].

3.10 OPERATION AND MAINTENANCE MANUALS

[In addition to the requirements of Section 01 78 00 CLOSEOUT SUBMITTALS,]
[Provide][five][three][_____] [printed and bound][PDF format] [legible] copies of the following information in the [Operation and Maintenance Manuals]. All information must be the most current and approved copy, reflecting any changes made during the construction process:

a. Shop Drawings.

b. Field Installation Drawings.

d. Seal Product Data.

e. Self-Lubricated Material Manufacturer's Warranty.

f. FCB Material Certifications.

g. Post-Assembly QC Report

h. Acceptance Test Report

i. Photographs showing the installed self-lubricated components

j. Guidance for when self-lubricated components need to be replaced

3.11 TRAINING

Provide field training conducted by the [self-lubricated material manufacturer] [erecting engineer] for operating staff after each system is functionally complete but prior to final acceptance. The training must be given for a period of not less than [four][_____] hours. Cover [operation], [inspection], and [maintenance] of [the self-lubricated bearing systems] include the items contained in the operation and maintenance manuals. Do not perform training until operation and
maintenance manuals have been approved. Provide [four weeks] [_____] advance notice of the scheduled training. [Record video and audio of training conducted and provide two CD-ROM copies of the training. Provide MPEG-2 or MPEG-1 format to be compatible with common DVD players in the United States.]

NOTE: This guide specification covers the requirements for fabricating, assembling, delivering, and installing stoplogs. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 LUMP SUM PRICES

NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.

1.1.1 Stoplogs Payment

Payment shall constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for
installing the stoplogs as specified.

1.1.2 Unit of Measure

Unit of measure: lump sum.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A320/A320M (2017b) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

MPa Minimum Tensile Strength (Metric)

ASTM A490M (2014a) Standard Specification for High-Strength Steel Bolts, Classes 10.9 and 10.9.3, for Structural Steel Joints (Metric)

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval.[information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Detail Drawings; G[, [_____]]

SD-03 Product Data
Sequencing and Scheduling; G[, [_____]]

SECTION 35 20 14  Page 4
1.4 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.5 DELIVERY, STORAGE, AND HANDLING

Delivery, handling and storage of materials and fabricated items shall conform to the requirements specified [herein and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Rubber seals shall be kept free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.5.2 Identification System

Submit an Identification System which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract.

1.6 SEQUENCING AND SCHEDULING

**************************************************************************
NOTE: The name of the appropriate railroad company or roadway agency should be inserted as indicated.
**************************************************************************

Before the work is commenced, submit the approved sequencing and scheduling plan which illustrates that work affecting [railroads] [roadways] has been coordinated with [____]. The plan shall include schedules, lists of labor or materials to be provided to the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities. The plan shall clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed.
PART 2   PRODUCTS

2.1 MATERIALS

Materials orders, materials lists and materials shipping bills shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel[, structural aluminum,] and other metal materials sections and standard articles shall be as shown and as specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to [ASTM A36/A36M][ASTM A242/A242M][ASTM A529/A529M][ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M].

2.1.1.2 Structural Aluminum

Structural aluminum shall conform to [ASTM B221M ASTM B221,] [ASTM B308/B308M,] [Alloy 6061, Temper T6].

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION and ZINC FILLER.
**************************************************************************

2.1.2.1 General Requirements

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa, 2,500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa, 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness</td>
<td>60 to 70</td>
<td>ASTM D2240</td>

<tr>
<td>(Shore Type A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
</tbody>
</table>
The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees plus/minus 2 degrees C for 22 plus/minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as W1 (W1 is defined in ASTM D471). The immersion temperature shall be 70 degrees plus/minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.2.2 [Fabrication]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be 0.762 [1.524] mm 0.030 [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform to the requirements specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

[High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325,] Type [____], [hot-dip galvanized] or [ASTM A490M ASTM A490,] Type [____].] [Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [____]] [Austenitic Steel, Grade [____], Class [____]]]. Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated.
2.2.3  [Clips and Clip Bolts for [Aluminum] [Steel] Panels

Clips and clip bolts for [aluminum] [steel] panels shall be approved standard manufactured stock items.]

2.3  FABRICATION

2.3.1  Detail Drawings

Detail drawings of stoplogs and appurtenant shop fabricated items, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.1.1  Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.3.1.2  Shop Assembly Drawings

Show on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3  Delivery Drawings

Show on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.3.1.4  Field Installation Drawings

Show on the field installation drawings a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; and methods for installing appurtenant items.

2.3.2  Structural Fabrication

Structural fabrication shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.3  Welding

Submit schedules of welding procedures for structural steel [and welding processes for aluminum]. Welding shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4  Bolted Connections

Bolted connections shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5  Machine Work

Machine work shall conform to the requirements specified in Section 05 50 14
2.3.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Zinc coating of hardware items shall conform to ASTM A153/A153M.]

2.3.7 Fabrications

2.3.7.1 Stoplogs [and Posts]

**************************************************************************

NOTE: Stoplogs and posts shall be fabricated of structural steel or aluminum. Where aluminum is specified, include the requirements for aluminum stoplogs and posts to be furnished by the Contractor, or aluminum materials and extrusion dies for fabricating stoplogs and posts to be furnished by the Government to the Contractor for fabricating aluminum stoplogs and posts if such is the practice in the Command.

**************************************************************************

[Stoplogs [and posts] shall be fabricated of [structural steel conforming to [ASTM A36/A36M] [ASTM A242/A242M] [ASTM A529/A529M] [ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M]] [extruded aluminum conforming to [ASTM B221M ASTM B221,] [ASTM B308/B308M,] [Alloy 6061, Temper T6].] [Steel items shall be galvanized where indicated.][Stoplogs [and posts] shall be fabricated with the aluminum materials and extrusion dies provided to the Contractor by the Contracting Officer. Furnish all other materials and equipment as required for fabrication.]

2.3.7.2 Stoplog Guides [and Post Pockets]

Stoplog guides [and post pockets] shall be fabricated of structural steel conforming to [ASTM A36/A36M] [ASTM A242/A242M] [ASTM A529/A529M] [ASTM A572/A572M, Grade [42,] [50,] [60,] [or] [65]] [ASTM A588/A588M].

2.3.7.3 Miscellaneous Embedded Metals

Corner protection angles, frames, base plates, and other embedded metal items required for complete installation shall conform to the details shown.

2.3.8 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The Vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine-finished after splicing.
2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Submit certified test reports for material tests, with all materials delivered to the site.

2.4.2 Testing of Rubber Seals

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM²</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.762 mm 0.030 inch</td>
<td>13.6 kg per 25 mm³0.030 pounds per inch width</td>
<td>13.6 kg per 25 mm³0.030 pounds per inch width</td>
</tr>
<tr>
<td>1.524 mm 0.060 inch</td>
<td>13.6 kg per 25 mm³0.030 pounds per inch width</td>
<td>13.6 kg per 25 mm³0.030 pounds per inch width</td>
</tr>
</tbody>
</table>

Failure of any specimen to meet the requirements of the test used will be cause for rejection of the piece from which the test specimen was taken.

PART 3 EXECUTION

3.1 INSTALLATION

Installation shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.1.1 Embedded Metals

Corner protection angles, frames, base plates, and other embedded metal items required for complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour.

3.1.2 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate[s], a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.
3.1.3  Painting

Exposed parts of stoplogs and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, rubber seals, and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.2  PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.3  ACCEPTANCE TRIAL OPERATION

After completion of installation, the Contracting Officer will examine the stoplog installation for final acceptance. The individual components of the stoplog installation will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will be required to place the stoplogs [and posts] in the guides [and post pockets] a sufficient number of times to demonstrate that the stoplogs fit properly and seat uniformly. Required repairs or replacements to correct defects, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected.

-- End of Section Table of Contents --
NOTE: This guide specification covers design-build gates and stop logs or boards made from fiber reinforced polymer (FRP) composite materials for use in low-head water control structures and weirs. Structures covered by this specification are to have a maximum static hydraulic head of 6.1 meters (20 feet), accounting for overflow, a maximum height of 3.7 meters (12 feet) and a maximum width of 3.7 meters (12 feet). This guide specification is not applicable if catastrophic failure of the water control structure would create a life safety risk as per ER 1110-2-1156. This specification covers the performance requirements for composite gates and stop logs or boards as well as appurtenant components such as seals, guide frames, anchors and fasteners.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

Units of work normally included should be FRP items which require specific fabrication to meet the desired project requirements.

PART 1   GENERAL
NOTE: The scope section may be edited by the User as needed. However, the maximum design head and maximum width must not be increased.

1.1 SCOPE

This guide specification covers low-head FRP water control structures, such as gates, valves or stoplogs, and any appurtenant features defined in the Contract Drawings that have a maximum static hydraulic head of 6.1 meters\textsuperscript{20} feet, accounting for overflow, a maximum height of 3.7 meters\textsuperscript{12} feet and a maximum width of 3.7 meters\textsuperscript{12} feet.

1.2 UNIT PRICES

Payment must constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for fabricating and installing the [Stoplogs] [Vertical Lift Gate] [_____] as specified.

1.2.1 Unit of Measure

Unit of measure: lump sum.

1.3 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

DEFINITIONS

1.4.1 Design Head

The maximum differential head that will actually be applied to the gate (from AWWA C563).

1.4.2 Failure Critical Member

Any member for which failure would cause collapse, partial collapse or loss of functionality of the structure.

1.4.3 Fracture Critical Member

A steel member (or component thereof) that is in tension and whose failure would result in collapse or partial collapse of the structure.

1.4.4 FRP Composites

A Fiber Reinforced Polymer (FRP) member composed of fibers and resin systems, including fillers and additives. These members are manufactured via pultrusion, filament winding, vacuum infusion, hand lay-up or other methods and may contain foam or wooden cores, metal frame members, other previously produced FRP composites or other materials. This includes structural shapes, sandwich panels, boards, or other members made of FRP.

1.4.5 Low-Head Water Control Structure

A gate, valve or stoplog structure with a maximum design head of 6.1 meters (20 feet), a maximum height of 3.7 meters (12 feet), and a maximum width of 3.7 meters (12 feet).

1.4.6 Stoplog

Horizontal members placed on top of each other fitting into a frame, groove or channel on each side channel in the water control structure.

1.4.7 Vertical Lift Gate

A gate that opens upward to allow water to flow under the gate. Vertical
lift gates may also be referred to as sluice gates or slide gates.

1.4.8 Weir Dam

A dam to control water level by flowing water over the top of the structure; may include a control mechanism made of stoplogs or movable gates.

1.5 SEQUENCING AND SCHEDULING

Before the work is commenced, submit the approved sequencing and scheduling plan which illustrates that work affecting [railroads] [roadways] [utilities] [appurtenances][_____] has been coordinated with [____]. The plan must include schedules, lists of labor or materials to be provided to the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities. The plan must clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] [appurtenances] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed or approved.

1.6 SUBMITTALS

**************************************************************************
NOTE:  Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.
Additional submittal requirements may be added by the User as needed.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Contractor, Manufacturer, and Engineer Qualifications; G[____]

Sequencing and Scheduling Plan; G[____]

Quality Control Plan

SD-02 Shop Drawings

Detail Drawings; G[____]

SD-03 Product Data

[Slide Gate][Stop Log] Technical Data Sheet; G[____]

Materials variances G[____]

SD-05 Design Data

Design Documentation; G[____]

SD-06 Test Reports

Test Reports; G[____]

Include test reports to verify all material properties used in design following ASTM or other specification bodies where possible.

SD-07 Certificates

Data Book; G[, [____]]

1.7 MAINTENANCE MATERIAL SUBMITTALS

1.7.1 Spare Parts

**************************************************************************
NOTE: Include a list of all spare parts required.
This information should be provided on the contract drawings.
**************************************************************************

[____]

1.8 QUALITY CONTROL

1.8.1 General

The Contractor is responsible for quality control and must establish and maintain an effective quality control system [in accordance with Contract Clauses 52.236-6 SUPERINTENDENCE BY THE CONTRACTOR and 52.236-5 MATERIAL AND WORKMANSHIP and with SECTION H, SPECIAL CONTRACT REQUIREMENTS]. The quality control system must consist of plans, procedures, and organization necessary to produce an end product which complies with the requirements of this contract. The system must cover all design, fabrication, painting, and delivery operations. The Contractor must submit a written Contractor quality control plan for approval.

1.8.2 Regulatory Requirements

**************************************************************************
NOTE: Include all regulatory information.
**************************************************************************

[____]

1.8.3 Contractor, Manufacturer, and Engineer Qualifications

**************************************************************************
NOTE: If an engineer of record is close to the minimum or if the user has concerns about the nature
and extent of the engineer's experience, the user may request a record of specific projects performed by the engineer in order to ensure the engineer possesses adequate qualifications to perform the proposed work.

Provide documentation from manufacturer having a minimum of [five][_____] years' experience in the manufacture of similar products and systems. Additionally, if requested, provide a record of at least [five][_____] previous, separate, similar successful installations in the last [five][_____] years. Submit Manufacturer's catalog data to include two copies of specifications, load tables, dimension diagrams, and anchor details for the following low-head water control structures and components.

Provide documentation from Engineer of Record having a minimum of [five][_____] years' experience in the design of [five][_____] similar products and systems and copy of current license. Additionally, if requested, provide a record of at least [five][_____] previous, separate, similar successful installations in the last [five][_____] years.

1.9 DELIVERY, STORAGE, AND HANDLING

1.9.1 General

Submit recommendations for shipping, handling, storage, installation procedures, and care and maintenance instructions. Deliver manufactured materials in original, unbroken pallets, packages, containers, or bundles bearing the label of the manufacturer. Ensure all related adhesives, resins and their catalysts and hardeners are crated or boxed separately, and noted as such to facilitate their movement to a dry indoor storage facility under controlled temperature and humidity.

1.9.2 Handling and Storage

Handle all materials to prevent abrasion, cracking, chipping, twisting, other deformations, and other types of damage. Store adhesives, resins and their catalysts in dry indoor storage facilities following MDS requirements.

1.10 PROJECT/SITE CONDITIONS

1.10.1 Design Parameters

**************************************************************************
NOTE: This information is to be provided by the user. The items suggested below are not necessarily all inclusive nor will all be necessary in all situations. User to edit this section as appropriate to include all relevant site conditions for the project and should be included with the scope of work or contract drawing documents.
**************************************************************************

**************************************************************************
NOTE: Provide information on the following items: type of water control structure; height and width of opening; design head (including operating head); bearing conditions (embedded metals condition and layout); type of actuator preferred to operate gate;
**************************************************************************
type of frame (conventional, self-contained thrust reaction) and installation (surface mounted, in-channel wall mounted, embedded in wall, etc.); frequency of operation; debris and ice loads; corrosive, acidic or alkaline water conditions; operational limits (lifting, handling, etc.); and other items listed in AWWA C563.

**WARRANTY**

**NOTE:** Designated appurtenances of the gate assembly may be guaranteed for a minimum period of 1 year from the date of acceptance thereof, either for beneficial use or final acceptance, whichever is earlier, against defective materials and workmanship. Such guarantees will require the Contractor to furnish and install new replacement parts immediately upon receipt of notice from the Government of the failure of any part of the guaranteed items during the warranty period. These warranty requirements will be covered in the CONTRACT CLAUSES and this paragraph should be deleted from this section of the specifications.

Furnish manufacturer's no-dollar-limit warranty for the FRP composite low-head water control structure or components. The warranty period is to be no less than [1] [5] [10] [15] [20] years from the date of acceptance of the work and be issued directly to the Government. The warranty must provide that, if within the warranty period, the composite low-head water control structure or components show evidence of deterioration resulting from defective materials and/or workmanship, correcting of any defects is the responsibility of the manufacturer. Repairs that become necessary because of defective materials and workmanship while the composite low-head water control structure or components are under warranty are to be performed within [32] [_____] hours after notification, unless additional time is approved by the Contracting Officer. Failure to perform repairs within [32][_____] hours of notification will constitute grounds for having emergency repairs performed by others and will not void the warranty.

**PART 2 PRODUCTS**

**2.1 SYSTEM DESCRIPTION**

**NOTE:** This section should be modified to account for the specific type of water control structure. The materials listed are suggestions showing most commonly used for such structures. Unsuitable materials for a particular application can be removed. Specify similar metals or provide dielectric insulators as necessary.

Provide [vertical lift gate] [stop logs] [_____] composed of fiber
reinforced polymer composites [and embedded metal frame] in qualities, quantities, properties, arrangements and dimensions as necessary to meet the design requirements and dimensions as specified on the contract drawings and specifications.

Provide reinforcement in the form of glass or carbon fibers, mats, or fabrics to meet the design requirements and dimensions as specified. Select the reinforcement format for failure critical FRP components according to the mechanical requirements of the application and the geometry/shape of the part. Confirm selected reinforcements are compatible with selected resin matrix system to ensure proper adhesion/load transfer and long-term performance of the component in its intended physical-chemical environment of use. Ensure all surfaces of FRP composite items and fabrications are smooth, resin-rich, free of voids, and without dry spots, cracks, and un-reinforced areas as per quality requirements herein. Ensure all reinforcing fibers are completely covered during manufacturing with resin to a depth of 0.25 to 0.51 mm 0.01 to 0.02 inches to protect against their exposure to wear, water immersion, or weathering. Seal over fasteners that penetrate the FRP skin, end cuts, and penetrations in a way that prevents delamination and water ingress. Use mechanical fasteners or mechanical plus adhesive for built up FRP members connected in tension after manufacturing. Provide documentation showing core materials are resistant to decay and attack by fungus and bacteria.

Embedded frames made of [FRP] [galvanized steel] [T-[-_____] stainless steel] [aluminum] may be used to provide added stiffness to meet the specified requirements, but must be submitted to the Contracting Officer or their approved representative for approval and have a minimum of 1/4 inch thick FRP on each side. [Metal frames made of [galvanized steel][T-[-_____] stainless steel] [aluminum] must meet ASME/ASTM standards, be fully encapsulated in the FRP structure, and design submittals must account for the potential for the FRP to delaminate from the frame] [Metal frames must be detailed to prevent galvanic corrosion if carbon is used in FRP]. Specification section [_____] must be referenced when embedded metals are used in conjunction with the composite structure. Provide anchored guide frames made of [carbon steel] [T-[-_____] stainless steel] [FRP] [aluminum] [or approved material] that attach into the sidewalls of the water control structure. [Galvanize or epoxy coat carbon steel frames as per AWWA C563.] Provide anchors which match the frame material and provide dielectric insulators to secure the guide frame into the surrounding water control structure. As necessary, coat anchors to inhibit corrosion.

2.1.1 Design Requirements

**************************************************************************
NOTE: A factor of safety of 5 is suggested based on the typical response of FRP composites under sustained loads. This can be adjusted based on the site conditions of the structure and the associated risks. The design life is the same as HSS, but it should be noted that FRP composites do not have the performance data needed to calibrate design codes. Thus, the determination of the parameters that affect the design life would be based on the judgment of the designer of record.
**************************************************************************

The water control structure must be designed in accordance with this
specification to achieve the objectives of constructability, safety, serviceability, with due regard to issues of inspectability, and economy. The structural system must be proportioned and detailed to ensure the development of significant and visible inelastic deformations at the strength and extreme event limit states before failure. Load-path redundant structures should be used unless there are compelling reasons to not do so.

Submit design documentation showing the water control structure is capable of meeting a factor of safety of [5] [_____] defined as the ratio of ultimate stress to the working or allowable stress using allowable stress design prior to commencement of work. Maximum sustained stress cannot exceed one-fifth of failure stress and account for creep and the effects of water adsorption. Design life should be assumed to be [100] [_____] years assuming routine inspection and maintenance. All design computations are to be stamped by a registered professional engineer who will be identified as the Engineer of Record. All design computations must also be initiated by an additional registered professional engineer who will be identified in the design documents as having provided design quality control. See paragraph 3.5.2 "Data Book" for additional requirements.

2.1.1.1 Mechanical Anchorage

Mechanical anchorage system to be designed to meet the load requirements as outlined in ASCE 7-16 and paragraph 1.10.1 Design Parameters. Anchorage calculations are stamped by a Registered Professional Engineer. Expansion anchors are not permitted.

2.1.2 Performance Requirements

**************************************************************************
NOTE: Delete columns as appropriate based on gate type. Leakage requirements should only be included for instances where leakage is considered a critical issue. Leakage tests can be performed in the shop or in the field, though testing may not be practical based on the size and head on the gate.
**************************************************************************

Submit documentation including [Slide Gate][Stop Log] Technical Data Sheet showing the full gate system is capable of meeting the following performance requirements prior to commencement of work.

<table>
<thead>
<tr>
<th>Test</th>
<th>Vertical Lift Gates</th>
<th>Stoplogs</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Leakage (AWWA C563)]</td>
<td>[Less than 1.3 lpm/m 0.1 gpm/ft of seating perimeter]</td>
<td>[Less than 0.62 lpm/m 0.05 gpm/ft of seating perimeter]</td>
</tr>
<tr>
<td>Gate Deflection</td>
<td>Less than 1/720 of the gate width at maximum head water</td>
<td>Less than 1/360 of the gate width, max of 6.4 mm 1/4 inch at maximum head water</td>
</tr>
<tr>
<td>Yoke Deflection</td>
<td>Less than 1/360 of the gate width, max 6.4 mm 1/4 inch at maximum head water</td>
<td>[not applicable]</td>
</tr>
</tbody>
</table>
2.2 MANUFACTURED UNITS

Miscellaneous materials and standard articles must conform to the respective standards or specifications below when that type of material is furnished. Where material requirements are not specified, materials furnished must be suitable for the intended use and are subject to approval. Submit date and type of manufacture including constituent materials. Submit materials variances for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1 Bolts, Nuts and Washers

Provide bolts, nuts, and washers of the material, grade, type, class, style and finish indented or best suited for the intended use.

2.2.1.1 Bolts

Where the use of high strength bolts is required, the materials, workmanship, and installation must conform to the applicable provisions of ASTM F3125/F3125M and RCSC S348. Bolts for low-temperature applications must conform to ASTM A320/A320M. Bolts for non-high strength applications must conform to the applicable provisions of ASTM A307, Grade A.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1.2 Nuts

All nuts to be used with high strength bolts must conform to ASTM A563 and ASME B18.2.2

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.1.3 Washers

All nuts must be equipped with washers. Washers to be used with high strength bolts must conform to ASTM F436/F436M. Plain washers must conform to ASME B18.22M or ASME B18.21.1, Type B as applicable. Lock washers must conform to ASME B18.21.1.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2 Anchorage

**************************************************************************
NOTE: For most jobs, ASTM F1554 248 MPa 36 ksi anchor bolts are used. If high tensile loads are anticipated, the designer should consider the use of 379 MPa 55 ksi or 724 MPa 105 ksi ASTM F1554 anchor bolts. If stainless steel is considered, the designer should select from material in ASTM A193/A193M.

SECTION 35 20 15 Page 13
2.2.2.1 Anchor Rods

ASTM F1554 [Stainless steel Gr 36 [55] [105], Class 1A [2A].
ASTM A193/A193M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.2 Anchor Nuts

ASTM A563, Grade A, hex style. [Stainless steel ASTM A193/A193M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.3 Anchor Washers

ASTM F844. [Stainless steel [Type 304][Type 316] conforming to ASTM A276/A276M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.4 Anchor Plate Washers

ASTM A36/A36M [Stainless steel [Type 304][Type 316] conforming to ASTM A276/A276M.]

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.2.2.5 [Sleeve Anchors][Adhesive Anchors]

Provide [_____] mm [_____] inch diameter [sleeve anchors][adhesive anchors]. Minimum concrete embedment must be [_____] mm [_____] in.
Design values listed must be as tested according to ASTM E488/E488M.

b. Minimum [ultimate][allowable] shear value: [_____] kN [_____] lb.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.3 EQUIPMENT

[Provide [manual] [powered] actuators to lift the gate as per AWWA C563].
[Provide lifting beams and storage racks for stop logs.]
2.4 MATERIALS

Miscellaneous materials and standard articles must conform to the respective standards or specifications below when that type of material is furnished. Where material requirements are not specified, materials furnished must be suitable for the intended use and are subject to approval. Submit materials variances for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.1 FRP Composites

**************************************************************************

NOTE: A wide range of strength properties for FRP composites are possible and depend on the fiber volume fraction, resin type, cross section, and manufacturing method. There is no need to specify a minimum design strength, as the manufacturer must design the low-head water control structure to meet the specified requirement. A manufacturer could use a weak material in bulk, or smaller quantities of a much stronger material. The key for the government is to ensure that the strength of the supplied FRP composite meets or exceeds the design values.

For reference, pultruded FRP composite structural shapes often have tensile, compressive and flexural strength design values at ultimate around 207 Mpa 30 ksi and tensile modulus around 17.2 Kpa 2.5 Msi in the lengthwise direction. Pultruded plates range from one half to two thirds of these values. FRP rods and bars are often two to three times stronger than structural shapes in tension and flexural. Properties of honeycomb members, sandwich panels and other shapes made via process other than pultrusion can vary significantly.

**************************************************************************

Submit documentation showing FRP composites meet the material properties used in the design as per the applicable [ASTM] [_____] test requirements. [Submit samples to permit verification testing for FRP composites made via hand-layup].

Submit documentation showing that FRP composites show no evidence of damage including breaks, cracks, blistering, delamination, exposure of fibers, or combination thereof, after being subjected to ASTM D4329 or ASTM G154 for a minimum of 720 hours.

Allowable visual defects of FRP Composite members must meet conditions as per ASTM D4385 for pultruded members, Level II of ASTM D2563 for laminates or a similar appropriate specification for other types of FRP composites. Dimensional tolerances for pultruded components must meet ASTM D3917.

2.4.2 Structural Steel

**************************************************************************

NOTE: If structural steel is not permitted to be used, omit this section.

**************************************************************************
Use non-fracture critical steel members conforming to ASTM A36/A36M or ASTM A992/A992M.

Use fracture critical steel members conforming to ASTM A709/A709M, Grade 50 (F) for temperature Zone 2 or ASTM A992/A992M, Grade 50 with a minimum average Charpy V-Notch (CVN) impact test value of 34 N-m 25 ft-lbs when tested at 4.4 degrees Celsius 40 degrees Fahrenheit.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

### 2.4.3 Stainless Steel

NOTE: If stainless steel is not permitted to be used, omit this section.

Use stainless steel bars and shapes conforming to ASTM A276/A276M, UNS [S20910,] [S30400,] [S40500,] [S31600,] [_____] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S17400,] [S45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

### 2.4.4 Aluminum

NOTE: If aluminum is not permitted to be used, omit this section.

Use aluminum bars and shapes conforming to [ASTM B209][ASTM B308/B308M][____].

Submit variances of these suggested materials for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

### 2.4.5 Rubber Seals

NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION OF RUBBER SEALS AND TESTING OF RUBBER SEALS.

Use [fluorocarbon (Teflon) clad rubber seals of the mold type only] [compounded of natural rubber, synthetic polyisoprene, or a blend of both, and must contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers]. Submit documentation showing the seals meet the following requirements prior to commencing work:
<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent</td>
<td>6.2 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent of tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test must be performed with distilled water. The washed specimen must be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees F plus or minus 4 degrees F for 22 hours plus or minus 1/4 hour. The specimen must then be removed, allowed to cool to room temperature in air, and weighed. The weight must be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature must be 70 degrees C plus or minus 1 degree F plus or minus 2 degrees F and the duration of immersion is to be 166 hours.

Rubber seals must have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film must be [0.726 mm] [1.524 mm] [0.030 inch] [0.060 inch] thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and must have the following physical properties:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa 2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film must be flush with the surface of the rubber seal and be free of adhering or bonded rubber. Strips and corner seals must be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film must be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

Submit variances of these suggested materials and test methods for engineering review and subsequent approval by the Contracting Officer or their authorized representative.

2.4.6 Ultrahigh Molecular Weight Polyethylene (UHMWPE)

********************************************************************************
**NOTE: If UHMWPE is not permitted to be used, omit this section.**
********************************************************************************
If used, ultrahigh molecular weight polyethylene (UHMWPE) must conform to the following physical properties:

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>TEST VALUE (+/- 10 percent)</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specific gravity</td>
<td>0.93 g/cm3 0.034 lbs/in3</td>
<td>ASTM D792</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>27.6 Mpa 4,000 psi</td>
<td>ASTM D638</td>
</tr>
<tr>
<td>Durometer</td>
<td>D68 (minimum)</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>Coefficient of friction</td>
<td>0.20 (maximum)</td>
<td>ASTM D1894</td>
</tr>
</tbody>
</table>

If the UHMWPE material is to be exposed to sunlight, the material must be stabilized for ultraviolet radiation via 2.5 percent carbon black or other equivalent stabilizer. The fabricated form must be from virgin resin. The virgin resin must be a homopolymer of ethylene and have an intrinsic viscosity (IV) between 22.0 and 28.0 dl/g per ASTM D4020.

2.5 FABRICATION

Follow the ACMA Code for pultruded FRP composites.

2.5.1 Drawings and Specifications

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the specified requirements [_____] days prior to starting fabrication. The structure design is communicated to the Government through the required submittals designated in these specifications. All information necessary to fabricate the structure as intended in the design is depicted in these documents. Denote failure critical members on all drawings with the abbreviation FC. Denote fracture critical members on all drawings with the abbreviation FCM. The notation of FC and FCM on the drawings provides critical information to the Government for the structural response of the structure. Drawings must not be reproductions of the Government furnished contract drawings.

2.5.2 Fabrication Drawings

Fabrication drawings must show complete details of materials, dimensions, tolerances, connections.

2.5.3 Fabrication Tolerances

Measure dimensions by an approved measuring system. Submit the measuring system for approval with the work plan (i.e. calibrated steel tape of approximately the same temperature as the material being measured). The overall dimensions of an assembled structural unit must be within the tolerances indicated on the drawings or as specified for the item of work. Where tolerances are not specified in other section of these specifications or shown, a variation of 0.8 mm 1/32-inch is permissible in the overall length of component members with both ends milled and component members without milled ends must not deviate from the dimensions shown by not more than 1.6 mm 1/16-inch for members 3.7 meters 12 feet or less in length.
2.5.4 Delivery Drawings

Delivery drawings must provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.6 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified material test reports with all material delivered to the site. Tests, inspections, and verifications for materials and fabricated items must conform to the requirements specified.

2.6.1 General

Tests, inspections, and verifications for materials must conform to the specified requirements. Submit certified test reports for material tests, with all materials delivered to the site.

2.6.2 Inspection

**************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************

Inspect shop assembled components for accurate fit and compliance with dimensional tolerances. Sealing, guiding, and connecting surfaces must be inspected to determine if their planes are true, parallel, and in uniform contact with opposing surfaces.

2.6.3 Operation Tests Prior to Installation

**************************************************************
NOTE: This paragraph is only applicable to slide gates.
**************************************************************

[The operation of the shop-assembled gate assembly must be tested by opening and closing the gate several times by use of the operating machinery. The force used to operate the gate must be the minimum required to open and close the gate. Since the sill of the unembedded gate frame is not fully supported during the operation tests, special precaution must be taken to prevent the application of excessive force on the gate leaf and frame when the gate is closed. The operation of the lifting beam must be tested by engaging and disengaging the lifting beam several times. Adjustments must be made as required until operations are satisfactory as determined by the Contracting Officer or their approved representative.]

**************************************************************
NOTE: The shop hydrostatic leakage test outlined below may not be practical due to the size or head requirements of the gate. This test should only be required if gate leakage is considered a critical issue.
**************************************************************

[The gate assembly must be tested hydrostatically prior to installation by applying a hydrostatic pressure of [_____] Mpa [_____] psi, measured at the sill of the gate frame, to the upstream side of the gate leaf in the closed sectional view.]

SECTION 35 20 15 Page 19
position. Under hydrostatic testing, the gate seals must prevent water leakage meeting paragraph 2.1.2.]

PART 3 EXECUTION

3.1 EXAMINATION

Gate will be inspected when delivered to site. When Government inspections result in product rejection, promptly segregate and remove rejected material from the premises. The Government may also charge an additional cost of inspection or testing when prior rejection makes re-inspection or retesting necessary.

3.2 PREPARATION

3.2.1 Protection

Protect the surrounding water control structure to prevent damage during the installation of the gate. Install temporary water control structures if replacing an existing gate to ensure water control is maintained.

3.3 INSTALLATION

Installation must conform to the requirements specified. Gate and appurtenant items must be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication must be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Submit certification of installation. Submit Certification of State Product Approval.

3.4 FIELD QUALITY CONTROL

3.4.1 Tests

******************************************************************************
NOTE: The field leakage test outlined below may not be practical due to the size or head requirements of the gate. This test should only be required if gate leakage is a critical issue. Consideration should be given to the ability to apply head to the gate in the field.
******************************************************************************

[Conduct a field leakage test including [operating the gate][removing and replacing stoplogs] to ensure the as-built gate meets the requirements of paragraph 2.1.2.]

3.5 CLOSEOUT ACTIVITIES

3.5.1 Demonstration and Training

Demonstrate gate operation and provide training for [USACE] [owner] [_____] employees for a maximum [8] [_____] hours.

Provide an operation and maintenance manual to [USACE] [owner] [_____].
3.5.2 **Data Book**

Compile and maintain a "Data Book" throughout the duration of the contract. The "Data Book" consists of copies of all Requests for Information (RFI's) with Government responses, Material Orders, Mill Certification Reports and Certification Letter's. Use tabs to separate each specific item identified above and a Table of Contents to identify which tab corresponds to which item. The in-progress "Data Book" must be available to the Government to review during shop inspections of the project.

When final revisions have been completed, prepare a "Certificate of Conformance" on their company letterhead certifying that: 1) all materials and workmanship included in the project were detailed, designed, manufactured, tested, inspected and documented as specified in the contract requirements; and 2) the requirements of applicable codes, standards, specifications and drawings have been complied with and that all required quality assurance documentation verify conformance to the contract documents have been submitted, signed by the Contractor's Quality Control System Manager and Engineer of Record.

Submit a draft copy of Final "Data Book" for review and approval within fifteen (15) calendar days following the completion of fabrication activities. Within thirty (30) calendar days of receipt of the Final "Data Book", the Government will return one copy annotated with any necessary corrections. Within fourteen (14) calendar days the Contractor must revise the "Data Book" accordingly at no extra cost and submit the Final Copy of the Final "Data Book" including the "Certificate of Conformance" to the Government. Approval and acceptance of the Final "Data Book" is required before final payment to the Contractor.

3.6 **WARRANTY**

******************************************************************************
NOTE: For USACE projects, delete the first two subparagraphs and utilize the tailored option.
******************************************************************************

3.6.1 Manufacturer's Warranty

Submit all manufacturers' signed warranties to Contracting Officer prior to final commissioning and acceptance.

3.6.2 Contractor's Warranty for Installation

Submit contractor's warranty for installation to the Contracting Officer prior to final commissioning and acceptance.

3.6.3 Contractor's Five (5) Year No Penal Sum Warranty
<table>

The composite low head water control structure or component installed on the above named structure is warranted by [_____] for a period of [5][10][20] [_____] years against workmanship and material deficiencies, wind damage and structural failure within project specified design loads[, and leakage exceeding paragraph 2.1.2]. The composite low-head water control structure and components covered under this warranty includes, but is not limited to, the following:

Framing and structural members, opening mechanisms including motors, storage racks, accessories, trim, miscellaneous closure items, connectors, components, and fasteners, and other system components and assemblies installed to enable operation of the composite low-head water control structure, and items specified in other sections of these specifications that become part of the composite low-head water control structure.

All material and workmanship deficiencies, system deterioration caused by exposure to the elements and/or inadequate resistance to specified service design loads and water leaks must be repaired as approved by the contracting officer.

All material deficiencies, structural failure, and leakage associated with the composite low-head water control structure covered under this warranty must be repaired as approved by the contracting officer.

This warranty covers the entire cost of repair or replacement, including all material, labor, and related markups. The above referenced warranty commenced on the date of final acceptance on [_____] and will remain in effect for stated duration from this date.

Signed, dated, and notarized (by company president)

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of miter gates and appurtenant items as specified and shown. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1   UNIT PRICES

NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.

Select Alternate 1 (one pay item) or Alternate 2 (two pay items). Delete all paragraphs of Alternate not selected.
1.1.1 Furnishing and Installing Miter Gates

**************************************************************************
NOTE: Alternate 1.
**************************************************************************

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing miter gates and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of miter gates and appurtenant items including gate leaves, diagonals, strut connections, miter guides, miter latches, recess latch strikes, quoin and miter contact blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and all other items necessary for complete installation.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Furnishing Miter Gates

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

1.1.2.1 Payment

Payment will be made for costs associated with furnishing miter gates and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of miter gates and appurtenant items including gate leaves, diagonals, strut connections, miter guides, miter latches, recess latch strikes, quoin and miter contact blocks, gudgeon top anchorages, pintle assemblies, [walkways,] [bridgeways,] gudgeon embedded anchorages, wall quoins, sill assemblies, seal assemblies, recess latches, bumpers, fenders, and other items necessary for complete installation.

1.1.2.2 Unit of Measure

Unit of Measure: lump sum.

1.1.3 Installing Miter Gates

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

1.1.3.1 Payment

Payment will be made for costs associated with the installation of miter gates and appurtenant items, which includes full compensation for the complete installation and testing of miter gates and appurtenant items.

1.1.3.2 Unit of Measure

Unit of measure: lump sum.
1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability
eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
1.4.2 [Safety Provisions for Zinc Filler]

The following safety provisions are required for heating and placing zinc filler:

a. Workers shall wear protective clothing including hard hats with fine wire mesh screen, goggles, leather sleeves, chaps, apron, and leather gloves.

b. Workers shall wear air-line respirators certified by National Institute for Occupational Safety and Health (NIOSH) or Mine Safety and Health Administration (MSHA). In enclosed spaces, both local exhaust ventilation and air-line respirators are required. Local exhaust ventilation shall consist of movable hoods placed close to the work to remove fumes at the source.

c. Ladles, equipment, and material shall be pre-heated before being used so that they will be moisture-free.

d. Heating devices and ladles shall be placed on a level, firm foundation, and protected against traffic, accidental tipping, or similar hazard.

e. Hot zinc shall not be carried up or down ladders.

f. Buckets or vessels used for handling and transporting hot zinc shall be substantially constructed and shall not be filled higher than 100 mm (4 inches) from the top.

1.4.3 Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.3.1 Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

1.4.3.2 Shop Assembly Drawings

Show on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

1.4.3.3 Delivery Drawings

Show on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

1.4.3.4 Field Installation Drawings

Show on the field installation drawings a detailed description of the field installation procedures. Include in the description the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of
maintaining components in correct alignment; plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler; [procedures and equipment used for heating and placing of the zinc filler;] and methods for installing other appurtenant items.

1.5 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items in accordance with the requirements specified [herein and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Do not distort rubber seals during handling.

1.5.2 Epoxy Filler

Deliver epoxy filler from the manufacturer just prior to use in the work to insure receipt of recently manufactured material and store under cover, out of direct sunlight, at a temperature between 20 to 30 degrees C 65 to 85 degrees F.]

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract. Materials orders, materials lists and materials shipping bills shall conform with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Submit approved samples prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum bronze and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to ASTM A36/A36M.
2.1.1.2 Structural Steel Plates

Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade 50].

2.1.1.3 Steel Pipe

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.4 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.5 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION and ZINC FILLER.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers.

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa2,500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>PHYSICAL TEST</td>
<td>TEST VALUE</td>
<td>TEST METHOD SPECIFICATION</td>
</tr>
<tr>
<td>---------------------------------------</td>
<td>------------------------------------------------</td>
<td>---------------------------</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree and the duration of immersion shall be 166 hours.

2.1.2.2 [Fabrication]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Tensile strength</th>
<th>13.8 MPa2,000 psi (min.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.1.3 Epoxy Filler

Epoxy filler shall be an approved epoxy resin formulation equal to "Nordback," a product of Nordberg Mfg. Co., or an approved equal, with a specific gravity of 1.70 to 1.75, minimum compressive strength after 72 hours at 20 degrees C 70 degrees F of 114 MPa 16,500 psi, and maximum shrinkage of 0.15 percent. Submit Manufacturer's certificate for epoxy filler stating that it meets or exceeds the specified physical properties; material shall be delivered to the site.

2.1.4 Zinc Filler

ASTM B6.

2.1.5 Bumpers and Fenders

[Bumpers and fenders shall be "Rubbumper," a product of Missouri Dry Dock & Repair Co., or an approved equal.] [Timber bumpers and fenders shall conform to [west coast fir] [or] [southern yellow pine], structural grade, dressed surfacing, pressure treated with creosote conforming to AWPA P3 in accordance with AWPA U1. Bumpers and fenders shall be cut, beveled, or bored as required before being pressure treated.]
2.1.6 Asphalt Saturated Preformed Filler Strips

ASTM D1751.

2.1.7 Asphalt Cement

ASTM D3019.

2.1.8 Asphalt Mastic

SSPC PS 9.01.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Perritic Steel, Grade [____]] [Austenitic Steel, Grade [____], Class [____]]. Bolts M16 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated on the drawings.

2.3 FABRICATION

2.3.1 Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown on the drawings. Splices shall occur only where shown or approved. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of [cathodic protection system devices and other] appurtenances as required.

2.3.2 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************
Welding shall conform with the requirements of AWS D1.1/D1.1M, AWS D1.2/D1.2M, the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.3.3 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Fabrications

2.3.6.1 Gate Leaf

Gate leaf shall be of welded structural steel fabrication consisting of horizontal girders, [vertical beams,] [vertical girders,] intercostals, diaphragms, quoin post, gudgeon pin hood, operating strut connections, skin plate, and adjustable diagonals. Gate leaf shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved by the Contracting Officer and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of the gate leaf shall not vary from the nominal dimension or differ from the mating gate leaf by more than 6 mm 1/4 inch. The surfaces of framing elements to which skin plates are to be welded shall not vary from a true plane by more than 5 mm 3/16 inch. The outside surfaces of skin plates welded to framing members shall not vary from a true plane by more than 5 mm 3/16 inch. Splices in skin plates shall be located only where shown or approved. [In addition to welds specifically indicated on the drawings for nondestructive testing, [____] percent of the welds in the girders, gudgeon pin hood, verticals and skin plate of the gate leaf shall receive nondestructive testing. The location of these additional welds for testing shall be as directed by the Contracting Officer.] Gate leaf shall be provided complete with quoin and miter contact [blocks] [posts], miter guide assembly, pintle assembly, gudgeon anchorage, seal assembly, and other appurtenant components as required for complete installation, specified herein and shown.
2.3.6.2 Wall Quoin

Wall quoin shall consist of a welded structural steel frame with adjustable stainless steel base anchors and adjustable stainless steel quoin contact [block] [post].

2.3.6.3 Quoin and Miter Contact [Blocks] [Posts]

Quoin and miter contact [blocks] [posts] shall be of stainless steel bars conforming to ASTM A276/A276M or ASTM A564/A564M. Splices in contact [blocks] [posts] shall be made by an offset method so that there will not be a continuous joint across the [block] [post]. [Splices in gate leaf contact [block] [post] shall occur only at the centerlines of horizontal girders.] Splice locations shall match those of the opposing [block] [post]. Contact faces of contact [blocks] [posts] shall be milled at splices to assure watertight joints. Contact [blocks] [posts] shall be provided with adjusting bolts as shown.

2.3.6.4 Pintle Assembly

Pintle assembly shall consist of pintle socket, pintle, and pintle base as shown. Pintle socket shall be of cast nickel-alloy steel. Pintle socket shall be press-fitted with an aluminum bronze bushing with bearing surfaces finished truly hemispherical. Pintle shall be of [cast alloy] [forged alloy] steel with bearing surfaces of corrosion-resisting steel. Pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing by scraping until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field. Pintle base shall be of cast steel. Bolt holes for attaching pintle socket to gate leaf shall be drilled and reamed after the pintle socket is assembled with gate leaf. Pintle socket shall be connected to the bottom of the lower girder web of the gate leaf with stainless steel bolts.

2.3.6.5 Gudgeon Anchorage

Gudgeon anchorage shall consist of gudgeon pin barrel, gudgeon anchorage links, gudgeon pin, and gudgeon embedded anchorage. Gudgeon pin barrel shall be of welded [structural steel plates] [forged alloy steel plates conforming to ASTM A668/A668M] and shall be fitted with a bronze bushing. Gudgeon anchorage links and gudgeon pin shall be of forged alloy steel conforming to ASTM A668/A668M. Gudgeon anchorage links shall be pin connected to the gudgeon embedded anchorage and shall have a threaded section for adjustment of the gate leaf. The threaded section shall have right and left threads, a hexagonal sleeve nut with 13 mm1/2 inch threads, and a jam nut with standard threads at each end of the sleeve nut. The gudgeon embedded anchorage shall consist of a structural steel frame with end-restrained anchor bolts conforming to [ASTM A325M. ASTM A325.] [ASTM A490M. ASTM A490M.]

2.3.6.6 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals
shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine-finished after splicing.

2.3.6.7 Appurtenant Items

Sill assemblies, latches, bumpers fenders, seal plates and shapes, and other appurtenant items shall conform to details specified and shown.

2.3.7 Shop Assembly

Shop assembly requirements for miter gates and appurtenant items shall be as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Miter gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved by the Contracting Officer, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise approved by the Contracting Officer. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.4.1 General

Tests, Inspections, and Verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.2 Testing of Rubber Seals

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:
THICKNESS OF FLUOROCARBON FILM | MACHINE METHOD AT 50 MM2 INCHES PER MINUTE | DEADWEIGHT METHOD
---|---|---
0.762 mm0.030 inch | 13.6 kg per 25 mm30 pounds per inch width | 13.6 kg per 25 mm30 pounds per inch width
1.524 mm0.060 inch | 13.6 kg per 25 mm30 | 13.6 kg per 25 mm30

PART 3 EXECUTION

3.1 INSTALLATION

Installation shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Miter gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Sill assemblies, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Pintle Assembly

Base anchors for the pintle assembly shall be embedded in first-pour concrete. The pintle assembly base plate shall be attached to base anchors, adjusted to the exact elevation and center-to-center distance shown, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete. The concrete shall be allowed to set 72 hours and must reach a minimum compressive strength of [_____] MPa psi before loading is applied. [The space in the floating pintle base not occupied by the pintle shoe shall be filled completely with sponge rubber before the gate leaf is set in place.]

3.1.3 Gudgeon Embedded Anchorage

Submit approved gudgeon embedded anchorage prestressing plan prior to initiating the anchorage operations. Gudgeon embedded anchorage prestressing record prior to completion of the contract. The gudgeon embedded anchorage, except for anchor bolts and horizontal anchor arms, shall be covered with asphalt saturated preformed strips applied with asphalt cement prior to being embedded in concrete. Anchor bolts shall be coated with asphalt mastic. The gudgeon embedded anchorage shall be aligned, leveled, and blocked rigidly in place to prevent displacement before concrete is placed. Concrete shall be placed in a manner not to damage the preformed strips. Anchor bolts shall be prestressed after the concrete has attained the specified strength in accordance with contract.
drawings and approved field installation drawings. A record of the gudgeon embedded anchorage prestressing operations shall be compiled and submitted immediately after completion of the prestressing operations.

3.1.4 Wall Quoin

Base anchors for the wall quoin shall be embedded in first-pour concrete. The wall quoin shall be attached to base anchors prior to setting the gate leaf in place. After the gate leaf is set in place, the wall quoin shall be plumbed and adjusted in relation to the gate leaf quoin so as to provide for continuous contact between the sealing surfaces of the wall and gate leaf quoin contact [blocks] [posts] over the full height of the gate leaf. This adjustment shall be made almost entirely by moving the wall quoin so that the gap for the [epoxy] [zinc] filler behind the gate leaf quoin contact [block] [post] remains near the nominal dimension. After final adjustments have been made, the wall quoin shall be anchored firmly and the second-pour concrete shall be placed in the blockout.

3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the field as required for installation. The pintle ball shall be coated with grease prior to setting the gate leaf in place. Pintle grease pipes shall be tapped into pintle bushing in correct register with bushing grease grooves. Grease pipes shall be flushed prior to connecting to bearings. All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the miter ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the components of gudgeon anchorage are connected to the gate leaf, the gate leaf shall be plumbed and brought into correct position by adjusting the sleeve nuts of the diagonals and the gudgeon anchorage links.

3.1.6 Diagonals

Gate leaf diagonals shall be attached to the gate leaf after the leaf is set in place. Diagonals prestressing shall be performed before the final adjustment of the quoin and miter contact [blocks] [post] are made. Prestressing of diagonals shall be as specified, shown, and as approved on the prestressing plan developed by the Contractor. Submit approved diagonal prestressing plan prior to initiating the prestressing operations. Submit diagonal prestressing records immediately after completion of the prestressing operations. The plan for prestressing the diagonals shall describe the method of prestressing, including the materials, connections, rigging, anchorages, and stress measuring equipment. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<table>
<thead>
<tr>
<th>STRESS DATA TABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gate Leaf Location:</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>Diagonal</td>
</tr>
<tr>
<td>[___]</td>
</tr>
</tbody>
</table>
1. Initial strain gage readings shall be made after slack is removed.

2. Final strain gage readings shall be made after prestressing is complete.

3. $E$ is the total elongation over the full length of the diagonal, computed from the strain gage readings.

4. $D$ is the prestress deflection of the leaf as shown on the drawings.

5. $d$ is the field deflection of the leaf measured after completion of the prestress operation; it is the deflection when final strain gage readings are taken.

3.1.7 Gate Leaf Quoin and Miter Contact [Blocks] [Posts]

After the wall quoin has been adjusted and concreted in place and final adjustments made to the gudgeon anchorage links, gate leaf quoin and miter contact [blocks] [posts] shall be adjusted to provide continuous contact over the full height of the gate leaf in the mitered position. After the gate leaf diagonals are prestressed and final adjustments of gate leaf quoin and miter contact [blocks] [posts] have been made with the gate leaf in the mitered position, the gate leaf shall be swung out of miter and [epoxy] [zinc] filler poured behind the quoin and miter contact [blocks] [posts]. Prior to pouring of the filler, the surfaces to receive the filler shall be cleaned free of dirt, rust, and other foreign materials. The adjusting and holding bolts shall be coated with grease or other bond breaker to prevent adherence of the filler.

3.1.7.1 Placing [Epoxy] [Zinc] Filler

[A field test to determine the indentation hardness of the epoxy filler compound shall be conducted prior to placement. The field test procedures are as follows:

a. Cast a 50 mm 2 inch cube sample of mixed epoxy filler compound in a mold and cure at room temperature (20 to 25 degrees C 70 to 80 degrees F ) for 24 plus or minus 8 hours.

b. Remove from mold and cut sample to expose interior surface.

c. Sand exposed interior surfaces to remove saw marks and provide a smooth surface.

d. Using a Type D Durometer conforming to ASTM D2240, measure the hardness across the exposed interior surface, taking a minimum of three readings on each half of the sample. Care must be taken during the durometer reading to insure the spring loaded pin used to penetrate the surface is not in a depressed surface caused by either residual saw marks or an exposed air bubble. The average reading should be at least 85, with no individual reading below 82. If the durometer readings fall below the required minimum values, the material will be rejected.
The manufacturer's instructions for placing the epoxy filler shall be followed explicitly. Special precautions must be taken to prevent leakage of the filler during placement. The complete masses of the metals whose surface areas are to receive the epoxy filler should have a temperature of 15 to 30 degrees C 60 to 90 degrees F. The epoxy filler shall be kept free from moisture or other foreign materials during mixing and placement and for at least 48 hours after placement.

[Immediately preceding the pouring of the zinc filler, the adjacent metal components shall be pre-heated to a temperature of 100 to 150 degrees C 212 to 300 degrees F by an approved method which does not buckle the metal components. The zinc filler shall then be poured at a temperature which will insure that it will completely fill all interstices. Pouring temperature of zinc filler shall be maintained between 430 and 480 degrees C 810 and 900 degrees F to minimize volatilization and oxidation of the zinc.]

3.1.7.2 Adjusting Contact [Blocks] [Posts]

After the [epoxy has set] [zinc has cooled], quoin and miter contact [blocks] [posts] shall be drawn up against the filler by tightening of the adjusting bolts. After the contact [blocks] [posts] are adjusted, the gate leaves shall swing into the mitered position without interference of the quoin contact [blocks] [posts] and the gate leaf quoin contact [block] [post] shall make tight contact with the wall quoin contact [block] [post].

3.1.8 Miter Guide

Miter guide shall be installed after the contact [blocks] [posts] have been properly set. The guide bracket and roller bracket shall be mounted on gate leaves with leaves in the mitered position. The roller shall be centered accurately in the saddle of the contact [blocks] [posts] and shall be in full contact with the [blocks] [posts]. Adjustment of the miter guide shall be accomplished by adjusting the guide bracket and roller bracket so that the gap behind the contact [blocks] [posts] for the [epoxy] [zinc] filler is kept at the nominal dimension. Proper adjustment of the brackets should allow either gate leaf to be mitered or opened without moving the other leaf. After final adjustments have been made, bolt holes shall be drilled in the brackets and gate leaves, brackets shall be bolted securely in place, and [epoxy] [zinc] filler shall be placed behind the contact [blocks] [posts].

3.1.9 Painting

Exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.10 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate(s), a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.
3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section 26 42 19.10 CATHODIC PROTECTION SYSTEMS FOR LOCK MITER GATES.

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skin Plate Watertightness Test

**************************************************************************
NOTE: Skin plate watertightness tests should not be required when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.
**************************************************************************

After the gate leaf diagonals are prestressed but prior to painting and mounting of seals, skin plate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 400 kPa 60 psi at the nozzle, to one face of the skin plate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]

3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of sector gates and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

1.1  UNIT PRICES

NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.

Select Alternate 1 (one pay item) or Alternate 2 (two pay items). Delete all paragraphs of Alternate not selected.
1.1.1 Furnishing and Installing Sector Gates and Appurtenant Items

******************************************************************************
NOTE: Alternate 1.
******************************************************************************

1.1.1.1 Payment

Payment will be made for costs associated with furnishing and installing sector gates and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of sector gates and appurtenant items including gate leaves, pintle assemblies, hinge assemblies, seal assemblies, walkways, bridgeways, bumpers, fenders, and other items necessary for complete installation.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Furnishing Sector Gates and Appurtenant Items

1.3 SUBMITTALS

********************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

SECTION 35 20 16.39 Page 5
The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.
1.4.2  **Detail Drawings**

Provide detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.2.1  **Fabrication Drawings**

Provide fabrication drawings showing complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

1.4.2.2  **Shop Assembly Drawings**

Provide shop assembly drawings showing details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

1.4.2.3  **Delivery Drawings**

Provide delivery drawings showing descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

1.4.2.4  **Field Installation Drawings**

Provide field installation drawings showing a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing hinge bracket anchors, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing pintle and hinge assemblies, including checking and maintaining alignments during concreting; and methods for installing other appurtenant items.

1.5  **DELIVERY, STORAGE, AND HANDLING**

Provide delivery, handling, and storage of materials and fabricated items as described below.

1.5.1  **Materials and Fabricated Items**

Delivery, handling, and storage of materials and fabricated items shall conform to the requirements specified[ and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.[ Materials and equipment delivered to the site by the Contracting Officer shall be unloaded by the Contractor. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing to the Contracting Officer. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.5.2  **Rubber Seals**

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the
rubber. Rubber seals shall not be distorted during handling.

PART 2  PRODUCTS

2.1  MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work, before completion of the contract; and materials orders, materials lists, and materials shipping bills in conformance with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1  Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, aluminum-bronze, and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1  Structural Steel Shapes

ASTM A36/A36M.

2.1.1.2  Structural Steel Plates

[ASTM A36/A36M,] [ASTM A572/A572M, Grade 50,] [or] [ASTM A588/A588M, Grade 50].

2.1.1.3  Steel Pipe

[ASTM A53/A53M, Type S, Grade B, seamless, black, normal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.] [ASTM A501/A501M, seamless, outside diameter and nominal wall thickness as shown.]

2.1.1.4  Steel Castings

ASTM A27/A27M, Grade [____], Class [____]; or ASTM A148/A148M, Grade [____].

2.1.1.5  Steel Forgings

ASTM A668/A668M, Class [____], carbon content not exceeding 0.35 percent, and chemical composition which results in satisfactory weldability.

2.1.1.6  High-Strength Steel Bar

ASTM A722/A722M, Type [____], and complying with all supplementary requirements.

2.1.1.7  Stainless Steel Bars and Shapes

ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.
2.1.1.8 Stainless Steel Plate, Sheet, and Strip

ASTM A167, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.9 Bronze Castings

ASTM B22/B22M, Copper Alloy UNS No. C91300.

2.1.1.10 Aluminum-Bronze Castings

ASTM A148/A148M, Copper Alloy UNS No. [____].

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers.

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modulus</td>
<td>6.2 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness (Shore Type A)</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M subscript 1 (M subscript 1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus one (1) degree and the duration of immersion shall be 166 hours.
2.1.2.2 [Fabrication]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm[0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>13.8 MPa2,000 psi (min.)</td>
</tr>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.1.3 Bumpers and Fenders

[Bumpers and fenders shall be "Rubbumper," a product of Missouri Dry Dock & Repair Co., or an approved equal.] [Timber bumpers and fenders shall conform to [west coast fir] [or] [southern yellow pine], structural grade, dressed surfacing, pressure treated with creosote conforming to [AWPA P3] in accordance with [AWPA U1]. Bumpers and fenders shall be cut, beveled, or bored as required before being pressure treated.]

2.1.4 Asphalt Mastic

SSPC PS 9.01.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown and specified in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, [Ferritic Steel, Grade [____]] [Austenitic Steel, Grade [____], Class [____]]. Bolts M16 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated on the drawings.
2.3  FABRICATION

2.3.1  Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown. Splices shall occur only where shown or approved. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of appurtenances as required.

2.3.2  Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************

Welding shall conform with [AWS D1.1/D1.1M, AWS D1.2/D1.2M,] the requirements specified, and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [______]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval of the Contracting Officer, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.3.3  Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.4  Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5  Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6  Fabrications

Submit approved samples, prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full
size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded. Fabrications shall conform to the following requirements.

2.3.6.1 Gate Leaf

Gate leaf shall be of welded fabrication except for bolted appurtenances. Gate leaf shall consist of a pintle socket, pipe column, and hinge pin housing integrally framed with horizontal and vertical trusses supporting vertical ribs faced with a continuous skin plate. Pintle socket shall be of cast steel conforming to ASTM A27/A27M. Pintle socket shall be press-fitted with bronze bushing conforming ASTM B22/B22M. Bearing surfaces of the bronze bushing shall have a truly hemispherical 0.4 micrometer 16 microinch finish. Pipe column shall conform to [ASTM A53/A53M] [ASTM A501/A501M]. Hinge pin housing shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. Trusses and vertical ribs shall be of structural steel conforming to ASTM A36/A36M. Skin plate shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade 50]. Gate leaf shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of the gate leaf shall not vary from the nominal dimension or differ from the mating gate leaf by more than 6 mm 1/4 inch. The surfaces of the vertical ribs to which skin plates are to be welded shall not vary from a true plane by more than 5 mm 3/16 inch. The outside surfaces of skin plates welded to the vertical ribs shall not vary from a true plane by more than 5 mm 3/16 inch. Splices in skin plates shall be located only where shown or approved. [In addition to welds specifically indicated on the drawings for nondestructive testing, [_____] percent of the welds in the [hinge pin housing] [joints between trusses and pintle socket] [joints between trusses and hinge pin housing] [joints between vertical webs and skin plate] [and] skin plate shall receive nondestructive testing. The location of these additional welds for testing shall be as directed by the Contracting Officer.] Gate leaf shall be provided complete with pintle assembly, hinge assembly, seal assembly, and other appurtenant components as required for complete installation as specified and shown.

2.3.6.2 Hinge Assembly

Hinge assembly shall consist of hinge bracket support anchor frame, hinge bracket support, hinge bracket, and hinge pin. Hinge bracket support anchor frame shall be a welded structural steel frame with high strength anchor bolts conforming to ASTM A722/A722M for prestressed anchorage of the hinge bracket support. Hinge bracket support and hinge bracket shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. The hinge pin barrel section of the hinge bracket shall be fitted with [a stainless steel collar conforming to ASTM A564/A564M and] [a bronze bushing conforming with ASTM B22/B22M] [an aluminum bronze bushing conforming to ASTM B148]. Hinge pin shall be of [forged steel conforming to ASTM A668/A668M] [stainless steel conforming to [ASTM A276/A276M] [ASTM A564/A564M]]. [In addition to welds specifically indicated on the drawings for nondestructive testing, [_____] percent of the welds in the hinge assembly components shall receive nondestructive testing. The location of these additional welds for testing shall be directed by the Contracting Officer.] [Welded hinge assembly components shall be
stress-relieved by heat-treating after all welding is completed. Stress-relieving shall be performed prior to machining.)

2.3.6.3 Pintle Assembly

Pintle assembly shall consist of pintle base anchor frame, pintle base, pintle socket seal retainer ring assembly, pintle, and pintle socket which shall be an integral component of the gate leaf. Pintle base anchor frame shall be a welded structural steel frame [with high strength anchor bolts conforming to ASTM A722/A722M for prestressed anchorage of the pintle base]. Pintle base shall be of [cast steel conforming to ASTM A27/A27M] [structural steel conforming to ASTM A36/A36M]. Pintle shall be of [cast alloy steel] [forged alloy steel with bearing surfaces of corrosion-resisting steel deposited in weld passes to a thickness of not less than 3 mm 1/8 inch and machined the required shape]. The pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing of the pintle socket by scraping the bushing until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field.

2.3.6.4 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and shall be machine-finished after splicing.

2.3.6.5 Appurtenant Items

Seal plates, seal shapes, pintle socket seal retainer ring assembly, bumpers, fenders, [walkways,] [bridgeways,] and other appurtenant items shall conform to details specified and shown.

2.3.7 Shop Assembly

Shop assembly requirements for sector gates and appurtenant items shall be as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Sector gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. Shop assembly and disassembly work shall be performed in the presence of the Contracting

SECTION 35 20 16.39 Page 13
2.4  **TESTS, INSPECTIONS, AND VERIFICATIONS**

Submit certified test reports for material tests, with all materials delivered to the site.

2.4.1  General

Tests, inspections, and verifications for materials shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.2  Testing of Rubber Seals

**************************************************************************

NOTE: If fluorocarbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUOROCARBON FILM</th>
<th>MACHINE METHOD AT 50 MM2 INCHES PER MINUTE</th>
<th>DEADWEIGHT METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.524 mm0.030 inch</td>
<td>13.6 kg per 25 mm30 pounds per inch width</td>
<td>13.6 kg per 25 mm30 pounds per inch width</td>
</tr>
<tr>
<td>0.726 mm0.060 inch</td>
<td>13.6 kg per 25 mm30</td>
<td>13.6 kg per 25 mm30</td>
</tr>
</tbody>
</table>

3.1  **INSTALLATION**

Perform installation in conformance with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Sector gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1  Embedded Metals

Seal shapes, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded
anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Hinge Assembly Embedded Anchorages

Submit record of the prestressing of hinge bracket anchors immediately after completion of the prestressing operations. The hinge assembly embedded anchorages consisting of the hinge bracket support anchor frame and attached hinge bracket support anchor bolts shall be aligned accurately, leveled, and blocked rigidly in place to prevent displacement before concrete is placed. Hinge bracket support anchor bolts shall be coated with asphalt mastic prior to the placement of first-pour concrete. Hinge bracket support shall be connected to anchor bolts and embedded in second-pour concrete. Anchor bolts shall be prestressed as shown on contract drawings and approved field installation drawings after the concrete has attained the specified strength. A record of the prestressing operations shall be compiled and submitted.

3.1.3 Pintle Base Anchor Frame and Pintle Base

**************************************************************************
NOTE: Design options provided in this paragraph consist of the pintle base bearing directly on an anchor frame embedded in second-pour concrete and anchored with bolts embedded in first-pour concrete, the pintle base bearing directly on second-pour concrete and anchored with bolts attached to an anchor frame embedded in first-pour concrete, and the prestressing of pintle base anchor bolts when attached to an anchor frame embedded in first-pour concrete.
**************************************************************************

[Anchor bolts for the pintle base anchor frame shall be embedded in first-pour concrete. Submit record of the prestressing of the pintle base anchors immediately after the prestressing operations are completed. Pintle base anchor frame shall be attached to the anchor bolts, aligned, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete. Pintle base shall be bolted to the pintle base anchor frame.] [Pintle base anchor frame shall be embedded in first-pour concrete. Pintle base shall be attached to the pintle base anchor bolts extending from the embedded anchor frame, aligned, leveled, blocked rigidly to prevent displacement, and embedded in second-pour concrete.] [Pintle base anchor bolts shall be prestressed as shown on contract drawings and approved field installation drawings. A record of the prestressing operations shall be compiled and submitted.] Concrete pours shall be allowed to set for 72 hours and must attain the specified before any loading is applied.

3.1.4 Pintle

Surfaces of the pintle base shall be cleaned thoroughly prior to installing the pintle. The pintle shaft shall be set in the pintle base and secured by lock-bolting.

3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the
field as required for installation. Pintle socket seal retainer ring assembly shall be attached to the pintle socket and the pintle ball shall be coated with grease prior to setting the gate leaf in place. Pintle grease pipes shall be tapped into pintle bushing in correct register with bushing grease grooves. Grease pipes shall be flushed prior to connecting to bearings. All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the sector gate leaf due to compression of blocking or other causes.

3.1.6 Hinge Bracket and Hinge Pin

Hinge bracket shall be attached to the hinge bracket support after the gate leaf has been set in place. Hinge pin shall be inserted to connect the hinge pin barrel of the hinge bracket to the hinge pin housing of the gate leaf. Hinge bracket shall be adjusted so that the center of the hinge pin is in vertical alignment with the center of the pintle and each gate leaf swings without interference and any point on the moving gate leaf remain in a plane throughout the range of movement.

3.1.7 Painting

Exposed parts of gates and appurtenances, except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.8 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gates, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section 26 42 19.10 CATHODIC PROTECTION FOR LOCK MITER GATE.

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skinplate Watertightness Test

**************************************************************************

NOTE: Skinplate watertightness tests should be deleted when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.

**************************************************************************

After the gate leaves are installed but prior to painting and mounting of seals, skinplate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 400 kPa 60 psi at the
nozzle, to one face of the skinplate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]

3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

NOTE: This guide specification covers the requirements for fabrication, assembly, delivery, and installation of tainter gates, anchorage assemblies, and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 UNIT PRICES

NOTE: Delete paragraph UNIT PRICES and incorporate appropriately edited paragraphs from below into Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES.

1.1.1 Alternate 1

a. "Furnishing Tainter Gates and Appurtenant Items"

(1) Payment will be made for costs associated with furnishing tainter gates and appurtenant items, which includes full compensation for materials, fabrication, shop assembly, and
delivery of tainter gates, including gates, trunnions, trunnion yokes, trunnion pins, and appurtenant items, including cable attachment brackets, seal assemblies, side seal plates, dogging brackets, sill beams, stop beams, and other items necessary for complete installation.

(2) Unit of measure: lump sum.

b. "Furnishing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing tainter gate anchorage assemblies, which includes full compensation for materials, fabrication, and delivery of tainter gate anchorage assemblies, including tainter gate trunnion girders and prestressing assemblies for anchoring trunnion girders to piers [and trunnion yokes to trunnion girders, and other items necessary for complete installation].

(2) Unit of measure: lump sum

c. "Installing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for cost associated with the complete installation of tainter gates anchorage assemblies.

(2) Unit of measure: lump sum

1.1.2 Alternate 2

a. "Furnishing and Installing Tainter Gates and Appurtenant Items"

(1) Payment will be made for costs associated with furnishing and installing tainter gates and appurtenant items, which includes full compensation for materials, fabrication, shop assembly, delivery, and installation of tainter gates, including gates, trunnions, trunnion yokes, trunnion pins, and appurtenant items, including cable attachment brackets, seal assemblies, side seal plates, dogging brackets, sill beams, stop beams, and other items necessary for complete installation.

(2) Unit of measure: lump sum.

b. "Furnishing and Installing Tainter Gate Anchorage Assemblies"

(1) Payment will be made for costs associated with furnishing and installing tainter gate anchorage assemblies, which includes full compensation for materials, fabrication, delivery, and installation of tainter gate anchorage assemblies, including tainter gate trunnion girders and prestressing assemblies for anchoring trunnion girders to piers [and trunnion yokes to trunnion girders, and other items necessary for complete installation].

(2) Unit of measure: lump sum.

1.1.3 Alternate 3

"Furnishing and Installing Tainter Gates, Appurtenant Items, and Tainter Gate Anchorage Assemblies"
(1) Payment will be made for costs associated with furnishing and installing tainter gates, appurtenant items, and tainter gate anchorage assemblies, which includes full compensation for materials, fabrication, shop assembly, delivery, and installation of tainter gates, including gates, trunnions, trunnion yokes, trunnion pins; appurtenant items, including cable attachment brackets, seal assemblies, side seal plates, dogging brackets, sill beams, and stop beams; and tainter gate anchorage assemblies, including tainter gate trunnion girders and prestressing assemblies for anchoring trunnion girders to piers [and trunnion yokes to trunnion girders, and other items necessary for complete installation].

(2) Unit of measure: lump sum.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control
System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**********

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
   Detail Drawings; G[, [_____]]

SD-03 Product Data
   Materials
   Prestressing Assemblies; G[, [_____]]
   Grout Admixture; G[, [_____]]
   Welding; G[, [_____]]

SD-04 Samples
   Materials
   Manufactured Units; G[, [_____]]
1.4 QUALITY ASSURANCE

1.4.1 Qualification of Welders and Welding Operators

Provide qualification of welders and welding operators conforming to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.4.2 Certification of Prestressing Technicians

Submit certificates, for prestressing technicians who will use the proposed system in the work, 30 days prior to the start of prestressing operations certifying by name that the technicians are trained and skilled in the use of the proposed system.

1.4.3 Manufactured Units and Fabricated Items

Samples of manufactured units and shop fabricated shall be full-size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is identified and its location recorded.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Perform delivery, handling, and storage of materials and fabricated items in conformance with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Do not allow prestressing steel materials to come in contact with the earth. Protective wrappings and coverings shall not be removed until immediately prior to use in the work. Each prestressing tendon shall be closely inspected prior to use in the work. Tendons with nicks, pits, bends or damaged threaded ends shall not be used in the work.

1.5.2 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 21 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

PART 2 PRODUCTS

2.1 MATERIALS

System of identification which shows the disposition of specific lots of
approved materials and fabricated items in the work, before completion of
the contract. Provide materials orders, materials lists, and materials
shipping bills conforming with the requirements of Section 05 50 14
STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze,
aluminum-bronze, and other metal materials used for fabrication shall
conform to the requirements shown on the drawings and specified herein and
in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel Shapes

ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

[ASTM A36/A36M,] [ASTM A572/A572M, Grade 50,] [or] [ASTM A588/A588M, Grade
50].

2.1.1.3 Steel Pipe

[ASTM A53/A53M, Type S, Grade B, seamless, black, normal size and weight
class or outside diameter and nominal wall thickness as shown on the
drawings, [plain] [threaded] [threaded and coupled] ends.] [ASTM A501/A501M,
seamless, outside diameter and nominal wall thickness as shown on the
drawings.]

2.1.1.4 Steel Castings

ASTM A27/A27M, Grade [_____,] Class [_____,]; or ASTM A148/A148M, Grade
[_____,].

2.1.1.5 Steel Forgings

ASTM A668/A668M, Class [_____,], carbon content not exceeding 0.35 per cent,
and chemical composition which results in satisfactory weldability.

2.1.1.6 Stainless Steel Bars and Shapes

ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A,
hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,]
[S 45000,] Condition A, age-hardened heat treatment, hot-finished or
cold-finished, Class C.

2.1.1.7 Stainless Steel Plate, Sheet, and Strip

ASTM A267, UNS S 30400; and ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S
40500,]. Plate finish shall be hot-rolled, annealed or heat-treated, and
blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.8 Bronze Castings

ASTM B22/B22M, Copper Alloy UNS No. C91300.

2.1.1.9 Aluminum-Bronze Castings

ASTM B148, Copper Alloy UNS No. [_____,].
2.1.1.10  Prestressing Steel Bar Tendons

ASTM A722/A722M, Type [____], including Supplementary Requirements, except the degree of bending for bend tests shall be 180 degrees. Certified manufacturing records and test reports for tendons shall be provided, identified with specific lots, and approved prior to use of tendons in the work. Manufacturing records for tendons shall include mixing casting, cooling, rolling, cold-stressing to 80 percent of the minimum ultimate strength, and stress-relieving. Test reports shall include chemical analyses, mechanical properties testing and stress-strain curves, mechanical coupling demonstration, and product analyses of finished tendons representing each heat.

2.1.1.11  Steel Bars for Concrete Reinforcement

Steel bars for concrete reinforcement other than steel bar prestressing tendons shall be as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.1.12  Anchorages and Couplers

Submit certificates for anchorages and couplers 30 days prior to the start of prestressing operations. Anchorages and couplers for prestressing tendons shall be of metal of proven corrosion resistance and compatibility with tendons and shall be tested by an approved method and certified to be capable of developing the minimum ultimate strength of tendons without excessive slip. Anchorages shall be plate, bar, or other positive connecting type which allows complete placement and consolidation of concrete around and within its confines and exerts uniform bearing on the concrete. Couplers shall be provided with housing or enclosures which are long enough to permit the necessary movements and fittings which allow complete grouting of all components.

2.1.1.13  Ducts

Ducts for encasing prestressing tendons shall be of the type [shown on the drawings] [approved by the Contracting Officer]. Ducts shall retain shape under the weight of concrete and shall not permit the entrance of cement paste from concrete.

2.1.2  Concrete

As specified in Section 03 30 00 CAST-IN-PLACE CONCRETE [and Section 03 45 33 PRECAST[ PRESTRESSED] STRUCTURAL CONCRETE].

2.1.3  Asphalt Mastic

Asphalt Mastic shall conform to [____].

2.1.4  Premolded Expansion Joint Sheets

As specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

2.1.5  Gaskets for Seal Assemblies

Rubber gasket sheets for seal assemblies shall have nominal Shore A durometer value of [40][55][80] with dimensions as shown on the drawings.
2.1.6 Rubber Seals

NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION below.

2.1.6.1 General

Rubber seals shall be [fluoro-carbon (Teflon) clad rubber seals of the mold type only, shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:

<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>

</table>

*The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 hours plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as W1 (W1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.6.2 [Fabrication]

Rubber seals shall have a fluoro-carbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant fluoro-carbon Film No. 4508, or equal, and shall have the following physical properties:

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish.
lengths shown on the drawings and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluoro-carbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.]

2.1.7 Cement for Grout

ASTM C150/C150M, Type I or II.

2.1.8 Grout Admixture

Submit manufacturer's description of grout admixture, for approval, 30 days prior to the use of the material in the work. Grout admixture shall be a shrinkage compensating type which produces 2 percent maximum and 10 percent maximum unconfined expansion of the grout when tested in accordance with ASTM C940, shall not contain chlorides, fluorides, or nitrates and may be dispensed in solid or liquid form. Complete manufacturer's description of the grout admixture shall be submitted for approval.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements shown on the drawings and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325, Type [____], [hot-dip galvanized] or ASTM A490, Type [____]. Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or ASTM A320/A320M, Ferritic Steel, Grade [____] [Austenitic Steel, Grade [____], Class [____]]. Bolts 13-mm 1/2-inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated on the drawings.

2.3 GROUT

Grout shall be a mixture of Portland cement specified in paragraph CEMENT FOR GROUT, shrinkage compensating admixture specified in paragraph GROUT ADMIXTURE, and potable water. Final mix proportions shall be based on test results of sample mixtures. The water content of grout shall be the minimum necessary for proper placement but the water-cement ratio shall not exceed 0.50 by weight. The fluidity of grout shall be determined in accordance with ASTM C939/C939M. The efflux time of a grout sample immediately after mixing shall not be less than 11 seconds. The minimum 7-day compressive strength of 50-mm 2-inch grout cubes molded, cured and tested in accordance with ASTM C109/C109M shall be 17.2 MPa 2500 psi.
2.4  FABRICATION

2.4.1  Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.1.1  Fabrication Drawings

Show on the fabrication drawings complete details of materials, tolerances, connections, machined surface finishes, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.4.1.2  Shop Assembly Drawings

Provide on the shop assembly drawings details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.4.1.3  Delivery Drawings

Provide on the delivery drawings descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.4.1.4  Field Installation Drawings

Provide on the field installation drawings a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for installation of prestressing assemblies, including proposed stressing sequences and stressing calculations for anchorage assemblies.

2.4.2  Structural Fabrication

Structural fabrication shall conform with the requirements shown on the drawings and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown on the drawings. Dimensional tolerances shall be as specified and shown on the drawings. Splices shall occur only where shown on the drawings or approved by the Contracting Officer. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of appurtenances as required.

2.4.3  Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************
Welding shall conform with the requirements [of AWS D1.1/D1.1M, AWS D1.2/D1.2M,] specified herein, and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown on the contract drawings and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated on the drawings and as follows: [____]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval of the Contracting Officer, by dye penetrant, magnetic particle tests, or ultrasonic tests. [Components shall be stress-relief heat treated after welding where shown on the drawings. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.]

2.4.4 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.5 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.7 Fabrications

Submit samples for approval prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded.

2.4.7.1 Gates

Gates shall be of welded fabrication except for bolted appurtenances as shown on the drawings. Structural steel framing members shall be of structural steel conforming to ASTM A36/A36M. Skin plate shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50,] [ASTM A588/A588M, Grade 50]. Gates shall be shop-fabricated. Contractor proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved by the Contracting Officer and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded. The overall height of gates shall not vary from the nominal dimension by more than 6 mm 1/4 inch. The surfaces of framing elements which support skin plates shall be in true alignment within 5 mm 3/16 inch so that skin plates will be in full bearing on all contact surfaces before being welded. The outside faces of skin plates after being welded to framing elements shall not vary from the surface established on the drawings by more than 5 mm 3/16 inch. Splices in skin plates shall be located only where shown on the drawings. Trunnions shall be an integral part of the gate framing and shall be stress-relieved by heat treatment.
after welding. The machining of trunnion hubs and bushings shall be performed after welding of the hubs is completed. The classification of fit between trunnion hubs and bushings shall be as shown on the drawings. Dowel holes and grease holes shall be drilled in bushings after installation in trunnion hubs. Gates shall be provided with seal assemblies and other appurtenant items as shown on the drawings.

2.4.7.2 Trunnion Pins

Trunnion pins shall be of [[cast steel conforming to [ASTM A27/A27M] [ASTM A148/A148M]] [alloy steel forging conforming to [ASTM A668/A668M] clad with corrosion resisting steel [weldment] [shrunken-on sleeve] as shown on the drawings. The clad surface shall be machined after completion of all welding. The thickness of the cladding after final machining shall be not less than 25 mm 1 inch thick] [corrosion resisting steel as shown on the drawing].

2.4.7.3 Trunnion Yokes

Trunnion yokes shall be provided complete with adjusting plates and bolts and thrust washers. Yokes shall be stress-relieved by heat treatment and machined to the class to fit shown on drawings after fabrication welding is completed.

2.4.7.4 Prestressing Anchorage Assemblies

Submit prestressing records immediately after the work is completed. Furnish descriptions of the proposed method for installing the prestressing assemblies, for approval, 30 days prior to the start of prestressing operations. Prestressing assemblies shall consist of prestressing tendons, anchorages, ducts, grout and other appurtenances as required and shown on the drawings.

a. Prestressing tendons shall be as specified in paragraph PRESTRESSING STEEL BAR TENDONS.

b. Anchorages shall be as specified in paragraph ANCHORAGES AND COUPLERS.

c. Ducts shall be as specified in paragraph DUCTS.

d. Grout shall be as specified in paragraph GROUT.

2.4.7.5 Trunnion Girders

Trunnion girders shall be [[cast-in-place] [precast] concrete girders of the 28-day compressive strength shown on the drawings and post-tensioned with prestressing anchorage assemblies. The ducts of the anchorage assemblies shall be cast in the girders in the positions and alignments shown on the drawings. The installation of prestressing assemblies shall be as specified in paragraph PRESTRESSING ANCHORAGE ASSEMBLIES. Reinforcement steel, premolded expansion joint sheets, blockouts and other components of the girders shall be as specified and indicated on the drawings] [structural steel as shown on the drawings].

2.4.7.6 Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the
full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown on the drawings. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown on the drawings and shall be machine-finished after splicing.

2.4.7.7 Appurtenant Items

Cable attachment brackets, dogging brackets, side seal plates, sill beams, stop beams and other appurtenant items shall conform to the requirements specified and shown on the drawings. The sealing surfaces of side seal plates and sill beams shall be flush, straight, and free from offsets, warps, twists or other distortions.

2.4.8 Shop Assembly

Shop assembly requirements for tainter gates, anchorage assemblies and appurtenant items shall be as shown on the drawings and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates shall be assembled completely in the shop to assure satisfactory field installation. Adjoining components and appurtenant items shall be fitted and bolted together to facilitate field connections. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions permit. Rubber seals shall be fitted and drilled to match the seal retainers on the gates, match-marked and removed for shipment. Drilled slots for attaching seals shall allow a minimum adjustment of plus/minus 10 mm 3/8 inch. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise waived in writing by the Contracting Officer. The presence of the Contracting Officer during assembly or disassembly will not relieve the Contractor of any responsibility under this contract.

2.5 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.5.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.5.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluoro-carbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluoro-carbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight
method. A \textit{25 mm 1 inch} long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluoro-carbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>THICKNESS OF FLUORO-CARBON FILM</th>

</tr>
</tbody>
</table>

PART 3   EXECUTION

3.1 INSTALLATION

Perform installation conforming with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Seal shapes, seal plates, frames, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 Trunnion Girders

Trunnion girders shall be anchored to concrete piers as specified and shown on the drawings. [The installation, post-tensioning and grouting of prestressing assemblies for anchoring trunnion girders shall conform to the requirements specified in paragraph PRESTRESSING ASSEMBLIES.]

3.1.3 Trunnion Yokes

Trunnion yokes shall be installed and adjusted in strict accordance with the procedure shown on the drawings. [The final alignment of trunnion yokes shall be performed after the prestressing tendons of the anchoring prestressing assemblies have been post-tensioned partially as specified in paragraph POST-TENSIONING.] Special precautions shall be exercised to align the trunnion yokes so that the center lines of trunnion pins at the opposite ends of each gate are concentrically located on the established horizontal line. The eccentricity of the actual centerline of each trunnion pin with respect to the established horizontal line shall not be more than \textit{0.8 mm 1/32 inch}. The horizontal distance between trunnion yokes...
shall not vary more than 3 mm 1/8 inch from the established dimension. [Second-pour, high-strength concrete fills shall be placed between the bases of trunnion yokes and trunnion girders [and concrete non-shrink grout fills shall be placed between the yokes of trunnion yokes and the abutting faces of concrete piers] after the successful completion of the trial operation specified in paragraph TRIAL OPERATIONS and the final alignment of trunnion yokes.] [Complete tensioning of the prestressing tendons shall be performed after the concrete fills have attained the minimum strengths. The installation, post tensioning and grouting of prestressing assemblies for anchoring trunnion yokes to trunnion girders shall conform to the requirements specified in paragraph PRESTRESSING ASSEMBLIES.]

3.1.4 Gates

**************************************************************************
NOTE: The water-tightness tests on the skinplates should be deleted when complete or spot radiographic or ultrasonic examination of the skinplates is required by the specifications.
**************************************************************************

The trunnion lubrication system lines shall be purged, filled with grease and connected to each trunnion assembly prior to installing gates. The bearing surfaces of trunnion pins and bushings shall be cleaned and coated with grease prior to installing the trunnion pins. Gates shall be assembled in the field in strict conformity with shop match markings. Controlling dimensions and alignments shall be checked and corrected as required before starting field welding. Welding shall be done in a manner such that distortion of gates is prevented. Erection bolts, lugs and ties shall be removed after welding is completed. Holes and depressions shall be filled with weld metal and surface projections shall be removed by grinding. [Skinplate welds shall be tested for water-tightness after the gates are installed but prior to painting and mounting of seals by coating one face of the skinplate with soapsuds and applying air pressure with a hose using a minimum air pressure of 414 kPa 60 psi at the nozzle to the opposite face.] Disclosed leaks shall be sealed with light welds.

3.1.5 Prestressing Assemblies

The proposed method and equipment for installing prestressing anchorage assemblies, including riggings, tensioning jacks, gages, dynamometers and load cells or other devices for measuring stress loads, shall provide for the accurate installation of the assemblies and shall be selected by the Contractor and submitted for approval.

3.1.5.1 Ducts

Ducts shall be accurately placed, aligned and adequately supported at close intervals to limit sag and deviation from established lines when tendons are inserted and concrete is placed. Ducts shall have grout openings at both ends and grout vents as required. Connections and other joints in ducts shall be watertight. Openings shall be adequately protected to prevent the entry of water, concrete or debris. Ducts shall not have blockages, dents or other defects which could cause increased friction between tendons and ducts or restrict grout flow.

3.1.5.2 Steel Bar Prestressing Tendons

Steel bar prestressing tendons shall be inspected before being placed in
ducts to assure that they are not bent, nicked, scored or have damaged threaded ends. Tendons should not be placed in ducts until all welding has been completed on templates, supports or other items near or in contact with the tendons.

3.1.5.3 Anchorages

Anchorages for steel bar prestressing tendons shall be set in a plan normal to the axis of the tendon so that uniform bearing on the concrete is assured and shall be positively connected to tendons. Ends of tendons shall extend beyond anchorages to accommodate testing. End extensions shall be removed after tests are completed and approved.

3.1.5.4 Post-Tensioning

Complete records of the prestressing operation shall be compiled and submitted as required in paragraph GROUT RECORDS. Tensioning of the steel bar prestressing tendons shall be as specified and shown on the drawings. Tendons shall be tensioned a minimum of [_____] days after the casting of concrete piers [and girders]. Tensioning shall not be started until tests on concrete cylinders made and cured under the same conditions as the piers [and girders] indicate that the concrete has attained the required minimum strength. The tensioning operation shall be conducted in a manner so that the load being applied and the elongation of the tendon may be measured at all times. Elongation measurements shall be accurate to 0.25 mm 0.01 inch. Jack gage readings shall be accurate to the nearest 500 kPa 100 psi. If the stress in a tendon determined by gage pressure differ from the stress determined by elongation measurement in excess of 5 percent the cause of the difference shall be determined and corrected before proceeding with the tensioning operation. [Longitudinal tendons in concrete trunnion girders shall be tensioned prior to the placement of the second-pour, high-strength concrete fills for the sections of piers adjacent to the face of trunnion girders.] [The transverse tendons which anchor trunnion girders to piers shall be tensioned after the second-pour concrete fills for the piers have attained the minimum required strength.] [The transverse tendons which anchor trunnion yokes to trunnion girders shall be partially tensioned prior to the trial operation of tainter gates as specified below in paragraph TRIAL OPERATIONS and prior to the final adjustment of trunnion yokes as specified and shown on the drawings. Complete tensioning of these tendons shall not be performed until after the trunnion yokes have been adjusted and the second-pour, high-strength concrete fills between the base of trunnion yokes and the trunnion girders [and the concrete grout fills between the yokes of trunnion yokes and the piers] have attained the required minimum [strength] [strengths].] Exposed ends of prestressing components shall be protected from damage during the tensioning operations; take the safety measures necessary to prevent accidents caused by failure of prestressing components.

3.1.5.5 Verification of Prestressing Forces

Individual prestressing tendons selected by the Contracting Officer shall be tested to verify the sustentation of prestress forces by being subjected to a force equal to the design force between 7 and 14 days after the complete tensioning of all tendons. Tendons which sustain the applied force without being unseated will be considered to be satisfactory. The number of tendons tested shall not exceed 10 percent of all tendons unless a tested tendon is unable to sustain the required test force. If a tested tendon is unable to sustain the required test force all tendons shall be tested and retensioned if required to the initial prestress. Retensioned
tendons shall be retested after 7 days at no additional cost to the Government.

3.1.5.6 Grouting

Prestressing assemblies shall be grouted immediately after complete tensioning of prestressing tendons and verification of prestressing forces. Grout shall conform to the requirements specified in paragraph GROUT. Grouting equipment shall provide continuous mechanical mixing and placing of grout, measure grout mix volume and measure volume of grout placed within 2500 cubic mm 0.1 cubic foot. Grout pump shall be a positive displacement type and have the capacity to develop a pressure of 1.38 MPa 200 psi. Stand-by water flushing equipment shall be provided for flushing out ducts partially grouted and stopped due to blockage or equipment breakdown. Ducts for prestressing tendons shall be flushed free of water, dirt or any other foreign substance and shall be blown out with compressed air until no water comes through just prior to grouting. Ducts shall be pressure grouted at a minimum pressure of 690 kPa 100 psi immediately after post-tensioning has been completed. Grouting shall continue until all air within the duct has been displaced with grout. Once the grouting of a system of prestressing tendons and ducts has been started the grouting operation shall be continuous until that system has been completely grouted. Grout placement records shall be compiled.

3.1.6 Appurtenant Items

Side seal plates, sill beams, stop beams and other items to be embedded in second-pour concrete shall be attached to anchors, aligned, leveled and rigidly blocked to prevent displacement during the placement of concrete. Side seal plates shall be aligned in planes normal to the axis of rotation of the gates and shall be checked before being embedded in concrete to ensure that they do not vary more than 2.5 mm 3/32-inch from the established alignment in an arc length of 3.6 m 12 feet. Welded field splices in exposed metals shall be ground smooth to assure proper sealing. Metal supports for rubber seals shall be continuous and free of waves, winds and distortions. Rubber seals shall be installed after the [skinplate water-tightness test and] gate painting operations have been completed. Seals shall be adjusted after installation so that they are slightly compressed in the closed, unwatered condition to prevent excessive depression and wear in the closed, watered condition. [The heating system for seals shall be installed as shown on the drawings and specified in Section [_____] CREST-GATE-SEAL.]

3.1.7 Trial Operations

Gates shall be trial operated after the complete installation of gates and appurtenant items. Trial operations shall be performed and approved prior to placing the second-pour, high-strength concrete fills around embedded appurtenant items [and between trunnion yokes and trunnion girders and prior to the complete tensioning of the prestressing tendons anchoring the trunnion yokes]. Hoist lifting cables shall be adjusted and trunnion bushings shall be lubricated through the permanent lubrication fittings with an approved, extreme-pressure lubricant before operating the gates. Gates shall move smoothly and without binding or lateral sway when raised and lowered through the complete range of travel. Defects disclosed from trial operations shall be corrected and trial operations repeated by the Contractor at no cost to the Government. Trial operations shall be repeated after complete tensioning and grouting of all prestressing assemblies.
3.1.8 Second-Pour, High-Strength Concrete [and Concrete Grout] Fills

**************************************************************************

NOTE: The zones and strengths of high-strength concrete and concrete grout should be shown on the drawings.
**************************************************************************

The second-pour, high-strength concrete fills for the sections of piers adjacent to the face of trunnion girders [and the space between the base of trunnion yokes and trunnion girders] [and the concrete grout fills between the yokes of trunnion yokes and the piers] shall be as shown on the drawings and as specified in Section 03 30 00 CAST-IN-PLACE CONCRETE.

3.1.9 Painting

Exposed parts of gates and appurtenances, except machined surfaces, stainless steel surfaces, surfaces of anchorages embedded in concrete, [cathodic protection system anodes,] and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.10 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gates, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 CATHODIC PROTECTION SYSTEM

The cathodic protection system shall conform to Section [26 42 17.00 10 CATHODIC PROTECTION SYSTEM (IMPRESSED CURRENT)] [26 42 19.10 CATHODIC PROTECTION SYSTEMS (IMPRESSED CURRENT) FOR LOCK MITER GATES].

3.3 OPERATING MACHINERY

Operating machinery shall conform to Section 35 01 41.00 10 ELECTROMECHANICAL OPERATING MACHINERY FOR LOCKS.

3.4 FIELD TESTS AND INSPECTIONS

3.4.1 [Skinplate Watertightness Test

**************************************************************************

NOTE: Skinplate watertightness tests should be deleted when complete or spot radiographic or ultrasonic examination of the skinplate is required by the specifications.
**************************************************************************

After the gate leaves are installed but prior to painting and mounting of seals, skinplate welds shall be tested for watertightness by applying air pressure with a hose, using a minimum air pressure of 414 kPa 60 psi at the nozzle, to one face of the skinplate with a light coating of soapsuds on the opposite face. Disclosed leaks shall be sealed with light welds.]
3.4.2 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate to the Contracting Officer's satisfaction that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no cost to the Government. The trial operation shall be repeated after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

3.5 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

UNIFIED FACILITIES GUIDE SPECIFICATIONS

References are in agreement with UMRL dated July 2020

SECTION 35 20 16.53

VERTICAL LIFT GATES

01/08

NOTE: This guide specification covers the requirements for the fabrication, assembly, delivery, and installation of vertical lift slide gate, vertical lift wheel gate, and vertical lift tractor gate and appurtenant items. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

1.1 LUMP SUM PRICES

NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (LUMP SUM PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.

Select Alternate 1 (one pay item) or Alternate 2 (two pay items). Delete all paragraphs of Alternate not selected.
1.1.1  Furnish & Install Gate & Appurtenances

**************************************************************************
NOTE: Alternate 1, Vertical Lift Slide Gate.
**************************************************************************

1.1.1.1  Payment

Payment will be made for costs associated with furnishing and installing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.1.2  Unit of Measure

Unit of measure: lump sum.

1.1.2  Furnish Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Slide Gate.
**************************************************************************

1.1.2.1  Payment

Payment will be made for costs associated with furnishing vertical lift slide gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery, of vertical lift slide gate and appurtenant items including gate leaf, stem, stem guides, leaf nuts, leaf nut wrench, seal collars, frame, [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate] for supporting operating machinery, [lock assembly,] [leaf springs,] [air vent liner,] and other appurtenances necessary for complete installation.

1.1.2.2  Unit of Measure

Unit of Measure: lump sum.

1.1.3  Install Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Slide Gate.
**************************************************************************

1.1.3.1  Payment

Payment will be made for costs associated with installing vertical lift slide gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift slide gate and appurtenant items.
1.1.3.2 Unit of Measure

Unit of measure: lump sum.

1.1.4 Furnish & Install Wheel Gate & Appurtenances

**************************************************************************

NOTE: Alternate 1, Vertical Lift Wheel Gate.
**************************************************************************

1.1.4.1 Payment

Payment will be made for costs associated with furnishing and installing vertical lift wheel gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift wheel gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.4.2 Unit of Measure

Unit of measure: lump sum.

1.1.5 Furnish Wheel Gate & Appurtenances

**************************************************************************

NOTE: Alternate 2, Vertical Lift Wheel Gate.
**************************************************************************

1.1.5.1 Payment

Payment will be made for costs associated with furnishing vertical lift wheel gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of vertical lift wheel gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.5.2 Unit of Measure

Unit of measure: lump sum.

1.1.6 Install Wheel Gate & Appurtenances

**************************************************************************

NOTE: Alternate 2, Vertical Lift Wheel Gate.
**************************************************************************

1.1.6.1 Payment

Payment will be made for costs associated with installing vertical lift wheel gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift wheel gate and appurtenant items.

1.1.6.2 Unit of Measure

Unit of measure: lump sum.
1.1.7 Furnish & Install Tractor Gate & Appurtenances

**************************************************************************
NOTE: Alternate 1, Vertical Lift Tractor Gate.
**************************************************************************

1.1.7.1 Payment

Payment will be made for costs associated with furnishing and installing vertical lift tractor gate and appurtenant items, which includes full compensation for the materials, fabrication, delivery, installation, and testing of vertical lift tractor gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.7.2 Unit of Measure

Unit of measure: lump sum.

1.1.8 Furnish Tractor Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Tractor Gate.
**************************************************************************

1.1.8.1 Payment

Payment will be made for costs associated with furnishing vertical lift tractor gate and appurtenant items, which includes full compensation for the materials, fabrication, and delivery of vertical lift tractor gate and appurtenant items including gate leaf, frame, guides, [lifting sling,] [lifting beam assembly,] [dogging devices,] [conduit liner,] [air vent,] and other appurtenances necessary for complete installation.

1.1.8.2 Unit of Measure

Unit of Measure: lump sum.

1.1.9 Install Tractor Gate & Appurtenances

**************************************************************************
NOTE: Alternate 2, Vertical Lift Tractor Gate.
**************************************************************************

1.1.9.1 Payment

Payment will be made for costs associated with installing vertical lift tractor gate and appurtenant items, which includes full compensation for the complete installation and testing of vertical lift tractor gate and appurtenant items.

1.1.9.2 Unit of Measure

Unit of measure: lump sum.
1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM A320/A320M (2017b) Standard Specification for Alloy-Steel and Stainless Steel Bolting for Low-Temperature Service

ASTM A490M (2014a) Standard Specification for High-Strength Steel Bolts, Classes 10.9 and 10.9.3, for Structural Steel Joints (Metric)

U.S. GENERAL SERVICES ADMINISTRATION (GSA)

FS RR-W-410 (Rev H) Wire Rope and Strand

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions

SECTION 35 20 16.53 Page 6
in Section 01 33 00 SUBMITTAL PROCEDURES and edit
the following list to reflect only the submittals
required for the project.

The Guide Specification technical editors have
designated those items that require Government
approval, due to their complexity or criticality,
with a "G." Generally, other submittal items can be
reviewed by the Contractor's Quality Control
System. Only add a "G" to an item, if the submittal
is sufficiently important or complex in context of
the project.

For submittals requiring Government approval on Army
projects, a code of up to three characters within
the submittal tags may be used following the "G"
designation to indicate the approving authority.
Codes for Army projects using the Resident
Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office
(Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for
Resident Office; and "PO" for Project Office. Codes
following the "G" typically are not used for Navy,
Air Force, and NASA projects.

The "S" following a submittal item indicates that
the submittal is required for the Sustainability
eNotebook to fulfill federally mandated sustainable
requirements in accordance with Section 01 33 29
SUSTAINABILITY REPORTING. Locate the "S" submittal
under the SD number that best describes the
submittal item.

Choose the first bracketed item for Navy, Air Force
and NASA projects, or choose the second bracketed
item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation;
submittals not having a "G" designation are for [Contractor Quality Control
approval.][information only. When used, a designation following the "G"
designation identifies the office that will review the submittal for the
Government.] Submittals with an "S" are for inclusion in the
Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY
REPORTING. Submit the following in accordance with Section 01 33 00
SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detail Drawings; G[, [_____]]

SD-03 Product Data

Materials

Welding; G[, [_____]]

Materials
SD-06 Test Reports
Tests, Inspections, and Verifications
Acceptance Trial Operation and Test

1.4 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Perform delivery, handling, and storage of materials and fabricated items conforming to the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Unload materials and equipment delivered to the site by the Contracting Officer. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify of such in writing within 24 hours after delivery.

1.5.2 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.6 WARRANTY

**************************************************************************
NOTE: Designated appurtenances of the gate assembly may be guaranteed for a minimum period of 1 year from the date of acceptance thereof, either for beneficial use or final acceptance, whichever is earlier, against defective materials and workmanship. Such guarantees will require the Contractor to furnish and install new replacement parts immediately upon receipt of notice from the Government of the failure of any part of the guaranteed items during the warranty period. These warranty requirements will be covered in the CONTRACT CLAUSES and this paragraph should be deleted from this section of the specifications.
**************************************************************************

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work before
completion of the contract. Furnish materials orders, material lists and material shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, monel, [babbit,] steel forgings, steel castings, stainless steel, bronze, aluminum bronze, brass and other metal materials used for fabrication shall conform to the requirements as shown and as specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.1.1.1 Structural Steel

Structural steel shall conform to ASTM A36/A36M.

2.1.1.2 Structural Steel Plates

Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade [______]].

2.1.1.3 Steel Pipe

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.4 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.5 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,] [S 41008]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.2 Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, omit paragraphs FABRICATION OF RUBBER SEALS AND TESTING OF RUBBER SEALS.
**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only] [compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers].

2.1.2.1 Physical Characteristics

Physical characteristics of the seals shall meet the following requirements:
<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent</td>
<td>6.2 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>(Shore Type A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>*Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs)</td>
<td>80 percent of tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees for 22 hours plus or minus 1/4 hour. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as $M_{1}$ ($M_{1}$ is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree and the duration of immersion shall be 166 hours.

2.1.2.2 Fabrication of Rubber Seals

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.726] [1.524] mm [0.030] [0.060] inches thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following physical properties:

<table>
<thead>
<tr>
<th>Tensile Strength</th>
<th>13.8 MPa 2,000 psi (min.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elongation</td>
<td>250 percent (min.)</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform with the requirements as shown and as specified and in Section 05 50 15 CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

[High-strength bolts, nuts, and washers shall conform to ASTM A325M]
ASTM A325, Type [______], [hot-dip galvanized] [_____] or ASTM A490M
ASTM A490, Type [______].] [Bolts, nuts, studs, stud bolts and bolting materials other than high-strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] [_____] or ASTM A320/A320M, [Ferritic Steel, Grade [______]] [Austenitic Steel, Grade [______], Class [_____]].] Bolts 13 mm 1/2 inch and larger shall have hexagon heads. The finished shank of bolts shall be long enough to provide full bearing. Washers for use with bolts shall conform to the requirements specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated.

2.2.3 Sheaves

Sheaves shall be of cast steel conforming to ASTM A27/A27M, sized for the wire rope used.

2.2.4 Wire Rope

Wire rope shall conform to FS RR-W-410, Type [______], Class [______], Construction [______], [wire size,] [strand seizing] as indicated.

2.2.5 Wheels

Wheels shall be short hub or long hub, rigid type, heavy duty steel casters fabricated with steel castings conforming to ASTM A148/A148M. Wheels shall be of the size and load capacity shown. Wheel shall be provided with lubrication fittings, roller bearings, and removable axle or shaft. Wheel treads shall be machined-finished as shown. Unless otherwise specified or shown, shafts for wheels shall be stainless steel conforming to ASTM A276/A276M, UNS S 30400.

2.3 FABRICATION

2.3.1 Detail Drawings

Submit detail drawings, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings, conforming to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.1.1 Fabrication Drawings

Fabrication drawings shall show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.

2.3.1.2 Shop Assembly Drawings

Shop assembly drawings shall provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3 Delivery Drawings

Delivery drawings shall provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.
2.3.1.4 Field Installation Drawings

******************************************************************************************************************

NOTE: If zinc filler is not specified, delete requirements for procedures and equipment for it.
******************************************************************************************************************

Field installation drawings shall provide a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment; methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler; procedures and equipment used for heating and placing of the zinc filler; and methods for installing other appurtenant items.

2.3.2 Structural Fabrication

******************************************************************************************************************

NOTE: Delete reference to cathodic protection if not required for project.
******************************************************************************************************************

Structural fabrication shall conform to the requirements as shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Dimensional tolerances shall be as specified and as shown. Splices shall occur only where shown. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation. Provisions shall be made for the installation of cathodic protection system devices and other appurtenances as required.

2.3.2.1 Welding

******************************************************************************************************************

NOTE: List applicable welds requiring radiographic examination. Delete reference to stress-relieving if not applicable for the project.
******************************************************************************************************************

Submit schedules of welding procedures for structural steel conforming with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be of the type shown and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated and as follows: [______]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise situated where radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests. Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed...
prior to the attachment of miscellaneous appurtenances.

2.3.2.2 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.2.3 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.2.4 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.3 Slide Gate Leaf

Slide gate leaf shall be of single-component structural fabrication. Slide gate shall be shop fabricated and shall be provided complete with gate stem, stem guides, leaf nut, leaf nut spanner wrench, bar seals, seal collars, [lock assembly,] [leaf springs,] and other appurtenant items as required for installation. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than 1/16 inch to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than 2 mm 1/16 inch. Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Gate leaf shall be stress-relieved prior to the attachment of bar seals. Surfaces where bar seals are attached shall be accurately machined to provide uniform bearing for the full contact dimensions. Top and side bar seals shall be firmly butted together at the corners. The ends of side bar seals shall be flush with the bottom seating surface of the gate leaf. Final machining of bar seals shall be performed after they are attached to the gate leaf. The bottom seat of the gate leaf shall be machined for a tight fit with the gate frame sill.

2.3.4 Slide Gate Frame and Bonnet

**************************************************************************
NOTE: Edit this paragraph to fit the project.
**************************************************************************

Slide gate frame and bonnet shall be shop fabricated. Guiding and seal surfaces of slide gate frame and bonnet shall be in a true vertical plane and shall be machined finished. Unmachined surfaces exposed to water flow shall match at joints between component parts, shall not depart from true planes shown by more than 2 mm 1/16 inch and shall be free of offsets or irregularities greater than 2 mm 1/16 inch. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. The bottom seat of the gate leaf shall be machined for a tight fit with the gate frame sill. Gate frame and bonnet shall be stress relieved prior to the attachment of bar seals. Surfaces where bar seals are attached shall be accurately machined to provide uniform bearing for the full contact dimensions. Top, side, and invert bar seals shall be firmly butted together at the corners. Final machining of
bar seals shall be performed after they are attached to the gate frame and bonnet. Babbit shall be poured in the gate frame sill and peened before machining the frame. When machining the gate frame sill, the tool travel shall be parallel to the long dimension of the babbit.

2.3.5 Slide Gate Bonnet Cover, Pedestal and Base Plate

 **************************************************************************
 NOTE: Edit this paragraph to fit the project.  
 **************************************************************************

The flanges of the bonnet cover, pedestal and base plate for the supporting the operating machinery for the slide gate shall be accurately machined and drilled to match mating flanges and provide the required true alignment. Unmachined oil-contacting surfaces of bonnet cover and pedestal shall be coated with alkyd resin as specified for the unmachined oil-contacting surfaces of hydraulic cylinder heads. Base plate dimensions may be altered to fit the operating machinery furnished, provided the basic configuration, plate thickness, and number and sizes of fasteners are equal to that shown and the altered dimensions are approved.

2.3.6 Wheel Gate Leaf

 **************************************************************************
 NOTE: Delete first sentence if not applicable for the project.  
 **************************************************************************

Wheel gate leaf shall be of single-component structural fabrication. Wheel gate leaf shall be shop fabricated and shall be provided complete with lifting brackets, wheel assemblies, seal assemblies, [guide shoes,] [plates,] [dogging brackets,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and notify the Contracting Officer if an unreasonable amount of counter-weighting is required to attain the center of gravity as designed. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than 2 mm 1/16 inch to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than 2 mm 1/16 inch. Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than 2 mm 1/16 inch. Gate leaf shall be stress relieved prior to the attachment of seal assemblies and other appurtenant items.

2.3.6.1 Wheel Gate Leaf Lifting Brackets

Fabrication details of wheel gate leaf lifting brackets shall be closely coordinated with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.

2.3.6.2 Wheel Gate Leaf Wheel Assembly

Wheel assemblies shall be products of a manufacturer regularly engaged in the manufacture of such products. Each wheel assembly shall be provided complete with wheel, shaft, roller bearing, lock washer, lock nut, bearing cover, seal housing, grease seal, seal retainer, shaft lock plate, lubrication fittings, fasteners, and other accessories as required for
complete and proper installation. Wheel diameter and thickness shall not be changed from that shown. The dimensions and tolerances of other components may be changed as required for compatibility with the manufacturer's product.

2.3.6.3 Wheel Gate Leaf Seal Assembly

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field-spliced only where shown and machine finished after splicing.

2.3.7 Wheel Gate Frame and Guides

**************************************************************************
NOTE: Delete last sentence if not applicable to the project.
**************************************************************************

Exposed unmachined surfaces of wheel gate frame and guides shall match at joints between component parts, shall not depart from true planes shown by more than 2 mm 1/16 inch, and shall be free of offsets or irregularities greater than 2 mm 1/16 inch. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. Surfaces of frames and guides to receive seal bars and wheel track bars shall be accurately machined to provide uniform bearing for the full contact dimensions. Seal bars shall be firmly butted together at corners. Bearing surfaces of wheel track bars and sealing surfaces of seal bars shall be machined to the tolerances shown to provide uniform bearing and sealing at all points of contact. Final machining of seal bars and wheel track bars shall be performed after they are attached to the gate frame and guides. Anchor bolt holes for gate frame and guides shall be accurately located using Government-furnished templates which provide the installation location of anchor bolts.

2.3.8 Wheel Gate Lifting Sling

Wheel gate lifting sling shall be of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.3.9 Wheel Gate Lifting Beam Assembly

Wheel gate lifting beam assembly shall be fabricated as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. The lifting beam shall be stress relieved prior to final machining and attachment of the roller and counterweight assemblies.
2.3.10 Tractor Gate Leaf

Tractor gate leaf shall be of single-component structural fabrication. Tractor gate leaf shall be shop fabricated and shall be provided complete with roller train assemblies, lifting brackets, seal assemblies, guide [shoes,] [plates,] [dogging brackets,] [pier guides,] [pier ties,] and other appurtenant items as required for installation and proper operation. Check the design center of gravity of the gate leaf prior to fabrication and give notification if an unreasonable amount of counterweighting is required to attain the center of gravity as designed. Surfaces of leaf framing elements to which skin plates are to be welded shall not vary from a true plane by more than \(2 \text{ mm} \) \(\frac{1}{16} \text{ inch}\) to provide uniform bearing. The outside surfaces of skin plates welded to framing elements shall not vary from a true plane by more than \(2 \text{ mm}1/16 \text{ inch}\). Splices in skin plates shall be located only where shown. The overall width and height of the fabricated gate leaf shall not vary from the respective dimensions shown by more than \(2 \text{ mm} \frac{1}{16} \text{ inch}\). Gate leaf shall be stress relieved prior to the attachment of seal assemblies and other appurtenant items.

2.3.10.1 Tractor Gate Leaf Lifting Brackets

Fabrication details of tractor gate leaf lifting brackets shall be closely coordinated with the details of the [lifting sling] [lifting hoist] [engaging and disengaging mechanism of the lifting beam assembly] to assure proper operation.

2.3.10.2 Tractor Gate Leaf Roller Train Assemblies

Roller train assemblies shall consist of roller guides, track plates, roller train, and roller train cover. Roller guides shall be adjustable and removable without dismantling the roller train. Turned bolts, jack screws, shims for mounting and adjusting roller guides, and cap screws for attaching track plates shall be provided as shown. Track plates shall be attached to the gate leaf so that the side faces of the track plates are parallel to a vertical plane within \(2 \text{ mm} \frac{1}{16} \text{ inch}\). The track surfaces of track plates shall be machined finished to a plane parallel to a common plane within \(2 \text{ mm} \frac{1}{16} \text{ inch}\) after being attached to the gate leaf. Roller train shall be provided complete with pins, link bars, retaining rings, and other appurtenances as shown and as required for proper installation and operation.

2.3.10.3 Tractor Gate Leaf Guide Shoes

Guide shoes shall be attached to the gate leaf for drilling and reaming for bolting. Guide shoes shall be accurately located on the gate leaf in a true vertical plane with each other in the upstream-downstream direction. Lines passing through face of guide shoes on each side of leaf shall be parallel within \(2 \text{ mm} \frac{1}{16} \text{ inch}\).

2.3.10.4 Tractor Gate Leaf Seal Assemblies

Seal assemblies shall consist of rubber seals, stainless steel retainer and spacer bars, and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper
installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. Vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Stainless steel retainer bars shall be field spliced only where shown and machine finished after splicing.

2.3.11 Tractor Gate Frame and Guides

NOTE: Delete last sentence if not applicable for the project.

Exposed unmachined surfaces of tractor gate frame and guides shall match at joints between component parts, shall not depart from true plane shown by more than 2 mm 1/16 inch, and shall be free of offsets or irregularities greater than 2 mm 1/16 in. Allowable offsets or irregularities less than 2 mm 1/16 inch shall be ground to a bevel of not greater than one on twenty-four. Surfaces of frames and guides to receive roller track plates and seal plates shall be accurately machined to provide uniform bearing for the full contact dimensions. Seal plates shall be firmly butted together at corners. Roller bearing surfaces of track plates and sealing surfaces of seal plates shall be machined to the tolerances shown to provide uniform bearing and sealing at all points of contact. Final machining of track plates and seal plates shall be performed after they are attached to the gate frame and guides. Anchor bolt holes for gate frame and guides shall be accurately located using Government furnished templates which provide the installation location of anchor bolts.

2.3.12 Tractor Gate Lifting Sling

Tractor gate lifting sling shall be of wire rope with thimble and socket fittings attached to the wire rope in a manner that develops the full strength of the wire rope.

2.3.13 Tractor Gate Lifting Beam Assembly

Tractor gate lifting beam assembly shall be fabricated as shown for automatic engaging and disengaging with the lifting brackets of the gate leaf. The lifting beam shall be stress relieved prior to final machining and attachment of the roller and counterweight assemblies.

2.3.14 Appurtenant Items

The fabrication requirements for [air vents,] [air vent liner,] [conduit liner,] [dogging devices,] [pier tie anchors,] [gate leaf pier guides,] and other appurtenant items shall conform to the details shown.

2.3.15 Shop Assembly

Shop assembly requirements for gate, gate frame and appurtenant items shall be as shown and as specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gate, frame, guides, and appurtenant items shall be assembled completely in the shop to assure satisfactory field
installation. The matchmarking of unassembled components shall be carefully preserved until the components are assembled. Adequate support shall be provided during assembly to maintain components within 2 mm 1/16 inch of actual installation planes. Mating surfaces and machined surfaces shall be coated with a rust preventive coating until assembled. Other connecting surfaces which are not required to be disassembled for shipment shall be thinly coated with an approved rust preventive coating before being joined. Adjoining components shall be fitted and bolted together to facilitate field connections. Shop assembled components shall be delivered assembled, if practically permitted by shipping and field installation conditions. Assembled components shall be shop welded in their final positions as much as delivery and field installation conditions allow. Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless otherwise approved. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.3.15.1 Gate Leaf

**************************************************************************
NOTE: This paragraph must be edited to fit the project.
**************************************************************************

Shop assembly of the gate leaf shall be in the [vertical position] [and] [horizontal position with the skin side of the gate leaf facing down]. Shop assembly shall include the attachment of all accessories to the gate leaf. The [wheel gate leaf] [and] [tractor gate leaf] shall be lifted by the lifting brackets and inspected for balance about the center of gravity after being shop assembled. If the gate leaf is out of plumb by more than 6 mm 1/4 inch in the total length in a vertical plane in the upstream-downstream direction, or by more than 2 mm 1/16 inch in the total width in a vertical plane perpendicular to the vertical plane in the upstream-downstream direction, it shall be balanced by counterweighting or some other method as approved at the Contractor's expense.

2.3.15.2 Wheel Assemblies

The gate leaf shall be supported in the horizontal position for adjusting wheel assemblies so that the wheels of the attached wheel assemblies are free to rotate to allow the proper adjustment. Attached wheel assemblies shall be adjusted so that the wheels remain perpendicular to the gate leaf and the contact surfaces of the wheels on each side of the gate leaf are in a single plane within 0.127 mm 0.005 inch when rotated 360 degrees. The final adjustment of wheel assemblies shall be made after the gate leaf is assembled with the gate frame and guides in the horizontal position. The top of each wheel shall be tapped to insure that the weight of the wheel assembly has caused the shaft to bear firmly on the supporting framing of the gate leaf. Wheel assemblies shall then be adjusted so that the tolerance on the distance between the plane through the downstream faces of the wheels and the plane through the downstream machined surfaces of the side bar supports for the seal assemblies shall not exceed 1 mm 1/32 inch. After wheel assemblies have been adjusted, they shall be locked in position by drilling the lock plate, support plate, and shaft and installing cap screws as shown. Wheel assemblies shall be lubricated after being locked in position with a lubricant that is suitable for underwater operation, equal to the lubricant recommended by the manufacturer of the wheel roller bearings, and as approved. Additional lubricant shall be applied at regular intervals until final acceptance of the work.
2.3.15.3  Roller Train Assemblies

Roller trains shall be mounted on the track plates with the gate leaf in the vertical position. Roller guides shall be adjusted so that the roller trains are in alignment and can traverse freely without binding and with a maximum sag of 19 mm 3/4 inch at the bottom. After the roller trains are mounted, the gate leaf shall be maintained in a vertical position unless the roller trains are securely restrained from sagging.

2.3.15.4  Guide Shoes

Guide shoes shall be drilled and reamed for bolting to the gate leaf while attached to the gate leaf. Guide shoes shall be accurately located on the gate leaf in a true plane with each other in the upstream-downstream direction and parallel to the plane established by the downstream machined surfaces of the side bar supports for the seal assemblies. Shims shall be provided as required.

2.3.15.5  Seal Assemblies

Seal assemblies shall be attached to the gate leaf during shop assembly and removed for shipment. The rubber seals of the assemblies shall be accurately fitted, drilled to match the seal retainers, match marked, and removed for shipment.

2.3.15.6  Lifting Beam Assembly

The lifting beam assembly shall be completely shop assembled in the sequence and manner shown. The balance of the completed assembly shall be checked by lifting the assembly by the pick-up pin. If the lifting beam is out of true horizontal by more than 10 mm 3/8 inch, counterweighting or some other method approved shall be used to balance the assembly at the Contractor's expense.

2.3.15.7  Dogging Devices

Dogging devices shall be completely shop assembled. Pin holes shall be drilled in base plates and dogs with these components in assembly.

2.4  TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified material test reports with all material delivered to the site. Tests, inspections, and verifications for materials and fabricated items shall conform to the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.1  Testing of Rubber Seals

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:
2.4.2 Inspection

Shop assembled components shall be inspected for accurate fit and compliance with dimensional tolerances. Sealing, guiding, and connecting surfaces shall be inspected to determine if their planes are true, parallel, and in uniform contact with opposing surfaces. With the gate leaf closed and uniformly blocked in the sealing position, gate leaf [wheels,] [rollers,] [bar seals,] [and] [rubber seals] shall be inspected to determine if they are in continuous contact with [track] [and] [seal plates]. [Compression of rubber seals shall not vary by more than 1 mm/32 inch.] [It shall not be possible to insert a feeler gauge of greater than 0.076] 0.003 [0.127] 0.005 mm thickness at any point between bar seals and seal plates.)

2.4.3 Operation Tests

******************************************************************************************
NOTE: This paragraph must be edited to fit the project.******************************************************************************************

The operation of the shop-assembled gate assembly shall be tested by opening and closing the gate several times by use of the operating machinery. The force used to operate the gate shall be the minimum required to open and close the gate. Since the sill of the unembedded gate frame is not fully supported during the operation tests, special precaution shall be taken to prevent the application of excessive force on the gate leaf and frame when the gate is closed. The operation of the lifting beam shall be tested by engaging and disengaging the lifting beam several times. Adjustments shall be made as required until operations are satisfactory. The gate assembly shall be tested hydrostatically by applying a hydrostatic pressure of [_____] kPa psi, measured at the sill of the gate frame, to the upstream side of the gate leaf in the closed position. For conducting the hydrostatic testing, the gate frame shall be bulkheaded or restrained by some other method as approved. Under hydrostatic testing, the gate seals shall be sufficiently tight to prevent water leakage.

PART 3   EXECUTION

3.1 INSTALLATION

Installation shall conform with the requirements specified and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gate and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant before assembly and installation. Components to be field welded shall be in correct alignment before welding is commenced.
3.1.1 Embedded Metals

Frames, bases, and other embedded metal items shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Shims, jackbolts, or other supports required to align and hold components rigidly in place until embedment concrete has attained the specified strength shall be provided. Anchors shall be installed as shown. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour.

3.1.2 Gate Frame and Guides

************************************************************************************
NOTE: This paragraph must be edited to fit the project.
************************************************************************************

Gate frame and guides shall be connected to embedded anchors, aligned, and rigidly blocked in place prior to the placement of second-pour concrete. The sealing surfaces of the slide gate frame seal bars shall serve as the reference plane for the installation alignment. Alignment shall be to two theoretical control planes described as control plane "A" and control plane "B". Control plane "A" is a vertical plane that is normal to the water passageway and is located at the sealing surface of the gate frame seal bars. Control plane "B" is a vertical plane that is parallel to the water passageway and is located at the centerline of the water passageway. The gate frame shall be aligned to within \(0.381 \text{ mm } 0.015 \text{ inch}\) of control planes "A" and "B". A taut piano wire and an electric micrometer or some other approved method shall be used to measure the vertical alignment tolerances. The alignment of [wheel gate] [and] [roller gate] frame and guides shall be such that planes through the bearing surfaces of track plates and the sealing surfaces of seal plates shall be within \(2 \text{ mm } 1/16 \text{ inch}\) of the alignment shown. Gate frame and guides shall be tested for proper alignment and clearances prior to being embedded in concrete by lowering and raising the gate leaf through the full operating range.

3.1.3 Gate Leaf

************************************************************************************
NOTE: Delete reference to rubber seals if not applicable for the project.
************************************************************************************

Gate leaf shall be completely assembled, including the attachment of all components and accessories, prior to being placed in the gate frame. All necessary precautions shall be taken to avoid distortion of the gate leaf and attached components during installation. Rubber seals shall be fastened securely to metal retainers. Before operating the gate, a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.1.4 Operating Machinery

************************************************************************************
NOTE: This paragraph must be edited to fit the project.
************************************************************************************

Operating machinery for the gate assembly and supporting components, including [bonnet,] [bonnet cover,] [pedestal,] [and] [base plate], shall be positioned and aligned to the installed location of the gate frame and guides and anchored in place. The location of the slide gate stem shall be projected to and scribed on the sill of the installed gate frame to serve as a reference point for the alignment of operating machinery and supporting components. Operating machinery and components shall be aligned to within 0.762 mm 0.030 inch of the reference point. Prior to being embedded in concrete, an alignment template shall be bolted to the [bonnet,] [bonnet cover,] marked, and drilled to match the exact center point of the gate stem.

### 3.1.5 Concrete and Concrete Grout Placement

The embedment of the gate frame and other components in concrete shall be performed in an approved manner to fill all voids, secure anchorage, prevent seepage, and provide uniform finish surfaces. After embedment concrete has cured for at least 7 days, any voids around embedded components shall be filled by pumping concrete grout around the components. After the pumped grout has cured for at least 7 days, hammer blows to the components shall be used to detect any remaining voids. Where remaining voids are located, 25 mm 1 inch diameter grout holes shall be drilled in the components and the voids shall be filled by pressure grouting through the grout holes. Grout holes in the components shall be plugged by welding and shall be ground flush.

### 3.1.6 Painting

Exposed parts of the gate and appurtenance components, except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces, shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

### 3.2 OPERATING MACHINERY

NOTE: Specify appropriate section for vertical lift gate operating machinery.

Operating machinery shall conform to Section [____].

### 3.3 ACCEPTANCE TRIAL OPERATION AND TEST

After the gate assembly has been installed, including operating machinery, the Contracting Officer will examine the complete system for final acceptance. Operation and test results shall be furnished to the Contracting Officer. The assembly will be examined first to determine whether or not the workmanship conforms to the specification requirements. Operate the gate throughout its full operating range a sufficient number of times to demonstrate proper operation. [The gate shall be operated from the remote control vault and the control panel in the control tower.] [Operation of hydraulic cylinders by use of compressed air will not be permitted.] The initial operation of the gate assembly shall be conducted in the dry. [With the gate leaf in the seated position and uniformly blocked so that the [wheels] [rollers] are in uniform contact with the track plates, the rubber seals shall be checked to ensure that they are
uniformly compressed against the seal plates. [The gate lock assembly shall be tested by destructing one set of lock pins. This shall be accomplished by inserting one set of pins in the lock position, permitting the weight of the gate leaf to rest on the pins, and using the hydraulic pressure system to break the pins by applying pressure to the top of the hydraulic cylinder. The pressure shall be adjusted at the pressure reducing valve to its lowest setting and gradually increased until the pins fail. The pressure reading at failure of the lock pins shall be recorded in the operation and test report. After completion of the test, broken pins shall be replaced by new ones.] The second trial operation and testing of the gate assembly shall be conducted with the reservoir normal operating pool hydrostatic pressure. The workmanship in the fabrication and installation of the gate assembly shall be such that the gate leaf shall form a watertight barrier when lowered to the seated position. Adjustments shall be made to the operation and control apparatus until all components function as required. The [lifting beam assembly,] [lifting sling,] [dogging devices,] and other appurtenances will be inspected to assure proper operation. Required repairs or replacements to correct defects, as determined by the Contracting Officer, shall be made at no additional cost to the Government. The trial operation and testing shall be repeated after defects are corrected.

3.4 PROTECTION OF FINISHED WORK

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.3 ACCEPTANCE TRIAL OPERATION

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for furnishing all plant, equipment, labor, and materials (except materials specified to be furnished by the government) for fabricating, assembling, delivering, and installing closure gates in accordance with these specifications and applicable drawings. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).
1.1.1 Closure Gates

1.1.1.1 Payment

Payment will constitute full compensation for furnishing all plant, labor, materials and equipment and performing all operations necessary for the installing of closure gates as specified.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

### 1.3 SUBMITTALS

**NOTE:** Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

- **SD-02 Shop Drawings**

Epoxy Filler

1.4 QUALITY ASSURANCE

The following special safety provisions are required for heating and placing zinc filler:

a. Workers shall wear protective clothing including hard hats with fine wire mesh screen, goggles, leather sleeves, chaps, apron, and leather gloves.

b. Workers shall wear air-line respirators certified by NIOSH or MSHA. In enclosed spaces, both local exhaust ventilation and air-line respirators are required. Local exhaust ventilation shall consist of movable hoods placed close to the work to remove fumes at the source.

c. Ladies, equipment, and material shall be pre-heated before being used so that they will be moisture-free.

d. Heating devices and ladles shall be placed on a level, firm foundation, and protected against traffic, accidental tipping, or similar hazard.

e. Hot zinc shall not be carried up or down ladders.

f. Buckets or vessels used for handling and transporting hot zinc shall be substantially constructed and shall not be filled higher than 100 mm 4 inches from the top.

1.5 QUALIFICATION OF WELDERS AND WELDING OPERATORS

Qualification of welders and welding operators shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

1.6 DELIVERY, STORAGE, AND HANDLING

Perform delivery, handling, and storage of materials and fabricated items
conforming to the requirements specified[ herein and] in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. [Unload materials and equipment delivered to the site by the Contracting Officer. Verify the condition and quantity of the items delivered by the Contracting Officer and acknowledge receipt and condition thereof in writing. If delivered items are damaged or a shortage is determined, notify the Contracting Officer of such in writing within 24 hours after delivery.]

1.6.1 Rubber Seals

Store rubber seals in a place which permits free circulation of air, maintains a temperature of 20 degrees C 70 degrees F or less, and prevents the rubber from being exposed to the direct rays of the sun. Keep rubber seals free of oils, grease, and other materials which would deteriorate the rubber. Rubber seals shall not be distorted during handling.

1.6.2 [Epoxy Filler]

Epoxy filler shall be delivered from the manufacturer just prior to use in the work to insure receipt of recently manufactured material and shall be stored under cover, out of direct sunlight, at a temperature between 20 to 30 degrees C 65 to 85 degrees F).

1.7 [SEQUENCING AND SCHEDULING]

**************************************************************************
NOTE: The name of the appropriate railroad company or roadway agency should be inserted as indicated.
**************************************************************************

Submit a sequencing and scheduling plan, approved before the work is commenced, which illustrates that work affecting [railroads] [roadways] has been coordinated with [____]. Include in the plan schedules, lists of labor or materials to be provided the affected [company] [agency], and any other aspects of the work that may impact on the operations of these entities as specified in Section SPECIAL CONDITIONS. The protection plan shall clearly demonstrate how all [railroad tracks] [public or private roads, streets, or highways] will be kept open to traffic at all times during the construction period, except as otherwise specified or directed. Refer to Section SPECIAL CONDITIONS for other requirements such as warning signs, flagmen, permits, and debris removal.

PART 2 PRODUCTS

2.1 MATERIALS

Submit system of identification which shows the disposition of specific lots of approved materials and fabricated items in the work before completion of the contract. Furnish materials orders, materials lists and materials shipping bills conforming with the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.1.1 Metals

Structural steel, steel forgings, steel castings, stainless steel, bronze, [aluminum alloy,] and other metal materials used for fabrication shall conform to the requirements shown and specified herein and in Section 05 50 15 CIVIL WORKS FABRICATIONS.
2.1.1.1 Structural Steel

Structural steel shapes shall conform to ASTM A36/A36M. Structural steel plates shall conform to [ASTM A36/A36M] [ASTM A572/A572M, Grade 50] [ASTM A588/A588M, Grade [_______]].

2.1.1.2 Steel Pipe

Steel pipe shall conform to ASTM A53/A53M, Type S, Grade B, seamless, black, nominal size and weight class or outside diameter and nominal wall thickness as shown, [plain] [threaded] [threaded and coupled] ends.

2.1.1.3 Self-Lubricating Bearings

Self-lubricating bearings shall conform to ASTM B823, Type II. The bearings shall be impregnated with a turbine grade lubricant containing oxidation and rust inhibitors and a polar anti-wear additive.

2.1.1.4 Bronze Castings

Bronze castings shall conform to ASTM B22/B22M, Copper Alloy UNS No. C91300 [and ASTM B148].

2.1.1.5 Stainless Steel Bars and Shapes

Stainless steel bars and shapes shall conform to ASTM A276/A276M, UNS [S 20910,] [S 30400,] [S 40500,] Condition A, hot-finished or cold-finished, Class C; or ASTM A564/A564M, UNS [S 17400,] [S 45000,] Condition A, age-hardened heat treatment, hot-finished or cold-finished, Class C.

2.1.1.6 Stainless Steel Plate, Sheet, and Strip

Stainless steel plate, sheet, and strip shall conform to ASTM A240/A240M, UNS [S 20910,] [S 30400,] [S 40500,] [S 41008]. Plate finish shall be hot-rolled, annealed or heat-treated, and blast-cleaned or pickled. Sheet and strip finish shall be No. 1.

2.1.1.7 High-Strength Steel Bar

High-strength steel bar shall conform to ASTM A722/A722M, Type I or II, and all supplementary requirements.

2.1.2 Rubber Seals

2.1.2.1 General

**************************************************************************
**NOTE: If fluorocarbon (Teflon) clad seals are not used, delete paragraph FABRICATION OF SEALS.**************************************************************************

Rubber seals shall be [fluorocarbon (Teflon) clad rubber seals of the mold type only and shall be] compounded of natural rubber, synthetic polyisoprene, or a blend of both, and shall contain reinforcing carbon black, zinc oxide, accelerators, antioxidants, vulcanizing agents, and plasticizers. Physical characteristics of the seals shall meet the following requirements:
<table>
<thead>
<tr>
<th>PHYSICAL TEST</th>
<th>TEST VALUE</th>
<th>TEST METHOD SPECIFICATION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>17.2 MPa 2500 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Elongation at Break</td>
<td>450 percent (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>300 percent Modules</td>
<td>6.2 MPa 900 psi (min.)</td>
<td>ASTM D412</td>
</tr>
<tr>
<td>Durometer Hardness</td>
<td>60 to 70</td>
<td>ASTM D2240</td>
</tr>
<tr>
<td>(Shore Type A)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Water Absorption</td>
<td>5 percent by weight (max.)</td>
<td>ASTM D471</td>
</tr>
<tr>
<td>Compression Set</td>
<td>30 percent (max.)</td>
<td>ASTM D395</td>
</tr>
<tr>
<td>Tensile Strength (after aging 48 hrs.)</td>
<td>80 percent of tensile strength (min.)</td>
<td>ASTM D572</td>
</tr>
</tbody>
</table>

The "Water Absorption" test shall be performed with distilled water. The washed specimen shall be blotted dry with filter paper or other absorbent material and suspended by means of small glass rods in the oven at a temperature of 70 degrees C plus or minus 2 degrees C for 22 plus or minus 1/4 hours. The specimen shall be removed, allowed to cool to room temperature in air, and weighed. The weight shall be recorded to the nearest 1 mg as M1 (M1 is defined in ASTM D471). The immersion temperature shall be 70 degrees C plus or minus 1 degree C and the duration of immersion shall be 166 hours.

2.1.2.2 [Fabrication of Seals]

Rubber seals shall have a fluorocarbon film vulcanized and bonded to the sealing surface of the bulb. The film shall be [0.762] [1.524] mm [0.030] [0.060] inch thick Huntington Abrasion Resistant Fluorocarbon Film No. 4508, or equal, and shall have the following minimum physical properties:

<table>
<thead>
<tr>
<th>Tensile strength</th>
<th>13.8 MPa 2,000 psi</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elongation</td>
<td>250 percent</td>
</tr>
</tbody>
</table>

The outside surface of the bonded film shall be flush with the surface of the rubber seal and shall be free of adhering or bonded rubber. Strips and corner seals shall be molded in lengths suitable for obtaining the finish lengths shown and with sufficient excess length to provide test specimens for testing the adequacy of the adhesion bond between the film and bulb of the seal. At one end of each strip or corner seal to be tested, the fluorocarbon film shall be masked during bonding to prevent a bond for a length sufficient to hold the film securely during testing.

2.1.3 [Epoxy Filler]

Submit manufacturer's certificate for epoxy filler with the material delivered to the site. Epoxy filler shall be an approved epoxy resin formulation equal to "Nordback Backing For Locks and Dams," a product of Fel-Pro Chemical Products LP, 6120 East 58th Ave., Commerce City, CO 80022, Phone 1-800-992-9799, or an approved equal, with a specific gravity of 1.70 to 1.75, minimum compressive strength after 72 hours at 20 degrees C 70
degrees F of 114 MPa, 16,500 psi, and maximum shrinkage of 0.15 percent.
The manufacturer must certify that the material meets or exceeds the
specified physical properties.

2.1.4 [Zinc Filler

Zinc filler shall conform to ASTM B6.]

2.2 MANUFACTURED UNITS

Bolts, nuts, washers, screws and other manufactured units shall conform
with the requirements shown and specified herein and in Section 05 50 15
CIVIL WORKS FABRICATIONS.

2.2.1 Bolts, Nuts and Washers

High-strength bolts, nuts, and washers shall conform to ASTM A325M ASTM A325,
Type [____], [hot-dip galvanized] or ASTM A490M ASTM A490, Type [____].
Bolts, nuts, studs, stud bolts and bolting materials other than high-
strength shall conform to ASTM A307, Grade A, [hot-dip galvanized] or
ASTM A320/A320M, [Ferritic Steel, Grade [____]] [Austenitic Steel, Grade
[____]], Class [____].] Bolts 13 mm 1/2 inch and larger shall have
hexagon heads. The finished shank of bolts shall be long enough to provide
full bearing. Washers for use with bolts shall conform to the requirements
specified in the applicable specification for bolts.

2.2.2 Screws

Screws shall be of the type indicated.

2.2.3 Shackles and Turnbuckles

Shackles and turnbuckles shall be of forged steel conforming to
ASTM A668/A668M, zinc coated. Turnbuckles shall be end-threaded right and
left hand and shall be of the size shown.

2.2.4 Screw Jacks

Screw jacks shall have a [____] ton (metric) (2000 lb) rated capacity and
shall conform to the details shown.

2.2.5 [Hoists

Hoists shall be of [____] ton (metric) (2000 lb) capacity, with [____] m
foot lift, link type chain and safety latch hook. Hoists shall be of light
weight design, weighing not over [____] kg lb and requiring not more than
[____] kg lb lever pull to lift the full-rated load.]

2.2.6 Winches

Winches shall be [____] ton (metric) (2000 lb) marine winches with [____] mm/inch
drum and adjustable handle. Each winch shall be equipped with
[____] mm foot of [____] mm inch diameter wire cable suitable for
exterior exposure.

2.2.7 Sheaves

Sheaves shall be of cast steel conforming to ASTM A27/A27M, sized for the
wire rope used.
2.2.8 [Rails]

Rails shall conform to ASTM A1, [No. 1] [No. 2], weighing [_____] kg/m. lb/yd. Rail stops shall be as recommended by rail manufacturer for [_____] kg/m 1b/yd rails and for the wheel diameters indicated.]

2.2.9 Wire Rope

Wire rope shall conform to FS RR-W-410, Type [____], Class [____], Construction [____], [wire size,] [strand seizing] as shown.

2.2.10 [Wheels]

Wheels shall be short hub or long hub, rigid type, heavy duty steel casters fabricated from steel castings conforming to ASTM A148/A148M. Wheel shall be of the size and load capacity shown and shall be provided with lubrication fittings, roller bearings and removable axle. Wheel treads shall be machined-finished to conform with the indicated rail. Unless otherwise specified or shown, axles for wheels shall be of stainless steel bars conforming to ASTM A276/A276M, UNS S30400.]

2.2.11 [Bridge Planks]

Bridge planks shall be of steel conforming to ASTM A1011/A1011M, Grade 33. Bridge planks shall have a minimum thickness and minimum section modulus as shown.

2.2.12 Chains and Attachments

Chains and attachments shall conform to FS RR-C-271, Type [____], Grade [____], Class [____], Style [____], Size [____], Finish [____].

2.2.13 Padlocks and Hasps

Padlocks shall conform to CID A-A-1928, Type [I][II]. Padlocks shall be keyed alike and provided with two keys. Hasps shall be of wrought steel and sized to accommodate padlocks.

2.2.14 [Elastomeric Bearing Pads]

Elastomeric bearing pads shall conform to the requirements of AASHTO HB-17, Chapter 25, and shall be reinforced with steel plates.]

2.3 FABRICATION

2.3.1 Detail Drawings

Submit detail drawings as specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS, of closure gates and appurtenant items, including fabrication drawings, shop assembly drawings, delivery drawings, and field installation drawings.

2.3.1.1 Fabrication Drawings

Fabrication drawings shall show complete details of materials, tolerances, connections, and proposed welding sequences which clearly differentiate shop welds and field welds.
2.3.1.2 Shop Assembly Drawings

Shop assembly drawings shall provide details for connecting the adjoining fabricated components in the shop to assure satisfactory field installation.

2.3.1.3 Delivery Drawings

Delivery drawings shall provide descriptions of methods of delivering components to the site, including details for supporting fabricated components during shipping to prevent distortion or other damages.

2.3.1.4 Field Installation Drawings

Field installation drawings shall provide a detailed description of the field installation procedures. The description shall include the location and method of support of installation and handling equipment; provisions to be taken to protect concrete and other work during installation; method of maintaining components in correct alignment; [plan for prestressing gate leaf diagonals, which shall include descriptions of connections, riggings, anchorages, and measuring equipment;] [methods for installing quoin and miter blocks, including checking and maintaining alignments of the blocks during concreting and placement of [epoxy] [zinc] filler;] [procedures and equipment used for heating and placing of the zinc filler;] [method for installing hinge anchor plates, including checking and maintaining alignments of the plates during concreting and placement of epoxy filler;] and methods for installing other appurtenant items.

2.3.2 Structural Fabrication

Structural fabrication shall conform with the requirements shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Components shall be shop-fabricated of the materials specified and shown. Dimensional tolerances shall be as specified and shown. Splices shall occur only where shown. Pin holes shall be bored in components after welding, straightening, stress-relieving, and threading operations are completed. Brackets, eye bar sections, and other components requiring straightening shall be straightened by methods which will not damage the material. Bronze bushings shall be press-fitted with supporting components. Bolt connections, lugs, clips, or other pick-up assembly devices shall be provided for components as shown and required for proper assembly and installation.

2.3.3 Welding

**************************************************************************
NOTE: List applicable welds requiring radiographic examination.
**************************************************************************

Submit schedules of welding procedures for structural steel conforming with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Welds shall be [in accordance with AWS D1.1/D1.1M[,][ and] AWS D1.2/D1.2M][, and] of the type shown and approved detail drawings. Radiographic examination is required on the major shop and field welds of the type and location indicated and as follows: [______]. Welds which have been designated to receive radiographic examination and are found to be inaccessible to a radiation source or film, or are otherwise so situated that radiographic examination is not feasible may be examined, with written approval, by dye penetrant, magnetic particle tests, or ultrasonic tests.[

SECTION 35 20 16.59 Page 12
Components shall be stress-relief heat treated after welding where shown. Stress-relieving of components shall be performed prior to the attachment of miscellaneous appurtenances.

2.3.4 Bolted Connections

Bolted connections shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.5 Machine Work

Machine work shall conform with the requirements specified in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.6 Miscellaneous Provisions

Miscellaneous provisions for fabrication shall conform with the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.3.7 Fabrications

Submit samples approved prior to use of the represented materials or items in the work. Samples of standard and shop fabricated items shall be full size and complete as required for installation in the work. Approved samples may be installed in the work provided each sample is clearly identified and its location recorded. Fabrications shall conform to the following requirements.

2.3.7.1 Gate Leaf

Gate leaf shall be of welded structural steel fabrication. Gate leaf shall be provided complete with [quoin and miter contact [blocks] [posts],] [miter guide assembly] [elastomeric bearing pads,] [hinge assemblies,] [pintle assembly,] [wheel assemblies,] [trolley assembly,] [tie-down assembly], [gate hooks,] seal assemblies, and other appurtenant components as specified and shown. [Proposed shop-fabrication of gate leaf in separate segments to facilitate handling and shipping must be approved and shall be as shown on approved detail drawings. Such segments shall permit easy field-assembly and shall be as few as practicable to minimize the number of joints to be field-welded.] The overall height of gate leaf shall not vary from the nominal dimension [or differ from mating gate leaf] by more than 6 mm. 1/4 inch. The surfaces of framing elements to which [skin plates] [bridge planks] are to be welded shall not vary from a true plane by more than 6 mm.1/4 inch. [Splices in [skin plates] [bridge planks] shall be located only where shown.] [In addition to welds specifically indicated for nondestructive testing, [_____] percent of the welds in the girders, verticals and [skin plate] [bridge planks] of the gate leaf shall receive nondestructive testing. The location of these additional welds for testing shall be as directed.]
conforming to ASTM A276/A276M or ASTM A564/A564M. Splices in the contact [block] [post] shall be made by an offset method so that there will not be a continuous joint across the [block] [post]. Contact faces of the contact [block] [post] shall be milled at splices to assure watertight joints. [Splices in the gate leaf contact [block] [post] shall occur only at the centerlines of horizontal girders.] Contact [blocks] [posts] shall be provided with adjusting bolts as shown.

2.3.7.4 [Hinge Assembly]

Outer cylinder of the hinge assembly shall be of steel pipe conforming to ASTM A53/A53M, Type S, Grade B. Cylinder bushing and thrust washer shall be of bronze casting conforming to ASTM B22/B22M, Copper Alloy UNS No. C91300. Hinge pin [and bearing pedestal for the lower hinge assembly] shall be of stainless steel conforming to ASTM A276/A276M, UNS S 21800. [The pedestal base plate for the lower hinge assembly] shall be of stainless steel conforming to ASTM A240/A240M, UNS S 30400. Hinge assembly gusset, stiffener, and anchor plates shall be of structural steel conforming to ASTM A36/A36M. [In addition to welds specifically indicated for nondestructive testing, [_____] percent of the welds in the hinge assembly and the welds connecting the hinge assembly to the gate framing shall receive nondestructive testing. The location of these additional welds for testing shall be as directed.] After all welding is completed, the hinge assembly shall be stress-relieved by heat-treating. Stress-relieving shall be performed prior to machining.

2.3.7.5 [Pintle Assembly]

Pintle assembly for miter gates shall consist of pintle socket, pintle, and pintle base as shown. Pintle socket shall be of cast nickel-alloy steel and shall be press-fitted with an aluminum bronze bushing with bearing surfaces finished truly hemispherical. Pintle shall be of [cast alloy steel] [forged alloy steel] with bearing surfaces of corrosion-resisting steel. The pintle ball shall receive a 0.4 micrometer 16 microinch finish and shall be fitted into the bushing by scraping until uniform contact is attained over the entire bearing surface as determined by testing with carbon paper or other approved coloring. The pintle ball shall be match-marked with the bushing when fitted and so erected in the field. Pintle base shall be of cast steel. Bolt holes for attaching pintle socket to gate leaf shall be drilled and reamed after the pintle socket is assembled with gate leaf.

2.3.7.6 [Trolley Gate Trolley Assembly]

Trolley gate trolley assembly shall consist of trolley beam, two (2) four-wheeled, push type trolleys, and trolley hangers. Trolleys shall be of steel fabrication, a manufacturer's standard product, rated for a minimum load of [_____] tons (metric) (2000 lb) and suitable for operation on the trolley beam of the type and size shown. Trolley wheels shall be single-flanged with a diameter of [_____] mm inches and the wheel treads shall be machined-finished to conform with the trolley beam. Trolley wheels shall be mounted on weather-protected roller bearings and a removable axle and shall be provided with accessible lubrication fittings. Trolley hangers shall be supported by the wheel axle and shall be provided with a cross pin with machined grooves and retaining rings spaced at intervals of [_____] mm inches to accommodate a [_____] mm inch thick suspension lug. The centerline of the cross pin shall be located [_____] mm inches below the bottom of the trolley beam. For proper clearance, the maximum horizontal dimension from the centerline of the trolley beam to the
end of the cross pin shall not exceed [_____] m. [_____] ft [_____] in.
Trolleys shall be designed for continuous outdoor service and shall be painted with the manufacturers standard paint system for outdoor operation.]

2.3.7.7 [Trolley Gate Overhead Support Beam]

Trolley gate overhead support beam shall conform to the details shown. Post-tensioned anchorage for support beam shall consist of ASTM A722/A722M, Type [_____] [_____] high-strength steel bars and prestressing system as specified in Section 03 23 00 STRESSED TENDON REINFORCING.]

2.3.7.8 [Rolling Gate Wheel Assembly]

Rolling gate wheel assembly shall be provided complete with cast steel wheels as specified herein and fittings, couplings and hoses for lubrication of wheels. Fittings shall be 6 mm 1/4 inch threaded-pipe fitting. Couplings shall be 6 mm 1/4 inch stainless steel half coupling. Hoses shall be 6 mm 1/4 inch inside diameter, double-braided stainless steel flexible hoses. Couplings and hoses shall have a pressure rating of 21 MPa. 3,000 psi.]

2.3.7.9 [Rolling Gate Stabilizing Trolley Assembly]

Stabilizing support for trolley wheels shall be of structural steel conforming to ASTM A36/A36M. Trolley wheels shall be of steel fabrication and rated for the minimum load shown. Trolley wheels shall be single-flanged and the wheel treads shall be machined-finished to conform with the guiding gate girder. Trolley wheels shall be mounted on weather-protected roller bearings and a removable axle and shall be provided with lubrication fittings.]

2.3.7.10 Seal Assembly

Seal assembly shall consist of rubber seals, steel retainer and spacer bars, [retractable support,] and fasteners. Rubber seals shall be continuous over the full length. Seals shall be accurately fitted and drilled for proper installation. Bolt holes shall be drilled in the rubber seals by using prepared templates or the retainer bars as templates. Splices in seals shall be fully molded, develop a minimum tensile strength of 50 percent of the unspliced seal, and occur only at locations shown. All vulcanizing of splices shall be done in the shop. The vulcanized splices between molded corners and straight lengths shall be located as close to the corners as practicable. Splices shall be on a 45 degree bevel related to the "thickness" of the seal. The surfaces of finished splices shall be smooth and free of irregularities. Steel retainer bars shall be field-spliced only where shown and machine-finished after splicing. [The retractable support shall be provided complete with hinge and operating winch.]

2.3.7.11 Miscellaneous Embedded Metals

Wall armor, shear anchors, protection and seal plates and shapes, and other miscellaneous embedded metals shall be of structural steel or corrosion-resisting steel conforming with the details specified herein and shown.

2.3.8 Shop Assembly

Shop assembly requirements for gates and appurtenant items shall be as
shown and specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled completely in the shop, unless otherwise approved, to assure satisfactory field installation. Adjoining components shall be fitted and bolted together to facilitate field connections. The matchmarking of unassembled items shall be carefully preserved until the items are assembled. Mating surfaces and machined surfaces shall be covered with a rust preventive until assembly. Assembled components shall be shop-welded in their final positions as much as delivery and field installation conditions will permit. Rubber seals shall be fitted and drilled to match the seal retainers, match-marked, and removed for shipment. [The trolley gate shall be suspended in the shop to verify its center of gravity location. If the trolley gate is more than 3 mm 1/8 inch out-of-plumb in the suspended position, it shall be balanced by means as directed.] Shop assembly and disassembly work shall be performed in the presence of the Contracting Officer unless waived in writing. The presence of the Contracting Officer will not relieve the Contractor of any responsibility under this contract.

2.4 TESTS, INSPECTIONS, AND VERIFICATIONS

Submit certified test reports for material tests with all materials delivered to the site.

2.4.1 General

Tests, inspections, and verifications for materials shall conform to the requirements specified herein and in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

2.4.2 Testing of Rubber Seals

**************************************************************************
NOTE: If fluorocarbon (Teflon) clad seals are not used, delete this paragraph.
**************************************************************************

The fluorocarbon film of rubber seals shall be tested for adhesion bond in accordance with ASTM D413 using either the machine method or the deadweight method. A 25 mm 1 inch long piece of seal shall be cut from the end of the seal which has been masked and subjected to tension at an angle approximately 90 degrees to the rubber surface. There shall be no separation between the fluorocarbon film and the rubber when subjected to the following loads:

<table>
<thead>
<tr>
<th>Thickness of Fluorocarbon Film</th>
<th>Machine Method at 50 mm 2 inches per minute</th>
<th>Deadweight Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.726 mm 0.060 inch</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
</tr>
<tr>
<td>1.524 mm 0.030 inch</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
<td>13.6 kg per 25 mm 30 pounds per inch width</td>
</tr>
</tbody>
</table>

PART 3 EXECUTION

3.1 INSTALLATION

Installation shall conform with the requirements specified herein and in
Section 05 50 14 STRUCTURAL METAL FABRICATIONS. Gates and appurtenant items shall be assembled for installation in strict accordance with the contract drawings, approved installation drawings, and shop match-markings. Before assembly and installation, all bearing surfaces requiring lubrication shall be thoroughly cleaned and lubricated with an approved lubricant. All components to be field-welded shall be in correct alignment before welding is commenced.

3.1.1 Embedded Metals

Corner protection angles, sill angles, seal plates, frames, pedestals, bases and other embedded metal items required for proper and complete installation shall be accurately installed to the alignment and grade required to ensure accurate fitting and matching of components. Embedded metals shall be given a primer coat of the required paint on all surfaces prior to installation in concrete forms. Anchors for embedded metals shall be installed as shown. Items requiring two concrete pours for installation shall be attached to the embedded anchors after the initial pour, adjusted to the proper alignment, and concreted in place with the second pour. Welded field splices in sealing surfaces of embedded items shall be ground smooth.

3.1.2 [Lower Hinge Assembly]

Base anchors for the lower hinge assembly shall be embedded in the first pour concrete. Base plate shall be attached to base anchors, set to the final position, and epoxy fill shall be placed in the void behind the base plates and allowed to reach the strength as shown and the approved field installation drawings. After the gate leaf is set in place, the hinge assembly shall be adjusted to provide for continuous contact between the sealing surfaces over the full height and length of the gate leaf. Allowances shall be made for the seals which shall not be attached until painting operations are completed. Second pour concrete shall be placed after final adjustments are completed.

3.1.3 [Pintle Assembly]

Base anchors for the pintle assembly shall be embedded in first pour concrete. The pintle assembly base plate shall be attached to base anchors, adjusted to the exact elevation and center-to-center distance as shown, leveled, blocked rigidly to prevent displacement, and embedded in second pour concrete. The concrete shall be allowed to set 72 hours and must reach a minimum compressive strength of [_____] MPa psi before loading is applied.

3.1.4 [Wall Quoin]

Base anchors for the wall quoin shall be embedded in first pour concrete. The wall quoin shall be attached to base anchors prior to setting the gate leaf in place. After the gate leaf is set in place, the wall quoin shall be plumbed and adjusted in relation to the gate leaf quoin so as to provide for continuous contact between the sealing surfaces of the wall and gate leaf quoin contact [blocks] [posts] over the full height of the gate leaf. This adjustment shall be made almost entirely by moving the wall quoin so that the gap for the [epoxy] [zinc] filler behind the gate leaf quoin contact [block] [post] remains near the nominal dimension. After final adjustments have been made, the wall quoin shall be anchored firmly and the second pour concrete shall be placed in the blockout.]
3.1.5 Gate Leaf

Gate leaf components not assembled in the shop shall be assembled in the field as required for installation. [[Lower hinge assembly bearings] [Pintle ball] shall be coated with grease prior to setting the gate leaf in place.] [Grease pipes shall be flushed prior to connecting to bearing.] All necessary precautions shall be taken to avoid distortion of the gate leaf or any component parts. Special care shall be exercised during installation to prevent any sag of the ends of the gate leaf due to compression of blocking or other causes. After the gate leaf has been set in place and the top hinge assembly installed, the gate leaf shall be plumbed and brought into correct position.

3.1.6 Diagonals

Gate leaf diagonals shall be attached to the gate leaf after the leaf is set in place. Submit diagonal prestressing records immediately after completion of the prestressing operations. Diagonals shall be prestressed before the final adjustment of the [quoin and miter contact [blocks] [post]] [hinge assemblies] are made. **Diagonal prestressing** shall be as specified herein and as shown and the prestressing plan developed by the Contractor. The plan for prestressing the diagonals shall describe the method of prestressing including the materials, connections, rigging, anchorages, and stress measuring equipment. Compile a record of the prestressing operations consisting of the information indicated in the following table:

<table>
<thead>
<tr>
<th>STRESS DATA TABLE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gate Leaf Location:</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>Diagonal Strain Gage Initial Readings Final</td>
</tr>
</tbody>
</table>

1. Initial strain gage readings shall be made after slack is removed.
2. Final strain gage readings shall be made after prestressing is complete.
3. E is the total elongation over the full length of the diagonal, computed from the strain gage readings.
4. D is the prestress deflection of the leaf as shown.
5. d is the field deflection of the leaf measured after completion of the prestress operation; it is the deflection when final strain gage readings are taken.

3.1.7 Top Hinge Assembly

After the gate leaf has been set in place, the top hinge assembly shall be installed and adjusted so that the center of the hinge pin is in vertical alignment with the center of the [pintle] [bottom hinge assembly pin]. When the top hinge pin is inserted, the gate leaf shall swing horizontally throughout its range of movement. [Any required final adjustments to the top hinge assembly shall be made after the gate leaf diagonals have been...
The second pour concrete shall be made after final adjustments are completed.

3.1.8  [Gate Leaf Quoin and Miter Contact [Blocks] [Posts]

After the wall leaf quoin has been adjusted and concreted in place and final adjustments made to the top hinge assembly, gate leaf quoin and miter contact [blocks] [posts] shall be adjusted to provide continuous contact over the full height of the gate leaf in the mitered position. After the gate leaf diagonals are prestressed and final adjustments of gate leaf quoin and miter contact [blocks] [posts] have been made with the gate leaf in the mitered position, the gate leaf shall be swung out of miter and [epoxy] [zinc] filler poured behind the quoin and miter contact [blocks] [posts]. Prior to pouring of the filler, the surfaces to receive the filler shall be cleaned free of dirt, rust, and other foreign materials. The adjusting and holding bolts shall be coated with grease or other bond breaker to prevent adherence of the filler.

3.1.8.1  Placing [Epoxy] [Zinc] Filler

[ Epoxy Filler:  The manufacturer's instructions for placing the epoxy filler shall be followed explicitly. Special precautions must be taken to prevent leakage of the filler during placement. The complete masses of the metals whose surface areas are to receive the epoxy filler should have a temperature of 15 to 30 degrees C. 60 to 90 degrees F. The epoxy filler shall be kept free from moisture or other foreign materials during mixing and placement and for at least 48 hours after placement. A field test to determine the indentation hardness of the epoxy filler compound shall be conducted prior to placement. The field test procedures are as follows:

a.  Cast a 50 mm 2 inch cube sample of mixed epoxy filler compound in a mold and cure at room temperature 20 to 25 degrees C 70 to 80 degrees F for 24 plus or minus 8 hours.

b.  Remove from mold and cut sample to expose interior surface.

c.  Sand exposed interior surfaces to remove saw marks and provide a smooth surface.

d.  Using a Type D Durometer conforming to ASTM D2240, measure the hardness across the exposed interior surface, taking a minimum of three readings on each half of the sample. Care must be taken during the durometer reading to insure the spring loaded pin used to penetrate the surface is not in a depressed surface caused by either residual saw marks or an exposed air bubble. The average reading should be at least 85, with no individual reading below 82. If the durometer readings fall below the required minimum values, the material will be rejected.]

[ Zinc Filler:  Immediately preceding the pouring of the zinc filler, the adjacent metal components shall be pre-heated to a temperature of 100 to 150 degrees C 212 to 300 degrees F by an approved method which does not buckle the metal components. The zinc filler shall then be poured at a temperature which will insure that it will completely fill all interstices. Pouring temperature of zinc filler shall be maintained between 430 and 480 degrees C 810 and 900 degrees F to minimize volatilization and oxidation of the zinc.]
3.1.8.2 [Adjusting Contact [Blocks] [Posts]]

After the [epoxy has set] [zinc has cooled], quoin and miter contact [blocks] [posts] shall be drawn up against the filler by tightening of the adjusting bolts. After the contact [blocks] [posts] are adjusted, the gate leaves shall swing into the mitered position without interference of the quoin contact [blocks] [posts] and the gate leaf quoin contact [block] [post] shall make tight contact with the wall quoin contact [block] [post].]

3.1.9 [Anchorage of Overhead Support Beam]

Submit record of the post-tensioning operation for the trolley gate overhead beam anchors, immediately after the anchorage is completed, set in place and post-tensioned anchored as shown and as specified in Section 03 23 00 STRESSED TENDON REINFORCING.]

3.1.10 [Rolling Gate Stabilizing Trolley Assemblies]

Rolling gate stabilizing trolley assemblies shall be installed after the gate is set in place and properly adjusted. Assemblies shall be placed on the top girder of the gate leaf, attached to anchors embedded in the top of the supporting concrete wall, shimmed as required, and secured in place.

3.1.11 Painting

Exposed parts of gates and appurtenances except machined surfaces, corrosion-resistant surfaces, surfaces of anchorages embedded in concrete, and other specified surfaces shall be painted as specified in Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

3.1.12 Seal Assemblies

Rubber seal assemblies shall be installed after the embedded metal components have been concreted in place and the gate installation, including painting, completed. Rubber seals shall be fastened securely to metal retainers. Before operating the gate[s], a suitable lubricant shall be applied to the rubber seal rubbing plates to protect the rubber.

3.2 Protection of Finished Work

Protection of finished work shall conform to the requirements of Section 05 50 14 STRUCTURAL METAL FABRICATIONS.

3.3 Acceptance Trial Operation

After completion of the gate installation, the Contracting Officer will examine the gates for final acceptance. The gates will be examined first to determine whether or not the workmanship conforms to the specification requirements. The Contractor will then be required to operate the gates from the fully-opened to the fully-closed position a sufficient number of times to demonstrate that all parts are functioning properly. The workmanship in the fabrication and installation of gates shall be such that the gates in the closed position will form a watertight barrier across the opening. Required repairs or replacements to correct defects, shall be made at no additional cost to the Government. Repeat the trial operation after defects are corrected. Prior to final acceptance of the gates, provide temporary restraints to prevent unauthorized operation of the gates.

-- End of Section Table of Contents --
NOTE: This guide specification covers the technical requirements for hoist applications using a squirrel-type induction motor commonly used for control gates for outlet works; penstock gates, crest gates, spillway tainter gates, and other similar applications. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This specification is to be used as a section of a supply specification for the procurement of hoisting equipment, or, with only minor modification, it may be used as a section in a general contract specification.

The specification is general and covers all types and ratings of hoist applications used by the Corps of Engineers on Civil Works structures where a squirrel cage induction-type hoist motor is used. The specification must be accompanied by a drawing or drawings showing the schematic wiring diagram of
the control system for the particular application, along with a description of the scheme of operation and illustrations showing the several items of electrical equipment.

In adapting this specification to any project, the form and phraseology will be changed as necessary to properly specify the work contemplated. When technical deviations from this specification are considered necessary and the specification is not submitted to Headquarters, US Army Corps of Engineers (HQUSACE), for review, prior approval of (HQUSACE) will be obtained. Instructions for the preparation and submission of specifications for approval are included in ER 1110-2-1200.

The electrical equipment requirements contained herein are based upon experience and information gained from similar equipment now in service and are considered the most suitable for use on hydraulic structures.

### 1.2 SYSTEM DESCRIPTION

All equipment furnished under these specifications will be subjected to [severe moisture] [moderately moist] conditions, [shall operate over a temperature range of [_____] to [_____] degrees C F,] and shall be designed to render it resistant to corrosion. The general requirements to be followed are specified below; any additional special treatment or requirement considered necessary for any individual item is specified under the respective item.
1.2.1 Fastenings and Fittings
Where practicable, all screws, bolts, nuts, pins, studs, springs, washers, and such other miscellaneous fastenings and fittings shall be of an approved corrosion-resisting material or shall be treated in an approved manner to render them resistant to corrosion.

1.2.2 Corrosion-Resisting Materials
Corrosion-resisting steel, copper, brass, bronze, copper-nickel, and nickel-copper alloys are acceptable corrosion-resisting materials. However, contact between dissimilar metals should be avoided as much as practicable, except where one of the dissimilar metals is steel or in the case of wiring and connections.

1.2.3 Corrosion-Resisting Treatments
Hot-dip galvanizing shall be in accordance with ASTM A123/A123M or ASTM A153/A153M as applicable. Other corrosion-resisting treatments may be used if approved by the Contracting Officer.

1.2.4 Frames, Enclosing Cases, and Housings
All surfaces of the enclosing cases or housings of controllers, brakes, limit switches, control stations, and other similar equipment, if other than plastic or stainless steel construction, shall be cleaned of rust, grease, mill scale, and dirt and then treated with an approved iron and zinc phosphate solution followed by rinsing with a chromic acid solution, bonderizing, or equivalent process. Immediately after rinsing and drying, the inside and outside surfaces shall be given one coat of a zinc molybdate primer and cured as required. For items of cast construction, the iron and zinc phosphate treatment may be omitted.

1.2.5 Finish Painting

**************************************************************************
NOTE: If severely moist conditions exist, a separate paint system should be specified using Civil Works Guide Specification UFGS Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, system 21, epoxy finish or equivalent. When such painting is specified, care must be taken to specify a paint that will adhere to and not be injurious to the protective painting provided under these specifications.
**************************************************************************
A minimum of two coats of paint shall be applied to all equipment in accordance with the manufacturer's standard process for the conditions specified.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.
**************************************************************************
The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

PART 2 PRODUCTS

2.1 HOIST MOTOR

Submit [6] [_____] copies of motor characteristics, curves or tabulated data (tested or calculated), indicating the speed, power factor, efficiency, current and kilowatt input, all plotted or tabulated against torque or percent of rated motor load.

a. Submit [6] [_____] copies of calculations to determine the required horsepower rating of each motor.

2.1.1 Motor Type

**************************************************************************
NOTE: When a single-speed motor or two single-speed motors in lieu of a two-speed motor is acceptable for the application, the designer will specify NEMA MG 1 standard design letter. The torque requirements listed in paragraph MOTOR LIMITS must be met, and the designer will verify that the design specified is sufficient. Design "C" and "B" have a 5 percent or less slip limit and are used where load inertia is lower. Design "D" has a 5 percent or greater slip and must be used where inertia is high. Designs "B," "C," and "D" provide
progressively higher torques and get progressively more expensive. Design "B" will generally apply to motors from 745 to 2240 W 1 to 3 hp, design "C" to motors between 2.24 to 11 kW 3 and 15 hp, and design "D" for motors larger than 11 kW 15 hp. This a general guide according to NEMA minimum standards and may vary with manufacturer's specific equipment.

At reduced cost, dripproof encapsulated construction may be used in protected locations. Consult manufacturer's data for information on application of this type motor to specific environmental conditions.

Provide a motor of the horizontal-shaft, squirrel-cage induction type [two-speed, two-winding, constant [torque] [horsepower]] [NEMA design [B] [C] [D]], designed for full-voltage starting, [of water-proof, totally enclosed, fan-cooled or nonventilated frame construction], [dripproof, encapsulated frame construction] and shall conform to the applicable requirements of NEMA MG 1.

2.1.2 Motor Rating

NOTE: For a two-speed motor, use single-voltage rating. Specify load conditions when Contractor designed. (Second Option) This specification covers three-phase motors which are suitable for most applications and shall be used whenever possible. When utility three-phase power is unavailable and forces use of single-phase motors, this specification may be modified accordingly. Generally, single-phase motors used for this application should be below 19 kW 25 horsepower. The torque limits should be carefully evaluated, and the testing requirements should be changed. Please consult Engineering Manual (EM) 1110-2-2703 for further guidance.

[The motor shall be rated [_____] horsepower, [_____] rpm synchronous speed for the machinery design shown on the drawings or, if the design is changed as permitted by [_____], shall have a horsepower rating as required by performance requirements specified to [_____] .] [The motor shall have a horsepower rating as required by the load conditions specified in [_____] .] The motor shall be rated for continuous full-load operation without exceeding the standard temperature rise for the class of insulation and frame construction used, and it shall be wound for [_____] [230/460] [460] volts, three-phase, 60-Hz.

2.1.3 Motor Torque

NOTE: The torque values are those required by design guidance given in EM-1110-2-2702 and EM-1110-2-2703. The gate design must be coordinated with the requirements of these documents to ensure that torque limits are met. Reducing the upper
limit or raising the lower limit will result in significant cost increase and should be avoided wherever possible.

2.1.3.1 Motor Limits

The torque limits for each individual winding shall be as follows:

a. Upper Limit: The upper limit of the torque between locked-rotor and breakdown shall be not more than 280 percent of the rated full-load torque of the motor.

b. Lower Limit: The lower limit of the torque between locked-rotor and breakdown shall be as high as possible consistent with good design but not less than 150 percent of the rated full-load torque of the motor.

c. When the characteristics of a motor or the winding of a motor results in a speed torque curve without a definite value of breakdown torque, the limitations on the minimum value of torque shall apply between locked-rotor and 75 percent of synchronous speed.

2.1.3.2 [Single-Speed Motor Limits

NOTE: Permit the use of two single-speed motors in lieu of a single two-speed motor where space is not a concern, and a two-speed motor cannot meet the specifications requirements.

Two single-speed motors may be used in lieu of a two-speed motor, providing the synchronous speed of the high-speed motor is not more than 1,800 rpm's and the low-speed motor will conform to the 50 percent over-speed requirements of the high-speed motor.

2.1.4 Frames and Shafts

NOTE: Shafts of stainless steel may be specified in lieu of manufacturer's standard treatment where extremely corrosive atmospheres exist. The use of stainless steel will change the motor design and increase the shaft diameter at a significant cost. Manufacturer's should be consulted before specifying stainless steel in a given application.

Size and dimensions of frames shall conform to NEMA MG 1 and shaft extension shall be as required. Eye bolts shall be provided on all motors. Each motor shall be provided with a drain-breather which shall be so located to prevent accumulation of water inside the motor. Frames shall have corrosion prevention in accordance with the requirements of paragraph CORROSION PREVENTION AND FINISH PAINTING. Exposed portions of shafts shall be treated with manufacturer's standard primer and two coats of moisture proof varnish in accordance with the manufacturer's recommendation.
2.1.5 Windings and Insulation

**************************************************************************
NOTE: Select insulation class based on NEMA temperature requirements as follows:

<table>
<thead>
<tr>
<th>CLASS</th>
<th>LIMITING TEMPERATURE (in degrees Celsius)</th>
</tr>
</thead>
<tbody>
<tr>
<td>B</td>
<td>130</td>
</tr>
<tr>
<td>F</td>
<td>155</td>
</tr>
<tr>
<td>H</td>
<td>180</td>
</tr>
</tbody>
</table>

Selection of insulation class should be left to the Contractor when he is also responsible for motor design, but in no case should it be less than Class B. Class F is typical.

Designer will provide ambient temperature values where possible.

**************************************************************************

Insulation shall be Class [B] [F] [H] [B or better as required for design conditions] with special moisture, [fungus], and oil proof treatment. Motors shall be designed and constructed to withstand the environmental conditions specified. The following specifications describe the minimum requirements for acceptable insulation and are not intended to restrict or prohibit the use of materials or methods which will give equal or better performance.

2.1.5.1 Insulated Windings

Insulated windings, unless otherwise approved, shall be completely assembled in the motor core before impregnating with the insulating compound. Insulating compound shall be 100 percent solid. Impregnation of the windings with the insulating compound shall be by vacuum impregnation method followed by baking. The procedure shall be repeated as often as necessary to fill in and seal over the interstices of the winding, but in no case shall the number of dips and bakes be less than two dips and bakes when the vacuum method of impregnation is used.

2.1.5.2 Magnet Wire

The magnet wire shall have an insulation or combination of insulations with an insulation thickness not less than that required for the environment specified and the temperature rating as required by the hot-spot temperature of the motor.

2.1.6 Winding Heaters

**************************************************************************
NOTE: Delete this paragraph and the requirement for "Winding Heaters," if dripproof encapsulated motor is used. Additionally, the designer should consider elimination of winding heaters if possible in other situations, i.e. where the probability of
condensation is low. In the past, heaters have been a maintenance problem and have been disconnected by project personnel.

A heater or heaters shall be installed in the motor frame or end bells or wrapped around the winding end turns. Heaters shall meet the requirements of paragraph HEATERS-GENERAL. Heaters installed around the winding end turns shall consist of the required turns of heating cable wrapped around the end turns and secured in place before the motor windings are impregnated.

2.1.7 Bearings and Lubrication

NOTE: The use of sealed bearings should be limited to special applications. Sealed bearings do not require as much maintenance but reduce the overall life of the motor.

The motors shall be provided with antifriction bearings, and the design of the housing and method of assembly shall permit ready removal of the end brackets and prevent escape of lubricant and entrance of foreign materials. Bearings shall be fitted with bronze or other approved bushings to prevent any binding of moving parts. Approved antifriction bearings of corrosion resisting construction may be used. Bearings [shall be of an approved prelubricated type requiring no addition or change of lubrication for a period of at least 5 years] [shall have fitted openings located on the top and bottom of the bearing housing. The openings shall be readily accessible for applying and draining the lubricant]. Pressure lubrication fittings may be used provided the housings are properly vented to prevent damage to the seals. When the brake housing or other equipment is to be assembled adjacent to or bolted to the motor end bell, suitable filler and drain pipe extensions, with the ends properly fitted and easily accessible, shall be provided. For those applications where the brake wheel is mounted on a shaft extension on the front end of the motor, the bearing housing, or a suitable flange, shall be furnished to provide a suitable surface and connecting means to allow the fastening of the brake enclosure to the bearing housing (see paragraph BRAKE ENCLOSING CASE).

2.1.8 Terminal Leads

Terminals leads shall extend outside the frame; shall have insulation equivalent to that of the motor winding; shall be terminated in a two-piece, watertight terminal box secured rigidly to the motor frame; and shall be suitably identified. Leads shall be positioned and sealed where they pass through the frame with a water-resistant seal of a synthetic rubber material or a synthetic rubber gasket. Terminal box shall have threaded conduit entrances on a minimum of four sides.

2.1.9 Machine Work

Machine work shall be accurate, of high quality, and in conformity with approved standard practice. Threads shall be in accordance with ASME B1.1. Thread fittings shall be Class 2. Threads on all body-bound bolts shall be chased a sufficient length so that when the nut is tightened there will be approximately one and one-half full threads under the nut. All bolts and cap screws shall be provided with lock washers.
2.1.10 Designation and Markings

Motor nameplates of a suitable corrosion-resisting material shall be attached to the frame of each motor and shall indicate clearly the motor NEMA temperature and insulation class, continuous amperage rating, voltage rating, operating frequency, rated RPM, horsepower rating, nominal efficiency, NEMA locked rotor code letter and serial number. In addition, the nameplate shall show a lead connection diagram. Identification or serial numbers shall be die stamped on the frame.

2.2 BRAKE

Submit [6] copies of detailed descriptive data covering the brake, with necessary cuts, photographs, and drawings to indicate clearly the construction of the brake and the materials used. Releasing device specifications and characteristics, including input current minimum voltage required for brake release.

2.2.1 Brake Type

The brakes shall be of the shoe type, spring set, with AC or DC magnet operated release and shall be completely enclosed in a watertight and dusttight enclosing case arranged for [floor mounting] [motor mounting].

2.2.2 Brake Rating

***************************************************************************
NOTE: Delete paragraph b. if constant torque two-speed motor or a single-speed motor is specified.
***************************************************************************

a. The brake shall have a torque rating not less than 150 percent of the full load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered. The torque rating shall be based on open construction, [1-hour] [continuous] duty.

b. [The brake shall have a torque rating of [___] pound-feet as shown on the plans, or if the design is changed as permitted by [___], the brake shall have a torque rating not less than 150 percent of the full-load torque of the motor when referred to the shaft on which the brake wheel is mounted, efficiency of speed reducer not being considered.] [For a two-speed motor, the rating shall be computed from the full-load torque of the low-speed winding of the motor.]

2.2.3 Adjustment

Means shall be provided for varying torque required for holding. Additionally, the brake shall have means of adjusting the position of the shoes to compensate for wear, unless the design is such that compensation for shoe wear is automatic.

2.2.4 Release

2.2.4.1 Releasing Magnets and Rectifier

***************************************************************************
NOTE: Coordinate voltage requirements with
***************************************************************************
The releasing magnets shall be of the DC or AC shunt type and of standard stock design, suitable for operation on [_____] [230] [460]-volt, 60-Hz, AC electrical power. Direct current shall be supplied by means of a self-contained rectifier unit of proper rating. The complete unit shall be suitable for connection to the control circuit or the power circuit of the motor with which the brake is used so that the brake will set or release when the motor is deenergized or energized, respectively. The brake releasing magnet shall be rated in accordance with the brake rating requirements of paragraph MOTOR RATING, and shall be sufficient to release and hold the brake in the released position with 85 percent of rated voltage impressed on the incoming terminals. The rectifier, when required, shall be mounted in the motor controller enclosing case unless otherwise noted.

2.2.4.2 Hand Release

Hand release shall be provided. It shall be operable only when the enclosing case cover is removed and shall be self-resetting.

2.2.5 Terminal Leads

Connecting leads from the releasing magnet shall be extended outside the enclosing case and shall be terminated on a terminal block located in a watertight terminal box, which shall be rigidly bolted or equally secured to and on the outside of the lower or fixed half of the enclosing case. The terminal box shall provide for conduit entrances on four sides. All conduit entrances to the brake terminal box shall be threaded. The leads inside the brake enclosing case shall be suitably protected. Enclosing case space heater leads shall be terminated in the same manner in separate terminal boxes.

2.2.6 Brake Enclosing Case

NOTE: Manufacturers do not generally weld enclosures. Welding required only where conditions require substantial construction and costs may be justified.

Submit [6] [_____] copies of dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts. The outdoor NEMA Type 4-watertight enclosing case shall be [welded type] [in accordance with the manufacturer's standard practice for the conditions indicated]. In order that the brake mechanism will be accessible from above, when the upper half or cover of the enclosing case is removed, the enclosing case shall be constructed to give equal accessibility to all portions of the brake. The joint between the two halves shall be made with a synthetic rubber gasket, not less than 6 mm 1/4 inch in width, and held in place by embedding in a groove or by other equally effective means. For those applications where the brake wheel is mounted on a shaft extension on the front end of the motor, the enclosing case shall be arranged to permit bolting to the bearing housing of the motor, the joint being made watertight with a gasket. For those applications where the brake wheel is mounted on a shaft of the operating machine or on a flange and shaft extension on the front end of the motor, suitable watertight seals shall be
provided on each part of the housing. The shaft seals shall be arranged for pressure lubrication and shall be adjustable for alignment relative to the shaft. An automatic drain breather, located in a protected location, shall be provided in the lower part of the enclosing case. If the drain breather cannot be located in a protected location, the tapped hole shall be plugged and the drain furnished separately for installation in the field. Enclosing case space heaters conforming to the applicable part of paragraph HEATERS-GENERAL, shall be provided. The enclosing case shall be treated to render the steel resistant to corrosion as required by paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.2.7 Mechanical Construction

Except for brake wheels, shoes, and electrical parts, no cast iron shall be used in brake construction. All pins, fittings, and other miscellaneous small metal parts shall be of approved corrosion-resisting metal or shall be treated to render them corrosion-resistant as required by paragraph CORROSION PREVENTION AND FINISH PAINTING. Bearings shall be fitted with bronze or other approved bushings to prevent any binding of moving parts. Approved antifriction bearings of corrosion-resisting construction may be used. Approved means for lubrication shall be provided for all bearings, unless bearings are of an approved self- or prelubricated type. The machine work shall conform to the requirements for the motor with which the brake is used.

2.2.8 Designation and Markings

A nameplate of suitable corrosion-resisting material shall be provided and attached to a part of the brake which ordinarily will not be renewed during its service life. The nameplate shall conform to standard practice and clearly indicate the manufacturer's name, identification symbols, serial number, and salient design features such as type, frame, torque, rating, voltage, phase, and frequency. If adjustment is required, pertinent information for making the adjustments is necessary.

2.3 CONTROL SYSTEM

******************************************************************************
NOTE: The scheme of control shown on the applicable plate at the end of this document should be retained where possible.

The Plates listed below, containing the related control sequences, are attached at the end of this spec.

PLATE NO. SUBJECT
1. Crest Gate, Electrical Control System (With Approximately 300 mm 1.0 Foot Increments)
2. Crest Gate, Electrical Control System (With Approximately 150 mm 0.5 Foot Increments)
3. Crest Gate, Electrical Control System (With Remote Control and Approximately 300 mm 1.0 Foot Increments)
4. Crest Gate, Electrical Control System (With Remote Control and Approximately 150 mm 0.5 Foot Increments)

5. Outlet Control Gate, Electrical Control System (Single-Speed Motor)

6. Outlet Control Gate, Electrical Control System (Multispeed Motor)

7. Intake Gate, Electrical Control System.

In some instances, where control for a penstock intake gate hoist where the emergency lower control switch is to be located in the powerhouse, the length of the connecting circuit may be such that its mutual inductance may render the circuit susceptible to false operation. In such cases, it will be necessary to use direct current and interpose an additional control relay. The direct current can be provided from a rectifier located in the control cabinet or from a circuit on the powerhouse control battery.

The scheme of operation of the [outlet control gate] [tainter gate] [intake gate] hoist motor control system shall be as described and indicated. The control system shall include the controller, limit switch, master control station[s], and such other items as may be required to accomplish the operating features specified. Each item shall be [installed and] tested as specified and shall be complete and ready for operation [, when installed under another contract,] in accordance with the scheme of operation.

2.4 CONTROLLER

NOTE: Separate mounting of the controller is usually the preferred practice. When mounting the controller on the hoist frame is desired, the Contractor will be required to submit a drawing showing the arrangement of the controller and other electrical equipment on the hoist frame. In this case, the electrical equipment should be wired in the shop complete and ready for operation upon bringing the power connection to the line side of the controller disconnect switch.

Submit [6] [_____] copies of a description of the operation scheme, if other than herein specified or shown on the drawings; a dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts, detailed panel layouts, schematic wiring diagrams, and a panel wiring diagram dimensioned outline drawings showing specific relationships and clearances between equipment and their component parts. Submit [6] [_____] copies of detailed descriptive data covering all component parts of the controller.
2.4.1 Controller Type

The hoist motor controller shall be of the full magnetic type initiated by the push-button control station and controlled automatically by a limit switch or limit switches. Limit switch(es) shall be driven by the hoist mechanism or other auxiliary operating devices as indicated or required to provide the sequence of operation specified or indicated on the plans.

2.4.2 Protection

The controller shall provide [under-voltage protection,] inverse-time-limit overload protection, or other protection as indicated or specified. [In addition, the controller shall provide protection from single-phase faults.] The protection shall be accomplished by suitable relays conforming to the requirements of paragraph RELAYS. Overload relays shall provide protection during both the starting and running condition, and approved means shall be provided to manually reset the relays without opening the enclosing case of the controller. All forward and reversing contactors shall be electrically interlocked. Controller disconnecting circuit breaker(s) shall be interlocked with the controller enclosing case access door to permit opening or closing the access door only when the disconnect is in the "OPEN" position.

2.4.3 Enclosure

**************************************************************************
NOTE: When controller is mounted in a dry room or gallery adjacent to the hoist equipment adjacent to the hoist equipment, a NEMA Type 12, industrial-use enclosure should be specified and the drawings and specifications revised accordingly. Hubs shall be specified for all conduit entrances.

Wall mounting is generally the least costly alternative and should be used whenever practical.

Designer shall coordinate padlock requirements with local standards.
**************************************************************************

Enclosing cabinet shall be of the NEMA Type [3R [stainless steel]] [4 watertight [stainless steel] and moisture-resisting] [12 industrial use] construction with interior dead-front panel meeting the requirements of NEMA ICS 6. Enclosing cabinet shall be designed for [floor mounting] [mounting on the hoist frame] [wall mounting]. Suitable padlock eyes shall be provided to allow locking the exterior door in the closed position. Padlocks, conforming to [_____], shall be provided with each controller and chained to the enclosing case. The chain shall be of a nonferrous material resistant to corrosion. Only front-connected devices shall be used, and clearances shall be in accordance with NEMA ICS 1 requirements. Threaded hubs for conduit entrance of the welded-in type shall be provided as indicated on the drawings or as required to make the wiring connections. An automatic breather-drain, not less than 3/8-inch size and located in a protected location and at the lowest point of the enclosure, shall be provided.

2.4.4 Air Circuit Breakers

Air circuit breakers as shown on the drawings or specified shall be
provided and assembled in the housing of each controller.

2.4.4.1 Circuit Breakers - General

Each air circuit breaker shall conform to the applicable requirements of UL 489. The circuit breakers shall be manually operated and shall be of the instantaneous trip type, unless otherwise specified or indicated on the drawings. All poles of each breaker shall be operated simultaneously by means of a common handle and shall be enclosed in a common molded plastic case. The contacts of multipole breakers shall open simultaneously when the breaker is tripped manually or automatically. The operating handles shall clearly indicate whether the breakers are in "ON," "OFF," or "TRIPPED" position. Each circuit breaker shall be externally operated [and interlocked] as specified in paragraph PROTECTION. Approved means shall be provided for padlocking the breaker[s] operating handle in either the "ON" or "OFF" position. A padlock of the same type as specified in paragraph ENCLOSURE, shall be provided for each breaker and shall be chained to the enclosing case. The circuit breakers shall be products of only one manufacturer and shall be interchangeable when of the same frame size.

2.4.4.2 Trip Units

Except as otherwise indicated on the drawings, the circuit breakers shall be provided with combination thermal and instantaneous magnetic trip units. The minimum frame sizes and the trip unit ratings shall also be as required for the equipment controlled. Nonadjustable instantaneous magnetic trip unit shall be set as approximately 10 times the continuous current ratings of the circuit breakers.

2.4.4.3 480-Volt AC Circuits

Air circuit breakers for 480-volt AC circuits shall be rated 600 volts AC and shall have a minimum NEMA interrupting capacity of 14,000 symmetrical amperes at 600 volts AC.

2.4.4.4 120-Volt AC Circuits

Air circuit breakers for 120-volt AC circuits shall be rated not less than 120/240 or 240 volts AC and shall have a minimum NEMA interrupting capacity of 10,000 symmetrical amperes.

2.4.4.5 125-Volt DC Circuits

Air circuit breakers for 125-volt DC circuits shall be two-pole rated 125/250 or 250 volts DC and shall have a minimum NEMA interrupting capacity of [5,000] [10,000] amperes DC.

2.4.5 Assembly of Controller

Furnish all necessary air circuit breakers, contactors, relays, resistors, interlocks, master switches, limit switches, or other devices required by the scheme of operation. The panel for mounting the relays and contactors shall be sheet steel of sufficient thickness to provide rigid support for the equipment mounted thereon. The steel panel shall be given a corrosion resisting treatment in accordance with the requirements of paragraph CORROSION PREVENTION AND FINISH PAINTING.
2.4.5.1 Wiring

Submit [6] [_____] copies of data sufficient to demonstrate that the proposed wire and cable conform to these specifications. Insulated wire shall conform to the requirements of paragraph CONDUCTORS. All wiring shall be securely held in place and arranged in a neat and orderly manner in horizontal and vertical runs. All wiring passing through steel gutters shall be protected by grommets, unless the openings in the steel gutter are formed to protect the wiring from damage. [All controllers shall be wired in like manner as to location of parts and phase sequence.] The wire and terminal numbers shall be neatly and legibly identified in an approved manner. Terminal blocks shall be used for making all external connections.

2.4.5.2 Terminal Blocks

Submit method of identifying conductors, terminal leads, and terminal blocks. Terminal blocks for control wiring shall be molded type with barriers, rated not less than 600 volts, and they shall be provided with covers. The terminals shall be removable, screw type, or of the stud type with contact and locking nuts. The terminals shall be not less than No. 10 AWG in size and shall have sufficient length and space for connecting at least two indented terminals on No. 10 AWG conductors to each terminal. The terminal arrangement shall be subject to the approval of the Contracting Officer.

a. Not less than 10 percent, but in no case less than 2 percent, spare terminals shall be provided on each block. Terminal blocks for conductors larger than No. 10 AWG or with a capacity of more than 30 amperes shall be adequate for the purpose intended, having length and space for at least two indented terminals of the size required on the conductors to be terminated.

b. For conductors rated more than 50 amperes, all screws shall have hexagonal heads. For conductors rated 50 to 99 amperes, the minimum screw size shall be 8 mm 5/16 inch. Conducting parts between connected terminals shall have adequate contact surface and cross section to operate without overheating.

c. White or other light-colored marking strips, fastened by screws to the molded sections at each block, shall be provided for circuit designation. Each connected terminal of each block shall have the circuit designation or wire number placed on the marking strip with permanent marking fluid. One reversible or one spare marking strip shall be furnished with each block.

2.4.6 Magnetic Contactors

2.4.6.1 Contactor Ratings

All heavy-duty magnetic contactors shall be of the voltage rating indicated on the drawings or otherwise required. They shall have a horsepower rating not less than the horsepower rating of the motor with which the controller is to be used, but in no case shall the contactor used be smaller than NEMA, Size 1. The contactors shall meet the requirements of NEMA ICS 2 and have continuous current ratings for the duty indicated. Contactors shall be suitable for at least 200,000 complete operations under rated load without more than routine maintenance. They shall operate successfully on 10 percent over-voltage and 15 percent under-voltage. The interrupting capacity shall conform to NEMA standards. Mechanical interlocking between
Contactors shall be provided as indicated or required and shall be accomplished without any mechanical attachment between the interlocking mechanism and the moving parts of the contactor, unless otherwise approved by the Contracting Officer.

2.4.6.2 Arcing Protection

For each pole, the interruption arc and flame shall be minimized by suitable arc chutes or other means so that no damage will be done to other portions of the device. The arc chutes, if provided, shall be easily removed without removing or dismantling other parts.

2.4.6.3 Contactors

All current carrying surfaces shall be of a silver alloy or of copper faced with a silver alloy and shall be easily accessible and removable for replacement. Contactors shall operate without chatter or perceptible noise while energized. Coils shall be suitable for continuous operation on the voltage specified.

2.4.6.4 Construction

Each contactor shall be provided with a minimum of three auxiliary contacts, which may be easily changed from normally open to normally closed. Contactor construction shall be such as to prevent corrosion in accordance with paragraph CORROSION PREVENTION AND FINISH PAINTING.

2.4.7 Relays

2.4.7.1 Control

Control relay devices shall meet applicable requirements of NEMA ICS 2 for Class A600 contacts. All contacts shall be of a silver alloy or of copper faced with a silver alloy.

2.4.7.2 Overload

Submit [6] [_____] copies of curves showing the overload relay tripping time versus current characteristics of the overload relays for the controller. Overload relays shall be the adjustable thermal type with normally closed control circuit contacts having a pilot and control circuit contact rating of A600, in accordance with NEMA ICS 2, and shall have combination manual and automatic-type reset. They shall have inverse-time tripping characteristics simulating the heating characteristics of the motor, shall protect the motor with which used against exceeding its specified temperature rise under any overload, stalled rotor, or single-phase condition, and shall be self-protecting under all conditions, except short circuit. A relay consisting of an assembly of individual-phase thermal elements actuating a common tripping bar shall be used. The means of adjustment shall provide a range from 90 percent to 110 percent of the heater rating and shall be sufficiently accurate to allow setting the relay at the full-load current value of the motor with which used. Reset mechanism shall be trip free and arranged for manual reset in accordance with paragraph PROTECTION, unless automatic reset is indicated. Reset mechanism shall be of design that will permit changing from manual to automatic reset or vice versa without the use of special tools.
2.4.8 Control Transformer

The control transformer shall be a standard, single-phase, 60-Hz, dry-type, [_____] 480/120 volts, and with kVA rating sufficient to supply the control [and heater] circuits.

2.4.9 Control Circuit Breakers

The control circuit breakers shall conform to the requirements of paragraph AIR CIRCUIT BREAKERS, except that an external operating mechanism is not required. Breakers shall be two-pole, 100-ampere frame, and 20-ampere continuous current rating.

2.4.10 Indicating Lights

Indicating lights shall be complete with low-voltage lamps, self-contained resistor or transformer units, and lens or color caps. Lens and lamp shall be removable from the front. They shall operate on 120 volts AC and be suitable for flush or semiflush mounting to the exterior cabinet door. Exterior mounting of the indication lights shall meet the requirement for the enclosure NEMA type. Hinge wire shall be used for connections between the indicator lights and the terminal block.

2.4.11 [Plug Receptacle for Inching Pendant Control Switch

**************************************************************************
NOTE: Inching pendant control switch in paragraph INCHING STATION, and receptacle is not required on crest gates. Omit requirement for receptacle on controller enclosure and mount receptacle on wall of gate inspection room if inspection room is above maximum flood.
**************************************************************************

The receptacle body shall be weather resistant with threaded cap and gasket complete with polarized female contact unit, four-wire, five-pole, grounded through shell and extra pole, and rated 30A, 460 volts.]

2.4.12 Equipment and Door Nameplates

Submit schedule of nameplates. Nameplates shall be provided for the front of the cabinet door and for each item of equipment within the enclosure. Anodized aluminum, stainless steel, or a laminated plastic sheet with black surface layer and a white bottom layer not less than 1/16 inch thick shall be used for the nameplate material. Equipment within the enclosure shall be identified by nameplates or other suitable marking on the equipment unit base or on the panel.

2.4.13 Heater

The heater shall be strip type and meet the requirements of paragraph HEATERS-GENERAL.

2.4.14 Grounding

The ground connection for the controller enclosing cabinet shall be made by a threaded post fitting which extends through the enclosure wall and which is provided with fittings to connect No. 6 AWG stranded copper ground wire both inside and outside the enclosure. Inside the enclosure, the ground
circuit shall be extended with No. 6 AWG stranded copper wire from the connector to the panel.

2.5 **CONTROL STATION[s]**

Submit [6] [_____] copies of detailed descriptive data covering the control station[s]. Control station[s] shall be of the rocker handle push-button type and shall provide the number of indicating lights and individual switches of the type or types required by the scheme of operation. Enclosure shall be NEMA-Type [3R] [4 watertight [stainless steel]] [12R industrial use] construction. All contacts shall be of the double-break bridging type and shall have a pilot and control circuit rating designation of A600 in accordance with NEMA ICS 2. Switch cases shall be provided with threaded bosses for conduit or cable connection and shall provide ample wiring space for conductors of the size and insulation specified.

2.5.1 Master Station

**************************************************************************
** NOTE: Use padlocked stop switch on all hoists except intake gate hoists provided with remote lowering. Intake gate hoists may use either padlock or "substantial metal cover" alternate. If metal cover alternate is used, the emergency lower contact "ELS" in parallel with the stop switch contact should be deleted. **
**************************************************************************

The master station shall be arranged with the elements stacked vertically and with [____]-inch conduit entrance from the bottom. The station shall provide [a red indicating light and] [3] [4] operating rocker handle-type push buttons. The station shall be arranged starting at top with [a red light followed by] the "RAISE," ["CONDUIT OPEN,"] "LOWER," and "STOP" push buttons. The station switch elements shall have nameplates with the above designations. [The "STOP" switch shall be provided with means of padlocking the switch in the stop or in the open position.] [The station shall be provided with a substantial removable or hinged metal cover which can be locked in the closed position to prevent operation of the switch elements.] The padlock shall be chained to the enclosing case with a chain made of nonferrous material.

2.5.2 [Inching Station]

The inching station shall be arranged with the elements stacked vertically and with conduit entrance on the top for a cable clamp. The cable shall be [_____] feet of five-conductor, No. 12 AWG portable cable with extra flexible conductors, heat and moisture resistant insulation, and outer Neoprene jacket. The station shall have two rocker handle-type push buttons. The switch elements shall be designated "INCH UP" and "INCH DOWN" from top to bottom, respectively.

2.6 **LIMIT SWITCH**

a. Submit [6] [_____] copies of all limit switch computations used to determine the selection of gear ratios and calibration for gate travel.
b. Submit [6] [_____] copies of complete descriptive data covering the limit switch with necessary cuts, photographs, and drawings to indicate clearly the construction, materials used in the parts, rating, accuracy of tripping and reset, method of adjustment, and safeguards.

2.6.1 Normal Operation

The limit switch shall be the linear solid-state programmable type with digital display and shall operate on 120 volts AC. It shall contain all the contacts required for making and breaking all control and interlocking circuits necessary for the proper control and operation in the manner specified or required.

2.6.2 Construction

The limit switch shall be of compact and rugged construction, totally enclosed in a NEMA Type 13 case, and housed within the controller enclosure. The digital display shall be visible without opening the enclosure door. This viewing port in the door shall have a replaceable gasketed piece of clear plastic mounted to maintain the NEMA rating of the enclosure. The cover shall be provided with cap screws or other approved means for readily breaking the cover free for removal unless the gasket is so designed that it will not stick. All parts shall be of corrosion-resisting metal or treated in an approved manner to render it resistant to corrosion. The switch shall permit final adjustment in the field. Tapped bosses shall be provided for making all conduit connections to the switch. A clamp-type connector bolted to the outside of the case shall be provided for making ground connections.

2.6.3 Switches

Switches shall be solid state with current rating as required and shall be assembled or combined into operating units as indicated on the plans. They shall be provided with suitable terminals for connecting the external conductors and shall provide for one remote digital readout. Each terminal shall be suitably marked or tagged with the wire number shown on the contract drawings. The tripping mechanism shall be designed for fail-safe operation and shall reset the contacts when moving in the reverse direction. The switch shall have an operator lockout feature which permits programming only by authorized personnel.

2.6.4 Transducer

The electromagnetic position sensor shall be single-turn, heavy-duty enclosed in a outdoor NEMA 4 watertight enclosure. A cable [chain] connector used for the enclosure shall be provided and be suitable for No. 16 AWG shield twisted pair.

2.6.5 Accuracy of Trip and Reset

**************************************************************************
NOTE: For installations where water control requires gate travel of over 9 m 30 feet, measurement of gate travel may become nonlinear. This is due to stretching of the wire rope. The attachment point for measurement of travel should be as near the switch as possible and need not be at the top of the gate. The designer shall investigate
possible options, including use of chain and additional limit switches.

The design of the switch elements and operating mechanism of the limit switch shall provide for uniform and accurate setting. Switch shall be single turn with 1,000 counts per turn and a minimum of 16 set points. The switch shall accurately transmit position within \(+\ 75\ mm\ 3\ inches\) and shall reset gate for drift exceeding \(150\ mm\ 6\ inches\).

2.7 WIRE AND CONDUIT

2.7.1 Conductors

Conductors shall be of annealed copper wire. Copper conductors shall be insulated with polyethylene. Conductors shall be Class B or Class C stranding, except for hinge wire which shall be Class D or K stranding. Unless otherwise specified, all wire and cable for power and control shall be single conductor. Insulation thickness shall be that required for a rated circuit voltage of 0 to 600 volts. Insulation shall be a cross-linked thermosetting polyethylene insulation type. Over the insulated conductor there shall be applied a moisture resisting thermoplastic jacket. The method of accomplishment shall be in accordance with the current practice of the industry. Wire for power and motor circuits shall have a current carrying capacity corresponding to the ampere rating of the circuit's air circuit breaker and not less than No. 10 AWG and the full-load current of the motor or the circuit. Wire for control circuits shall not be smaller than No. 12 AWG.

2.7.2 Control Wire

All control wire shall be type SIS switchboard wire meeting the requirements of UL 44.

2.7.3 Conduit

Rigid steel conduit shall conform to ANSI C80.1 and shall, in addition, be zinc-coated (galvanized) both inside and outside by the hot-dip method.

2.7.4 Fittings

Conduit fittings shall conform to the requirements of NEMA FB 1 and CID A-A-50553.

2.7.5 Assembly

NOTE: For contracts where all conduit and wiring are furnished and installed by others, use paragraph 'a.'

For contracts where all conduit and wiring are on the hoist and are furnished and installed under this contract, use paragraph 'b.'

For contracts where the conduit and wiring on the hoist are furnished and installed under this contract and the connections to remotely located items are made under a subsequent contract, use...
paragraph 'c.'

The hoist motor, motor brake, controller, limit switch, and master control station shall be installed on the [hoist frame] [as shown on contract drawings].

[a. The conduit and wiring connections external to the items of electrical equipment previously mentioned will not be furnished or installed under this contract.]

[b. The conduit and wiring connections external to these previously mentioned items of electrical equipment shall be furnished, installed, and connected complete and ready for operation. The conduit, wiring, and connections for the incoming power will be made by others under a subsequent contract.]

[c. The conduit and wiring connections external to these previously mentioned items of electrical equipment which are installed on the hoist frame shall be furnished, installed, and connected complete and ready for operation. The conduit and wiring connections to the remotely located control equipment and the incoming power connections will be made by others under a subsequent contract.]

d. All wiring shall be installed in rigid hot-dip galvanized metal conduit with threaded-type fittings (Condulets) and zinc-coated watertight outlet and pull boxes. The conduit shall be securely mounted and fastened to the hoist framework and shall be installed in a neat and workmanlike manner. Change of direction of a conduit run shall be made by means of threaded-type fittings (Condulets) or factory fabricated bends, and the conduit shall be installed to fit close to the hoist framework. Conduit unions shall be used whenever it is necessary to join conduits that are to be turned right and left. No running threads will be permitted. Ends of conduits shall be carefully reamed. All threaded connections shall be made up with electrically conductive colloidal copper rust-inhibiting compound or other suitable compound. Separate conduit systems shall be provided for power and control circuits. The entire conduit system shall be grounded and shall be installed so that any moisture will be drained away from terminal boxes and equipment. All conduit connections to equipment enclosures shall be of the watertight threaded type. Suitable "drain-breather" devices shall be provided at all low points of the conduit system to prevent an accumulation of water. All conductors shall be terminated in an approved manner. Indented terminals shall be used on No. 12 AWG and larger conductors and shall be terminated on screw or stud terminals. Toothed lock washers shall be used on all screw terminals and locking nuts or lock washers shall be used on all stud terminals.

2.8 HEATERS - GENERAL

Enclosure heaters shall be strip type constructed with a chrome-nickel heating element embedded in a refractory insulating material and encased in an approved watertight, corrosion-resisting, nonoxidizing metal sheath. The rate of heat dissipation shall be uniform throughout the effective length. Watt density shall not exceed 20 watts per square inch for chrome-nickel type.
2.8.1 Heater Ratings

Heaters shall be of such rating that, when energized, the temperature of the windings or enclosure will be held approximately 10°C above ambient. They shall be designed for 120 volts AC and for continuous operation under the conditions of installation. The rate of heat dissipation shall be uniform throughout their effective length.

2.8.2 Insulation

Insulation for the heating cable (winding wrap around type) heaters shall be suitable for a conductor temperature of 180°C.

2.8.3 Heater Terminals

The terminals of the heater, including the leads, shall be watertight. The leads shall be terminated and sealed in a watertight terminal box located as selected by the motor manufacturer. The method of sealing shall be as specified for the motor winding leads.

2.9 TESTS

**************************************************************************
NOTE: If designer elects to do operational tests of the gate hoist equipment, in conjunction with testing of the hoist itself, the hoist specification number must be included.
**************************************************************************

Each item of equipment furnished, one of each rating and type and selected at random by the Contracting Officer, shall be given a complete test. The remaining items of equipment shall be given a routine test. All complete tests required herein shall be witnessed by the Contracting Officer, unless waived in writing, and no equipment shall be shipped until it has been approved for shipment by the Contracting Officer. Notify the Contracting Officer sufficiently in advance of the date of the tests, so that arrangements can be made for the Contracting Officer to be present at the tests. The test equipment and the test methods used shall conform to the applicable requirements of ANSI, IEEE, and NEMA standards and shall be subject to the approval of the Contracting Officer. Submit [6] certified copies of the reports of all complete and routine tests, including complete test data. Certified copies of the results of a complete test for duplicate equipment will be accepted in lieu of the requirement of the complete test specified. Reports shall include analysis and interpretation of test results and shall be properly identified with the test systems and materials. Provide test reports for "complete tests" on the motor, brake, and controller. Certified copies of "Complete Tests" on duplicate equipment may be accepted with the approval of the Contracting Officer. No substitute will be accepted for the routine test. The cost of performing all tests shall be borne by the Contractor and shall be included in the price bid. [Operational tests shall be made on the equipment in conjunction with the tests specified in [_____] for the assembled hoist.] [Operational tests shall be made on equipment after it is installed.] Performance curves indicating the results of the motor tests shall be furnished as follows:

a. Excitation Tests. Volts or percent of rated voltage as abscissa vs. amperes and watts as ordinates.
b. Impedance Tests. Volts or percent of rated voltage as abscissa vs. amperes and watts as ordinates.

c. Performance Test. Torque or percent of rated horsepower output as abscissa vs. efficiency, power factor, amperes watts, and rpm or percent slip as ordinates.

d. Speed-Torque Test. Torque in foot-pounds as abscissa vs. speed in rpm or percent of synchronous speed as ordinates.

e. Temperature Test. Time in minutes as abscissa vs. temperature rise in degrees C as ordinate.

f. Insulation Resistance Test. Test result values shall be plotted on semilogarithmic graphs, the insulation resistance values as logarithmic ordinates, and the temperature values as uniform abscissa.

g. Routine test reports shall include analysis and interpretation of test results and shall be properly identified with the test systems and materials. No substitute will be accepted for the routine test. Provide test reports for "routine tests" on the motor, brake, controller, limit switch, [interrupter,] and wiring.

h. Submit [6] copies of description of "Interrupter" drive including copies of dimensioned outline drawing of the interrupter. Show on the Drawings specific relationships and clearances between equipment and their component parts.

2.9.1 Motor Tests

All tests shall be performed in accordance with the requirements of IEEE 112 for three-phase induction motors.

2.9.1.1 Complete Motor Tests

The complete tests shall include the following:

a. Excitation test.

b. Impedance test.

c. Performance and speed-torque test (Prony brake or other approved method).

d. Temperature test.

e. Insulation resistance tests. Measurements shall be taken following temperature test with readings taken at approximately 10C intervals. Temperature shall be determined by the resistance method.

f. Dielectric test.

g. Cold and hot resistance measurement.

h. Effectiveness of enclosure.

i. Motor winding heater test.

(1) Successful operation.
2.9.1.2 Routine Motor Tests

The routine tests shall include the following:

a. Excitation test: (One point - no load, volts, amperes, and watts.)

b. Impedance test: (One point - half-voltage amperes and watts.)

c. General operation.

d. Insulation resistance - temperature test (one point).

e. Resistance measurements.

f. Dielectric.

g. Motor winding heater test.

(1) Successful operation.

(2) Dielectric.

h. Interrupter.

2.9.2 Brake Tests

2.9.2.1 Complete Brake Tests

The complete tests shall include the following:

a. Check operation of brake release at the specified rated brake torque for rated and 85 percent terminal voltage.

b. Heat run on release magnet at the specified rated brake torque and voltage.

c. Insulation resistance of release magnet including leads and terminal block.

d. Resistance measurements of release.

e. Dielectric test of release magnet including leads and terminal block.

f. Brake space heater test.

(1) Successful operation.

(2) Dielectric.

2.9.2.2 Routine Brake Tests

The routine tests of the brake shall be the same as specified in paragraph COMPLETE BRAKE TESTS, except that the heat run tests shall be omitted.
2.9.3 Controller Tests

2.9.3.1 Complete Controller Tests

The complete tests shall include all tests listed in paragraph ROUTINE CONTROLLER TESTS, and the following:

a. Effect of voltage and frequency variation.

b. Temperature Test.

2.9.3.2 Routine Controller Tests

The routine tests shall include the following:

a. Adjustment, fit, and material.

b. Successful operation.

c. Resistance.

d. Dielectric.

e. Insulation Resistance.

f. Enclosure space heater test.
   (1) Successful operation.
   (2) Dielectric.

2.9.4 Limit-Switch Tests

Each drive shall be tested in the manufacturers shop by suitable means, simulating service conditions, to ascertain that it will transmit the correct information for the control sequence specified. In addition, the routine tests shall include the following:

a. Adjustment, fit, and material.

b. Accuracy of trip and reset.

c. Successful operation.

d. Dielectric.

e. Insulation resistance.

2.9.5 Wiring Tests

All wiring shall be given a dielectric test following installation by applying, for 5 minutes, a voltage test of 1,500 volts to each circuit and ground and between each conductor and all other conductors in the same conduit.

PART 3 EXECUTION [(Not Applicable)]

**************************************************************************

NOTE: Designer should place any requirements for
field installation in this section.

[____].
1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

   (1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER," and "STOP."

   (2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

c. Operating Features

   (1) Actuation of the "RAISE" and LOWER" contacts shall provide seal-in operation.

   (2) A limit switch geared or directly connected to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   (3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed and the intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

   (2) When the gate is at or above the intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

   (1) When the gate is between the over travel raised position and the intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the intermediate position and stop.

   (2) When the gate is at or below the intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.
c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the master control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

   (1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER" and "STOP."

   (2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

c. Operating Features

   (1) Actuation of the "RAISE" and "LOWER" contacts shall provide seal-in operation.

   (2) A limit switch geared or directly connect to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   (3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed position and the first intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 0.5 foot and stop.

   (2) When the gate is at or above the first intermediate position and is below the second intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

   (3) When the gate is at or above the second intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

   (1) When the gate is between the over travel raised position and the second intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the second intermediate position and stop.
(2) When the gate is at or below the second intermediate position and above the first intermediate position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

(3) When the gate is at or below the first intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 0.5 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the master control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

(1) A push button selector switch station located on the gate hoist with momentary push button contacts designated "RAISE", "LOWER", and "STOP" and selector switch contacts designated "LOCAL" and "REMOTE."

(2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

(3) A push button station, located on the spillway gate remote control board with momentary contacts designated "RAISE", "LOWER", and "STOP."

(4) A synchronous type indicator, located on the spillway gate remote control board to show the gate position.

c. Operating Features

(1) Actuation of the "RAISE" and "LOWER" contacts of the remote or local control station shall provide seal-in operation.

(2) The position of the "REMOTE-LOCAL" control switch will determine which station is operative.

(3) The remote control shall utilize direct current interposing relays.

(4) A limit switch geared or directly connected to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

(5) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

(1) When the gate is between the closed position and the intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.
(2) When the gate is at or above the intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the intermediate position and stop.

(2) When the gate is at or below the intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the master control station.
1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

   (1) A push button selector switch station located on the gate hoist with momentary push button contacts designated "RAISE", "LOWER", and "STOP" and selector switch contacts designated "LOCAL" and "REMOTE."

   (2) A push button station located on the door of the controller cabinet with momentary contacts designated "BACKOUT FROM RAISE OVER TRAVEL" and "BACKOUT FROM LOWER OVER TRAVEL."

   (3) A push button station, located on the spillway gate remote control board with momentary contacts designated "RAISE", "LOWER", and "STOP."

   (4) A synchronous type indicator, located on the spillway gate remote control board to show the gate position.

c. Operating Features

   (1) Actuation of the "RAISE" and "LOWER" contacts of the remote or local control station shall provide seal-in operation.

   (2) The position of the "REMOTE-LOCAL" control switch will determine which station is operative.

   (3) The remote control shall utilize direct current interposing relays.

   (4) A limit switch geared or directly connected to the hoist machine, shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

   (5) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

2. SEQUENCE OF OPERATION

a. Raising

   (1) When the gate is between the closed position and the first intermediate position, each actuation of the "RAISE " contact will cause the gate to raise approximately 0.5 foot and stop.
(2) When the gate is at or above the first intermediate position and is below the second intermediate position, each actuation of the "RAISE" contact will cause the gate to raise approximately 1 foot and stop.

(3) When the gate is at or above the second intermediate position, actuation of the "RAISE" contact will cause the gate to raise continuously to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and the second intermediate position, actuation of the "LOWER" contact will cause the gate to lower continuously to the second intermediate position and stop.

(2) When the gate is at or below the second intermediate position and above the first intermediate position, each actuation of the "LOWER" contact will cause the gate to lower approximately 1 foot and stop.

(3) When the gate is at or below the first intermediate position and is above the closed position, each actuation of the "LOWER" contact will cause the gate to lower approximately 0.5 foot and stop.

c. Over Travel. If during normal operation, the gate motor should fail to stop when the gate reaches the raised or closed positions, the over travel limit switch contacts shall stop the hoist motor after over travel by de-energizing the "main" or "line" contactor of the controller. To operate the gate after an over travel, the appropriate backout switch contact shall be held closed to permit operation of the gate only in the direction away from the over travel position after operation of either the "RAISE" or "LOWER" contact on the master control station.
1. SCHEME OF OPERATION
   
a. General. The control system for the gate shall be as indicated by schematic control wiring diagram, and as specified below.

   b. Control Points. The operation of the hoist motor shall be controlled by:

      (1) A push button station located on the gate hoist with contacts designated "RAISE," "CONDUIT OPEN," "LOWER," and "STOP."

      (2) A push button station located on the gate hoist with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

      (3) A pendant push button station with momentary contacts designated "INCH UP" and "INCH DOWN," provided with a portable cable of suitable length to permit operation from the inspection room. The cable shall terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

   c. Operating Features

      (1) Actuation of the "RAISE", "CONDUIT OPEN", and "LOWER" contacts of the push button station shall provide seal-in operation.

      (2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station shall not provide seal-in operation.

      (3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

      (4) A limit switch geared to directly connected to the hoist machine shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

2. SEQUENCE OF OPERATION
   
a. Raising

      (1) When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously to the raised position.

      (2) When the gate is between the closed position and the conduit open position, actuation of the "CONDUIT OPEN" contact will cause the gate to open continuously to the conduit open position.

b. Lowering. When the gate is between the over travel raised position and the closed position, actuation of the "LOWER" contact will cause the gate to
gate to lower continuously to the closed position.

c. Inching

(1) To raise the gate above the raised position the "INCH UP" contact shall be held closed. The gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contact shall be held closed. The gate will be stopped at the raised position by the limit switch.

d. Over Travel

(1) Over travel limit switches shall stop the driving motor if it fails to stop at the raised or closed position on the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact shall be held closed to operate the gate from over travel closed and over travel raised, respectively.
OUTLET CONTROL GATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM
(Multispeed Motor)

1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

(1) A push button station located on the gate hoist with momentary contacts designated "RAISE", "CONDUIT OPEN", "LOWER", and "STOP."

(2) A push button station located on the gate hoist with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

(3) A pendant push button station with momentary contacts designated "INCH UP" and "INCH DOWN", provided with a portable cable of suitable length to permit operation from the inspection room. The cable shall terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

c. Operating Features

(1) Actuation of the "RAISE", "CONDUIT OPEN", and "LOWER" contacts of the push button station shall provide seal-in operation.

(2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station shall not provide seal-in operation.

(3) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

(4) A limit switch geared to be directly connected to the hoist machine shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

2. SEQUENCE OF OPERATION

a. Raising

(1) When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously at low speed to the conduit open position.

(2) When the gate is between the closed position and the conduit open position, actuation of the "CONDUIT OPEN" contact will cause the gate to open continuously at low speed to the conduit open position where the limit switch shall cause the gate to open continuously at high speed to the raised position. (3) When the gate is between the conduit open position and the raised position, actuation of the "RAISED" contact will cause the gate to open.
continuously at high speed to the raised position.

b. Lowering

(1) When the gate is between the over travel raised position and conduit open position, actuation of the "LOWER" contact will cause the gate to lower continuously at high speed to the conduit open position where the limit switch shall cause the gate to close continuously at low speed to the closed position.

(2) When the gate is between the conduit open position and the closed position, actuation of the "LOWER" contact will cause the gate to lower continuously at low speed to the closed position.

c. Inching

(1) To raise the gate above the raised position the "INCH UP" contact shall be held closed. The gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contact shall be held closed.

(3) The gate will be stopped at the raised position by the limit switch.

d. Over Travel

(1) Over travel limit switches shall stop the driving motor if it fails to stop at the raised or closed position or the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact shall be held closed to operate the gate from over travel closed and over travel raised, respectively.
INTAKE GATE
ELECTRICAL CONTROL SYSTEM
DESCRIPTION OF CONTROL SYSTEM

1. SCHEME OF OPERATION

a. General. The control system for the gate shall be as indicated by the schematic control wiring diagram, and as specified below.

b. Control Points. The operation of the hoist motor shall be controlled by:

(1) A push button station located on the gate hoist with momentary contacts designated "RAISE," "LOWER," and "STOP."

(2) A push button station located on the door of the controller with momentary contacts designated "BACKOUT FROM LOWER OVER TRAVEL" and "BACKOUT FROM RAISE OVER TRAVEL."

(3) A pendant push button station with momentary contacts designate "INCH UP" and "INCH DOWN," provided with a portable cable of suitable length to permit operation from the inspection room. The cable shall terminate in a polarized plug matching receptacle located on motor controller cabinet or other suitable place.

c. Operating Features

(1) Actuation of the "RAISE" and "LOWER" contacts of the push button station shall provide seal-in operation.

(2) Actuation of the "INCH UP" and "INCH DOWN" contacts of the pendant push button station shall not provide seal-in operation.

(3) Actuation of the "CLOSE" contact of the emergency lower switch shall provide seal-in operation.

(4) Actuation of the "STOP" contact during any operation shall stop the hoist motor and set the brake.

(5) A "balanced-pressure switch" with normally closed contact.

(6) A limit switch geared or directly connected to the hoist machine shall control the incremental and stopping operations initiated manually from the control station as described under sequence of operation.

(7) Gate position indicating lights as follows:

(a) A red light on push button station and with emergency lower switch indicating gate is in normal operating position.

(b) A green and blue light with emergency lower switch indicating gate is in closed and raised position, respectively.

(c) An amber light with emergency lower switch indicating gate is closing.
2. SEQUENCE OF OPERATION

a. Raising. When the gate is between the closed position and the raised position, actuation of the "RAISE" contact will cause the gate to open continuously to the raised position. If there is a pressure difference between the two sides of the gate, the gate will stop at the cracked position. After pressure is balanced actuation of the "RAISE" contact will cause the gate to open to the raised position.

b. Lowering. When the gate is between the over travel raised position and the closed position, actuation of the "LOWER" contact will cause the gate to lower continuously to the closed position.

c. Normal Operating Position

(1) The gate is placed in the normal operating position by either the raising or lowering operation described above.

(2) The red light indicates the gate is in normal position.

(3) Actuation of the "STOP" contact of the push button station stops the gate.

d. Emergency Closing. When the gate is between the normal position and the closed position, actuation of the "CLOSE" contact of the emergency lower switch will cause the gate to lower continuously to the closed position.

e. Inching

(1) To raise the gate above the raised position the "INCH UP" contact shall be held closed. Gate will be stopped at upper inch position by the limit switch.

(2) To lower the gate when it is above the raised position the "INCH DOWN" contacts shall be held closed. Gate will be stopped at the raised position by the limit switch.

f. Over Travel

(1) over travel limit switches shall stop the driving motor if it fails to stop at the raised or closed position of the gate.

(2) The "BACKOUT FROM LOWER OVER TRAVEL" or "BACKOUT FROM RAISE OVER TRAVEL" contact shall be held closed to operate the gate from over travel closed and over travel raised, respectively.

3.5 FINAL EXAMINATION AND ACCEPTANCE

3.6 PLANT REMOVAL

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for dredging.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com).

NOTE: The techniques of sounding, sweeping, or a combination thereof are applicable methods in the acceptance examination, depending upon specific requirements of the project. In general, for maintenance dredging or for new dredging on soft bottom, the acceptance examination by soundings will be acceptable; for new dredging on hard coral or rock bed, and also for dredging below existing channel bottom on hard coral or rock bed, sweepings are required. For new dredging on hard bed harbor channel and turning basin for capital ships (such as aircraft carriers), the combination of soundings and sweepings is required. If modification of navigation charts is required after completion of dredging work, the EFD shall coordinate with Naval Facilities Engineering Command Code 04A3 for the proper data transfer procedures to the Defense Mapping Agency. In the case of inland rivers all navigation chart updates shall be coordinated with Inland Electronic Navigation Chart (IENC) team of the Corps of Engineers.
PART 1   GENERAL

1.1 GENERAL INFORMATION

NOTE: Identify any known site specific information that would impact the contract work. Identification of known subsurface/submerged materials does not relieve the Contractor for doing their own investigations and should be noted in the contract.

This Section covers furnishing suitable dredging plant and performing all work required to remove the specified materials from within the prescribed work area limits as indicated, and placement of the dredge material within the prescribed material placement areas. The Contractor is responsible for making their own investigation of submerged, surface, and overhead structures in the work areas and other locations they find necessary to traverse. The exact location, depths, and heights of various structures including, but not limited to submarine cables, pipes, highlines, docks, piers, bulkheads, and bridges (as applicable), are not known and it will be necessary for the Contractor to ascertain interference problems and notify the respective owners in advance of dredging operations. The Contractor is responsible for making necessary arrangements with the respective owners of the structure(s) to assure satisfactory completion of dredging in the vicinity with a minimum interruption of service, and shall perform their operations in such a manner as will avoid damage to these facilities.

1.2 DEFINITIONS

1.2.1 Maintenance Material

Maintenance material is defined as that comprising shoaling which has occurred since the channel areas were last dredged.

1.2.2 New Work Material

New work material is defined as previously undredged material.

1.2.3 Hard Material

Hard material is defined as material requiring [blasting or] [the use of] special equipment for economical removal, and includes boulders or fragments too large to be removed in one piece by the dredge.

1.3 SUBMITTALS

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be
reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
Submerged Pipelines
Soundings or Sweepings; G[, [____]]

Indicate pipeline location and installation details. Submit drawings of surveys during progress of work by soundings or sweepings.

SD-07 Certificates
Protection Plan

1.4 METHOD OF COMMUNICATION

NOTE: Where appropriate, also require communications between dredging crews, placement
area, and the US Coast Guard or Port Services
Department of the Naval installation. Section
01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS should be
referenced to ensure there is no redundancy or
discrepancy.

Provide a system of communication between the dredge crew and the crew at
the placement area. A portable two-way radio is acceptable.

1.5 OTHER DREDGING OPERATIONS

The Contractor should anticipate the possibility of concurrent dredging
operations, adjacent to or nearby the dredge and placement areas in this
contract. Delays should be anticipated in transiting to, and through, the
placement sites during concurrent dredging and placement operations. As a
standard safety precaution, observe all placement site specific
restrictions pertaining to the limit of dredges operating within at any
given time. Coordination with other dredge plant in the vicinity of the
dredge and placement areas is required.

1.6 ENVIRONMENTAL COMPLIANCE AND PROTECTION

NOTE: USACE Division 01 specification concerning
environmental compliance should be referenced to
ensure there is no redundancy or discrepancy.

Comply with conditions and requirements of State or Federal permits. The
Government will secure the permit for dredging and placement of material as
indicated. Coordinate with [_____] for placement of excavated materials.

During the life of the contract, provide and maintain environmental
protective measures. Also, environmental protective measures required to
correct conditions, such as oil spills or debris, that occur during the
dredging operations, must be provided. Comply with Federal, State, and
local regulations pertaining to water, air, and noise pollution.

1.7 BASIS FOR BIDS

NOTE: USACE shall reference Division 00 and
Division 01 to ensure there is no redundancy or
discrepancy. Where applicable, choose one of the
following options. Choose the first option for lump
sum bidding of dredging, in projects where exact
quantities can be practically determined prior to
the actual work. Choose the second option for unit
price bidding of dredging. Specify unit price bid
items for dredging for projects where exact
quantities cannot be practically determined prior to
the actual work.

[Base bids on the quantity of dredging indicated. Should the total
quantity of dredging vary from that specified as the basis for bidding, the
contract price will be adjusted in accordance with FAR 52.243-4 Changes.
The dredging conditions specified and indicated describe conditions which
are known. However, the Contractor is responsible for other conditions encountered which are not unusual when compared to the conditions recognized in the dredging business as usual in dredging activities such as those required under this contract.

NOTE: For NAVFAC PAC projects: Edit applicable attachments from 00 21 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS for inclusion in Standard Form 1442, "Solicitation, Offer and Award" and "Schedule of Bid Items." Select first bracketed text.

NOTE: For NAVFAC LANT projects, use the following for unit price bidding.

Payment will be at the contract unit price per cubic meter cubic yard, multiplied by total cubic meters cubic yards of acceptable dredging. Base bids on total cubic meters cubic yards of dredging[, as specified in Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS]. Include a bid unit price per cubic meter cubic yard of dredging based on the quantity [as specified or indicated.] [stated in Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS.] If the Contracting Officer requires an increase or a decrease in total volume of dredging, the contract price will be adjusted in accordance with the FAR 52.211-18 Variation in Estimated Quantity. Dredging conditions specified and indicated describe conditions which are known. However, the Contractor is responsible for other conditions encountered which are not unusual when compared to conditions recognized in the dredging business as usual in dredging activities such as those required under this contract.

PART 2 PRODUCTS

2.1 CHARACTER OF MATERIAL

NOTE: Include silt, sand and mud if project is for maintenance dredging. Delete new material if area has been previously dredged to design depth. New material is material which has never been dredged. Provide the site specific material description if it is known. For USACE, review any site investigations specifications, as applicable, to ensure consistency as it relates to material characterization.

The material to be removed is [silt, sand, and mud] [new material] [maintenance material] [______]. The in situ bulk density of the predominant material to be dredged is as follows:

a. Dredge Area 1 has an in situ bulk density of [______] grams/liter, and consists of [______] percent sand, [______] percent gravel, and [______] percent fines.
b. The Contractor is ultimately responsible for determination of the characteristics of materials to be dredged.

**************************************************************************

NOTE: When blasting will not be permitted, so state. When blasting is permitted, incorporate the project specification information relative to maximum amount of charge that will be permitted and detailed requirements applicable to the specific project.

**************************************************************************

Remove hard material as needed to achieve the required template. Use of blasting operations will be permitted. Reference Section 31 23 00.00 20 EXCAVATION AND FILL for blasting requirements.

PART 3  EXECUTION

3.1  INSPECTION

**************************************************************************

NOTE: Choose one of the following options. Choose the first option for projects which incorporate Contractor Quality Control. Choose the second option for projects which do not incorporate Contractor Quality Control.

**************************************************************************

[Inspect the work, keep records of work performed, and ensure that gages, targets, ranges, and other markers are in place and usable for the intended purpose. Provide, at the request of the Contracting Officer, boats, boatmen, laborers, and materials necessary for inspecting, supervising, and surveying the work. When required, provide transportation for the Contracting Officer and inspectors to and from the placement area and between the dredging plant and adjacent points on shore.]

[The Government will keep a record of work performed and will require that gages, ranges, and other markers are usable for the intended purpose. Provide, at the request of the Contracting Officer, boats, boatmen, laborers, and materials necessary for inspecting, supervising, and surveying the work. When required, provide transportation for the Contracting Officer and inspectors to and from the placement area and between the dredging plant and adjacent points on shore.]

The dredge plant will be inspected by the Contracting Officer, or their representative, prior to beginning work to ensure total dredging plant is in safe working condition. Before any machinery or mechanized equipment is placed in service, it must be inspected and tested by the Contractor and certified to be in safe operating condition.

3.2  DREDGING

3.2.1  Order of Work

**************************************************************************

NOTE: Special scheduling requirements, restrictions, or other similar features bearing on the Contractor performing the work, should be
The Contracting Officer will direct the Contractor on the order of work. The Government reserves the right to change the order of work at any time.

3.2.2 Interference with Navigation

NOTE: If known, include types of vessel and volume of traffic expected to be encountered. USACE review Section 01 35 26 GOVERNMENTAL SAFETY REQUIREMENTS for Contractor requirements to ensure there is no redundancy or duplication.

Minimize interference with the use of channels and passages. The Contractor is responsible for shifting or moving of dredges or the interruption of dredging operations to accommodate the movement of vessels and floating equipment, if necessary. Adhere to Coast Guard Regulations for passing vessels.

3.2.3 Lights

Each night, between sunset and sunrise and during periods of restricted visibility, provide lights for floating plants, pipelines, ranges, and markers. Also, provide lights for buoys that could endanger or obstruct navigation. When night work is in progress, maintain lights from sunset to sunrise for the observation of dredging operations. Lighting must conform to United States Coast Guard requirements for visibility and color.

3.2.4 Navigation Warnings

Furnish and maintain navigation warning signs along the pipeline. Provide notice to increase public awareness of potential hazards presented by dredge plant equipment by stating the location, date of construction, equipment mooring, marshaling areas, using local newspapers, radios, television, waterway users associations, or other appropriate area specific communication networks. Ensure that an announcement is made through the same networks at the beginning of the dredging operation. Make periodic updates/status announcements at intervals of not more than a month throughout the contract life.

Display a sturdy and prominent warning sign at all public boat marinas within 10 miles of dredging operations or moored equipment. The Contractor is responsible for keeping this sign current with respect to the dredging operations or equipment.

3.2.5 Ranges, Gages, and Lines

Provide, set, and maintain ranges, buoys, and markers needed to define the work and to facilitate inspection. Establish and maintain gages in locations observable from each part of the work so that the depth may be determined. Suspend dredging when the gages or ranges cannot be seen or followed. The Contracting Officer will furnish, upon request by the Contractor, survey lines, points, and elevations necessary for the setting of ranges, gages, and buoys.
3.2.6 Dredge Plant and Equipment

NOTE: Include either (dredge type) or option for (clamshell) (hydraulic cutterhead) (trailing suction hopper) (other) after bracket.

a. A [_____] dredge will be used to perform all dredging work under this contract.

NOTE: Include (number) or (count).

b. [_____] dredge(s) may be in operation under this Contract at a time.

c. Maintain all dredge plant and associated equipment such as, but not limited to, scows, coamings, barges, and pipelines, to meet the requirements of the work. Promptly repair leaks or breaks along pipelines.

3.2.7 Layout of Work

NOTE: Include datum following bracket to identify purpose of bracket.

The Contractor will be provided layout charts for all dredging areas based on the schedule of work, the Contractor’s hydrosurvey requests, and/or the results of Government hydrographic survey monitoring. The most current Government hydrosurvey information will be displayed on the dredging layout charts and provided to the Contractor. All depths are measured from [_____] Other pertinent information to be included with each layout package will be: payment method, required and maximum dredging depths, coordinates for the material placement site, distance one-way from dredging location to placement site, specific placement site instructions, supplemental tide gauge information, horizontal control locations, and computed hydrosurvey quantities.

NOTE: For USACE, quantities for project dredging, overdepth dredging, and total in the blanks are included in the Bid Schedule and should be deleted from herein.

The total estimated quantity of material to be removed is computed as that material that is within the specified limits, including side slopes, but excluding unpaid overdepth. The quantities listed are estimates only. All estimated quantities are subject to FAR 52.211-18 Variation in Estimated Quantity.

3.2.7.1 Overdepth Dredging

To cover unavoidable inaccuracies of dredging processes, material actually removed to a depth of [_____] meters feet below the minimum required depth.
specified and within the dredging limits will be measured and paid for at full contract price.

The maximum amount of allowable unpaid overdepth dredging is [_____] meters feet below the specified maximum paid dredging depth.

3.2.7.2 Side Slopes

**************************************************************************

NOTE: Use the first bracketed item when the side slope overdredge allowance is specified; use second bracketed item when side slope overdredge allowance is not specified. For first bracketed item, insert allowable depth for dredging of side slopes beyond the indicated or specified side slopes for which payment will be made.

Ensure project requirements consider slope natural angle of repose and potential for sloughing when selecting appropriate language herein. Dredge equipment used will impact the resultant amount of material required to be removed.

**************************************************************************

Side slopes in the dredge areas within this contract will be measured and paid based on a [_____] meter feet horizontal to [_____] meter feet vertical ratio. Dredging on side slopes must follow, as closely as practicable, the dredge area limits indicated on associated layout drawings.

[ A [_____] meter feet allowance will be made for dredging beyond the indicated or specified side slopes, except as provided herein. Material removed from within the allowance area will be unpaid. The allowance will be determined by projecting a line upwards, paralleling the project design side slopes, from the intersection of the overdepth dredging limit (at a point located vertically below the limit of dredging at the top of slope). The amount of material excavated from side slopes will be determined by either cross-sections or computer, or both.

][No allowance will be made for dredging beyond the dredge area limits as indicated on the associated layout drawings. No dredging can occur outside of the dredge area and side slope limits.

3.2.8 Obstructions and Debris

**************************************************************************

NOTE: Choose one of the following options. Choose the first option where no known obstructions exist and site is not near existing piers. Choose the second option where known obstructions exist or for dredging around existing piers.

**************************************************************************

[ The Government has no knowledge of cables, pipes, or other artificial obstructions or of any wrecks, wreckage, or other material that would necessitate the use of explosives or the employment of additional equipment for economical removal. Contractors should however exercise due diligence in determining the existence of any obstructions within proposed work areas during bid preparation.
The Government has knowledge of debris such as, but not limited to, metal bands, pallets, pieces of broken cable, rope, fire hose, and broken piles. The Contractor is responsible for the disposal of the removed debris. This disposal must occur outside the limits of government property, and done so in accordance with all federal, state, and municipal regulations.

The Government has no knowledge of existing wrecks, wreckage, or other material of such size or character as to require the use of explosives or special or additional plant for its economical removal.

3.2.9 Dredging Requirements

******************************************************************************
NOTE: Include requirements for various dredge areas. The current text is a template for use.
******************************************************************************

Dredge Areas

1) Dredge Area 1
   a) As determined by the results of a hydrographic survey monitoring, the Government will direct the Contractor to dredging areas within [______]. Dredging depths at this area will be between plus or minus [______] and plus or minus [______] meters [feet] [datum] including paid overdepth, unless otherwise stated in the layout drawing.

   b) Material placement will be [______] site. See Section [01 20 00.00 20 PRICE AND PAYMENT PROCEDURES] [01 22 00.00 10 PRICE AND PAYMENT PROCEDURES] for more details.

2) Dredge Area 2

3.2.10 Quality Control

Establish and maintain quality control for operations to assure compliance with contractual requirements and maintain records of this quality control for dredging operations.

While performing all dredging work control the horizontal positioning of the dredge with electronic positioning.

3.2.11 Surveys during Progress of Work

Quality of dredging depth will be determined by soundings or sweepings taken behind the dredge as work progresses. The [Government will] [Contractor will] take progress soundings or sweepings.

3.2.12 Skimming of Hoppers

Skimming of hoppers must be performed in compliance with environmental requirements and ABS/USCG load line marks.

3.2.13 Salvaged Material

Anchors, chains, firearms, and other articles of value, which are brought to the surface during dredging operations, must remain or become the property of the Government and will be placed on shore at a convenient location.
location near the site of the work, as directed.

3.2.14 Safety of Structures

The prosecution of work must ensure the stability of piers, bulkheads, and other structures lying on or adjacent to the site of the work, insofar as structures may be jeopardized by dredging operations. Repair damage resulting from dredging operations is the responsibility of the Contractor, insofar as such damage may be caused by variation in locations or depth of dredging, or both, from that indicated or permitted under the contract. The Contractor is responsible for coordinating with the owner of the structure for any necessary repairs.

3.2.15 Protection Plan

Prior to blasting, submit a plan for protection of surrounding structures, equipment, and vessels in accordance with Section 31 23 00.00 20 EXCAVATION AND FILL for blasting requirements.

3.3 PLACEMENT OPERATONS

3.3.1 Placement of Excavated Materials

**************************************************************************
NOTE: Delete inapplicable language for placement area; insert other placement area language as appropriate.
**************************************************************************

Provide for safe transportation and placement of dredged materials. Transport and placement of dredged material in the [_____][placement area][area designated for placement of dredged material]. The Contractor may, at his option, place dredge material at [_____] or provide placement at an government approved placement area.] The placement of dredged materials in unauthorized places is forbidden. Comply with rules and regulations of all, federal, state and local authorities.

3.3.2 Method of Placement

**************************************************************************
NOTE: Delete inapplicable method of placement and include only the language appropriate for the method of placement to be used. Details should be specified regarding exact location for discharge into the placement area, maximum allowable elevation of buildup, and any other limitations or special provisions for placement. It is not recommended to pay based on scow measurement.
**************************************************************************

Place all dredged material by [the hydraulic process][hopper dredge][self-dumping scow or barge]. Coordinate completion of load with the Government. Notify the Government when scows or barges are returned to the dredge area.] Pipeline for hydraulic dredging must discharge into the placement area.

3.3.3 Placement in Indicated Site(s)

**************************************************************************
NOTE: Include any special requirements for the construction and maintenance of fill area bulkheads and weirs. Delete when fill areas are not shown on the contract drawings. Require bulkheads and weir submittals for Contracting Officer review.

In placing excavated material for fill, uniformly grade and allow for shrinkage. Provide and maintain necessary bulkheads, dikes, ditches, weirs, spillways, and other construction necessary to confine and retain the fill in the dredge fill area.

3.3.4 Charges for Material Placement

NOTE: Insert "Department of the Army" in the first blank where placement area is under jurisdiction of the Corps of Engineers. Insert name of placement area in second blank. Delete entire paragraph when not applicable.

The [Government][Contractor] is responsible for payment of charges imposed by the [_____] for placement of material in the [_____] placement area.

3.3.5 Operation of Sluiceways

NOTE: Insert Corps of Engineers or other controlling agency in the blank provided. Delete when not applicable to the project.

Sluiceways on the placement area levees will be operated and maintained by the [______]. The Government will relieve the Contractor of operations thereof.

3.3.6 Misplaced Dredged Material

Any dredged materials deposited at locations other than in areas designated or approved by the Contracting Officer will be considered misplaced material and will not be paid for until the Contractor, at his own expense, removes and deposits such misplaced material where directed. This required removal and redeposit of the misplaced material and any necessary placement site restoration work is not the basis for a time extension or additional compensation under this contract.

3.3.7 Submerged Pipelines

If a leak occurs in the discharge pipeline, immediately discontinue using the line until leaks are repaired. Following a leak, the Contractor should conduct, or request the Government to conduct, a hydrosurvey to ensure that any dredged material discharged through the leak did not accumulate or cause mounding. If accumulation did occur, the Contractor must coordinate with the Government to remove the accumulated material, if deemed necessary. The Contractor is responsible for any resulting costs of repair and restoration.
3.4 MEASUREMENT

NOTE: FOR US Army Corps of Engineers Projects, the measurement is discussed in Division 01 Measurement and Payment and should not be included in the specification herein.

The [Government will be][Contractor is] responsible for taking soundings before and after dredging.

Final quantities will be subject to deductions or correction of deductions previously made because of excessive overdepth, dredging outside or authorized areas, or placement of material in an unauthorized manner.

3.4.1 Method of Measurement

NOTE: The method of survey shall be defined by the Government. Details for the method of measurement, calculations, and time frame for measurements to be made shall all be defined herein.

Quantity of material removed that will be paid for will be measured by cubic meter cubic yard [in place][by means of volume difference from soundings taken before and after dredging][by means of topographic surveys of fill sites taken before and after dredging][______]. The drawings represent existing conditions based on current available information, but will be verified and corrected, if necessary, by soundings taken before dredging in each locality. Areas sounded within [_____] of completion of work. The Contractor has the option of being present when such soundings are made.

3.4.2 Monthly Estimates

NOTE: The progress payments requirements for US Army Corps of Engineers Contracts are typically included in Division 01 Measurement and Payment, as well as the front end clauses, and if so, shall be deleted from herein.

Monthly estimates of work completed will be based on the result of soundings taken during the progress of the work[ or, at the option of the Contracting Officer, on 85 percent of the scow or barge measurement]. Deductions will be made for dredging and placement not in accordance with the specifications.

3.5 FINAL EXAMINATION AND ACCEPTANCE

NOTE: The techniques of sounding, sweeping, or a combination thereof are applicable methods in the acceptance examination, depending upon specific requirements of the project. In general, for maintenance dredging or for new dredging on soft
bottom, the acceptance examination by soundings will be acceptable; for new dredging on hard coral or rock bed, and also for dredging below existing channel bottom on hard coral or rock bed, sweepings are required. For new dredging on hard bed harbor channel and turning basin for capital ships (such as aircraft carriers), the combination of soundings and sweepings is required. If modification of navigation charts is required after completion of dredging work, the EFD shall coordinate with Naval Facilities Engineering Command Code 04A3 for the proper data transfer procedures to the Defense Mapping Agency. In the case of inland rivers all navigation chart updates shall be coordinated with Inland Electronic Navigation Chart (IENC) team of the Corps of Engineers.

For USACE, do not use if removal requirements are included in other specification sections.

As soon as practicable after the completion of areas, which in the opinion of the Contracting Officer, will not be affected by further dredging operations, each area will be examined by the Government by sounding or sweeping, or both. Remove shoals and lumps as required by methods approved by the Government. However, if the bottom is soft and the shoal areas form no material obstruction to navigation, removal may be waived at the discretion of the Government. The Contractor will be notified when soundings or sweepings are to be made and will be permitted to accompany the sounding or sweeping party and to inspect the data and methods used in preparing the final quantity for payment. When areas are found to be in a satisfactory condition, the work therein will be accepted as complete.

Re-dredging at the Contract price, within the limit of available funds, may be completed with the consent of both the Government and the Contractor when infill or shoaling beyond the Contractor's control occurs in any area previously accepted.

3.6 PLANT REMOVAL

Upon completion of the work, remove all dredging plant, including ranges, buoys, piles, and other markers or obstructions within [_____] days.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for stone protection, including foundation preparation, bedding layers and filters, for the slopes and bottom of channels, ditches, structures, lock approaches, etc.; constructing trenchfill revetment, bank paving, and outlet drains; stone revetment, stonefill dikes, stoneroots, and junctions; constructing stone capouts and revetment reinforcing along the river; revetment repairs; shoreline/coastal protection. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1  GENERAL

NOTE: The EMs and ETLs referenced in this guide specification can be found on the Internet at http://www.usace.army.mil/inet/usace-docs.

To clarify the difference between Stone Protection, Channel Protection, and Shoreline Protection, the
following definitions are provided. Stone Protection is defined as a system which includes a layer of bedding material or layers of filter material beneath a layer or layers of riprap. Stone protection is placed around structures in slack water or within a dewatered site. Stone protection may also be used to protect channel banks when it is placed in the dry or in slack water. Riprap is defined as a material having a gradation band similar to those specified in EM 1110-2-1601, Chapter 3. Channel Protection is stone placed in a current as revetment, dikes, or slope paving without the use of a separate layer of bedding or filter material. In this type of environment, bedding sand or geotextiles and materials with gradation bands with a top size of 150 mm 6 inches will not stay where placed. Shoreline Protection is defined as a system of bedding or filter materials and stone used to protect coastlines of lakes and oceans and for harbor protection.

Grouted riprap should only be used when the quantity of larger stone on a project is very small and in a noncritical area. Also, grouted riprap should be considered only when minor settlement is expected in the foundation, potential of undermining is very low, and the density of the fill material is at a minimum of 95 percent Standard Proctor. Additional information provided in ETL 1110-2-334.

EM 1110-2-2302, Construction with Large Stone, presents criteria and gives guidance for selection, evaluation, and use of large-stone materials in construction. This document also references other EM's that have additional related guidance for the protection design. One additional reference not listed is EM 1110-2-1614, Design of Coastal Revetments, Seawalls, and Bulkheads. However, the quality criteria specified in this document was based upon a limited review of criteria being used by Corps. Quality criteria that is specified by a District should be that which has been selected to be used on its projects or criteria specified by a Division to be used by the District to meet the durability requirements for the project being constructed.

"Riprap Quality Criteria in Standard Specification and Engineering and Guidance", Rock for Erosion Control, ASTM STP 1177; and TR-GL-81-8, Evaluation of Quality and Performance of Stone as Riprap or Armor", both support the need to perform freeze-thaw testing by COE CRD-C 144 instead of ASTM procedures. Also, both indicate that soundness tests and L.A. Abrasion tests are of limited use when evaluating Riprap and Armor Stone.

**************************************************************************
1.1 UNIT PRICES

**************************************************************************
NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.
**************************************************************************

1.1.1 [Bedding] [and] [Filter] Layer(s)

1.1.1.1 Payment

Payment for gravel, crushed stone, and sand placed for bedding and/or filter material will be made at the applicable contract unit prices for [Sand "[_____]",] [and] [Gravel "[_____]",][ and ] [Filter Stone,] [Bedding Stone]. Price(s) and payment(s) shall include all costs of furnishing, hauling, placing and maintaining the bedding and/or filter material until placement of the riprap cover is completed and accepted. Geotextiles used as filters will be paid for in accordance with provisions of Section [01 22 00.00 10 PRICE AND PAYMENT PROCEDURES][31 05 22 GEOTEXTILES USED AS FILTERS]. Preparation of the base will not be paid for separately and all costs incidental thereto shall be included in contract prices for other items for which payment will be made. No payment will be made for excess thickness of bedding and/or filter material, nor for material required to replace subgrade material lost by rainwash, wind erosion, overexcavation or otherwise.

1.1.1.2 Measurement

**************************************************************************
NOTE: Alternative 1.
**************************************************************************

[[Gravel,][ crushed stone,][ and sand] placed for bedding and/or filter layers will be measured for payment by the ton (metric) ton. Quantities will be computed to the nearest whole ton. Gravel, crushed stone, and sand will be measured for payment, in the presence of the Contracting Officer, by weighing on approved, accurately calibrated scales furnished by and at the expense of the Contractor.[ The scales shall be capable of printing a weight ticket including time, date, truck number, and weight.] Weight certificates furnished by a public weighmaster will be acceptable.] Submit Weigh Scale Certification and Certified Weight Scale Tickets, by a copy of the certification from the regulation agency, attesting to the scale's accuracy and a copy of each certified weight scale ticket after [_____] working day(s) after weighing.

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

[[Gravel,][ crushed stone,][ and sand] placed for bedding and/or filter layers will be measured for payment as the volume determined by multiplying the area[, as measured in the field,] of the surface on which the gravel, crushed stone, or sand is placed, by the thickness measured perpendicular to the surface of the gravel, crushed stone, or sand as dimensioned on the contract drawings.] Geotextiles used as filters will be measured in
accordance with provisions of Section [01 22 00.00 10 PRICE AND PAYMENT PROCEDURES] [31 05 22 GEOTEXTILES USED AS FILTERS]. Preparation of the base will not be measured for payment.

1.1.1.3 Unit of Measure

Unit of measure: [ton (metric)] [cubic meter] [ton] [cubic yard].

1.1.2 [Riprap] [[Manufactured] Derrick Stone] [Capstone] [Graded Stone] [Stone] [Bedding/Mattress Stone] [Splash/Fill Stone] [Armor/Cover Stone] [Core/Underlayer/Scour Stone]

1.1.2.1 Payment

**************************************************************************
NOTE: Select the first optional paragraph for Alternate 1; select the second optional paragraph for Alternate 2a; select the last optional paragraph for Alternate 2b.
**************************************************************************

[Payment for [riprap] [and] [stone] satisfactorily placed will be made at the applicable contract unit price for [M[_____] R[_____] Riprap,] [Grouted M[_____] R[_____] Riprap,] [Manufactured Derrick Stone,] [Capstone,] [Stone,] [Bedding/Mattress Stone,] [Splash/Fill Stone,] [Armor/Cover Stone,] [Core/Underlayer/Scour Stone]. Price(s) and payment(s) shall constitute full compensation for furnishing, hauling, handling, placing, and maintaining the [riprap] [stone] until final acceptance by the Government. [No separate payment will be made for the stockpiling of [riprap] [and] [stone], and all cost in connection with stockpiling shall be included in the contract unit price for [riprap] [and] [stone].]

[Payment for [riprap] [and] [stone] satisfactorily placed will be made at the applicable contract unit price for [M[_____] R[_____] Riprap,] [Grouted M[_____] R[_____] Riprap,] [Manufactured Derrick Stone,] [Capstone,] [Stone,] [Bedding/Mattress Stone,] [Splash/Fill Stone,] [Armor/Cover Stone,] [Core/Underlayer/Scour Stone]. Price(s) and payment(s) shall constitute full compensation for furnishing all plant, labor, materials and equipment and constructing the stone protection in the work as specified. [No separate payment will be made for the stockpiling of [riprap] [and] [stone], and all cost in connection with stockpiling shall be included in the contract unit price for [riprap] [and] [stone].]

[Payment for stone satisfactorily placed in constructing the [trenchfill revetment,] [stonefill dikes,] [stonefill revetments and junctions,] [excluding trenchfill revetments, wrap-around,] [dike capouts,] [reinforcements,] [bank paving,] and [outlet drains] will be made at the contract unit price for [Graded Stone ["A"] ["B"] [and/or] ["C"], [57][_____] kg [125][_____] pound stone]. Price(s) and payment(s) shall constitute full compensation for furnishing all plant, labor, stone, and performing all work necessary in placing the stone in constructing the trenchfill revetment, bank paving, and drainage structures as specified herein or shown on the drawings. Full payment for stone will not be permitted until trenchfill bank paving has been completed in a satisfactory manner. Twenty (20) percent of the payment for stone will be retained until bank paving has been completed in a satisfactory manner.]
1.1.2.2 Measurement

**************************************************************************

NOTE: Alternative 1.
**************************************************************************

[Riprap] [Stone] will be measured for payment by the ton (metric) ton. Quantities will be computed to the nearest whole ton. [Riprap] [Stone] will be measured for payment, in the presence of the Contracting Officer, by weighing on approved, accurately calibrated scales furnished by and at the expense of the Contractor.[ The scales shall be capable of printing a weight ticket including time, date, truck number, and weight.][ Weight certificates furnished by a public weighmaster will be acceptable.]

**************************************************************************

NOTE: Alternative 2a.
**************************************************************************

[Riprap] [Stone] will be measured for payment as the volume determined by multiplying the area [as measured in the field,] of the surface on which the [riprap] [stone] is placed, by the thickness of the [riprap] [stone] measured perpendicular as dimensioned on the contract drawings.

**************************************************************************

NOTE: Alternative 2b.
**************************************************************************

[Riprap] [and] [Stone] will be measured for payment by the ton (metric) ton as determined by [barge] [vessel] displacement, [certified railroad weights,] where direct placement into structure(s) is practicable, or by weighing by the truckload on approved scales meeting the requirements of paragraph TRUCKLOAD.

a. Truckload. Each truck load will be weighed to the nearest 0.10 ton (metric) 0.1 ton and the final quantity rounded to the nearest whole ton. [Riprap] [and] [Stone] will be measured for payment by weighing on approved scales before being placed in the work. Scales shall be of sufficient length to permit simultaneous weighing of all axle loads and shall have an accuracy within 0.2 percent throughout the range of the scales. The scale's accuracy shall conform to the applicable requirements of NIST HB 44 and shall be certified [by an acceptable scales company representative] [by an inspector of the State Inspection Bureau charged with scales inspection within the state in which the project is located] prior to weighing any [riprap] [and] [stone].[ The scales shall be located at the site of work.][ The scales shall be capable of printing a weight ticket including time, date, truck number, and weight.][ If commercial scales are readily available in close proximity (within [_____] [16] km [_____] [10] miles) of site of work, documentation shall be submitted certifying that the scales meet the requirements of the specification.][ Furnish the scales and weigh the [riprap] [and] [stone] in the presence of the Contracting Officer, [who will read and record the weights thereof][ who will certify the correctness thereof].[ The Contracting Officer may elect to accept certified [railroad weights or] weight certificates furnished by a public weighmaster in lieu of scale weights at the jobsite.][ Quarry weights will not be accepted.][ Scales will be checked and certified before hauling [riprap] [and] [stone] [and after each [50000] [_____] tons (metric) [50,000] [_____] tons increment of [riprap][ and ][stone] weighed under this contract].
b. [Barge] [or vessel] Load

(1) If delivered by [barge] [or vessel], [riprap] [and] [stone] will be measured for payment by the Contracting Officer by weight determined by [barge] [vessel] displacement. Furnish the Contracting Officer a [barge] [vessel] displacement table not less than 10 work days prior to unloading the [riprap] [and] [stone] from any [barge] [vessel]. Each table submitted shall show the name and/or number of the [barge] [vessel] owner, the name of the fabricator, and the certification and date of certification of the person or firm preparing the table. Furnish with the [barge] [vessel] displacement tables a drawing or sketch of each [barge] [vessel], dimensioned in sufficient detail to permit checking of the tables. The drawings shall show, as a minimum, the length, width, depth of the [barge] [vessel], and dimensions of the rake or rakes. Each such table shall have its accuracy certified by a person or firm, other than the Contractor, customarily performing this service. Each table submitted shall contain, in parallel columns, the freeboard of the [barge] [vessel] in meters feet and tenths from zero to the full depth of the [barge] [vessel] and the corresponding gross displacement to the nearest ton. Each [barge] [vessel] shall be suitably marked with [two] [three] displacement gaging locations on each side near each end of the [barge] [vessel] [and two amidships on opposite sides]. Each gaging location shall be marked by a line perpendicular to the edge of the [barge] [vessel], 100 mm 4 inches wide and 300 mm 1 foot long, on both the deck and side of the [barge] [vessel] [and two amidship on opposite sides]. [Barges] [Vessels] with rakes shall have the displacement gaging lines placed at each corner of the box section between the rakes. If a [barge] [vessel] has a box end or ends, the gaging locations shall be placed approximately 1200 mm 4 feet from the box end(s). The freeboard will be measured at the [four] [six] gaging locations and the displacement determined by the use of "STANDARD [BARGE] [VESSEL] TABLES" from the average of these measurements. The displacement will be determined before and after being unloaded and the difference between these values shall be the quantity delivered. Submit the Gaging Table Data, stone hauling vessel, gaging tables [and a copy of the data and calculations used for the preparation of the tables]. [Barges] [Vessels] shall be loaded so that the readings taken at the gaging locations do not vary more than 450 mm 1.5 feet port to starboard fore and aft and do not vary more than 150 mm 0.5 feet port to starboard. If such is not the case, trim the carrier by shifting the stone until this limit is reached, before the measurement will be accepted. [The draft shall be determined from the average of all six readings weighting the readings of the middle gage at double those of the end gages. \( G_1 + G_2 + 2xG_3 + 2xG_4 + G_5 + G_6 \) divided by 8 = average draft.] [All carriers used in transporting stone shall be free of leaks such as would render accurate gauging difficult. Facilities for inspecting the hold of each carrier to determine whether leakage is occurring shall be provided. Each carrier shall also be provided with adequate pumping facilities, and if water is found to be accumulating in the hold, the carrier shall be pumped dry before each gaging, both before and after unloading.] [Lightening by pumping or by transfer of crew or supplies will not be permitted while stone is being transferred.] [Rejected [riprap] [stone] [_____] and unacceptable material shall
be left aboard the [barge][vessel] until after the final readings have been taken.]

(2) [If [barge][vessel] tables are furnished for fresh water and if it is believed that [barge][vessel] displacement measurements made within the contract limits of the work are being taken in water that has salinity, the Contractor has the option of obtaining water samples and determining densities or unit weights of these samples. These water samples shall be taken in accordance with ASTM D3370 (Practice A - Grab Samples) at depths of 1200 and 2400 mm 4 and 8 feet in the area where measurements are made. Water sampling shall be performed when the [barges][vessels] are measured for quantities, both when fully loaded and when empty. Take water samples, as witnessed by the Contracting Officer, with the use of "Polypro" 2000 ml water sampler, or equal. Densities shall be determined as specified in ASTM D1429 (Method D-Hydrometer Method). Testing shall be done for the Contractor by a certified testing laboratory, and test results certified by the laboratory. After review and approval of the test results by the Contracting Officer, the average of the densities obtained at 1200 and 2400 mm 4 and 8 feet will be used as the suitable salt water conversion factor. In all calculations, the unit weight of 1000 kN/m$^3$ 62.4 pounds per cubic foot will be used for fresh water.]

c. Stockpiled [Riprap] [Stone] [____]. If the Contractor elects to stockpile [riprap] [stone] [____] [on the worksite] [or] [offsite], the [riprap] [stone] [____] shall be weighed immediately before placement by [either] [the] method described above. [[Riprap] [Stone] [____] placed in temporary storage on the worksite as specified in paragraph WORKSITE STOCKPILE will not be required to be re-weighed prior to placement.] [If the [barge][vessel] displacement method is elected, a minimum of [one-third the total maximum displacement of the [barge][vessel]] [____] [500] tons (metric) [____] [500] tons of [riprap] [stone] [____] is required on each [barge][vessel].]

(1) Determination of Excess Stone. All stone outside the limits and tolerances of the cross sections of the structure, except variations so minor as not to be measurable, will be deducted from the quantity of new stone for which payment is to be made. Weight of excess stone will be determined from the cross sections obtained by the method provided for in paragraph FINAL SURVEYS, on the basis that the cubic meters feet of volume (including voids) for each type of stone, as listed in the Table in paragraph FACTORS USED FOR CONVERTING IN PLACE VOLUME TO WEIGHT, is equal to one ton (metric) or 1000 kg one ton or 2,000 pounds for the bulk specific gravity and percentage of voids shown. If the bulk specific gravity of the stone furnished or the percentage of voids is other than as listed below, the cubic meters feet of volume equaling 1000 kg 2,000 pounds shall be recomputed as described in paragraph REVISIONS OF BIDDING SCHEDULE QUANTITIES. Should any excess stone be disclosed above the tolerance line as defined in paragraph TOLERANCES, its volume will be computed by the average end area method, based upon the cross section in the following manner. The average end area of excess stone above the tolerance line for two (2) successive cross sections, multiplied by the distance between the cross sections will be accepted as the volume. [The Contractor will not be required to remove such excess stone and deductions for the weights thereof will be made from contract payments for new stone. ]In addition to the above,
stone, which has been delivered to the site and has been lost or wasted or otherwise not properly incorporated into the final required work, shall be deducted from the quantity for which payment is to be made.

(2) Final Surveys. Survey work and measurements required for determination of excess volume computations for stone materials shall be performed in the presence of the Contracting Officer. Notify the Contracting Officer not less than 3 days in advance of each survey. [In the event of unavailability of the Contracting Officer, perform the survey and certify to the Contracting Officer that it complies with the specifications.] Cross section surveys shall be taken perpendicular to the axis of the structures. Elevations and soundings shall be taken on lines [8][____] m [25][____] feet apart measuring along the structure reference line, with the readings at 1.5-meter 5-foot intervals and at breaks in the grade along the line. Other survey intervals and readings may be used if deemed appropriate or advisable by the Government's on-site representative. Additional cross sections, elevations, and soundings may be taken if determined necessary by the Government's on-site representative. Determination of quantities will be made by the Government's on-site representative and having once been made, will not reopen, except on evidence of collusion, fraud or obvious error. Prior to performing any work under this Section, coordinate all operations with the Government's on-site representative so that excess volume surveys will be made at the appropriate time. The surveys made under paragraph CHECK SURVEYS may be used when deemed appropriate by the Government's on-site representative, as part of the surveys required herein. Stone quantity computations shall be based entirely upon weights of new stone as determined from carrier displacement or certified scale weight tickets. [Existing stone placed in lieu of new stone from off-site sources is excluded from measurement and payment.]

1.1.2.3 Unit of Measure

Unit of measure: [ton (metric)][cubic meter] [ton][cubic yard].

1.1.3 [Concrete Grout for Grouted Stone Protection]

1.1.3.1 Payment

Payment will be made for cost associated with concrete grout for grouted stone protection, which includes full compensation for furnishing all plant, labor, material, equipment and other items necessary and incidental to the completion of the work.

1.1.3.2 Measurement

Concrete grout for grouted stone protection will be measured for payment based upon the volume determined from the calculated batch volume and the number of mixed batches delivered to the site and acceptably placed in the work.

1.1.3.3 Unit of Measure

Unit of Measure: cubic meter cubic yard.
1.1.4 Bedding Sand

1.1.4.1 Payment

Payment for bedding sand will be made at the contract unit price for "Bedding Sand" and shall constitute full compensation for material and placement of bedding sand in constructing drainage structures as specified herein.

1.1.4.2 Measurement

Bedding sand shall be measured for payment by the ton (metric) of sand satisfactorily in-place in accordance with the requirements for stone measurement in paragraph STONE.

1.1.4.3 Unit of Measure

Unit of measure: ton (metric).

1.1.5 Revetment Repairs

1.1.5.1 Earthwork, Small Repairs

When less than 8000 cubic meters 10,000 cubic yards of earthwork is specified, the earthwork shall be considered Earthwork, Small Repairs.

a. Payment will be made for costs associated with grading and excavation, which includes furnishing all equipment, labor and materials, and performing all clearing, except range clearing, drift removal and disposal of debris; grading and excavation; disposal of material from grading, whether or not used for fill; dressing; and all other operations incidental thereto.

b. Earthwork, Small Repairs will be measured for payment based upon on-site surveys, taken under the direction of the Government Representative, of the required grading or excavation areas prior to commencement and on-site surveys taken after completion of the work. All quantities removed will be determined from these surveys computed to the nearest cubic meter yard.

c. Unit of measure: cubic meter yard.

1.1.5.2 Earthwork, Large Repairs

When 8000 cubic meters 10,000 cubic yards or more of earthwork is specified, the earthwork shall be considered Earthwork, Large Repairs.

a. Payment will be made for costs associated with grading and excavation, which includes furnishing all equipment, labor and materials, and performing all clearing, except range clearing, drift removal and disposal of debris; grading and excavation; disposal of material from grading, whether or not used for fill; dressing; and all other operations incidental thereto.

b. Earthwork, Large Repairs will be measured for payment based upon on-site surveys, taken under the direction of the Government Representative, of the required grading or excavation areas prior to commencement and after completion of the work. All quantities removed will be determined from these surveys computed to the nearest cubic...
c. Unit of measure: cubic meter yard.

1.1.5.3 Breaking Out Pavement

a. Payment will be made for costs associated with breaking out asphalt and/or concrete pavement, which includes furnishing all material, equipment and labor for breaking out pavement, breaking concrete or asphalt into the required sizes, and using the broken pavement as fill where required, disposing of any excess material, and performing all work incidental thereto. No payment will be made for breakout in those areas where only restoration or dressing of subgrade is necessary.

b. Breaking Out Pavement will be measured for payment based upon the number of square meters feet broken out, computed to the nearest 1/10 square meter 1/100 square foot.

c. Unit of measure: square meter feet.

1.1.5.4 Bedding Stone

a. Payment will be made for costs associated with Bedding Stone satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. Bedding Stone will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.5 [[57][____]-kg [125][____]-Pound Stone] [[____] Riprap]

a. [Payment will be made for costs associated with [57][____]-kg [125][____]-Pound Stone] [[____] Riprap] satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [[57][____]-kg [125] [____]-Pound stone] [[____] Riprap] will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.6 [Graded Stone ["A"] ["B"] ["C"]] [[____] [Stone][Riprap]], Small Repairs

a. Payment will be made for costs associated with [Graded Stone ["A"] ["B"] ["C"]] [[____] [Stone][Riprap]], Small Repairs, satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that
stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [Graded Stone ["A"] ["B"] ["C"]] [[_____] [Stone][Riprap]], Small Repairs, will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.7 [Graded Stone ["A"] ["B"] ["C"]] [[_____] [Stone][Riprap]], Large Repairs

a. Payment will be made for costs associated with [Graded Stone ["A"] ["B"] ["C"]] [[_____] [Stone][Riprap]], Large Repairs, satisfactorily placed, which includes furnishing all material, equipment, and labor; placing the stone, including overbank paving and stone fills; dressing of subgrade; and performing other work incidental thereto, except that stone used in overbank paving, overbank stone spur, or stone landward of an obstruction will be paid for under pay item "Stone Placement Premium".

b. [Graded Stone ["A"] ["B"] ["C"]] [[_____] [Stone][Riprap]], Large Repairs, will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.5.8 Stone Placement Premium

a. A premium payment will be made for costs associated with [Crushed Stone][[57][_____]-kg [125][_____]-Pound] [Riprap][Stone][Graded Stone A, Small Repairs][Graded Stone A, Large Repairs] satisfactorily placed in overbank paving, overbank stone spur, or stone landward of an obstruction satisfactorily constructed or repaired, which includes furnishing all material, equipment, and labor; preparing the subgrade; hauling or rehandling stone; shaping spurs to the lines and grades specified; and performing other work incidental thereto.

b. Stone Placement Premium will be measured for payment based upon the quantities of stone satisfactorily placed.

c. Unit of measure: ton (metric) ton.

1.1.6 Reworking and Utilizing Existing Stone Materials

1.1.6.1 Payment

Payment for reworking existing stone materials and utilizing existing stone in lieu of required materials from off-site sources will be paid for separately from construction utilizing materials obtained from off-site sources. [Specifications pertaining to construction with existing onsite materials are included in Section 31 00 00 EARTHWORK for Site Preparation.]

1.1.6.2 Measurement

Reworking and Utilizing Existing Stone Materials will be measured for payment based upon [_____][cubic][square] meters [cubic yards][square feet] of surface area of existing protection.
1.1.6.3 Unit of Measure

Unit of measure: [ton (metric)] [square meter] [ton] [square foot].

1.3  DEFINITIONS

1.3.1  Bank Stabilization

This paragraph explains certain terminology which is common to construction of bank stabilization work on the [_____] and which may not be self explanatory in the subsequent applicable provisions of the technical specifications and on the drawings.

1.3.1.1  Revetments

The term "revetment" applies to various types of stabilization structures that are constructed along the river approximately parallel to the current. The revetments are constructed of stone or piling.

1.3.1.2  Dikes

The term "dike" applies to the types of stabilization structures that are...
constructed along the river at an angle to the current. The dikes are constructed of stone or piling.

1.3.2 Standard Drawings

Details of various types of structures in general use on the [_____] are shown on standard drawings forming a part of these specifications.

1.3.3 Stone Protection

Stone Protection is defined as a system which includes a layer of bedding material or layers of filter material beneath a layer or layers of riprap. Stone protection is placed around structures in slack water or within a dewatered site. Stone protection may also be used to protect channel banks when it is placed in the dry or in slack water.

1.3.4 Riprap

Riprap is defined as a material having a gradation band similar to those specified in EM 1110-2-1601, Chapter 3, uniform graded material. Riprap is normally produced by mechanical methods, with a jaw crusher and grizzly after the stone has been mined by blasting in a quarry. Riprap gradations have a maximum top size of 3.5 tons.

1.3.5 Graded Stone

Graded Stone is defined as material with gradations that are produced by the mining technique and minimal additional processing other than the use of a skeleton bucket or a bar grizzly. The gradation band have more fines than riprap and have gradations with top size up to 3.5 tons and could be classified as being well graded.

1.3.6 Channel Protection

Channel protection is stone placed in a current as revetment, dikes, or slope paving without the use of a separate layer of bedding or filter material. In this type of environment, bedding sand or geotextiles and materials with gradation bands with a top size of 150 mm (6 inches) will not stay where placed.

1.3.7 Shoreline Protection

Shoreline Protection is defined as a system of bedding or filter materials and stone used to protect coastlines of lakes and oceans and for harbor protection.

1.4 SYSTEM DESCRIPTION

1.4.1 Factors Used for Converting In-Place Volume to Weights

**************************************************************************
NOTE: Insert values from the design report in the following table.
**************************************************************************

The following factors were used in converting the in-place volume to the quantities shown in the BIDDING SCHEDULE.
### 1.4.1.1 Revision of Bidding Schedule Quantities

The estimated quantities of stone listed in the BIDDING SCHEDULE were computed on the basis of stone having a percentage of voids and a bulk specific gravity (saturated surface dry (SSD) basis) as shown in the above table based on water having a unit weight of 1000 kg per cubic meter or 62.4 pounds per cubic foot. When the bulk specific gravity (SSD) of the stone to be used in the work is other than that shown in the above table, the estimated quantities will be revised by multiplying them by the fraction which results when the bulk specific gravity (SSD) of the stone furnished is divided by the value shown in the above table for each respective stone gradation. Revision for the percentage of voids will likewise be made. The Contracting Officer will issue a modification to the contract in accordance with FAR 52.243-4 Changes, in Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS to adjust the estimated quantities in the BIDDING SCHEDULE. The revised quantities will then be the quantities from which the allowable fifteen percent (15 percent) variation in estimated quantity, for payment purposes, will be determined as defined in FAR 52.211-18 Variation in Estimated Quantity, in Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO OFFERORS.

### 1.4.1.2 Re-revision of Estimated Quantities

If during the progress of the work it is determined that the delivered stone actually placed has a percentage of voids or a bulk specific gravity range different from that on which the BIDDING SCHEDULE is based, the BIDDING SCHEDULE will be further revised in accordance with paragraph REVISION OF BIDDING SCHEDULE QUANTITIES.

### 1.4.2 Bulk Specific Gravity of Stone and Redesign

If the Contractor, after award of the contract, requests approval of stone from a source(s) which has a range of bulk specific gravity (SSD), whose
limits are lower or higher than the specified design range of [2.5 to 2.9] 
[_____] as specified in paragraph MATERIAL QUALITY, consideration will be 
given to revising the project design through modification of the design 
range under the following conditions:

a. The modification of the specified design range will result in a savings 
to the Government. Such savings shall not be subject to FAR 48 Value 
Engineering of Section 00 22 13.00 20 SUPPLEMENTARY INSTRUCTIONS TO 
OFFERORS.

b. Only one (1) such proposal for modification will be allowed. In 
addition, the required completion time shall not be extended more than 
[thirty (30) [_____] calendar days as a result of redesign for any 
reason, including acts of the Government.

c. The modified design range of bulk specific gravity (SSD) to be used 
shall not have a lower limit of less than [2.30] [_____] nor higher 
than [3.50] [_____].

d. The stone sections of the required structure are to be redesigned by 
the Government. Such redesign will be based upon the Contractor's 
proposed modifications to the specified design range of bulk specific 
gravity (SSD) and will include any required revisions to allowable 
tolerances. Only one such redesign will be made. A charge of [$5,000] 
[$_____] will be assessed the Contractor whether the redesign is used 
or not.

(1) The above redesign will be made upon written request from the 
Contractor. The request shall state the proposed modified design 
range of bulk specific gravity (SSD). With the request, submit 
records of laboratory tests performed on the proposed stone 
source(s) indicating the range of bulk specific gravity (SSD) of 
the stone source(s). The laboratory tests shall have been 
performed by a Government validated commercial laboratory.

(2) The Government shall be allowed a period of [twenty-one (21)] 
[_____] calendar days after receipt of the request to make the 
redesign. The redesign will be made based upon the lower limit of 
the proposed modified design range of bulk specific gravity (SSD) 
furnished.

(3) Upon completion, redesign will be furnished to the Contractor, 
including revised estimated quantities for the BIDDING SCHEDULE, 
based upon the average bulk specific gravity (SSD) of the proposed 
modified design.

(4) Upon receipt of the redesign, make a formal proposal to modify 
the allowable range and to perform the work in accordance with 
the redesign, within fifteen (15) calendar days after receipt of 
the Government's redesign; if the Contractor proposes to utilize 
stone having a specific gravity outside of the specific design 
range, and as a result thereof, the Government provides the 
Contractor with a redesign. The submittal shall include a 
statement of the direct savings to the Government and a tabulation 
in the form of a revised BIDDING SCHEDULE showing unchanged unit 
prices for the revised quantities.

e. Any proposal to modify the specified design range shall be submitted 
within fifteen (15) calendar days after receipt of the Government's
redesign and shall include a statement as to the savings which will result from the modification. If a formal proposal is not submitted within the time limit, the work shall be performed in accordance with the specified design, in which case use of stone having a bulk specific gravity (SSD) less than the specified design range will not be allowed.

f. The statement of savings shall be in the form of a proposed revised BIDDING SCHEDULE showing unchanged unit prices for the revised quantities.

g. If the Contractor elects to perform the work in accordance with the redesign, the estimated quantities to be shown in the BIDDING SCHEDULE will be the quantities derived from the Government's redesign. See the above paragraph REVISION OF BIDDING SCHEDULE QUANTITIES.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation;
Submittals not having a "G" designation are for [Contractor Quality Control approval.] [Information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data

SECTION 35 31 19 Page 19
1.6 QUALITY ASSURANCE

1.6.1 Stone

NOTE: For contracts having a short duration or awarded for emergency repair, there will be insufficient time to allow a Contractor to propose an unlisted source and have it evaluated; therefore, the bracketed sentences in paragraph STONE, subparagraphs SOURCES and EVALUATION TESTING, should be deleted.

Submit suitable stone samples prior to delivery of any such material to the worksite if stone is not from one of the stone sources listed at the end of this section.

1.6.1.1 General

All stone shall be durable material as approved by the Contracting Officer. [Selected stone from the required excavation may be used if it satisfies all requirements as to quality and dimensions.] [In case an unlisted source is to be used, show that an adequate quantity of material is available and provide quality test data.] Stone shall be of a suitable quality to ensure permanence in the structure and in the climate in which it is to be used. It shall be free from cracks, blast fractures, bedding, seams and other defects that would tend to increase its deterioration from natural causes. [Inspections for cracks, fractures, seams and defects shall be made by visual examination. If, by visual examination, it is determined that 10 percent or more of the stone produced contains hairline cracks, then all stone produced by the means and measures which caused the fractures shall be rejected.] A hairline crack that is defined as being detrimental shall have a minimum width of 0.1 mm 4 mil and shall be continuous for one-third the dimension of at least two sides of the stone. [The stone shall be clean and reasonably free from soil, quarry fines, and shall contain no refuse.] [The stone shall be clean and adequately free from all foreign matter. Any foreign material adhering to or combined with the stone as a result of stockpiling shall be removed prior to placement.]

1.6.1.2 Sources

NOTE: A special test that could be used to evaluate the abrasion resistance of the riprap is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete. Assume that an Abrasion-Erosion Loss, percent by Mass of approximately 4 is equal to an L.A. Abrasion of 20 percent for a chert aggregate, and 8 is equal to an L.A. Abrasion of 20 percent for limestone.

The number of work days specified in this paragraph are based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and
petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

On the form attached at the end of this section, the Specifier shall insert a listing of acceptable sources, giving at the minimum quarry locations, addresses, and telephone numbers applicable for the contract or a more detailed list as presented in EM 1110-2-2302, Figure 4-2.

[Stone shall be furnished from any of the sources listed at the end of this section[, or at the option of the Contractor may be furnished from any other source designated by the Contractor and accepted by the Contracting Officer, subject to the conditions herein stated]. [Non-listed sources are prohibited.]} [If the Contractor proposes to furnish stone from a source not currently listed at the end of this section, the Government will conduct a quarry investigation and evaluate the quality test data provided by the Contractor to determine whether acceptable stone can be produced from the proposed source.] Satisfactory service records on other work may be acceptable. In order for stone to be acceptable on the basis of service records, stone of a similar size must have been placed in a similar thickness and exposed to weathering under similar conditions as are anticipated for this contract, and must have satisfactorily withstood such weathering for a minimum of [5][20] years. If no such records are available, the Government will conduct tests to assure the acceptability of the stone. [In addition to an acceptable 5 year service record, the Contracting Officer has the option to elect to have representative samples taken and tested.]

[a. List of Sources. On the basis of information and data available to the Contracting Officer, stone meeting the quality requirements of these specifications has been produced from the sources listed at the end of this section.]

[a. List of Sources]

(1) Category I Sources: Category I sources have been inspected and evaluated within the last five years by the Government and have produced stone materials of acceptable quality from satisfactory geological formations. The Category I sources have previously demonstrated effective quality control programs at the source and the test results of the materials furnished have been verified that some material are of satisfactory quality. In a like manner, the source would be capable of providing the quality[, quantity,][ and] [gradation] of required stone materials. Further evaluation and testing of the source will not be required unless the preparation of the required demonstration stockpile reveals an adverse condition not previously taken into account.

(2) Category II Sources: Category II sources either have not been inspected and evaluated within the past five years or have had a deficiency in the past which may or may not affect its qualifications to provide stone materials for this project. Deficiencies may include, but are not limited to: ineffective
quality control program; unsatisfactory production techniques; unacceptable quality of material in the geological formation being quarried; insufficient quantities of required materials; or unsatisfactory durability of stone materials previously furnished. These factors of this kind do not disqualify the source for this project. A current inspection and evaluation of the source by the [Government][Contractor] would be necessary [to determine whether acceptable stone can be produced from the proposed source][before allowing the source to proceed with preparation of demonstration stockpiles]. [Disapproval of a proposed Category II source based on the inspection and evaluation would necessitate having the Contractor name a replacement source from the Category I list.]

b. Selection of Source. Designate in writing only one source or one combination of sources from which he proposes to furnish stone. [If the Contractor proposes to furnish stone from a source not listed at the end of this section, he may designate only a single unlisted source for stone and he shall notify the Contracting Officer at least 60 workdays before the stone leaves the quarry.] It is the Contractor's responsibility to determine that the stone source or combination of sources selected is capable of providing the [quality,] quantities and gradation needed and at the rate needed to maintain the scheduled progress of the work. [Samples for acceptance testing shall be provided in accordance with paragraph EVALUATION TESTING below. If a source for stone so designated by the Contractor is not accepted for use by the Contracting Officer, the Contractor may not propose other sources but shall furnish the stone from a source listed[ in Category I] at the end of this section with no additional payment.]

c. Acceptance of Materials. [Acceptance of a source of stone is not to be construed as acceptance of all material from that source. The right is reserved to reject materials from certain localized areas, zones, strata, or channels, when such materials are unsuitable for stone as determined by the Contracting Officer. The Contracting Officer also reserves the right to reject individual units of produced specified materials in stockpiles at the quarry, all transfer points, and at the project construction site when such materials are determined to be unsuitable. During the course of the work, the stone may be tested by the Government, if the Contracting Officer determines that testing is necessary. If such tests are determined necessary, the testing will be done in [the Government's testing laboratory][ or ][commercial laboratory selected by the Government]. Materials produced from a listed or unlisted source shall meet all the requirements herein. The cost of testing will be at the Government's expense.][During the contract period, both prior to and after materials are delivered to the job site, visual inspections and measurements of the stone materials may be performed by the Contracting Officer. If the Contracting Officer, during the inspections, finds that the stone quality, gradation or weights of stone being furnished are not as specified or are questionable, re-sampling and re-testing is required. Sampling of the delivered stone for testing and the manner in which the testing is to be performed shall be as directed by the Contracting Officer. This additional sampling and testing shall be performed at the Contractor's expense when test results indicate that the materials do not meet specified requirements. When test results indicate that materials meet specified requirements, an equitable adjustment in the contract price will be made for the sampling and testing. Any material rejected shall be removed or disposed of as specified and at the Contractor's expense.]
1.6.1.3 Evaluation Testing of Stone

**************************************************************************
NOTE: Alternate 1 - Use this paragraph if testing is to be performed by the Government at the Material Testing Center at CEWES or at a Government selected commercial laboratory that has been validated to being able to perform the required tests; delete paragraph EVALUATION TESTING OF STONE (Alternate 2) in PART 2 PRODUCTS.

For contracts having a short duration or are awarded for emergency repair, there will be insufficient time to allow a Contractor to propose and unlisted source and have it evaluated; therefore, delete the bracketed sentences in paragraph STONE above; and subparagraphs SOURCES, above, and this paragraph, EVALUATION TESTING OF STONE, should be deleted.

Table 6-1 of EM 1110-2-2302 gives a broad generalization of desired quality criteria for stone. However, the quality criteria specified in this document was based upon a limited review of criteria being used by Corps. Each District or Division should specify the desired quality of stone necessary to meet performance criteria. It is recommended that at a minimum the stone should be evaluated using petrographic analysis, specific gravity, unit weight, freezing and thawing, and resistance of rock to wetting and drying. The freezing and thawing testing should be performed in accordance with COE CRD-C 144 or ASTM D5312/D5312M on the largest sawn sections of stone, between [_____] mm² (144-2304 square inches), so that bedding planes or any potential planes of weakness can be evaluated. These size samples require stone samples that range between 70 kg and 3400 kg 150 pounds and 7400 pounds. If ASTM D5313/D5313M are required, the test specimen shall be of the same size range as specified above. LRD has testing and evaluation procedures for shoreline protection that require larger samples for evaluation of material being used on their projects due to the severity of their environment and the larger sizes of stone used for shoreline protection. These procedures should be investigated if the standard procedures specified are not giving you adequate durability for stone placed on past projects.

A special test that could be used to evaluate the abrasion resistance of stone is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete.

The number of work days specified in this paragraph are based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data.
from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

The size of a sample has been reduced to three pieces of stone weighing 70 kg 150 pounds minimum each for stone gradations with a nominal top size less than 1400 kg 3000 pounds. The number of pieces has been reduced by the COR being a geologist or materials engineer and present during the sample collection. Also, the pieces need to be washed to make sure they are similar and only three pieces are required by the Laboratory for evaluation of sample. Larger size stones may be required for evaluating stone used for shoreline protection.

Delete this submittal if evaluation testing of stone will be performed by the Government at a Government Laboratory.

**************************************************************************
Submit a copy of the laboratory inspection report along with actions taken to correct deficiencies and a copy of the test reports, prior to delivery of such material to the worksite; since quality test on the stone in accordance with PART 2 paragraph EVALUATION TESTING OF STONE is the responsibility of the Contractor. The tests to which the stone may be subjected will include petrographic analysis, specific gravity, unit weight, absorption, wetting and drying, freezing and thawing and such other tests as may be considered necessary to demonstrate that the stone is of a satisfactory quality which is at least equivalent to stone from the sources listed at the end of this section.

a.  [Unit Weight][Bulk Specific Gravity, saturated surface dry (SSD)] and Absorption. Stone shall [weigh more than [_____][2500] kN/m³ [_____][155] pounds per cubic foot][have a bulk specific gravity, saturated surface dry, (SSD), greater than [_____][2.48]]. The stone shall have an absorption less than [2][_____] percent unless other tests and service records show that the stone is satisfactory. The method of test for [unit weight][bulk specific gravity (SSD)] and absorption will be ASTM C127.

b.  Samples. Samples of stone from a source not listed at the end of this section shall be taken by a representative of the quarry under the supervision of the Contracting Officer for testing and acceptance prior to delivery of any stone from this source to the site of the work. Samples shall consist of at least three pieces of stone, roughly cubical in shape and weighing not less than [70][_____] kg [150][_____] pounds each from each unit that will be used in the production of the required stone. If the source is an undeveloped quarry[, or if the operation has been dormant for more than one year such that fresh samples are not available,] expose fresh rock for 6 m 20 feet horizontally and for the full height of the face proposed for production, prior to the field evaluation.[ The Contracting Officer may also require documentation of subsurface exploration of an undeveloped quarry in order to determine whether or not sufficient reserves are available.] The samples shall be shipped at the Contractor's expense to [Waterways Experimental Station, Structures Laboratory, 3909 Halls Ferry Road, Vicksburg, MS 39180, (Attn: [Mr.
Joe Tom[____], and [Mr.][Ms.] [____], [____] Branch, [____]

District shall be notified to arrange for testing at least
[40][60][____] workdays before the stone leaves the quarry.

c. Tests. The tests will be conducted in accordance with applicable Corps
of Engineers methods of tests given in the Handbook for Concrete and
Cement or ASTM methods of tests. [The cost of testing one new source
will be borne by the Government.]

1.6.1.4 [Random Sampling]

The stone produced by each source will be sampled by the Government for
Quality Assurance testing on the basis of a minimum once each year[ or once
during the production of each [____][25 000][50 000] tons (metric) tons of
stone produced each year for the Government]. The samples will be evaluated
based upon petrographic analysis, specific gravity, [unit weight, ] [bulk
specific gravity (SSD),] [____], and absorption.

1.6.1.5 [Drop Test]

A drop test provides an immediate evaluation of the durability of very
large stone during handling of the stone including placement into a
structure. For comparability, the test stone(s) shall be dropped from a
bucket or by other means from a height of not less than half the average
diameter of the stone onto a rigid surface or second stone of comparable
size. Dumping from a truck is not acceptable. The stone shall be examined
carefully before as well as after the completion of the test. Failure
criteria is the development of new cracks, opening of old cracks, and the
loss of piece from the surface of the stone. Each stone shall be dropped a
total of [five][____] times for evaluation purposes with examination after
each drop. Provide all necessary equipment and operating personnel to help
perform the testing.

1.6.2 [Concrete Grout for Stone Protection]

**************************************************************************
NOTE: If the Designer elects to specify grouting
requirements for the project under another section,
special care should be taken to delete all grouting
requirements specified in this section and
appropriate references added identifying the section
specifying the grouting requirements.
**************************************************************************

1.6.2.1 General

The Government reserves the right to sample and test the aggregates and
grout to determine compliance with the specifications. Provide facilities
and labor as may be necessary to assist the government in procurement of
representative test samples. Samples of aggregates will be obtained at the
point of batching in accordance with ASTM D75/D75M. Grout will be sampled
in accordance with ASTM C172/C172M. The slump and air content will be
determined when cylinders are molded in accordance with ASTM C143/C143M
and ASTM C231/C231M, respectively. Compression test specimens will be made,
cured and transported in accordance with ASTM C31/C31M. Compression test
specimens will be tested in accordance with ASTM C39/C39M. Samples for
strength tests will be taken not less than once each shift in which grout
is produced. A minimum of three specimens will be made from each sample,
two will be tested at 28 days (90 days if pozzolan is used) for acceptance
and one will be tested at 7 days for information.

### 1.6.2.2 Concrete Grout Mixture Proportions

Concrete grout mixture proportions shall be the responsibility of the Contractor. Submit the mixture proportions that will produce grout of the qualities required, ten days prior to placement. Submit grout mixture proportions for grouting manufactured derrick stone. Mixture proportions shall be submitted for review [_____][10] days prior to being used under this contract. Mixture proportions shall include the dry weights of cementitious material(s); the specific gravities, absorptions, and saturated surface-dry weights of the fine and coarse aggregates; the quantities, types, and names of admixtures; and quantity of water per cubic meters cubic yards of grout. Also, applicable test reports, such as air content, compressive strength, and unit weight of the grout, shall be submitted to verify the proportions selected will produce grout of the quality specified. The approved grout mixture proportions shall not be changed without approval. The air content shall be between 4.5 and 7.5 percent. The specified compressive strength f’c shall be [1.4][1.8][_____] kg/mm$^2$ [2000][2500][_____] pounds per square inch at 28 days (90 days if pozzolan is used). The maximum water cement ratio shall be [_____] [0.70]. The slump of the grout mix shall be 150 mm 6 inches plus or minus 25 mm 1 inch. For maximum coarse aggregate size see paragraph AGGREGATES FOR CONCRETE GROUT.

### 1.6.2.3 Evaluation and Acceptance of Grout

The acceptance test results will be the average of the strengths of the two specimens tested at 28 days (90 days if pozzolan is used). The strength of the concrete grout will be considered satisfactory so long as the average of three consecutive acceptance test results equal or exceed the specified compressive strength f’c and no individual acceptance test result falls below the specified strength f’c by more than [350] g/mm$^2$ 500 pounds per square inch.

### 1.7 REGULATORY REQUIREMENTS

*******************************************************************************************************
NOTE: Insert the appropriate State Highway 
Department specifications as applicable.
*******************************************************************************************************

The regulatory requirements listed below form a part of this specification to the extent referenced. The regulatory requirements are referred to in the text by basic designation only.

[_____] STATE HIGHWAY AND TRANSPORTATION DEPARTMENT ([____])

[____] [(____)] Standard Specifications for Highway Construction

### 1.8 CONSTRUCTION TOLERANCES

*******************************************************************************************************
NOTE: For tolerances in general, 1/2 of the average stone dimension of gradation range is allowed above 
the neatline and 1/4 of the same dimension is 
allowed below the neatline for stone gradation with

SECTION 35 31 19  Page 26
a maximum size of 300 kg 650 pounds. For large stone the tolerance may be reversed.

The finished surface and stone layer thickness shall not deviate from the lines and grades shown by more than the tolerances listed below. Tolerances are measured perpendicular to the indicated neatlines. Extreme limits of the tolerances given shall not be continuous in any direction for more than [_____] [five] times the nominal stone dimension nor for an area greater than [9.3][18.6][93] m² [100][200][1000] square feet of the structure surface.

The intention is that the work shall be built generally to the required elevations, slope and grade and that the outer surfaces shall be even and present a neat appearance. Placed material not meeting these limits shall be removed or reworked as directed by the Contracting Officer. Payment will not be made for excess material which the Contracting Officer permits to remain in place.

PART 2 PRODUCTS

2.1 BEDDING MATERIAL

***********************************************************************************************************************************************
NOTE: This paragraph presents gradation bands of materials that were developed based upon seepage criteria presented in EM 1110-2-1913. Each bedding material system should be designed to be used with a specific range of riprap gradations, foundation conditions, and channel conditions.
***********************************************************************************************************************************************
2.1.1 General

Submit the source for materials used in riprap, [and] [filter], [and] [bedding]. Bedding material shall consist of [a washed] [gravel or] crushed stone. Submit test reports attesting that the [bedding material] [and] [filter material] meet specified requirements.

2.1.2 Material

**************************************************************************
NOTE: Delete gradation limits that are not required.
**************************************************************************

Bedding material shall be composed of tough, durable particles, adequately free from thin, flat and elongated pieces, and shall contain no organic matter nor soft, friable particles in quantities considered objectionable by the Contracting Officer. The aggregates shall meet the quality requirements of ASTM C33/C33M [or paragraph REGULATORY REQUIREMENTS]. Gradation shall conform to the following requirements:

</tbody>
</table>

Provide bedding material well-graded between the limits shown. Perform at
least one test on each 1000 tons [to be delivered to the project site] for each specified gradation in accordance with ASTM C136/C136M. [A representative sample weighting not less than 45 kg 100 pounds shall be removed from the bedding layer placed at locations directed by the Contracting Officer.] All points on individual grading curves obtained from representative samples of bedding material shall lie between the boundary limits as defined by smooth curves drawn through the tabulated gradation limits plotted on ENG FORM 2087 or similar form. The individual gradation curves within these limits shall not exhibit abrupt changes in slope denoting either gap grading or scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the bedding layers.

2.2 FILTER MATERIAL

******************************************************************************
NOTE: This paragraph presents gradation bands of materials that were developed based upon seepage criteria presented in EM 1110-2-1913. Each filter material system should be designed to be used with a specific range of riprap gradations, foundation conditions, and channel conditions.

The Specifier should use Alternative 1 if there is a concrete section in the specifications and if the gradations therein are satisfactory for filter materials. If there is no concrete section, or if the gradations therein are unsatisfactory for filter materials, the Specifier should use Alternative 2.

NOTE: Alternative 1.
******************************************************************************

Submit certificates of compliance attesting that the materials meet specification requirements. [Filter material shall consist of [washed] sand and gravel [and crushed stone] [filter stone and geotextile]. [Sand and gravel] [and crushed stone] for filter materials shall meet the applicable requirements of Section 03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE, paragraph MATERIALS, subparagraph AGGREGATES.] [Geotextiles shall be as specified in Section 31 05 22 GEOTEXTILES USED AS FILTERS.]

******************************************************************************
NOTE: Alternative 2.
******************************************************************************

[Filter material shall consist of [Sand "[_____]"],[Gravel "[_____]"],[Filter Stone] [Filter Stone and Geotextile]. The [filter material] [filter stone] shall be composed of tough, durable particles, adequately free from thin, flat and elongated pieces, and shall contain no organic matter nor soft, friable particles in quantities considered objectionable by the Contracting Officer. The aggregate shall meet the quality requirements of ASTM C33/C33M [or paragraph REGULATORY REQUIREMENTS]. Grading shall conform to the following requirements:

</tbody>
</table>

The [filter materials] [filter stone] shall be well-graded between the limits shown. [Gravel shall not be crushed stone.] At least one test shall be performed on each 1000 tons [to be delivered to the project site][placed for each specified gradation in accordance with ASTM C136/C136M.
[A representative sample weighing not less than 45 kg (100 pounds) shall be removed from the filter layer placed at locations directed by the Contracting Officer.] All points on individual grading curves obtained from representative samples of [filter material] [filter stone] shall lie between the boundary limits as defined by smooth curves drawn through the tabulated gradation limits plotted on ENG FORM 2087 or similar form. The individual gradation curves within these limits shall not exhibit abrupt changes in slope denoting either gap grading or scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the filter. Geotextile shall be as specified in Section 31 05 22 GEOTEXTILES USED AS FILTERS.

2.3 [BEDDING] [SAND] [FILL] [CUSHION LAYER]

**************************************************************************
NOTE: Sand fill is used to bring areas which are below grade in paragraph BASE PREPARATION to within allowable minus tolerance instead of using filter or bedding materials.
**************************************************************************

[Sand shall be a clean, free draining sand in accordance with classification SP in ASTM D2487, except that no more than 5 percent by weight of the material smaller than a No. 4 sieve, shall pass a No. 200 sieve. If sand meeting this criteria is available on site it may be used.] [Sand shall meet [paragraph REGULATORY REQUIREMENTS specification] [ASTM C33/C33M] gradation requirements for fine aggregate.]

2.4 STONE

2.4.1 General

2.4.1.1 Evaluation Testing of Stone

**************************************************************************
NOTE: Alternate 2 - Use this paragraph if testing is to be performed by the Contractor at a Commercial Laboratory; delete paragraph EVALUATION TESTING OF STONE (Alternate 1) in PART 1 GENERAL.
**************************************************************************

For contracts having a short duration or are awarded for emergency repair, there will be insufficient time to allow a Contractor to propose an unlisted source and have it evaluated; therefore, delete the bracketed sentences in paragraph STONE above, and subparagraphs SOURCES, above, and this paragraph EVALUATION TESTING OF STONE, should be deleted.

Table 6-1 of EM 1110-2-2302 gives a broad generalization of desired quality criteria for stone. However, the quality specified in this document was based on a limited review of criteria being used by the Corps. Each District or Division should specify the desired quality of stone necessary to meet performance criteria. It is recommended that at a minimum the stone should be evaluated using petrographic analysis, specific gravity, unit weight, absorption, freezing and thawing, and resistance of rock to wetting and
drying. The freezing and thawing testing should be performed in accordance with COE CRD-C 144 or ASTM D5312/D5312M on the largest sawn sections of stone, between $0.09-1.49 \text{ m}^2$ $144-2304 \text{ square inches}$ so that bedding planes or any potential planes of weakness can be evaluated. These size samples require stone samples that range between 70 kg and 3400 kg 150 pounds and 7400 pounds. If ASTM D5313/D5313M is required, the test specimen shall be of the same size range as specified above. LRD has testing and evaluation procedures for shoreline protection that require larger samples for evaluation of material being used on their projects due to the severity of their environment and the larger sizes of stone used for shoreline protection. These procedures should be investigated if the standard procedures specified are not giving you adequate durability for stone placed on past projects.

A special test that could be used to evaluate the abrasion resistance of the stone is COE CRD-C 63, Abrasion-Erosion Resistance of Concrete.

The number of work days specified in this paragraph is based on the assumption that to tentatively approve the use of a source under a single contract requires data for unit weight, absorption, and petrographic analysis of the stone. A minimum of 80 work days would be required to have available data from the freeze and thawing test. Arrangements need to be made with the testing laboratory when notice is given to evaluate source not after samples are collected.

The size of a sample has been reduced to three pieces of stone weighing 70 kg 150 pounds minimum each for stone gradations with a nominal size less than 1400 kg 3000 pounds. The number of pieces has been reduced by the COR being a geologist or materials engineer and present during the sample collection. Also, the pieces need to be washed to make sure they are similar and only three pieces are required by the laboratory for evaluation of sample. Larger size stones may be required for evaluating stone used for shoreline protection.

**************************************************************************

If the Contractor proposes to furnish stone from an unlisted source, have evaluation tests performed on stone samples collected from the proposed source. The quarry investigation shall be performed by a registered geologist or registered engineer. The tests to which the stone shall be subjected include petrographic examination (ASTM C295/C295M), [bulk specific gravity (SSD),] [unit weight,] absorption (ASTM C127), resistance of stone to freezing and thawing ([COE CRD-C 144][ASTM D5312/D5312M]), and if argillaceous limestone and sandstone are used, resistance to wetting and drying (ASTM D5313/D5313M). The laboratory to perform the required testing shall be validated based on relevant paragraphs of ASTM D3740, and no work requiring testing shall be permitted until the laboratory has been inspected and validated. A copy of the documents, provided by the
Materials Testing Center (MTC) at CEWES[ or other governmental agency], that validates that the laboratory can perform the required tests. The individual tests shall be listed for which the validation covers along with the date of the inspection. The first inspection of the facilities shall be at the expense of the Government and any subsequent inspections required because of failure of the first inspection shall be at the expense of the Contractor.

[a. Bulk Specific Gravity Range. All stone shall have a minimum bulk specific gravity, saturated surface dry (SSD), of [_____][2.50] and a maximum bulk specific gravity of not more than [_____][2.90] based upon water having a unit weight of 9.8 kN/m$^3$ 62.4 pounds per cubic foot. The method of test for bulk specific gravity (SSD) shall be ASTM C127. Reference is made to paragraph FACTORS USED FOR CONVERTING IN-PLACE VOLUME TO WEIGHT for instructions for converting in-place volume to bid quantities and for instructions on adjusting bid schedule quantities for variations in bulk specific gravity and percentage of voids.]

b. Unit Weight and Absorption. Stone shall [weigh more than [24][_____] kN/m$^3$ [155][_____] pounds per cubic foot][have a bulk specific gravity, saturated surface dry, greater than [2.48][_____]][2.60]]. The stone shall have an absorption less than [1][2][_____] percent unless other tests and service records show that the stone is satisfactory. The method of test for unit weight and absorption shall be ASTM C127.

c. Petrographic Examination. Stone shall be evaluated in accordance with ASTM C295/C295M which shall include information required by ASTM D4992, paragraph 10. COE CRD-C 148 shall be used to perform Ethylene glycol tests required on rocks containing smectite as specified in ASTM D4992 and on samples identified to contain swelling clays.

d. Resistance to Freezing and Thawing. Stone shall have a maximum loss of [_____] [5][10] percent after the number of cycles specified in ASTM D5312/D5312M, Figure 1, when determining the durability of stone when subjected to freezing and thawing in accordance with [COE CRD-C 144][ASTM D5312/D5312M], except the surface area of one side of the sample shall be between [0.09][_____] and [1.49][_____] m$^2$ [144][_____] and [2304][_____] square inches.

e. Resistance of Rock to Wetting and Drying. Stone shall have a maximum loss of [1][_____] percent when determining the durability of stone when subject to wetting and drying in accordance with ASTM D5313/D5313M, except the surface area of one side of the sample shall be between [0.09][_____] and [1.49][_____] mm$^2$ [144][_____] and [2304][_____] square inches.]

f. Samples. Samples of stone from a source not listed at the end of this section shall be taken by a representative of the Quarry under the supervision of the Contracting Officer for testing and acceptance prior to delivery of any stone from this source to the site of the work. Information provided with the samples shall include the location within the quarry from which the sample was taken along with a field examination of the quarry. The field examination shall include the information outline in ASTM D4992, paragraph 7. Samples shall consist of at least three pieces of stone, roughly cubical in shape and weighing not less than [70][_____] kg [150][_____] pounds each from each unit that shall be used in the production of the required stone. If the source is an undeveloped quarry, or if the operation has been
dormant for more than one year such that fresh samples are not available, expose fresh rock for 6 m 20 feet horizontally and for the full height of the face proposed for production, prior to the field evaluation. [The Contracting Officer may also require documentation of subsurface exploration of an undeveloped quarry in order to determine whether or not sufficient reserves are available.] The samples shall be shipped at the Contractor's expense to a laboratory validated by the government to perform the required tests.

g. Tests. Conduct the tests in accordance with applicable ASTM and Corps of Engineers methods of tests, given in the Handbook for Concrete and Cement, in a laboratory validated by the government. The cost of testing shall be borne by the Contractor.

2.4.1.2 Quarry Operations

Conduct quarry operations in a manner to produce stone conforming to the requirements specified, this may involve selective quarrying, handling, processing, blending, and loading as necessary, all of which shall be as specified in Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL. Control blasting and handling of rock to produce rock of the size ranges and quality specified. Techniques such as the use of proper hole diameter, hole depth, hole angle, burden and spacing distances, types and distribution of explosives, delay intervals and sequence, removal of muck piles between each shot, and special handling techniques are required as necessary to produce the specified materials. All aspects of blasting operations shall be specifically designed so that the end product is not damaged from the blasting technique and that the stone is suitable for the intended purpose.

a. Curing Stone

Conduct curing operations on freshly quarried stone to allow it to release stored energy and moisture and to allow the stone to demonstrate that it will not fracture during the energy release and drying-out phase. Stones of sizes which are individually picked shall be temporarily stockpiled at the quarry site a minimum of [_____] calendar days before being shipped to the project site, unless this requirement is waived by the Contracting Officer. Such waiver will be granted only if the stone has characteristics that make curing unnecessary.

b. Stone Quarrying Exclusion Period

**************************************************************************
NOTE: Exclude the possibility of waiving the quarrying period restrictions unless the District Geologist authorizes inclusion of the language in the specification for the project.
**************************************************************************

Stone quarried between the [_____] [15th of September and the 15th of April] will not be approved for use in the project. [If the stone is not affected by freeze-thaw cycles, and the durability history of the stone demonstrates that quarrying during the exclusion period has not adverse effect on the durability of the stone and the Contracting Officer approves the use of stone quarried during the exclusion period, the stone quarrying period exclusion may be waived by the Contracting Officer.] Stone quarried before the the exclusion period at a time
which will not permit sufficient curing time before being subjected to freezing conditions, and which is subject to fracturing as a result of freeze-thaw cycles, will not be approved for use.

c. Temporary Storage at Quarry

Storage of stone materials subsequent to shipment from the quarry and prior to permanent placement in the required work shall be subject to approval of the Contracting Officer. [Underwater storage of stone materials is prohibited.]

2.4.1.3 Gradation Test

**************************************************************************
NOTE: As a rule of thumb the sample size should be between 20 to 100 times the weight of the maximum size stone within a specified gradation (see ASTM D5519, Note 2). Recommend using either the calculated minimum sample size or the following size samples for the ranges specified.

15 metric ton sample required for riprap with a top size up to 225 kg 500 pounds. 25 metric ton sample required for riprap or stone with top size between 225 kg 500 pounds and 1000 kg 2200 pounds and 50 metric ton sample required for riprap or stone with top size larger than 1000 kg 2200 pounds up to 3400 kg 7500 pounds.

For sources which have riprap or stone as a standard production item: One gradation test minimum, at the quarry, required for each 50 000 metric tons of riprap or stone with a top size of 460 kg 1,000 pounds or larger, or one test required for each 25,000 metric tons of smaller riprap or stone.

To allow the Contractor to perform a gradation test without the Contracting Officer present, the quantity of riprap or stone required for the project shall be less than 10,000 metric tons.
**************************************************************************

Perform a gradation test or tests on the riprap, stone, or [_____] at the quarry in accordance with paragraph GRADATION TEST METHOD FOR RIPRAPP, GRADED STONE, AND [______]. Take the sample in the presence of the Contracting Officer. Notify the Contracting Officer not less than 3 days in advance of each test. Submit the gradation tests using the GRADATION TEST DATA SHEET enclosed at end of this section for riprap or stone. [In the event of unavailability of the Contracting Office, perform the tests and certify to the Contracting Officer that the riprap, stone, or [_____] shipped complies with the specifications.] At least [one] [_____] gradation test(s) shall be performed per [50,000] [_____] tons (metric) tons of each size of riprap, stone, or [_____] placed, but not less than one test shall be performed. The gradation tests shall be reported using the forms, GRADATION TEST DATA SHEET and ENG FORM 4794-RM 4794-R, attached at end of this section. [Designate on the test form that portion in tons (metric) tons of the lot tested which is applicable to this contract. Any deviation from the reported tonnage shall be corrected and recorded on a revised GRADATION TEST DATA SHEET.]{ The sample shall consist of not less
than [15] [25] [50] [_____] tons (metric) of [_____] riprap, stone, or [_____] and shall be collected in a random manner which will provide a sample which accurately reflects the actual gradation arriving at the jobsite. The sample shall consist of between 30 to 35 pieces of armor stone and jetty stone. A minimum of two tests are required for acceptance of armor stone and jetty stone. The weight of the individual pieces of armor stone and jetty stone, representing the minimum, maximum and 50 percent greater than sizes for the specified armor stone and jetty stone gradation, shall be printed on each stone [and be placed at the quarry to provide visual comparison during production at the quarry] and be placed in a location adjacent to the work site in order to provide a basis for visual comparison during placement of the armor stone and jetty units. These stones shall be used as the last order of work. Failure of the test on the initial sample and on an additional sample will be considered cause for rejection of the quarry and/or quarry process, and all riprap, stone, or [_____] represented by the failed tests shall be set aside and not incorporated into the work. Any additional tests required because of the failure of an initial test sample will not be considered as one of the other required tests. If collected by the truckload, each truckload shall be representative of the gradation requirements.

The Contracting Officer may direct additional testing of the riprap, stone or [_____] at the project site if the riprap, stone, or [_____] appears, by visual inspection, to be out of gradation. The additional tests shall be performed on in-place materials at the locations directed, or on random loads selected by the Contracting Officer. In-place test areas shall be not less than 3.6 by 3.6 m 12 by 12 feet [_____] and shall include the full thickness of the placed riprap, stone, or [_____] layer, without disturbing or including the underlying material and shall meet the minimum sample size specified above]. Each pit excavated for an in-place test sample shall be refilled and reworked to provide a surface void of signs of disturbance. One in-place gradation shall be performed on each 3800 cubic meters 7500 tons (metric) 5,000 cubic yards 7,500 tons or portion thereof placed. If the gradation test fails, additional gradation tests will be required at the Contractor's expense to delineate the limits of unacceptable stone. The additional gradation tests shall not count as part of the minimum number of gradation tests required. The unacceptable stone shall either be reworked to bring the stone within the specified gradation or the stone shall be removed from the project site as determined by the Contracting Officer. The Contracting Officer may direct this testing under FAR 52.246-12 Inspection of Construction. Provide all necessary screens, scales and other equipment, and operating personnel, to grade the sample. Certification and test results shall represent riprap, stone, or [_____] shipped from the quarry. Certification and tests results must be received by the Contracting Officer at the jobsite before the riprap, stone, or [_____] is used in the work.

2.4.1.4 Proportional Dimension Limitations

The maximum aspect ratio (greatest dimension:least dimension) of any piece of stone for size ranges [which are not graded with a screen or grizzly,] shall be not greater than 3:1 when measured across mutually perpendicular axis. Not more than 25 percent (25 percent) of the stones within a gradation range shall have an aspect ratio greater than 2.5:1. A maximum of 5% 10% 15% percent flat and elongated pieces by weight will be acceptable. A flat and elongated piece of riprap is defined as having a ratio of width to thickness or length to width greater than 3:1. ASTM D4791 shall be used as a guide to perform the test.
2.4.1.5 [Riprap][Stone][_____] Stockpile

Storage of [riprap][stone][_____] at the worksite is not to be confused with off-site stockpiling of riprap, stone, or [_____]. If the Contractor elects to provide off-site stockpiling areas, the Contracting Officer shall be notified of all such areas. [The Contractor's stockpile shall be a maximum of 3.6 m 12 feet high and formed by a series of layers of truckload dumps, where the rock essentially remains where it is placed. Subsequent layers shall be started 3 m 10 feet from the edge of the previous layer so that the rock will not roll down the edges of the previous layers.] The first layer shall be a maximum of 1.8 m 6 feet high. After being stockpiled, any riprap, stone, or [_____] which has become contaminated with soil or refuse shall not be put into the work unless the contaminating material has been removed from the riprap, stone, or [_____] prior to placement.

a. Worksite Stockpile. [Riprap, stone, or [_____] delivered to the work sites, which requires temporary storage[landward of top of slope,] shall be placed in a container suitable for storing the riprap, stone, or [_____] without waste[, or a sand-clay-gravel or crushed stone pad may be constructed for the storage area and removed upon completion of the work. If the sand-clay-gravel or crushed stone pad method is used, the pad shall have a minimum thickness of at least 150 mm 6 inches.] The container[or sand-clay-gravel or crushed stone pad method] shall be subject to approval prior to delivery of the riprap, stone, or [_____] . Upon completion of the work, the storage areas shall be cleaned of all storage residues and returned to their natural condition.] [Temporary storage of riprap, stone, or [_____] at the worksite will be allowed, provided the stockpile toe of the riprap, stone, or [_____] be no closer than [18][30] m [60][100] linear feet from the closest edge of the [excavation's][stream's] top slope, and the amount shall not exceed 200 t 200 T[unless otherwise approved]].

b. Off-site Stockpile. In areas where riprap, stone, or [_____] is stockpiled for placement, the area shall have excess rock removed prior to completion of work. All rock and spalls greater than 75 mm 3 inches in diameter shall be removed. Where rocks may have become buried due to soft ground or operation of the equipment, the rock shall be [disposed of as directed] [put in a disposal area]. After the rock has been removed, the storage area shall be graded, dressed, and filled to return the ground surface as near as practical to the condition that existed prior to construction.

2.4.2 Riprap

**************************************************************************
NOTE: At the end of this section, the Specifier must attach copies (Plates) of ENG FORM 4794-RM RIPRAP GRADATION CURVES for M40, M65, M90, M180, or M300 (ENG FORM 4794-R RIPRAP GRADATION CURVES FOR R90, R140, R200, R400, or R650), etc., as applicable for this contract.

The riprap gradations presented were developed in Lower Mississippi Valley Division in 1981 and were standardized to limit the number of gradation bands that a producer would have to produce. These gradation bands were developed from gradation bands presented in EM 1110-2-1601, Chapter 3. All bands
were modified slightly after meetings with producers in AR, MO, and IL to reduce production costs. These five of thirteen gradation bands are provided as examples.

The Specifier will not specify riprap by layer thickness. Riprap shall be specified by the weight of the maximum D100 size of the riprap gradation.

**************************************************************************

Only quarried stone shall be used. Riprap quality shall be as specified in paragraph GOVERNMENT TESTING AND STUDIES, subparagraph STONE. Stone shall be well graded and shall conform to [the table(s) below and to Plate(s) [____], [____], [____] and [____] attached at the end of this section][the gradation requirements for [____], [____], and [____] as specified in [paragraph REGULATORY REQUIREMENTS][____]].

2.4.3 [Riprap][Stone] Paving

The stone for [riprap][stone] paving shall be in pieces approximately rectangular in cross section, each piece having its greatest dimension not more than three times its least dimension and with one dimension not varying more than 50 mm 2 inches from the thickness of the paving as shown.

2.4.4 [Manufactured ]Derrick Stone

**************************************************************************
NOTE: Specifier should insert weight limits, a weight tabulation to define the desired range of sizes (similar to a riprap gradation), or a range of sizes.
**************************************************************************

[Manufactured derrick][Derrick] stone shall be unreinforced concrete shapes weighing not less than 2300 kN/m³ 145 pounds per cubic foot. Concrete shall be as specified in Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE] [03 70 00 MASS CONCRETE]. [Submit the design of the shapes of the manufactured derrick stone prior to commencing their manufacture. [Either handling] [Handling] holes shall be formed in the shapes[ or handling hardware shall be embedded in the shapes] at the time they are manufactured.] Derrick stone shall consist of [pieces weighing [_____] kg plus or minus [_____] kg pounds plus or minus [_____] pounds] [pieces as tabulated below:] [rectangular pieces [_____] m feet long by [_____] m feet wide by [_____] m feet thick.] [pieces with dimensions as tabulated below:]

[_____]  [_____]  
[_____]  [_____]  
[_____]  [_____]  

[The stone shall be [roughly] graded as to size between the several limits.] [Stone shall be in pieces generally rectangular in cross section, each piece having its greatest dimension not more than three times its
least dimension.]

2.4.4.1 Grout for Manufactured Derrick Stone

The materials required to make the grout shall be as specified in Section [03 70 00 MASS CONCRETE] [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]. The grout shall be mixed in the proportions of one part cement to [_____] parts sand, [and] sufficient water to produce a workable mixture[, and that amount of admixture which will entrain sufficient air to produce durable grout. The grout mixture proportions shall be submitted in accordance with paragraph SUBMITTALS.]

2.4.4.2 Epoxy Materials

Epoxy materials shall meet the requirements of ASTM C881/C881M, [Type IV, when mixed with packaged sand to form a mortar] [Type VII, for a sealer.]

2.4.5 [Capstone][ and ][Derrick Stone]

[Capstone][ and ][Derrick stone] shall consist of [pieces weighing [_____] kg plus or minus [_____] kg pounds plus or minus [_____] pounds] [pieces as tabulated below:] [rectangular pieces [_____] m feet long by [_____] m feet wide by [_____] m feet thick.] [pieces with dimensions as tabulated below:]

[_____] [_____]  
[_____] [_____]  
[_____] [_____]  

[The stone shall be [roughly] graded as to size between the several limits.] [Stone shall be in pieces generally rectangular in cross section, each piece having its greatest dimension not more than three times its least dimension.]

2.4.6 Graded Stone "A"

Graded Stone "A" shall conform to the following table:

<table>
<thead>
<tr>
<th>STONE WEIGHT (kg) (Pounds)</th>
<th>CUMULATIVE PERCENT (Finer by Weight)</th>
</tr>
</thead>
<tbody>
<tr>
<td>23005000</td>
<td>100</td>
</tr>
<tr>
<td>11502500</td>
<td>70-100</td>

<td>20-45</td>
</tr>
<tr>
<td>25</td>
<td>0-15</td>
</tr>
<tr>
<td>0.51</td>
<td>0-5</td>
</tr>
</tbody>
</table>

A plot of the gradation curve is attached at the end of this section.
2.4.7 Graded Stone "B"

[____].

2.4.8 Graded Stone "C"

[____].

2.4.9 57-kg 125-Pound Stone

Except as indicated by the following tolerances, 57-kg 125-pound riprap stone shall be in pieces weighing not less than 2.7 kg 6 pounds each nor more than 57 kg 125 pounds each, and no dimension shall be over 500 mm 20 inches. Each shipment shall be graded as follows:

<table>
<thead>
<tr>
<th>WEIGHT OF PIECES (KG)(LBS)</th>
<th>PERCENT OF TOTAL WEIGHT</th>
</tr>
</thead>
<tbody>
<tr>
<td>34 to 57 75 to 125</td>
<td>10 Maximum</td>
</tr>
<tr>
<td>11 to 34 25 to 75</td>
<td>40 to 60</td>
</tr>
<tr>
<td>3 to 11 6 to 25</td>
<td>20 to 40</td>
</tr>
<tr>
<td>0 to 30 6</td>
<td>0 to 15</td>
</tr>
</tbody>
</table>

Note: Not more than 5 percent shall pass a 25 mm 1-inch sieve.

******************************************************************************
NOTE: For any of the following four paragraphs, when the size of the largest stone within a gradation is 115 kg 250 pounds or less, specify the gradation by dimension (mm inches) instead of by weight.
******************************************************************************

2.4.10 [Bedding/Mattress] Stone

The stones furnished for [bedding/mattress] stone shall weigh between [_____] kg pounds and [_____] kg pounds each, and shall be free of fines and well graded within the following limits:

<table>
<thead>
<tr>
<th>STONE WEIGHT IN KG LBS</th>
<th>PERCENT LIGHTER BY WEIGHT OF TOTAL MIXTURE</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

2.4.11 [Core/Underlayer/Scour] Stone

The stones furnished for [core/underlayer/scour/riprap] stone shall weigh between [_____] kg pounds and [_____] kg pounds each, and shall be free of fines and well graded within the following limits:

SECTION 35 31 19 Page 41
2.4.12 [Armor/Cover] Stone

**************************************************************************

NOTE: The design of armor/cover stone should be based upon criteria presented in EM 1110-2-2904.
**************************************************************************

The stones furnished for [armor/cover/riprap] stone shall weigh between [_____] kg pounds and [_____] kg pounds each, and shall be free of fines. Seventy-five percent (75 percent) of the stones shall weigh greater than [_____] kg pounds each.

2.4.13 Splash/Fill Stone

The stones furnished for splash/fill stone behind the steel sheet pile wall shall be well graded from [_____] mm inch to [_____] mm inches, free of fines and shall contain no more than five percent (5 percent) stones larger than [_____] mm inches in any dimension.

2.5 [CONCRETE GROUT]

**************************************************************************

NOTE: If concrete grouting is not required for the project, delete this paragraph and its subparagraphs in their entirety.
**************************************************************************

Requirements are written to match an abridged version of Section 03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE and meet the requirements of ETL 1110-2-334, Design and Construction of Grouted Riprap, dated 21 Aug 92. Grouted riprap shall not be used in areas where frost heave or ice in the sub-base can be expected to cause uplift failure and on the river-side slopes of levees. A system designed for pressure relief and drainage should be provided beneath the area to be grouted along with edge and toe design to prevent undercutting and lateral movement of water beneath the grouted riprap.

**************************************************************************

2.5.1 Cementitious Materials

Cementitious materials will be accepted on the basis of a manufacturer's certificate of compliance, accompanied by mill test reports, that the materials meet the requirements of the specification under which it is furnished.

2.5.1.1 Portland Cement

ASTM C150/C150M, Type [I,] [IA,] [II,] [IIA], low alkali.
2.5.1.2 Pozzolan

ASTM C618, Class C or F, including requirements of Tables 1A and 2A. Pozzolan in amount not to exceed 25 percent, based on absolute volume, may be substituted for an equivalent amount of portland cement in the grout mixture proportions.

2.5.2 Aggregates for Concrete Grout

**************************************************************************
NOTE: Insert the appropriate State Highway Department gradation requirements if applicable.
**************************************************************************

The fine aggregates for grout shall meet the quality and gradation requirements of either ASTM C33/C33M or paragraph REGULATORY REQUIREMENTS.

The coarse aggregates shall meet the quality and gradation requirements of ASTM C33/C33M, Class designation 4M, Size No. 67, 7 or 8[ or paragraph REGULATORY REQUIREMENTS], Class designation [____], Size No. [____].

2.5.3 Admixtures

Submit manufacturers' literature for the concrete admixtures and curing materials. Admixtures to be used, when required or approved, shall comply with the following:

b. Water-Reducing or Retarding Admixture: ASTM C494/C494M, Type A, B, or D.

2.5.4 Curing Materials

Curing materials shall be as follows:

a. Impervious Sheet Materials: ASTM C171, type optional, except polyethylene film, if used, shall be white opaque.

b. Membrane-Forming Curing Compound: ASTM C309, Type 1-D or 2, Class [A] [B].

2.5.5 Water

Water for mixing and curing shall be fresh, clean, potable, and free from injurious amounts of oil, acid, salt, alkali, except that nonpotable water may be used if it meets the requirements of COE CRD-C 400.

2.5.6 [Equipment]

Batching and mixing equipment will be accepted on the basis of manufacturer's data which demonstrates compliance with the applicable specifications.

PART 3 EXECUTION

3.1 DEMONSTRATION SECTION

Prior to placement of stone, construct a section of [stone][channel]
protection consisting of [toe stone][riprap][grouted stone][_____] to
demonstrate his proposed operations for production placement. The section
shall demonstrate procedures and capability of grading, placing [toe] stone
and bank protection[, and placing grout, and curing of the grouted stone]
within the tolerances specified. The demonstration section shall be
[30][_____] m [100][_____] feet in length and shall conform to all
applicable specifications.

3.1.1 Methods and Equipment

Methods and equipment employed for placement shall demonstrate the adequacy
for use in placement of [toe stone][riprap][grouted stone][_____] and shall
conform with the requirements specified. The quantities of all materials
placed within the section shall be accurately tabulated and provided
immediately to the Contracting Officer for comparison with computed
quantities.

3.1.2 Demonstration Section Evaluation

Do not proceed with placing [stone][channel] protection prior to the
approval of the demonstration section. Within a period of 7 days after
completion of the section, the Contracting Officer shall determine the
adequacy of the section to function as part of the permanent construction.
The Contractor will be notified as to the acceptability of the section and
may be directed to modify methods of construction[, mix design,] and remove
the section if necessary.

3.1.3 Removal of Demonstration Section

If removal of the demonstration section is required, it shall be conducted
in such a manner as to maintain the integrity of the underlying subgrade.
Make arrangements for disposal in areas not located on the site.

3.2 BASE PREPARATION

**************************************************************************

NOTE: Sand fill is specified for the filling of low
areas below the waterline around structures in slack
water and giving the Contractor the option of using
bedding or filter materials. However, if fill
material is required where the designer assumes
there will be flowing water, the designer will have
to determine the minimum size of materials that will
stay in place until the stone protection can be
completed. This may require the fill material to be
specified as bedding/filter material or riprap.

Tolerances plus 50 to 75 mm 2 to 3 inches (Above
water placement).

Tolerances plus 300 mm 1 foot and minus 600 mm 2 feet
(Below water placement).
**************************************************************************

Areas on which [geotextile and riprap are] [filter layers and riprap are]
[bedding material and riprap are] to be placed shall be graded and/or
dressed to conform to cross sections shown on the contract drawings within
an allowable tolerance of plus 50 mm 2 inches and minus 100 mm 4 inches
from the theoretical [slope] lines and grades. The prepared base shall be
approved by the Contracting Officer. Where such areas are below the allowable minus tolerance limit they shall be brought to grade by fill [with earth similar to the adjacent material] [with sand fill] and then compacted to a density equal to the adjacent in place material. [Subaqueous areas on which [bedding material and riprap] [filter materials and riprap] are to be placed shall be graded and/or dressed to conform to cross sections shown on the contract drawings within an allowable tolerance of plus 300 mm 1 foot and minus 600 mm 2 feet from the specified [slope] line and grades. Where such areas are below the allowable minus tolerance limit they shall be filled with sand fill. As an alternative, these areas may be filled with [bedding material] [filter material]. No payment will be made for any material thus required.) Immediately prior to placing the [geotextile] [bedding layers] [filter layers], the prepared base will be inspected by the Contracting Officer and no material shall be placed thereon until that area has been approved.

3.3 PLACEMENT OF BEDDING LAYERS

3.3.1 General

******************************************************************************
NOTE: The following construction tolerances will be used for bedding layer placement. Tolerances will vary based upon District experience and project conditions.

Plus or minus 50 mm 2 inches

Plus 100 mm 4 inches or minus 50 mm 2 inches

Plus 150 mm 6 inches or minus 50 mm 2 inches (below water) should be possible if water depths are less than 3 m 9 feet. Placement tolerances at greater depths should be deleted and replaced with tons/square as specified for under water placement of stone.
******************************************************************************

A bedding layer, consisting of a [_____] -mm -inch layer of [gravel or] crushed stone, shall be placed on the prepared base as described below, in accordance with the details shown on the contract drawings, and within the limits shown on the contract drawings or staked in the field. A tolerance of plus 50 mm 2 inches and minus 25 mm 1 inch from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the bedding, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet.

3.3.2 Placement of Bedding Material on Prepared Base

Bedding material shall be spread uniformly on the prepared base to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the prepared base. Placing of [gravel or] crushed stone by methods which tend to segregate the particle sizes within the bedding layer [or cause mixing of the separate layers] will not be permitted. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Any damage to the surface of the prepared base during placing of the material shall be repaired before proceeding with the
work. Compaction of material placed on the prepared base will not be required, but [the material surface] [each layer] shall be finished to present an adequately even surface, free from mounds or windrows.

3.4 PLACEMENT OF FILTER LAYERS

3.4.1 General

******************************************************************************
NOTE: The following construction tolerances will be used for filter layer placement. Tolerances will vary based upon District experience and project conditions.

Plus or minus 50 mm 2 inches

Plus 100 mm 4 inches or minus 50 mm 2 inches

Plus 150 mm 6 inches or minus 50 mm 2 inches (below water) should be possible if water depths are less than 3 m 10 feet. Placement tolerances at greater depths should be deleted and replaced with tons/square as specified for under water placement of stone.

******************************************************************************
NOTE: Alternative 1.
******************************************************************************

[Filter layers, composed of geotextile [and a [_____] -mm -inch layer of filter stone][ and a [_____] -mm -inch layer of sand (cushion layer)] shall be placed on the prepared base as described below, in accordance with the details shown on the contract drawings, and within the limits either shown on the contract drawings or staked in the field.] [A tolerance of plus 50 mm 2 inches and minus [25][50] mm [1 inch][2 inches] from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the filter layers, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet.]

******************************************************************************
NOTE: Alternative 2.
******************************************************************************

[Filter layers composed of a [_____] -mm -inch lower layer of [Sand "[_____]"], [a [_____] -mm -inch middle layer of Gravel "[_____]"], and a [_____] -mm -inch upper layer of [Gravel "[_____]""] [Filter Stone] shall be placed on the prepared base as described below, in accordance with the details on the contract drawings, and within the limits shown on the contract drawings or staked in the field.] [A tolerance of plus [_____] mm inch(es) and minus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the filter layers, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet].

3.4.2 [Geotextile

******************************************************************************
Installation of geotextile shall be as specified in Section 31 05 22 GEOTEXTILES USED AS FILTERS.]

3.4.3 [Placement of [Filter Material] [Sand Cushion Layer] on Geotextile]

[Crushed stone][Filter material] shall be spread uniformly on the geotextile to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the geotextile. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Placing of [crushed stone][filter stone][sand cushion layer] by methods which tend to segregate the particle sizes within the filter layer will not be permitted. Any damage to the surface of the geotextile during placement of [crushed stone][filter stone][sand cushion layer] shall be repaired before proceeding with the work. Compaction of material placed on the geotextile will not be required, but shall be finished to present an adequately even surface, free from mounds or windrows.]

3.4.4 Placement of Filter Material on Prepared Base

Filter material shall be spread uniformly on the prepared base to the [slope] lines and grades as indicated on the contract drawings and in such manner as to avoid damage to the prepared base. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Placing of [sand,] [gravel,] and [crushed stone] by methods which tend to segregate the particle sizes within the filter layers or cause mixing of the separate layers will not be permitted. Any damage to the surface of the prepared base during placement of the material shall be repaired before proceeding with the work. Compaction of material placed on the prepared base will not be required, but each layer shall be finished to present an adequately even surface, free from mounds or windrows.

3.5 PLACEMENT OF RIPRAP

[At the end of this section, the Specifier must attach copies (Plates) of ENG FORM 4794-RM RIPRAP GRADATION CURVES for M40, M____ (ENG FORM 4794-R RIPRAP GRADATION CURVES for R90, R____), etc.]

3.5.1 General

[The Specifier will not specify riprap by layer thickness. Riprap shall be specified by the weight of the maximum D100 size of the riprap gradation.]
Riprap shall be placed on the [filter] [and] [bedding] layers specified in paragraph(s) [BEDDING MATERIAL] [and] [FILTER MATERIAL] within the limits shown on the contract drawings.

3.5.2 Placement

**************************************************************************
**NOTE: Select appropriate Alternative.**
**************************************************************************

[Under water placement rates shall be used when the top of the layer to be placed is covered by more than 900 mm 3 feet of water.]

3.5.2.1 [Above Water]

**************************************************************************
**NOTE: Alternative 1.**
**************************************************************************

For placement of riprap above water on a bedding layer or filter layer(s).

For tolerances in general, 1/2 of the average stone dimension of gradation range is allowed above the neatline and 1/4 of the same dimension is allowed below the neatline.

Bottom hinged tailgates shall be added to dump trucks used in placing the riprap if larger than M180 R400 riprap is specified.

**************************************************************************
**[Riprap shall be placed in a manner which will produce a well-graded mass of rock with the minimum practicable percentage of voids, and shall be constructed, within the specified tolerances, to the lines and grades shown on the contract drawings or staked in the field. A tolerance of plus [_____] mm inch(es) and minus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the riprap, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerances specified above. [Riprap shall be placed by means of truck, crane operated skip-pan (box), dragline bucket, clamshell, rock-bucket, hydraulic excavator, trackhoe, or other approved equipment. [The use of tractor loaders or other equipment commonly referred to as front end loaders shall not be permitted. [Pneumatic tired front end loaders may be used provided that in the opinion of the Contracting Officer no degradation of the rock occurs.]]] Riprap shall be placed to its full course thickness in one operation and in such manner as to avoid displacing the [bedding] [filter] material. The large stones shall be well distributed and the entire mass of stones in their final position shall be graded to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. The finished riprap shall be free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping it into chutes, or by similar methods likely to cause segregation of the various sizes, shall not be
permitted. Placing riprap by dumping it at the top of the slope and pushing it down the slope shall not be permitted. No equipment shall be operated directly on the completed stone protection system. The desired distribution of the various sizes of stones throughout the mass shall be obtained by selective loading of the material at the quarry or other source; by controlled dumping of successive loads during final placing; or by other methods of placement which will produce the specified results. Each truckload shall be representative of the gradation requirements. [All dump trucks used in placing the riprap shall be equipped with bottom hinged tailgates. The gate releasing mechanism shall be arranged so that it may be operated only from, at, or near the front of the truck.] Rearranging of individual stones shall be required to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. [However, manipulating stone by means of dozers or other blade equipment shall not be permitted.] [Unless otherwise authorized by the Contracting Officer, riprap shall be placed in conjunction with the construction of the embankment and with only sufficient lag in construction of the stone protection as may be necessary to prevent mixing of embankment and stone protection materials.] Maintain the stone protection until accepted by the Contracting Officer; any material displaced prior to acceptance due to the Contractor's negligence shall be replaced with no additional payment and to the lines and grades shown on the contract drawings.]

******************************************************************************

NOTE: Alternative 2.

For placement of riprap on geotextile or geotextile and filter stone.

Tolerance +100 mm and -50 mm +4 inches and -2 inches for riprap with a top size up to 230 kg 500 pounds riprap and a tolerance of +150 mm and -150 mm +6 inches and -6 inches for large riprap.

Bottom hinged tailgates shall be added to dump trucks used in placing the riprap if larger than M180 R400 riprap is specified.

Drop heights of 900 mm 3 feet specified in this paragraph are based on the geotextile having a minimum puncture strength of 0.51 kN 115 pounds and a minimum tensile strength of 1.07 kN (240 pounds) and the riprap has a top size larger than 90 kg 200 pounds. For riprap with a top size larger than 90 kg 200 pounds and less than 225 kg 500 pounds, the drop height is reduced to 600 mm 2 feet without a layer of filter stone or a sand cushion layer is required.

******************************************************************************

[Place riprap to produce a well graded mass of rock with the minimum practicable percentage of voids, and construct within the specified tolerances to the lines and grades indicated. Begin placement at the bottom of the area to be covered and continue up slope. Place subsequent loads of material against previously placed material to ensure a relatively homogenous mass. A tolerance of plus [_____] mm inch(es) or minus [_____] mm inch(es) from the slope lines and grades indicted will be allowed in the finished surface of the riprap, except that either extreme of such tolerance shall not be continuous over an area greater than 18 m² 200}
square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerance specified above. Do not drop stone through air from a height greater than 900 mm 3 feet and do not drop stones heavier than 230 kg 500 pounds from a height greater than 600 mm 2 feet. [The drop height of riprap with a top size greater than 225 kg 500 pounds shall be less than 300 mm 1 foot, but can be increased by placing a cushioning layer of sand [or [_____]] on top of the geotextile before placing the riprap, or other methods deemed necessary if demonstrated in the field to not damage the geotextile.] Distribute the larger stones and roughly grade the entire mass of stones in their final position to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. The finished riprap shall be free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping into chutes or by similar methods likely to cause segregation of the various sizes will not be permitted. Placing riprap by dumping it at the top of the slope and pushing it down the slope will not be permitted. No equipment shall be operated directly on the completed stone protection system. Obtain the desired distribution of the various sizes of stones throughout the mass by selective loading of the material at the quarry or other source, by controlled dumping of successive loads during final placing, or by other methods of placement which will produce the specified results. Equip all dump trucks used in placing the riprap with bottom hinged tailgates. Arrange the gate releasing mechanism so that it may be operated only from, at, or near the front of the truck. Rearranging of individual stones will be required to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. Maintain the stone protection until accepted by the Contracting Officer; replace any material displaced by any cause, with no additional payment, to the lines and grades indicated.

3.5.2.2 Under Water

**************************************************************************
NOTE: The equation presented in this paragraph (Alternative 3) was developed to simplify the relationship between required riprap layer thickness and underwater placement rate in slack water. This equation assumes that riprap weighs approximately 1.8 tons metric per cubic meter 1.5 tons per cubic yard and that the underwater placement rate is based upon a required layer thickness 1.5 times the layer thickness required to be constructed in the dry. The quantities are based on a placement to be performed in two passes with the second pass being perpendicular to the first. This equation is provided as an example and should be modified to meet project design criteria.

\[
\frac{(1.36t)(1.5)}{(25M^2)(304 \text{ mm})} = R_M
\]

\(T_{mm} = \text{Required theoretical thickness if placed in the dry. (Layer thickness given in mm.)}\)

\(R_M = \text{Required placement rate in Tons/sq m/pass}\)

180 kg placement rate is 10 T/sq m/pass (assume required thickness in the dry is 750 mm for high
turbulent flow criteria).

90 kg placement rate is 5 T/sq m/pass (assume required thickness in the dry is 400 mm for low turbulent flow criteria). 

\[
\frac{T(0.347)}{(27 \text{ ft}^3/\text{yd}^3)(12 \text{ in./ft})(2)} = \frac{R}{(1.5 \text{ T/yd}^3)(100 \text{ ft}^2)(1.5)}
\]

\( T = \) Required theoretical thickness if placed in the dry. (Layer thickness given in inches.)

\( R = \) Required placement rate in Tons/sq/pass. Where a square is referring to 100 square feet.

400 pound placement rate is 10 T/sq/pass (assume required thickness in the dry is 30 inches for high turbulent flow criteria).

200 pound placement rate is 5 T/sq/pass (assume required thickness in the dry is 16 inches for low turbulent flow criteria).

Alternative 3:

The depth of water over the geotextile is based on the puncture strength of the geotextile being a minimum of 0.61 kN 140 pounds and the impact energy of 1.74 kN 400 pounds top size riprap being placed without a layer of filter stone or sand cushion layer.

**************************************************************************

When riprap [with a maximum size of 180 kg 400 pounds,] is placed under water onto geotextile it may be dropped from the water surface if the water depth over the geotextile is greater than 1.5 m 5 feet. Riprap placed in the wet shall be placed evenly at a rate of [_____] tons per square (9.3 m²) tons per square (100 square feet) per pass for M[_____] R[_____] riprap and [_____] tons per square (9.3 m²) tons per square (100 square feet) per pass for M[_____] R[_____] riprap. Prior to starting work, submit the proposed method of placing riprap under water. Riprap to be placed in the wet shall be done during periods of low water levels during the months of June through November. The riprap shall be placed in two passes, with the second pass perpendicular to the first pass. The total quantity of M[_____] R[_____] riprap placed in two passes shall be [_____] tons per square and the total quantity of M[_____] R[_____] riprap placed in two passes shall be [_____] tons per square.

] [3.6  PLACEMENT OF GROUTED RIPRAP

3.6.1 General

Place riprap on the [filter] [and] [bedding] material specified in paragraph(s) [FILTER MATERIAL] [and] [BEDDING MATERIAL] within the limits shown. [Pressure relief holes shall be installed every 3 m 10 feet and formed by 75-mm 3-inch diameter pipe. The end(s) of the pipe shall be installed into the [bedding][filter] layer so that it will not become clogged with grout. The end(s) of the pipe which is buried in the
[bedding] [filter] layer shall be capped and shall be perforated with holes or slots. Care shall be taken to prevent grout from entering the weep holes.

3.6.2 Placement

**************************************************************************
NOTE: Placement of grouted riprap will always be placed in the dry on filter layers or bedding layer.

Tolerances of +150 mm +6 inches for riprap up to 300 kg 650 pounds and a tolerance of +300 mm +12 inches for large riprap.

Bottom hinged tailgates shall be added to dump trucks used in placing the riprap if larger than 180-kg 400-pound riprap is specified.
**************************************************************************

[Riprap shall be placed in a manner which will produce a well-graded mass of rock with the minimum practicable percentage of voids, and shall be constructed, within the specified tolerance, to the lines and grades either shown on the contract drawings or staked in the field. A tolerance of not less than plus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the riprap except that the extreme of this tolerance shall not be continuous over an area greater than 18 m^2 200 square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerances specified above. Riprap shall be placed to its full course thickness in one operation and in such manner as to avoid displacing the [filter] [bedding] material. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. The large stones shall be well distributed and the entire mass of stones in their final position shall be graded to conform to the gradation specified in paragraph RIPRAP, subparagraph GENERAL. The finished riprap shall be free from objectionable pockets of small stones and clusters of larger stones. Placing riprap in layers will not be permitted. Placing riprap by dumping it into chutes, or by similar methods likely to cause segregation of the various sizes, will not be permitted. Placing riprap by dumping it at the top of the slope and pushing it down the slope will not be permitted. No equipment shall be operated directly on the completed stone protection system. The desired distribution of the various sizes of stones throughout the mass shall be obtained by selective loading of the material at the quarry or other source; by controlled dumping of successive loads during final placing; or by other methods of placement which will produce the specified results. Each truckload shall be representative of the gradation requirements. [All dump trucks used in placing the riprap shall be equipped with bottom hinged tailgates. The gate releasing mechanism shall be arranged so that it may be operated only from, at, or near the front of the truck.] Rearranging of individual stones will be required to the extent necessary to obtain a well-graded distribution of stone sizes as specified above. [Unless otherwise authorized by the Contracting Officer, riprap shall be placed in conjunction with the construction of the embankment and with only sufficient lag in construction of the stone protection as may be necessary to prevent mixing of embankment and stone protection materials.] Maintain the stone protection until accepted by the Government; any material displaced prior to acceptance due to the Contractor's negligence shall be
replaced with no additional payment, and to the lines and grades shown on
the contract drawings."

3.6.3 Grouting of Riprap

Placement of grout shall be as specified in paragraph PRODUCING, CONVEYING
AND PLACING GROUT.

3.7 [PLACEMENT OF RIPRAP PAVING STONE]

3.7.1 General

Riprap paving shall be placed on the [filter][ and ][bedding] material
specified in paragraph(s) [FILTER MATERIAL][ and ][BEDDING MATERIAL] within
the limits shown.

3.7.2 Placement

Riprap paving stone shall be carefully placed, by hand or machine, in a
manner which will produce a compact paving to the lines and grades either
shown on the drawings or staked in the field. The stone shall be placed in
a single layer with the dimensions of the stones corresponding to the
thickness of the paving laid normal to the plane of the slope. Adjacent
stones shall be selected for size and shape and laid in such close contact
as to produce a reasonable minimum of voids. Placement shall begin at the
bottom of the area to be covered and continue up slope. Subsequent loads
of material shall be placed against previously placed material in such a
manner as to ensure a relatively homogenous mass. The stones shall be
roughly coursed with courses running horizontally and breaking joints with
the preceding course as far as practicable. Double-decking of the flat
stones to obtain the required depth of paving will not be permitted.
Spaces between the stones in the face of the paving shall be filled with
tightly driven spalls and the paving tamped if necessary to produce a
compact mass and an adequately even surface. A tolerance of plus or minus
[_____] mm inch(es) from the slope lines and grades shown will be allowed
in the finished surface of the riprap paving, except that the extreme of
this tolerance shall not be continuous over an area greater than 18 m² 200
square feet.

3.8 [PLACEMENT OF HAND-PLACED RIPRAP]

3.8.1 General

Hand-placed riprap shall be placed on the [filter][ and ][bedding] material
specified in paragraph(s) [FILTER MATERIAL][ and ] [BEDDING MATERIAL] within
the limits shown. Stone shall conform to the requirements of paragraph
RIPRAP. Except for spalls for wedging, stone shall be roughly rectangular
in shape of which the least dimension shall be not less than one-third the
length.

3.8.2 Placement

The riprap shall be carefully placed by hand in such a manner that adjacent
stones are in close contact and, in general, have their greatest dimensions
across the slope. "Through stones" shall be well-distributed throughout
the mass and the sum of their cross sections, parallel to the slope being
protected, shall be not less than two-thirds of such area. As used in this
specification a "through stone" is defined as a stone whose dimension
normal to the surface being riprapped is not less than the full depth of
the riprap. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material placed on the slope shall be immediately adjacent to previously placed material in such a manner to ensure a relatively homogenous mass. The riprap along the lower edge of an area shall consist of the largest stones set in a trench so as to form a band. Except for spalls used to fill voids between larger stone, no stone shall be used in the exposed face of the riprap which will extend less than one-half the thickness of the riprap. Spaces between the larger stones shall be filled with spalls and smaller stones of the largest feasible size to form a compact mass. Spalls and small stone shall not be place in nests in lieu of larger size stone. A tolerance of plus or minus [_____] mm inch(es) from the slope lines and grades shown will be allowed in the finished surface of the riprap paving, except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet.

3.9 [PLACEMENT OF GROUTED HAND-PLACED RIPRAP]

3.9.1 General

Hand-placed riprap shall be placed on the [filter][ and ][bedding] material specified in paragraph(s) [FILTER MATERIAL][ and ][BEDDING MATERIAL] within the limits shown. Stone shall conform to the requirements of paragraph RIPRAP. Except for spalls for wedging, stone shall be roughly rectangular in shape of which the least dimension shall be not less than one-third the length.

3.9.2 Placement

The riprap paving shall be carefully placed to form a layer [_____] mm inch(es) in thickness. The riprap shall be placed in conformance with the general requirements of paragraph PLACEMENT OF HAND-PLACED RIPRAP, except that the stone shall be laid with open joints to facilitate grouting and the smaller spaces between stones in the face of the paving shall not be filled with spalls but shall be left open to receive grout readily. [Pressure relief holes shall be installed every 3 m 10 feet and formed by 75-mm 3-inch diameter pipe. The end(s) of the pipe shall be installed into the [bedding][filter] layer so that it will not become clogged with grout. The end(s) of the pipe which is buried in the [bedding][filter] layer shall be capped and shall be left open to receive grout readily. Care shall be taken to prevent grout from entering the weep holes.]

3.9.3 Grouting of Hand-Placed Riprap

Placement of the grout shall be as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.

3.10 [PLACEMENT OF GROUTED RIPRAP PAVING]

3.10.1 General

Riprap paving shall be placed on the [filter][ and ][bedding] material specified in paragraph [FILTER MATERIAL][ and ][BEDDING MATERIAL] within the limits shown. Stone shall conform to the requirements of paragraph RIPRAP PAVING.
3.10.2 Placement

The riprap paving shall be carefully placed to form a layer [_____] mm inch(es) in thickness. The riprap shall be placed in conformance with the general requirements of paragraph PLACEMENT OF RIPRAP PAVING except that the stone shall be laid with open joints to facilitate grouting and the smaller spaces between stones in the face of the paving shall not be filled with spalls but shall be left open to receive grout readily. [Pressure relief holes shall be installed every 3 m 10 feet and formed by 75-mm 3-inch diameter pipe. The end(s) of the pipe shall be installed into the [bedding][filter] layer so that it will not become clogged with grout. The end(s) of the pipe which is buried in the [bedding][filter] layer shall be capped and shall be perforated with holes or slots. Care shall be taken to prevent grout from entering the weep holes.]

3.10.3 Grouting of Riprap Paving

Placement of grout shall be as specified in paragraph PRODUCING, CONVEYING AND PLACING GROUT.

3.11 [PLACEMENT OF [DERRICK STONE] [AND] [CAPSTONE]]

******************************************************************************

NOTE: The tolerance for the riprap layer may have to be tightened in paragraph PLACEMENT OF RIPRAP to meet tolerance required for this layer.

******************************************************************************

3.11.1 General

[Derrick Stone] [and] [Capstone] shall be placed carefully with equipment suitable for handling the stone of the size(s) specified on a [_____] mm inch(es) thick layer of [M40] [M____] [R90] [R____] riprap specified in paragraph PLACEMENT OF RIPRAP.

3.11.2 Placement

The various sizes of [derrick stone] [and] [capstone] shall be distributed in such a manner as to produce a compact, uniform, well-graded mass [within the limits shown on the contract drawings.] [to the lines and grades indicated on the contract drawings and staked in the field.] Placement shall begin at the bottom of the area to be covered and continue up slope. Subsequent loads of material shall be placed against previously placed material in such a manner as to ensure a relatively homogenous mass. Adjacent stone shall be selected with reasonable care as to size and shape and placed in close contact, the smaller stones filling the spaces between the larger ones so as to leave a reasonable minimum of voids. "Through stones" shall be well distributed throughout the mass, and the sum of their cross sections parallel to the surface being protected shall be not less than 70 percent of such area. As used herein, a "through stone" is defined as a stone whose dimension normal to the surface being protected is not less than the full depth of the protection. A tolerance of not less than plus [_____] mm inch(es) from the slope lines and grades shown on the contract drawings will be allowed in the finished surface of the stone except that the extreme of this tolerance shall not be continuous over an area greater than 18 m² 200 square feet. The average tolerance of the entire job shall have no more than 50 percent of the tolerances specified above. Maintain the stone until accepted by the Government; any material displaced prior to acceptance due to the Contractor's negligence shall be
replaced with no additional payment and to the lines and grades shown on the contract drawings.

3.12 GROUTING OF STONE PROTECTION

Placement of grout shall be as specified in paragraph PRODUCING, CONVEYING AND PLACING OF GROUT.

3.12.1 Producing, Conveying and Placing of Grout

3.12.1.1 Producing Grout

The batching and mixing equipment shall provide sufficient capacity to prevent cold joints. Materials shall be stockpiled and batched by methods that will prevent segregation or contamination of aggregates and insure accurate proportioning of the ingredients of the mixture. No mixing water in excess of the amount required by the job mix shall be added to the grout mixture during mixing, hauling, or after arrival at the delivery point, except as required and approved.

a. Ready-Mixed Concrete Grout shall conform to ASTM C94/C94M except as otherwise specified.

b. Volumetric Batching and Continuous Mixing shall conform to ASTM C685/C685M.

c. Onsite Batching and Mixing. The Contractor has the option of using an onsite batching and mixing facility. The facility shall provide sufficient capacity to prevent cold joints and be able to batch the cement and aggregate by weight, and the water and admixtures by weight or volume. The method of measuring materials, the batching operation, and the mixer shall be approved in accordance with paragraph SUBMITTALS. On-site plant shall conform to the requirements of either ASTM C94/C94M or ASTM C685/C685M.

3.12.1.2 Preparation for Placing

[Adequate precautions shall be taken to prevent grout from penetrating the upper filter layer. ]The rock shall be flushed with water to remove the fines from the rock prior to placing the grout. The rock shall be kept moist just ahead of the actual placing, but no flowing or standing water shall be present during the grout operation. Snow and ice shall be removed. All equipment needed to place, protect, and cure the grout shall be at the placement site and in good operating condition. The entire preparation shall be accepted by the Contracting Office prior to placing the grout.

3.12.1.3 Conveying and Placing

Grout placement will not be permitted when weather conditions prevent proper placement, except upon approval. Submit the methods and equipment for transporting, handling, depositing, and consolidating the grout prior to first grout placement. The grout mixture shall not be placed until the stone protection has been inspected and approved. Grout shall be in place within 15 minutes after discharge from the mixer. Grout shall not be dropped more than 1.5 m 5 feet vertically unless suitable equipment is used to prevent segregation.

a. Conveying
When the grout is mixed [and] or transported by a truck mixer, the grout shall be delivered to the site of the work and discharge shall be completed within 1-1/2 hours after introduction of the cement to the aggregate and water. When the air temperature is 29 degrees C or greater) or under conditions contributing to quick stiffening of the grout, the time between the introduction of the cement and discharge of the grout shall not exceed 45 minutes. The Contracting Officer may allow a longer time, provided the setting time of the grout is increased a corresponding amount by the addition of an approved set-retarding admixture. Grout shall be deposited as close as possible to its final position by methods that will prevent segregation of the aggregates or loss of mortar.

b. Placing

The riprap shall be kept moist just ahead of the actual grout placement, but the grout shall not be placed in standing or flowing water. Grout placed on inverts or other nearly level areas may be placed in one course. On slopes, the grout shall be placed in two (2) courses in successive lateral strips approximately 3 m or 10 feet in width starting at the toe of the slope and progressing to the top. The grout shall be delivered to the place of final deposit and discharged directly on the surface of the riprap, using a splash plate of metal or wood to prevent displacement of the rock directly under the discharge. The flow of grout shall be directed with brooms, spades or baffles to prevent it from flowing excessively along the same path and to assure that all intermittent spaces are filled. Sufficient barring shall be done to loosen tight pockets of riprap and otherwise aid the penetration of grout so that all voids shall be filled and the grout fully penetrates the riprap (as specified) from the base of the riprap layer to at least two-thirds of the thickness of the stone layer. All brooming on slopes shall be uphill and after the grout has stiffened, the entire surface shall be rebroomed to eliminate runs, to fill voids caused by sloughing, and to remove grout from the top surface and pockets or depressions of the upper stones.

3.12.1.4 Cold-Weather Requirements

No grout placement shall be made when the ambient temperature is below 2 degrees C or 35 degrees F, nor if the ambient temperature is below 5 degrees C or 40 degrees F and falling. Suitable covering and other means, as approved, shall be provided for maintaining the grout at a temperature of at least 10 degrees C or 50 degrees F for not less than 72 hours after placing and at a temperature above freezing for the remainder of the curing period. When freezing conditions prevail, riprap to be grouted must be covered and heated to a range of 5 to 16 degrees C or 40 to 60 degrees F for at least 24 hours prior to placing the grout. Salt, chemicals, or other foreign materials shall not be mixed with the grout to prevent freezing. Any grout damaged by freezing shall be removed and replaced at the expense of the Contractor.

3.12.1.5 Hot Weather Requirements

When the rate of evaporation of surface moisture, as determined by use of Figure 2.1.5 of ACI 305R, is expected to exceed 100 g/m² or 0.2 pounds per square foot per hour, provisions for windbreaks, shading, fog spraying, or wet covering with a light-colored material shall be made in advance of placement, and such protective measures shall be taken as quickly as
finishing operations will allow.

3.12.2 Curing and Protection of Grouted Stone Protection

Beginning immediately after placement and continuing for at least 7 days, all grout shall be cured and protected from premature drying, extremes in temperature, rapid temperature change, freezing, mechanical damage, and exposure to rain or flowing water. All materials and equipment needed for adequate curing and protection shall be available and at the site of the placement prior to the start of grout placement. After completion of any strip or panel, no workman or other load shall be permitted on the grouted surface for a period of twenty-four (24) hours. Exposed surfaces shall be kept continuously moist for the entire period, or until curing compound is applied. Preservation of moisture for grout surfaces shall be accomplished by one of the following methods:

a. Continuous sprinkling and ponding.

b. Application of absorptive mats or fabrics kept continuously wet.

c. Application of sand kept continuously wet.

d. Application of impervious sheet material conforming to ASTM C171.

e. Application of membrane-forming curing compound conforming to ASTM C309. The compound shall be sprayed on the moist surface as soon as free water has disappeared, but shall not be applied to any surface until finishing of that surface is completed. The compound shall be applied at a uniform rate of not less than \(300 \text{ ml/m}^2\) or \(1 \text{ gallon per 150 square feet}\) of surface and shall form a continuous adherent membrane over the entire surface. Curing compound shall not be applied to surfaces requiring bond to subsequently placed grout. If the membrane is damaged during the curing period, the damaged area shall be resprayed at the rate of application specified above.

3.13 TRENCHFILL REVETMENT, BANK PAVING, AND OUTLET DRAINS

3.13.1 Trenchfill Revetment

Stone for the trenchfill shall be Graded Stone "A" "B" "C" [[____]-kg][[____]-Pound] Stone and shall be back-dumped from the dump trucks, placed by skip, clamshell, or other approved method directly in the trench excavated at the toe of the graded revetment slope. Stone placement in trench shall not be accomplished more than 300 m 1,000 feet in advance of the completed trenchfill section, including upper bank paving, unless otherwise permitted by the Contracting Officer. The trenchfill shall be constructed to the elevations and cross sections shown on the drawings. A tolerance of [150][____] mm [6][____] inches above or below the lines and grades of final excavation will be permitted provided the area of the finished section is not less than the area of the theoretical section. Placement of the trenchfill shall be completed prior to placement of the bank paving. Bulldozing of stone from the upper bank into the excavated trench will not be permitted.

3.13.2 Bank Paving

Stone bank paving shall be Graded Stone "C" [[57][____]-kg [125][____]-pound stone] [[____]-kg -Pound riprap. Excess stone placed directly in the trench at the toe of the graded revetment slope may be...
dragged up the slope a maximum of 3 m 10 feet vertically above the average lower water plane (ALWP). The remainder of the upper bank paving stone may be placed in continuous stockpiles at 3 m 10 feet intervals above the ALWP by means of back-dumping from dump trucks or by skip, clamshell, or other approved method, and dragged up the slope a maximum of 3 m 10 feet vertically. The remainder of the upper bank paving stone may also be back-dumped from dump trucks; placed by skip, clamshell, or other approved method; and spread by bulldozing except that pushing stone down the slope will not be permitted. The stone shall be placed in such a manner to achieve a minimum of segregation of sizes in the in-place upper bank paving stone, with uniform gradation from the bottom of the slope to the top elevation of the stone as indicated on the drawings. Prior to placing the stone, the graded slopes shall be brought to final grade and dressed to conform to the limits specified in Section 31 00 00 EARTHWORK. A tolerance of 75 mm 3 inches above and below the specified bank paving thickness will be allowed provided the area of the finished section is not less than the area of the theoretical section. To prevent overtopping of the paved portion of the slope by rising river stages, place bank paving in strips parallel to the water's edge when directed by the Contracting Officer. Repair any damage to the graded bank or paving occasioned by such overtopping of the paving because of failure to keep paving operations above the water surface.

3.13.3 Outlet Drains

Where required, standard outlet drains or special drainage ditches shall be constructed. A tolerance of 150 mm 6 inches above or below the lines and grades will be permitted provided the area of the finished section is not less than the area of the theoretical section. Graded Stone "C" [[_____] -kg -Pound stone] [[_____] -kg -pound riprap] shall be placed for all outlet drain paving to provide a minimum of segregation of sizes in the in-place materials. A layer of 150-mm 6-inch thick bedding stone shall be placed under the Graded Stone "C" [[_____] -kg -pound stone] [[_____] -kg -pound riprap] in the manner and at the locations shown on the drawings. A thickness tolerance of plus 25 mm 1 inch for the 150-mm 6-inch thick bedding material will be allowed. Where the outlet drains must be constructed in silts or silty sands, a 150-mm 6-inch layer of bedding sand shall be placed beneath the bedding stone. The bedding sand shall meet the quality and gradation requirements as specified in paragraph BEDDING MATERIALS.

3.13.4 Toe Trench Revetment

Toe trench revetment shall be constructed, when so ordered on the construction schedule, at locations where the existing bank or riverbed at the structure azimuth line is 3 m 10 feet or less below [Average Low Water Plane (ALWP)] [______]. It shall consist of stone placed along the toe of the bank excavated as specified in [Section 31 00 00 EARTHWORK] [______] and on the graded slope of the upper bank as applicable. Toe trench revetment shall be of two types as shown on the contract drawings for the following conditions:

a. Type "A" - For conditions where the top of the graded slope is 2700 mm 9 feet or more above [Average Low Water Plane (ALWP)] [______].

b. Type "B" - For conditions where the top of the graded slope is less than 2700 mm 9 feet above [Average Low Water Plane (ALWP)] [______].
3.13.4.1  Trench Fill

A fill consisting of stone shall be placed along the excavated toe of the
bank to the elevation and cross section designated on the contract drawings
for both types of toe trench revetment. The fill shall consist of not less
than 27 tons 9 tons nor more than 41 tons 14 tons of stone per meter linear
foot of fill, unless otherwise specified on the construction schedule.
The use of a dozer shall not be permitted in moving stone from the upper
bank into the trench.

3.13.4.2  Upper Slope Fill

For Type "A" revetment, a fill consisting of stone shall be placed on the
graded slope to a minimum depth normal to the slope of 250 mm 10 inches at
the top of the slope and increasing uniformly therefrom to a minimum depth
of 375 mm 15 inches where it abuts the trench fill. The upper slope fill
shall be arranged uniformly with the larger stone at the bottom of the
slope and the small stone at the top and shall not exceed 0.7 t/m² 7 T per
100 square foot of upper slope fill. Rearrange the upper slope fill stone
as necessary to conform to these specifications. The use of a dozer is not
permitted in placing the upper slope fill.

3.13.4.3  Crown Fill

For Type "B" revetment, a fill consisting of stone shall be placed,
abutting the trench fill, to the elevation and crown width specified on the
construction schedule. The crown fill shall have a riverward side slope of
1V on 3H, a landward side slope of 1V on 2H, and a minimum thickness of 375
mm 15 inches as shown on the contract drawings.

3.13.4.4  Juncture With Other Types of Revetment

Where toe trench revetment joins an existing structure and the alignment
and riverward slopes of the stone fills in the structures are not the same,
a transition shall be made by gradually adjusting the alignment and slope
of the toe trench revetment over a distance of approximately 30 m 100 feet
so that it conforms to the alignment and slope of the existing stone fill
at the junction of the structures. The transition shall be made in a
workmanlike manner and as directed by the Contracting Officer.

3.13.4.5  Intermittent Repair of the Trench Fill and Upper Slope Area of
Revetment

Intermittent repair shall consist of stone placed along the trench fill
and/or upper slope area of the revetment to the elevation and cross section
designated on the drawings for trench fill or upper slope, and is ordered
on the construction schedule. When specified by the Contracting Officer,
adjustment in the line and grade may be authorized to accomplish necessary
repairs to conform to alignment and grade of undamaged sections. Trench
fill repair shall not be performed when the river stage exceeds [Average
Low Water Plane (ALWP)] [_____] and upper slope repair shall not be
performed when the river stage exceeds 1.5 m 5 feet above [Average Low
Water Plane (ALWP)] [_______], unless otherwise directed by the Contracting
Officer.

3.13.5  Stone Fill Revetment

Stone fill revetment shall be constructed when so ordered on the
construction schedule, and shall consist of a stone fill placed as
specified in [Section 31 00 00 EARTHWORK] [____]. If required to obtain proper placement of material, the Contractor has the option of using either mooring piles, anchors, spud barges, or other suitable methods approved by the Contracting Office to obtain the proper configuration and alignment while placing stone.

3.13.5.1 Stone Fill

A fill consisting of stone shall be placed along the structure azimuth line to a cross-section as shown on the contract drawings and to such elevation and crown width as specified on the construction schedule. The riverward slope shall be 1V on 1.5H and shall intersect the structure azimuth line 900 mm 3 feet below [Average Low Water Plane (ALWP)] [____] unless otherwise specified; minor irregularities will be permitted. The stone shall be placed in lifts of such height and length as the Contracting Officer may consider necessary to prevent or reduce scour ahead of the fill.

3.13.5.2 Juncture With Other Types of Revetment

Where stone fill revetment joins and existing structure and the alignment and riverward slope of the stone fills in the structures are not the same, a transition shall be made by gradually adjusting alignment and slope of the stone fill revetment over a slope of the existing stone fill at the junction of the structures. The transition shall be made in a workmanlike manner and as directed by the Contracting Officer.

3.14 STONE REVETMENT, STONEFILL DIKES, STONEROOTS, AND JUNCTIONS

3.14.1 Excavation and Grading

Where required for bank protection, the existing ground at the proposed structures shall be excavated and graded to provide a foundation for the complete placement of stone. Excavation and grading shall be in accordance with Section 31 00 00 EARTHWORK.

3.14.2 Construction Method

The stonefill revetment and dikes shall be constructed of [Graded Stone "A" "B" "C"] to the lines, grades, and sections shown or as noted on the drawings. Construction of the stonefill revetments and stonefill dikes shall commence at the upstream end and continue progressively to the downstream end. The initial work shall consist of a stone blanket approximately 600 mm 2 feet thick and extending over the full width and length of the revetment or dike. If stone is placed by land based equipment, this stone blanket is not required. The remaining stone required to complete the underwater portion of the revetment or dike shall be placed from the shoreward to the riverward end of the revetment or dike in approximately uniform layers not exceeding 1.5 m 5 feet in thickness and extending over the full width and length of the revetment or dike. The portion of the revetment or dike above the water may be placed in one lift.

3.14.3 Placement

The stone shall be placed in the revetment and dikes by skip or clamshell, cast off barges by hand or machine, or by other methods approved by the Contracting Officer. The larger stone shall be well distributed throughout the mass, and the finished revetment or dike shall be free from pockets of small stone and clusters of larger stone. A tolerance of plus or minus 300 mm 1 foot will be allowed on the prescribed crown elevation and width. The
side slopes shall be determined by the natural angle of repose of the stone, varying from 1V on 1.25H to 1V on 2H.

3.14.4 Stoneroots

The stoneroots shall consist of [Graded Stone "A"] ["B"] ["C"] [_____] -kg -pound stone][[_____] -kg -pound riprap] placed in the excavated trench as specified in paragraph PLACEMENT and as shown on the drawings.

3.14.5 Junctions

The junctions shall consist of [Graded Stone ["A"] ["B"] ["C"] [_____] -kg -pound stone][[_____] -kg -pound riprap]. The 60 m 200 feet trenchfill revetment wraparound portion of the junction shall consist of Graded Stone "B" and measurement and payment shall be as specified in paragraph UNIT PRICES. Placement of Graded Stone "B" shall be as specified in paragraph PLACEMENT and shown on the drawings.

3.15 CAPOUT AND REINFORCEMENT

The work covered by this section consists of furnishing all plant, labor and stone, and performing all work necessary in placing the stone for the revetments and dikes capouts, and reinforcement, complete, all as specified herein and shown on the drawings. Stone shall be Graded Stone "B" and shall conform to the requirements specified.

3.15.1 Debris Removal

Debris shall be removed from the structures to allow for the placement of the stone in the capout and reinforcement. The Contracting Officer will determine the location and amount of debris to be removed. There will be no measurement and payment for the debris removal and all costs will be considered incidental to the contract. The debris shall be disposed of landward of the existing structures so as not to interfere with placement of capouts and reinforcement.

3.15.2 Construction Method

The capouts and reinforcement shall be constructed of Graded Stone "B" at the lines, grades and sections shown or as noted on the drawings. Construction shall commence at the upstream end of each structure or portion thereof and continue progressively to the downstream end. The stone required to complete the underwater portion of the capouts and reinforcement shall be placed from the upstream to the downstream end of the revetments and landward end to the riverward end of the dikes in approximately uniform layers not exceeding [1.5][_____] m [5][_____] feet in thickness and extending over the full width and length of the revetment. That portion of the revetments or dikes above the water may be placed in one lift. Where reinforcement is required to be placed below the water surface, the stone shall be dropped from barges or placed by other approved methods to provide a close compact paving with a required thickness of [600][_____] mm [2][_____] feet. Ensure that the stone placement methods for placement of stone between Structural Azimuth Line (SAL) stations [_____] to [_____] will not result in damages to the "sensitive historic site." Prior to the start of work submit, for approval, the proposed method or methods for placing stone underwater.
3.15.3 Placement

The stone shall be placed in the capouts and reinforcement by skip, clamshell, cast off barges by hand or machine, or by other methods approved by the Contracting Officer. The larger stone shall be well distributed throughout the mass and the finished revetment shall be free from pockets of small stone and clusters of larger stone. A tolerance of plus or minus [150][_____] mm [6][_____] inches will be allowed for reinforcement and a tolerance of plus or minus [300][_____] mm [1][_____] foot will be allowed for capouts on the prescribed crown elevation and width provided the area of the finished section is not less than the area of the theoretical section. The allowable tolerances from the prescribed theoretical cross section shall not be continuous for more than [60][_____] m [200][_____] linear foot of revetment and/or dike. There shall be no abrupt changes in the revetment and/or dike crown widths and elevations. The side slopes shall be determined by the natural angle of repose of the stone, varying from 1V on 1.25H to 1V on 2H.

3.16 STONE DIKE

3.16.1 Dike Stone Placement

The dikes shall be constructed to the elevations, cross sections, and minimum thicknesses and within the limits shown on the contract drawings. Side slopes shall be determined by the angle of repose of the stone, approximately 1V on 1.25H. The dikes shall be constructed of Graded Stone "A" as specified in paragraph GRADED STONE "A". Stone shall be placed in the dikes in such a manner as to produce a well-graded mass of stone with the minimum practicable percentage of voids. A tolerance of 300 mm 1 foot will be allowed in the specified elevation, and 300 mm 1 foot under and 600 mm 2 feet over in the specified crown width provided these variations are gradual over a minimum distance of 30 m 100 feet measured along the dikes centerlines. The stone may be placed by either backhoe or dragline equipped with rock bucket; by [either bulldozer or ]front-end loader or bulldozer, except when placing the base blanket subaqueously; and by trucks and other methods, if approved by the Contracting Officer. Additional stone shall be added if either soundings or sections indicate such to be necessary. The large stones shall be well distributed throughout the mass and the finished dikes shall be free from pockets of small stones and clusters of large stones. Bulldozing stone into excavated trenches will not be permitted. Subaqueous placement of stone will not be permitted at river stage limitations as specified in [Section [_____] [_____] paragraph [RIVER STAGE LIMITATIONS], without prior approval, in writing, by the Contracting Officer or at any river stage when site and current conditions prevail which, in the opinion of the Contracting Officer, make construction operations either impractical or uneconomical.

3.16.2 Placement Control

Furnish, operate, maintain necessary equipment, and furnish all necessary material and supplies while maintaining control of the placement of stone in the dikes. At all times when stone placement from floating plant is underway, the means by which the Contractor positions the plant, equipment, and stone supply barges must function accurately and consistently. The plant and equipment shall have a dragline or backhoe capable of being mobile on the spud barge and the flexibility to perform stone placement by the drag-off method. The kick-off method for stone placement shall not be used unless approved by the Contracting Officer. Whatever the method employed, it must readily permit the Contractor and the Government
inspector to determine the exact position of the stone-placing operation. Do not not place anchors for the purpose of holding floating plant in place over existing or partially completed dikes.

3.16.2.1 Alignment Control

The method of alignment control shall be either a manned transit or laser or either colored or polarized light beams, or any other method demonstrated to be practicable and sufficiently precise and reliable as approved by the Contracting Officer.

3.16.2.2 Distance Control

The method of distance control for floating plant engaged in the subaqueous placement of stone shall be either wire distance wheel or another equally accurate measuring device as approved by the Contracting Officer.

3.16.2.3 Depth Finder

An electronic recording depth finder, approved by the Contracting Officer, in writing, shall be provided during the construction of the dikes. The depth finder shall have a recording scroll not less than 150 mm 6 inches wide with a scale of not more than 3 m of depth to 25 mm 10 feet of depth to the inch. The depth finder shall be capable of obtaining accurate profiles and cross-sections during construction of the dikes and shall be used to monitor anticipated and actual scour and as an aid in the control of stone placement. Furnish and maintain an adequate stock of recording paper for the depth finder.

3.16.2.4 Nonpermitted Devices

The use of buoys and piles of stone placed above the water surface as placement control devices will not be permitted. The use of bank targets for alignment control will not be permitted for work distances of more than 120 m 400 feet without prior approval, in writing, by the Contracting Officer.

3.16.2.5 Skiff or Boat

Furnish an aluminum skiff or boat with a minimum length of 5.5 m 18 feet and equipped with a 38 kW 50 hp outboard motor.

3.16.3 Longitudinal Stone Dike Placement

**************************************************************************
NOTE: For use with stone under 180 kg 400 pounds top size.
**************************************************************************

The stone shall be placed in the longitudinal peaked stone dikes, stone tiebacks and transverse stone dikes by skip, grapple, hand, or other approved method, in such a manner as to produce a well graded mass or stone with the minimum practicable percentage of voids. Stone shall not be dropped from a height greater than 900 mm 3 feet. A variation of 300 mm 1 foot above or 150 mm 6 inches below the specified deviation and 150 mm 6 inches under or 300 mm 1 foot over the specified crown width will be allowed provided these variations are gradual over a minimum distance of 3 m 10 feet measured along the dike's centerline. Bulldozing stone into excavated trenches will not be permitted. Stone delivered on-site shall be
3.17 CORRECTIVE EARTHWORK

3.17.1 Grading

Grading shall consist of the sloping of bluff banks damaged by failures in the bank paving and the preparation of the subgrade for placement of new paving; reshaping of damaged drains and constructing new drains; reshaping of overbank areas; and any incidental work as may be required in the prosecution of the work. Most of the grading will be in areas where mechanical equipment can be used, but some hand grading will be required. Material resulting from grading operations, including broken pavement, if any, shall be used for making fills where required, including the restoration of deficient slopes. All grading and filling shall be done to the lines and grades as staked in the field or as specified. Material used in making fills or restoring the subgrade shall be free from roots, brush or other debris; and shall be placed in layers not to exceed 300 mm 1 foot in thickness. Each layer shall be thoroughly compacted to a density at least equal to that of the adjacent undisturbed earth. Excess material [may be wasted in the river or ]shall be spread on the slope adjacent to the area of repair.

3.17.2 Excavation

Excavation shall be required in some failures where protrusion of stone above adjacent surface is objectionable. Where excavation is specified, the subgrades shall be excavated 250 to 300 mm 10 to 12 inches below the surface of the adjacent paving. Large areas may not require excavating throughout, but excavation to the depths specified above will be required only for a distance of 1.5 m 5 feet inside the perimeter of the failure. Most of the excavation can be accomplished by mechanical means, but some hand work around the edges will be required. All work shall be to the lines and grades as staked in the field or as specified. Material resulting from the operation shall be used for making fills where required as specified in paragraph GRADING. Excess material may be wasted in the river or spread on the adjacent slopes.

3.18 BREAKING OUT PAVEMENT

The work consists of the breaking out of concrete or asphalt pavement in damaged or undermined areas of pavement. The concrete pavement is approximately [100][_____] mm [4][_____] inches in thickness, and the asphalt pavement is approximately [125][_____] mm [5][_____] inches in thickness. The area of pavement to be broken out will be marked by the Contracting Officer prior to the start of work. Any additional areas to be broken out adjacent thereto will be marked as required as the work progresses. Any pavement outside the limits marked to be broken out that is damaged by the Contractor's operations shall be repaired by the Contractor with no additional payment. The breaking out may be done by any method which will accomplish the results desired and will not damage paving outside the limits marked.[ Blasting will not be permitted.]

3.18.1 Concrete Breakout

Damaged or undetermined monolithic,articulated or slab concrete shall be broken into pieces not exceeding 450 mm 18 inches in any dimension. The pieces shall be left on the subgrade where broken. In areas where grading may be required, the concrete shall be broken out to the extent necessary.
to permit grading the bank to slopes suitable for paving and the broken concrete used in making fills adjacent to the breakout.

3.18.2 Asphalt Breakout

Generally, asphalt breakout will be limited to areas requiring grading of the bank to slopes suitable for paving. The broken asphalt shall be used to the extent possible in making fills adjacent to the breakout. When broken asphalt is used in making fills, the pieces shall not exceed 450 mm (18 inches) in any dimension. The broken asphalt that is not used for fill shall be spread out sufficiently to avoid abrupt humps on the adjacent paving. In areas where asphalt is damaged and grading of bank is not required, stone may be placed on top of the broken or damaged asphalt to the extent necessary to cover the damaged area.

3.18.3 Removal of Drift and Clearing

Accumulations of drift shall be removed from the areas to be repaired. Clearing will not generally be necessary; however, any trees, stumps or brush in the areas where repair work is prescribed shall be cut off flush with the ground or to an elevation 300 mm (1 foot) below the top of the fill, and removed from the area. The debris shall be disposed of as specified in [Section 01 74 19 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL] and [Section 31 11 00 CLEARING AND GRUBBING].

3.18.4 Preparation of Subgrade

In areas where grading or excavation is required, the subgrade shall be dressed to a uniform surface suitable for paving. In other areas where crushed stone or [riprap] (stone) is specified, the subgrade shall be dressed as necessary to provide an even surface for paving or to provide for a suitable tie to the existing paving.

3.19 STONE WORK

Bedding stone, [_____] -kg -pound [riprap] [stone], and/or [Graded Stone "A"],["B"],["C"] shall be used to repair failure areas in existing paving or to protect the upstream, downstream, and landward areas adjacent to an existing paved bank; for constructing or repairing drains; for making stone fills, both above and below the water surface; and for constructing overbank spurs. Stone shall be placed on the bank or overbank area by crane or dragline equipped with skip, grapple, clamshell, or rock bucket; by front-end loader [or bulldozer]; or by trucks or other methods approved by the Contracting Officer. Unless otherwise approved by the Contracting Officer, the maximum capacity of dragline buckets used to place [riprap] (stone) paving on the bank will be limited to 2.3 cubic meters (3 cubic yards).

3.19.1 Placement

It is contemplated that the quantities required will be in increments of a barge load of approximately [_____] [1000] tons (metric) [_____] [1,000] tons for placement at a single revetment. When less than [_____] [10 000] tons (metric) [_____] [10,000] tons of [Graded Stone "A"],["B"],["C"] [_____] is specified at a single revetment, the stone shall be considered "Graded Stone "A", Small Repairs" for payment purposes. When [_____][10 000] tons (metric) [_____][10,000] tons or more of Graded Stone "A" is specified at a single revetment, the stone shall be considered "Graded Stone ["A"],["B"],["C"] [_____], Large Repairs" for payment purposes.
3.19.1.1 Bedding Material

Bedding stone may be required for use under [riprap] [stone] paving or to fill scoured areas or depressions in the subgrade, or as a blanket in the construction or repair of drains. Bedding stone is normally placed [100][_____] mm [4][_____] inches in thickness above the water surface, [150][_____] mm [6][_____] inches in drains and in the amount of 1.8 t per square (9.3 m²) [two][_____] T per square (100 square feet) when placed below the water surface. Placement above the water shall be to the lines and grade specified or as staked in the field; below the water surface, in the amount specified or as directed at the time of placing.

3.19.1.2 [Riprap] [Stone] Paving

**************************************************************************
NOTE: For determining the placement rate for under water placement, see notes at paragraph PLACEMENT OF RIPRAP, subparagraph [UNDER WATER].
**************************************************************************

[Riprap][Stone] of the specified maximum size shall be placed on the dry slope or overbank areas and rearranged by hand as necessary to provide complete coverage of the specified area with an average thickness of [250][_____] mm for [57][_____]-kg [10][_____] inches for [125][_____]-pound [riprap][stone]. A tolerance of 50 mm 2 inches above or below the average thickness will be allowed. Openings between stones exposing more than 2600 mm² 4 square inches of the graded slope will not be allowed. Spalls and quarry chips may be used as a base but not as a filler. In underwater placement, the stone shall be uniformly distributed at the rate of [_____] [7.3] tons per square [_____] [8] tons per square unless another rate is shown or specified. [Riprap] [Stone] may be required for use in constructing stone fills and making other repairs to revetments. [It is contemplated that the quantities of [_____] -kg -pound [riprap][stone] required will be in increments of a barge load of approximately 1000 tons for placement at one or more nearby locations.]

3.19.1.3 Overbank Paving

[Riprap] [Stone] paving may be required to repair scour damage behind top bank. Overbank paving will generally consist of a blanket of stone 250 mm 10 inches thick and up to 15 m 50 feet wide placed behind the top bank or landward of the existing paving. Overbank paving shall be placed in accordance with paragraph [RIPRAP] [Stone] PAVING above or as specified.

3.19.1.4 Stone Fills

Stone fills may be required to be constructed of [_____] -kg -pound [riprap][stone] or Graded Stone ["A"] ["B"] ["C"] as specified. Stone fills specified above the water surface shall be placed to the lines and grades specified or as staked in the field. Where specified below the water surface, the material may be placed by any method elected by the Contractor, subject to approval by the Contracting Officer. The location of the fill and the quantities to be placed at each underwater location shall be as specified or as directed at the time of placing.

3.19.1.5 Overbank Stone Spurs

In the repair or prevention of overbank scour, [riprap][stone] shall be required to construct or repair spurs landward of the top of bank at some
locations. The spurs shall consist of stone fill with variable crown widths and side slopes, usually tying into the revetment paving and extending landward at varying angles with the top of bank. Extensions of existing overbank spurs may also be required. The height of stone spurs will usually be from 900 to 1800 mm (3 to 6 feet), with maximum heights depending upon the depth of overbank scour. Generally, work will not extend beyond 90 m (300 feet) landward of the top of the bank, but conditions at some locations may require construction beyond this limit. The location, alignment, and dimensions of the overbank spurs shall be as shown or as directed. [Riprap] [Stone] that can be placed entirely by the floating plant will not be considered Overbank Stone Spur.

3.19.1.6 Stone Landward of an Obstruction

Occasionally in the repair of a revetment, stone must be placed on the revetment slope behind or landward of a structure which prevents placement of stone by a barge-mounted dragline or at a revetment location which, in the opinion of the Contracting Officer, is inaccessible by floating plant for other reasons. These repairs may be accomplished by hauling or other means approved by the Contracting Officer.

3.20 SLOPE DRESSING AND [RIPRAP] [STONE] PAVING

3.20.1 Slope Dressing

The work consist of furnishing all plant, labor and materials and performing all work in strict accordance with these specifications, schedules and drawings for construction of [riprap] [stone] paving on the [river banks] [banks of the [_____] River between [_____] and [_____]]. The work shall be performed at several localities which will be selected after the award of the contract and will be designated in the jobsite specifications and "Before Construction" drawings to be issued pursuant to paragraph [_____], Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [_____]. Perform the work regardless of the number of localities involved. Work may not be required under these specifications at all localities at which mattress sinking operations will be performed; however, work may be required at locations where articulated concrete mattress is not required. The work to be performed normally includes the final preparation of the slopes and procuring and placing the [riprap] [stone] on the graded bank. At some locations, underwater and/or overbank paving may be required. Such locations will be specified in the jobsite specifications or indicated on the "Before Construction" drawings. The Government reserves the right to accomplish all or any portion of the work at any location by other means.

3.20.1.1 General

The bank will be graded, including finish grading, by others. However, preparatory to placing the paving, dress the slope to eliminate any irregularities, including irregularities in the bedding material placed by others, due to rain or wave wash or operations of the Contractor’s equipment. Irregularities in the ungraveled slope shall be filled with layers of earth not greater than 300 mm (1 foot) in uncompacted thickness and firmly compacted into place. If directed by the Contracting Officer, irregularities in graveled areas shall be filled with stone, and payment will be made at the applicable contract unit price for "[Riprap] [Stone] Paving" for stone so placed. Earth fill material shall be acquired from adjacent areas within the limits of the right-of-way. Redress and/or clean out any landside drainage ditch damaged by the operations.
3.20.1.2 Regrading

Any regrading necessitated by slides in the bank occurring before or during construction of the bank paving will be done by others and will in no way be the responsibility of the Contractor except that evidence of such slides should be reported promptly to the Contracting Officer and no paving shall be placed on such a disturbed area until the slide has been graded out or otherwise corrected.

3.20.1.3 Repairs

Repair, with no additional payment, any damage to the graded bank or strip paving caused by failure to place paving at the rate required by paragraph [_____] of Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [______]. If strip paving is ordered by the Contracting Officer due to reasons beyond the control of the Contractor and the graded bank or strip paving is damaged by rain wash or overtopping, make the repairs as ordered by the Contracting Officer and an adjustment in the contract price and time of performance as appropriate for that portion of the work will be made in accordance with the Contract Clause, CHANGES.

3.20.2 [Riprap] [Stone] Paving

3.20.2.1 General

[Riprap] [Stone] upper bank paving shall consist of a course of stone with an average thickness of 250 mm 10 inches, measured normal to the slope, except where other thickness is specified or indicated on the drawings. The paving shall cover the surface of the bank between the limits of work as shown on the jobsite plans or surface of the bank between the limits of work as shown on the jobsite plans or as determined by the Quality Assurance Representative in the field. The landward limit of [riprap] [stone] paving may include an overbank strip not exceeding a distance of 15 m 50 feet landward of the top of the bank. The bank to be paved will have been graded by others to a slope that will vary from approximately 1V on 3H to 1V on 5H and any overbank area to be paved will have been dressed by others to a surface suitable for paving. In general, the width of the paving will vary between approximately 15 m 50 feet and 60 m 200 feet slope measurement.

3.20.2.2 Strip Paving

When directed by the Contracting Officer, pave the bank in strips parallel to the water's edge. It is anticipated that strip paving will be required whenever there is more than 600 m 2,000 linear feet of unpaved bank available to the Contractor for paving or whenever rising river stages threaten overtopping of the inshore limit of mattress within that area. In areas where an articulated concrete mattress has been placed, strip paving shall consist of placing [riprap] [stone] paving in a strip along and parallel to the inshore edge of mattress. Unless otherwise authorized or directed, the strip paving shall be 9 m 30 feet wide except it shall include complete paving of drains within the area. At locations requiring only stone paving, the underwater paving shall be placed along with a strip 9 m 30 feet wide above and parallel to the water's edge and shall include paving of drains. Once strip paving operations are directed, this method of paving shall continue as long as required by the Contracting officer, and shall be conducted at such locations and in such order of precedence as he requires in order to protect the interest of the Government. If strip
paving operations and moving, as required by the Contracting Officer to be performed the most essential work, prevent the Contractor from maintaining the required production rate, an equitable adjustment in contract time will be allowed upon written request and justification. Additional towing required to move between jobs as prioritized by the Contracting Officer and to return to unfinished jobs to complete them will be paid for as provided in Section 01 35 13 [SPECIAL CONTRACT REQUIREMENTS] [____], paragraph [PAYMENT FOR EXCESS TOWING] [____].

3.20.2.3 Underwater Paving

Where specified in the jobsite specifications or indicated on the "Before Construction" drawings, underwater [riprap] [stone] paving shall be placed on subaqueous areas not covered by articulated concrete mattress. The underwater [riprap] [stone] paving shall be uniformly distributed over the area to be paved in the amount of 7.3 tons per square (9.3 m²) 8 tons per square (100 square feet) or such other amount as indicated in the jobsite specifications.

3.20.2.4 Placement

The stone shall be placed on the graded slopes by crane or dragline equipped with skip, grapple, clamshell, or rock bucket or by other method approved by the Contracting Officer and rearranged by use of a trackhoe or by hand as necessary to provide complete coverage of the banks to the specified average thickness. If the entire upper bank cannot be paved from floating plant and stone is windrowed on the upper slope, the windrowed stone shall be spread to the prescribed thickness by pulling the stone up the slope with a trackhoe or by other approved methods. In no case shall the stone be pulled or bulldozed down the slope. A tolerance of 50 mm 2 inches above and below the specified average thickness will be allowed. Openings between stones exposing more than 2600 mm² 4 square inches of the graded slope or gravel blanket will not be permitted. In underwater placement, the stone shall be uniformly distributed in the amount specified. [Riprap] [Stone] placed underwater shall be controlled to the extent necessary to provide coverage as indicated on the "Before Construction" drawings and/or to assure a connection between articulated concrete mattress and [riprap] [stone] paving placed above water.

3.20.2.5 Connections

Connections between [riprap] [stone] upper bank paving and concrete mattress or paving shall be made as detailed on the drawings. Any stone placed or spilled onto the concrete mattress shall be removed and placed by hand into the paving and mattress connection area. The thickness of stone in the connection shall be not less than 450 mm 18 inches at a point 1200 mm 4 feet from the concrete mattress or paving, and shall taper to an average thickness of 250 mm 10 inches at the edge of the mattress and at a point 1800 mm 6 feet from the mattress or paving, unless other thickness is specified. At the connection between [riprap] [stone] paving and existing asphalt paving, the thickness of the [riprap] [stone] paving shall be increased to 250 mm 18 inches in a strip approximately 1200 mm 4 feet in width along the connection of the [riprap] [stone] and existing asphalt paving.

3.20.2.6 Bedding Material

Bedding material approximately [100] [____] mm [4] [____] inches thick will have been placed by others at most locations from approximately the
[_____] contour to the [_____] contour. Exercise reasonable care in placing [riprap] [stone] so that the bedding material will not be damaged.

3.20.2.7 Exposed Flanks

When the bank paving ends with a flank or flanks not connected with existing work, the Contracting Officer may direct that the last 18 m 60 linear feet be paved with [riprap] [stone] averaging 500 mm 20 inches in thickness from a point 1200 mm 4 feet landward of the articulated concrete mattress to the landward limit of the paving.

3.20.2.8 Ditch Outlets

The bottom and side slopes of drainage ditches shall be paved for a distance of 3 to 8 m 10 to 25 feet landward of the top bank as specified in [the Supplementary Specifications] [_____] or in the jobsite specifications).

3.21 DIKE REPAIRS

The work requires grading and paving areas of damaged dike bankheads, placing stone fill in areas of dikes where damage has occurred, and performing other stone repairs necessary to maintain integrity of the dike field. Except as provided below, work will be required only on portions of dike fields which are accessible by floating plant. Jobsite work orders will be issued for each dike field where work is required, setting forth the details and limits of work. It is anticipated that at some locations where dike field repairs are specified, the site may be inaccessible to floating plant, and hauling of stone may be necessary to restore the integrity of the dike field or to extend a dike landward. In such cases, [except for work at [_____] ] the Contractor will be given the option of performing work at the applicable contract unit prices or omitting the work. However, should the Contractor agree to do the work, the entire work specified at that location must be satisfactorily completed. The Contractor will be furnished a jobsite work order with details as necessary to perform the work. After a review of the jobsite work order and an inspection of the site, notify the Contracting Officer, in writing, whether the work will be performed at the contract unit price or omitted from the job. It is anticipated that the length of a landward dike extension will not exceed [150] [_____] m [500] [_____] feet. Grading and dressing of the bank and excavation may be required. The type of stone required may be [57] [_____] kg [125] [_____] pounds [riprap] [stone], or Graded Stone ["A"] ["B"] ["C"]. The placing of any of the above types of stone may include placing fill in a dike, bank paving and the filling of key trench. Where the Contractor agrees to perform stone dike repair work, which is inaccessible by floating plant and must be hauled, additional compensation for the tonnage hauled will be made at the applicable contract unit price for "Stone Placement Premium".

3.21.1 Tolerances

The following tolerances will be allowed in the specified repairs, provided the extremes do not occur adjacent to each other.

a. Surface Elevations

(1) [Upstream [_____] m feet of dike crown - zero to minus 300 mm 1 foot] [_____].
(2) [Downstream 2700 mm 9 feet of crown and apron -plus or minus 150 mm 6 inches] 56.

b. Crown line (each side) -150 mm 6 inches inside to 300 mm 1 foot outside.

c. Slopes - plus or minus 300 mm 1 foot.

3.21.2 Earthwork

3.21.2.1 Grading

The bank shall be graded or filled with material available from grading to the slopes indicated in the jobsite work order and as staked in the field. Slopes shall be not steeper than 1V on 3H except that steeper slopes may be authorized in making connection with existing paving. The grade of the slope shall conform to the prescribed grade within the limits of plus or minus 300 mm 1 foot. When less than 7600 m$^3$ 10,000 cubic yards is specified in the jobsite work order for a single dike field, the grading shall be considered "Earthwork, Small Repairs" for payment purposes. When 7600 m$^3$ 10,000 cubic yards or more of grading is specified in the jobsite work order for a single dike field, the grading shall be considered "Earthwork, Large Repairs" for payment purposes.

3.21.2.2 Key Trench

A key trench may be required along the downstream limit of the [riprap] [stone] paving or at other locations on the bankhead. Unless otherwise specified or directed, the key trench shall extend from top of bank to waters edge, have a bottom width of 3 m 10 feet and side slopes of 1V on 1H. The bottom grade shall be 1.5 m 5 feet below the prescribed grade of [riprap] [stone] paving.

3.21.2.3 Disposal of Material

Material from grading in excess of that used as fill shall be disposed of by depositing riverward of the top of bank upstream or downstream from the limits of the repair work.

3.21.2.4 Stone Work

a. Stone quality and size shall be as specified.

b. Where [riprap] [stone] is required in dike repairs, the size shall be [57][_____]-kg [125][_____]-pound [riprap][stone], as specified in the jobsite work orders. It is contemplated that the quantities of [riprap] [stone] specified will be in increments of a barge load of approximately 1000 tons for placement at one or more nearby dike and revetment locations.

(1) [Riprap] [Stone] Paving - Unless otherwise specified, [riprap] [stone] paving shall consist of a course of graded stone with an average thickness of 300 mm 12 inches measured normal to the slope. Where paving is placed under water, the amounts required shall be 7.3 tons 8 tons per square unless otherwise shown in the jobsite work order or directed. Placing of stone shall follow grading and excavation as soon as practicable. Preparatory to placing the [riprap] [stone] paving, dress the slope to eliminate any irregularities due to wave or rain wash, or operation of the Contractor's equipment. The stone shall be placed by crane or
dragline equipped with skip, clamshell, or rock bucket; by frontend loader or bulldozer; or by trucks or other methods approved by the Contracting Officer and rearanged by hand as necessary to provide complete coverage of the bank to the specified average thickness. A tolerance of 20 percent above or below the specified average thickness will be allowed. Openings between stones exposing more than 2600 mm\(^2\) 4 square inches of the graded slope will not be permitted. In underwater placement, the stone shall be uniformly distributed in the amount specified.

(2) Stone-Filled Key Trench - The excavated key trench shall be filled to the elevation of adjacent [riprap] [stone] with stone of the specified size to provide a thickness of 1.5 m 5 feet with a tolerance of 300 mm 1 foot. Bulldozing stone into the excavated trenches will not be permitted.

(3) [Riprap] [Stone] Fill - Eroded areas of stone dikes shall be restored and minor gaps filled with [riprap] [stone] of the specified size. The stone fill shall be placed to the elevations and sections of adjacent portions of the dike or in accordance with the jobsite work orders or as directed by the Contracting Officer. The underwater portion of the repairs shall be accomplished in uniform horizontal layers of about 1.5 m 5 feet thickness. Each lift shall be carried the entire length of the dike repairs. Generally a 1800 mm 6 feet crown width with slopes of angle of repose (approximately 1V on 1\(\frac{1}{4}\)H) will be required. A tolerance of plus or minus 300 mm 1 foot will be allowed in the specified elevation and crown width. The stone shall be placed by a crane or dragline equipped with a skip, grapple, clamshell, or rock bucket; by frontend loader or bulldozer; or by trucks or other equipment approved by the Contracting Officer. Placing of stone along the dike will not be permitted when river stages are above the top of dike without prior approval of the Contracting Officer or at any river stages when site and current conditions prevail which, in the opinion of the Contracting Officer, make operations impracticable or uneconomical.

3.21.2.5 Placement Control

Control placement of stone in the dikes, and furnish, operate, and maintain the necessary equipment, and all necessary material and supplies. At all times, when stone placement from floating plant is underway, the means by which the plant, equipment, and stone supply barges are positioned must function accurately and consistently. Whatever the method employed, it must permit the Contractor and the Government Quality Assurance Representative to readily determine the exact position of the stone-placing operation. Prior approval of the contracting Officer will be required in each instance before placing any stone subaqueously without the aid of any equipment listed below.

a. The method of alignment control may consist of piles or pile clumps. Other acceptable methods of alignment control include the use of a manned transit, laser, colored or polarized light beams, or other method demonstrable to be practicable and sufficiently precise and reliable.

b. Acceptable methods of distance control for floating plant engaged in subaqueous placement of stone may consist of piles or pile clumps at intervals of 90 to 120 m 300 to 400 feet. Piles or pile clumps, if
used, shall be supplemented by a wire distance wheel or other equally accurate measuring device for use in conjunction with the piles. Other acceptable methods include the use of electronic distance surveying instruments or other method demonstrable to be practicable and sufficiently precise and reliable.

c. Suitable recording electronic depth finder shall be provided at each location of work under this contract. The depth finder shall have a recording scroll not less than 100 mm 4 inches wide with a scale of not more than 3 m of depth to 25 mm 10 feet of depth to the inch. The depth finder shall be capable of obtaining accurate soundings and shall be used as an aid in the control of subaqueous stone placement. Ensure that the depth finder is in proper working order at all times and furnish and maintain an adequate stock of recording paper for the depth finder. Submit to the Contracting Officer, for approval, the manufacturer's name, model number, and/or model name of the electronic depth finder proposed for use prior to the unit being place in service.

d. The use of buoys as placement control devices will not be permitted. The use of bank targets for alignment control will not be permitted for working distance of more than 1200 mm 400 feet without prior approval of the Contracting Officer.

3.22 PLACEMENT OF SHORELINE PROTECTION

3.22.1 Debris

Any timbers, unsatisfactory material and debris within the reaches for construction shall be removed except as otherwise directed by the Contracting Officer, and upon removal shall become the property of the Contractor. All materials shall be properly disposed of in accordance with the requirements of Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS, including any applicable local requirements.

3.22.2 Limitations of Placement Procedures

Stone construction in advance of completed permanent protection except as specified herein shall be at the Contractor's risk. Keep the Contracting Officer informed as to any and all situations that may result in a possible interruption of work.

3.22.2.1 Interruptions

If the Government can anticipate that the stone construction will be interrupted for more than [_____] [four (4)] continuous days, including weekends and holidays, the Contractor may be required to complete the placement of [_____] and [_____] stone on both sides of the breakwater and provide protection of the exposed ends prior to the start of the interruption. The above-required protection for the exposed ends of the breakwater shall consist of the same type of stone protection required on the lake side of the breakwater. All material used for protecting the exposed ends of the breakwater shall be removed after the need therefor has ended and shall be appropriately incorporated into the required permanent construction. All materials which are removed and placed in the permanent construction, in accordance with the provisions of this section, will be measured and paid for only once. When temporary protection of exposed ends of construction in progress is ordered or directed by the Contracting Officer, an equitable adjustment will be made for the work of temporarily placing and removing the stone materials. The Government has no obligation.
to order that exposed ends be protected. If the Government takes no action to have exposed ends protected, then the provisions of the paragraph MATERIAL PLACEMENT IN ADVANCE shall apply.

3.22.2.2 Material Placement in Advance

The breakwater shall not be constructed more than [_____] m feet in advance of completed placement of the [_____] and [_____] stone. If at the completion of a day's placement operations the unprotected portion (maximum [_____] m feet) is surveyed to determine the shape and grade of the materials placed, the Government will assume the responsibility for the cost to replace it (maximum [_____] m feet) if it is displaced or lost due to a storm during the nonwork period but not exceeding a continuous [_____] [four (4)] day nonwork period. In the event an unprotected section of any length unsurveyed is left during a nonwork period or is left unprotected for a period longer than four continuous days and is damaged or causes damage to a completed section, the damaged portion(s) shall be replaced or reshaped as approved by the Contracting Officer with no additional payment.

[3.22.3 Core/Mattress/Bedding Stone

Place stone to the lines, grades and thickness shown. The method used in placement shall be such that any soft and organic materials on the lake floor will be displaced outward towards the extreme outside toes of the required sections of the structure and in the direction of the construction. Stone placement shall start at the centerline of the stone structure and extend outward to the toes of the structure in a fashion whereby the line of stone advancement takes an inverted "U" shape. [Placement by self-unloading lake carriers is [not] acceptable.] Placement shall be with reasonably systematic care that segregation of particle sizes will not occur. [If the materials are placed by clam shell, dragline, or other similar equipment, the stone shall not be dropped from a height exceeding [_____] [600] mm [_____] [two] feet above the existing lake bottom or previously placed material.] [Placement with bottom dump scows will [not] be allowed.] The finished surface of the stone shall be adequately smooth and shall be free of mounds or windrows. [The finished work shall be free of clusters or small stones and cluster of larger stones.]

][3.22.4 Armor/Cover/Riprap Stone

Place stone in the locations and at the thickness shown without deviating from the lines and grade shown, including allowance for tolerances. Final shaping of the slope shall be performed concurrently with the initial placement of the stone. Stones shall be randomly selected and set in contact with each other so that the interstices between adjacent stones shall be as small as the character of the stone will permit. The face of stone having the largest area shall be placed against the surface of the underlying material. Begin placement at the bottom of the slope. The heaviest stones shall be placed as toe stones. Stones shall be placed in a manner to avoid displacing underlying materials or placing undue impact force on underlying material that would cause the breaking of stones. Unless otherwise specified, stone shall not be dropped from a height greater than [_____] [600] mm [_____] [two] feet. The equipment used in placing the stone shall be suitable for handling materials of the sizes required including the ability to place the stone over its final position before release and if necessary pick up and reposition the stone. Dragline buckets and skips shall not be used in placement. Moving stone by drifting or manipulating down the slope will not be permitted. The finished work shall be a well distributed mass, free of pockets of either smaller or
larger stone, having a minimum of voids and with the maximum of interlocking of stones. It should be anticipated that rehandling of individual stones after initial placement will be required to achieve the above requirements. Stones required to be placed over or adjacent to drains and subsurface pipes shall not be dropped, but gently lowered and placed in their final position by material handling equipment.

][3.22.5 Underlayer Stone

Place stone, to a full zone thickness, in one operation in a manner to avoid displacing the underlying material or placing undue impact force on underlying materials and supporting subsoils. The underlayer stone shall be placed in a manner to produce a resultant graded mass of stone with minimum voids. Rearranging of individual stones may be required to achieve this result. Placement by any method which is likely to cause segregation of the various sizes will not be permitted. Unsegregated stone shall be lowered in a bucket or container and placed in a systematic manner directly on the underlying material. Placement shall begin at the bottom of the slope and proceed upward. Casting or dropping of stone over [_____] [600] mm [_____] [2] feet or moving by drifting and manipulating down the slope will not be permitted. Final finish of the slope shall be performed as the material is placed.

][3.22.6 Scour/Riprap Stone

Place stone, to a full zone thickness, in one operation in a manner to avoid displacing the underlying material or placing undue impact force on underlying materials and supporting subsoils. Place the stone in a manner to produce a resultant graded mass of stone with minimum voids. Rearranging of individual stones may be required to achieve this result. Placement by any method which is likely to cause segregation of the various sizes will not be permitted. Unsegregated stone shall be lowered in a bucket or container and placed in a systematic manner directly on the underlying material. Placement shall begin at the bottom of the slope and proceed upward. Casting or dropping of stone over [_____] [300] mm [_____] [one] foot or moving by drifting or manipulating down the slope will not be permitted. Final finish of slope shall be performed as the material is placed.

][3.22.7 Fill Stone

Placement of fill stone within steel sheet pile walls shall not be done until tie-rods, wales, and connections are installed, tightened, and inspected; and the structure aligned within the required tolerances. The fill materials shall be uniformly deposited in maximum [_____] [900]-mm [_____] [3]-foot lifts and in such a manner that there will be no undue later settlement of the materials and that the structure will not be subjected to undue strains, deformations, or other damage. Responsibility for damage to the structure due to filling operations shall rest with the Contractor. The stone shall be distributed and consolidated by use of a vibratory hammer or similar vibrating hammer or similar vibrating equipment affixed to a steel beam which shall be inserted into the fill at intervals not greater than [_____] [1.5] m [_____] [5] feet. The vibratory operations shall be continued until there is no visual continuation of settlement. Other distribution or consolidation methods may be used when approved by the Contracting Officer. Stone above water shall be compacted to [_____] [ninety percent (90 percent) of maximum density obtained at optimum moisture content as determined by the Contractor in accordance with [EM 1110-2-1906] [______]]. Perform at least [_____] [one (1)] compaction...
test for each [_____] metric ton ton of material placed.

3.22.8 Splash Stone

Place stone to the lines and grades shown and in a manner that will avoid tearing the underlying geotextile.

3.22.9 Fitted Cap Stone

Place the fitted cap stone upon the geotextile covering the fill stone within the limits of the steel sheet pile structure to the lines and grades shown. The stones used shall be of assorted sizes and shall be placed to tightly fit against each other in the space bounded by the perimeter [_____] [concrete sidewalk]. Individual stones of the maximum size which will fill a given space shall be used to fill spaces between larger stones to minimize the size of spaces to be filled by chinking. The flattest face of each stone shall be the top surface of the placed stone. Following placement of the cap stones, the remaining spaces between individual stones shall be filled with pieces of smaller stone obtained from the required [underlayer] stone gradation materials being supplied for this contract. The spaces between cap stones shall be filled with selected stones of the maximum size which will fit in each remaining space. At the elevation of the upper horizontal surface of the cap stones, the stones used for chinking shall be placed with their elongated dimension in a vertical direction and forced into place in the spaces between cap stone spaces such that they become firmly wedged in place.

3.22.10 Slides

In the event of the sliding or failure of any part of the structure during its construction, or after its completion, but prior to its acceptance, [upon written order of the Contracting Officer,] cut out and remove the slide from the structure and then rebuild that portion of the structure with new materials or reuse the displaced materials for rebuilding if deemed appropriate. The Contracting Officer shall determine the nature and cause of the slide. In case the slide is caused through fault of the Contractor, the foregoing operations shall be performed without cost to the Government.

3.23 TESTS AND INSPECTIONS

3.23.1 Concrete Grout

3.23.1.1 General

**************************************************************************
NOTE: Select the first bracketed option if ACI International references are cited in the project specification; select and verify the correctness of the second bracketed option if ACI International references are not cited in the project specifications.
**************************************************************************

Individuals who sample and test grout as required by this section shall have demonstrated a knowledge and ability to perform the necessary test procedures equivalent to ACI minimum guidelines for certification of Concrete Transportation Construction Inspector or ACI Concrete Construction Inspector Level II, obtainable from [the address and telephone number for...
3.23.1.2 Preparations for Placing

Riprap shall be inspected in sufficient time, prior to each grout placement, in order to certify that it is ready to receive the grout.

3.23.1.3 Air Content

Air Content shall be checked at least [once] [twice] during each shift that grout is placed. Samples shall be obtained in accordance with ASTM C172/C172M and tested in accordance with ASTM C231/C231M. Whenever a test result is outside the specification limits, the grout shall not be delivered to the area to be grouted and an adjustment shall be made to the air-entrainment admixture.

3.23.1.4 Slump

Slump shall be checked [once][twice] during each shift that concrete grout is produced. Samples shall be obtained in accordance with ASTM C172/C172M and tested in accordance with ASTM C143/C143M.

3.23.1.5 Placing

The placing foreman shall not permit placing to begin until he has verified that adequate equipment and workmen are available.

3.23.2 Pre-Production

3.23.2.1 Bulk Specific Gravity

Submit, at least [120] [_____] calendar days in advance of shipment of stone to the work site, a copy of bulk specific gravity test results for each gradation range of stone proposed to be furnished. The information shall be furnished prior to preparation of pre-production demonstration stockpiles.Quantity determinations are contingent upon the range of bulk specific gravity (saturated surface dry (SSD) basis) of stone to be supplied. Therefore, during the process of selecting a source or sources of stone for the project, make an investigation to determine the lowest and highest bulk specific gravity (SSD) of stone available at the source or sources proposed to be utilized for each gradation range of stone. Tests shall be performed at a Government approved testing laboratory in accordance with [____:]. The testing results shall be submitted in accordance with paragraph SUBMITTALS. Test results which display an extraordinarily wide range of values may necessitate additional testing to determine whether the source contains strata with stones of an acceptable range of bulk specific gravity. For Category I sources which have been acceptably tested not more than two years earlier, and the material is of an acceptable quality and bulk specific gravity, the Contracting Officer may waive the requirement for bulk specific gravity testing.

3.23.2.2 Material Quality

Before selecting a source for preparation of a demonstration stockpile, be reasonably certain that the source is capable of meeting the quality and source requirements specified in paragraphs SOURCES and EVALUATION TESTING.
3.23.2.3 Borderline Material Quality

If the COR's evaluation of a demonstration stockpile results in not being able to determine by visual examination whether the material is acceptable or unacceptable, the COR will select at least one but not more than three representative stones from the demonstration stockpile to be prepared for shipment to the Government's laboratory for testing in accordance with paragraph EVALUATION TESTING OF STONE. Where specified sizes are in excess of 900 kg 2,000 pounds, cut or break a representative piece, weighing approximately 900 kg 2,000 pounds each, off of the selected stones. For specified stone sizes of less than 900 kg 2,000 pounds but more than 230 kg 500 pounds, individual samples shall be the size of the largest stone specified for the size range. Samples of stone groupings with a maximum size less than 230 kg 500 pounds shall contain at least two (2) stones representative of the higher limit of the stone weights specified. In addition, the sample shall be representative of the gradation specified and the minimum weight of the total sample shall be not less than 230 kg 500 pounds. The sampling and testing procedures shall be repeated for each strata being quarried. Ship the samples to the laboratory as specified in paragraph EVALUATION TESTING OF STONE. If the laboratory testing reveals the materials are unacceptable, submit a replacement source for approval and proceed with the demonstration stockpile procedures anew.

3.23.2.4 Demonstration Stockpile at Source

Following submittal of the Contractor's Quality Control (CQC) Plan and selection of a source, but prior to the Government's approval of a source and the CQC Plan, make arrangements to provide a pre-production demonstration stockpile for each of the stone size ranges for the project. The stockpiles shall be located at the source of the stone and be shaped in windrow fashion. The stones with a size range greater than [_____] [2.7] tons [_____] [3] tons shall be placed in a single layer with [_____] [300] mm [_____] [1] foot of clear space around each stone. Stones under [_____] [2.7] tons [_____] [3] tons in weight shall not be stacked higher than [_____] [1200] mm [_____] [4] feet. The stones placed in the demonstration stockpiles shall be representative of the overall quality of materials in the source and shall not consist of the best specimens unless it is reasonable to determine that the source will provide the required amount of stone of the applicable size range with a degree of quality no less than that existent in the demonstration stockpile. The quantity of stone in each demonstration stockpile shall be dependent upon the gradation size range to be produced for the project. The following parameters shall apply:

<table>
<thead>
<tr>
<th>SIZE OF INDIVIDUAL STONES WITHIN A RANGE</th>
<th>DEMONSTRATION STOCKPILE QUANTITY BASED ON PROJECT QUANTITY FOR SIZE RANGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
<tr>
<td>[_____]</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

The stones placed in the stockpile shall have been preselected by the
Contractor's Quality Control Plan (CQCP) inspector or supervisor and acceptable stones over 230 kg 500 pounds in size shall have been marked with spray paint on three mutually perpendicular sides with a coded mark to denote acceptability for a certain size range. A stockpile of representative reject stones marked with a red "X" shall also be maintained at the site as examples of unacceptable materials or shapes.

3.23.2.5 Evaluation of Demonstration Stockpile at Source

Notify the Contracting Officer when stockpiles are ready for evaluation. The Contractor's approved Quality Control Plan (QCP) supervisor and all QCP inspectors shall accompany the Contracting Officer's Representative (COR) during the Government's evaluation of the demonstration stockpiles. Arrange to have individual stones turned as necessary to accommodate the COR's evaluation. The COR will mark rejected stones with a red "X" and such stones shall be removed to the reject stockpile or to a crusher if one is available. If more than [___] unacceptable stones are found within a stockpile, the entire stockpile will be rejected by the Government and a replacement stockpile will be created for re-evaluation. If the replacement stockpile is rejected, revise and resubmit its Quality Control Plan (QCP) and create another replacement demonstration stockpile for evaluation. If the third demonstration stockpile for a particular size range at a single source is found unacceptable, the source will be disapproved for such size range and a new source shall be submitted for approval. In addition, submit the name and qualifications for a person to replace the QCP supervisor. The Contractor may choose a replacement source at the time a first or second demonstration stockpile is found unacceptable. The replacement of demonstration stockpiles or stone sources shall be at no additional cost to the Government and with no change in the time of completion.

3.23.2.6 Approval of Demonstration Stockpile at Source

At the time the COR finds the contents of a demonstration stockpile to be unacceptable, either through visual examination or through laboratory testing, the Contractor will be notified in writing that the source, the QCP plan and QCP staff are approved, whereupon the Contractor may proceed with production of materials for the project provided they are consistent with demonstration stockpiles.

3.23.2.7 Duration of Demonstration Stockpile at Source

Other than for being shipped as the final quantities of materials to be placed in the work, each demonstration stockpile shall remain unchanged at the source until all other required material of the size range represented by the stockpile has been shipped from the source.

3.23.3 Placement Control

3.23.3.1 Quality Control Measures

Establish and maintain quality control for all work performed at the job site under this section to assure compliance with contract requirements. Maintain records of the quality control tests, inspections and corrective actions. Quality control measures shall cover all construction operations including, but not limited to, the placement of all materials to the slope and grade lines shown and in accordance with this section.
Surveys made by the Contractor are required on each material placed for
determining that the materials are acceptably placed in the work. Make
checks as the work progresses to verify lines, grades and thicknesses
established for completed work. At least one (1) check survey as specified
below shall be made for each [_____] [twenty-five (25)] foot section as
shown as practicable after completion. Following placement of each type of
material, the cross section of each step of the work shall be approved by
the Contracting Officer before proceeding with the next step of the work.
Approval of cross sections based upon check surveys shall not constitute
final acceptance of the work. Cross sections shall be taken on lines
[_____] [8] m [_____] [25] feet apart, measured along the structure
reference line, with readings at [_____] [1.5]-m [_____] [5]-foot intervals
and at beaks along the lines. However, other cross section spacing and
reading intervals may be used if determined appropriate by the Contracting
Officer. Additional elevations and soundings shall be taken as the
Contracting Officer may deem necessary or advisable. The surveys shall be
conducted in the presence of an authorized representative of the
Contracting Officer, unless this requirement is waived by the Contracting
Officer.

a. Above Water: The elevation of stone above the water surface shall be
determined by the use of a leveling instrument and a rod having a base
300 mm 12 inches in diameter. If approved by the Contracting Officer
other means may also be used.

b. Below Water: For portions of the work that are under water, sounding
surveys shall be performed either by means of a sounding pole or a
sounding basket weighing about 4 kg 8 1/2 pounds, each of which has a
base measuring 300 mm 12 inches in diameter.

c. Gage Board: The gage shall be checked prior to any survey. Install a
gage board at the project site.

d. Electronic Depth Recorder Method: When using an electronic depth
recorder the following procedures shall be used.

(1) The depth recorder shall be calibrated and adjusted for the gage,
with check bar, at least [_____] [six (6)] times within a normal
eight (8) hour work day.

(2) Normal calibration times shall be at the beginning of the work
day, mid-morning, close of morning's work, start of afternoon's
work, mid-afternoon, and the end of the day.

(3) Further calibrations shall be performed whenever there is any
malfunction within the depth recorder or transducer which might
affect the soundings, a major gage change, or change in water
temperature due to industrial discharge or other causes.

(4) The check bar shall be set at approximately the deepest sounding
in the area to be sounded.
(5) The depth recorder shall be calibrated to read at low water datum.

(6) When checking the calibration at mid-morning, end of morning, mid-afternoon and end of work, the same setting used for the previous calibration shall be used.

(7) If the calibration check does not agree with the previous calibration, the depth recorder shall be calibrated to the proper setting.

(8) Under no circumstances shall the setting of the depth recorder be changed between calibrations.

e. Electronic Depth Recorder: The survey depth recorder used must be a standard model acceptable to the Contracting Officer using a sounding chart that can be read directly to the nearest 300 mm foot and estimated to the nearest 30 mm tenth (0.1) of a foot. Accuracy shall be better than 1/2 of 1 percent.

f. Tagline Method of Horizontal Location Along Station: If a tagline is used with a depth recorder, the soundings shall be marked with a fix every [_____] [1.5] m [_____] [5] feet.

g. Predetermined Transit Angle Method or Ranges Method: The interval between predetermined angles or ranges along a sounding line shall not exceed [_____] [60] m [_____] [200] feet along the entire length of the sounding line. No predetermined angle shall form an intersection with the sounding line of less than 45 degrees.

h. Speed of the Sounding Boat: When sounding, the speed of the sounding boat shall be as constant as possible, preferably between 55 and 67 m per minute 180 and 220 feet per minute.

i. Checking Gage: The gage shall be checked prior to each calibration and recorded on the sounding chart or in the field notes.

3.23.4 Bedding Layers, Filter Layers, and Sand Fill

3.23.4.1 General

Perform gradation tests to assure compliance with contract requirements and shall maintain detailed records. The bedding material, filter materials and/or sand fill shall be sampled in accordance with ASTM D75/D75M and tested in accordance with ASTM C136/C136M. Perform the tests before and after surveys of each layer of stone protection material placed.

3.23.4.2 Reporting

Reporting shall be in accordance with paragraph GRADATION TEST.

3.23.5 [Trenchfill Revetment, Bank Paving, and Outlet Drains]

Establish and maintain quality control for stone placement operations to assure compliance with contract specifications and maintain records of his quality control for all construction operations including, but not limited to, the following:

a. Check grades of trenchfill and bank paving for compliance with design sections.
b. Record tonnage of stone placed in each station of trenchfill revetment and check quantity for compliance with design sections.

c. Check for uniform thickness of paving stone and specified elevation of top paving on graded slopes.

d. Check for even distribution of spalls used in paving.

e. Insure that outlet drains conform with design sections.

3.23.6 [Stonefill Revetment and Stonefill Dikes]

Check grade, slope, and placement of stone for compliance with design sections and specifications.

3.23.7 [Stone Dike]

[Establish and maintain quality control for all stone dike operations to assure compliance with contract requirements and maintain detailed records of this quality control for all construction operations, including, but not limited to, the following:

a. Placement and alignment of stone in the dike.

b. Periodic fathometer surveys as directed by the Contracting Officer.]

c. Record of the tonnage of stone placed in each station.

3.23.8 [Revetment Repairs]

Inspect the revetment repairs for compliance with the contract requirements and record the inspection of all operations including, but not limited to, the following:

a. Bank grading, excavating or reshaping damaged drains through the paving, placing graded material into areas, and disposing of waste material.

b. Breaking out pavement within specified limits.

c. Disposition of cleared material, drift, and other debris.

d. Preparation of subgrade for paving.

3.23.9 [Stone] [Riprap] Paving

Establish and maintain quality control for slope dressing and riprap paving to assure compliance with contract requirements, and maintain records of his quality control for all construction operations, including but not limited to the following:

a. Dressing the slope to eliminate any irregularities, including irregularities in the gravel blanket placed by others, due to rain or wave wash or operations of the Contractor's equipment.

b. Grading and dressing necessary to secure a suitable connection with the riprap paving in place.
c. Underwater paving to assure proper connection with concrete mattress and complete coverage.

d. Above-water connection between riprap paving and concrete mattress.

e. Connection between riprap paving and asphalt paving.

f. Placement of riprap on gravel blanket, upper bank slope, and if applicable, overbank areas for thickness and proper coverage.

g. Placement of riprap in ditch outlets.

3.23.10 Dike Repairs

Inspect all dike stone repair operations for compliance with contract requirements and record the inspection of all operations including, but not limited to the following:

a. Grading of slopes to design grade within tolerance.

b. Disposition of material from grading and excavation.

c. Dressing of slope before placement of paving.

d. Placement of slope and underwater paving.

e. Grade and section of stone fill.

Furnish to the Contracting officer a copy of these records and tests, as well as records of corrective action taken.

3.23.11 Gradation Tests for Stone

3.23.11.1 [Gradation Test Method for Riprap]

Gradation tests shall be performed in accordance with ASTM D5519, Test Method A [____].

3.23.11.2 [Standard Test Method for Gradation of Quarry Run Stone or Stone Paving]

**************************************************************************
NOTES: Alternative 2. The gradation test method was developed to provide guidance to field personnel and Contractors so that the procedures would be uniform. This test procedure is provided as an example.

This test method should not be used in contract specifications that cover stone, upper bank and stone, overbank, and quarry run stone.
**************************************************************************

a. Select a representative sample (Note No. 1), weigh and dump on hard stand.

b. Select specific sizes (see example) on which to run "individual weight larger than" test. (See Note No. 2). Procedure is similar to the standard aggregate gradation test for "individual weight retained".

SECTION 35 31 19 Page 84
c. Determine the largest size stone in the sample. (100 percent size)

d. Separate by "size larger than" the selected weights, starting with the larger sizes. Use reference stones, with identified weights, for visual comparison in separating the obviously "larger than" stones. Stones that appear close to the specific weight must be individually weighed to determine size grouping. Weigh each size group, either individually or cumulatively.

e. Paragraph d above will result in "individual weight retained" figures. Calculate individual percent retained (heavier than), cumulative percent retained, and cumulative percent passing (lighter than).

NOTE NO. 1: Sample Selection: The most important part of the test and the least precise is the selection of a representative sample. No "standard" can be devised; larger quarry run stone is best sampled at the shot or stockpile by given direction to the loader; small graded stone is best sampled by random selection from the transporting vehicles. If possible, all parties should take part in the sample selection and agree before the sample is run that the sample is representative.

NOTE NO. 2: Selection of Size for Separation: For these types of stone gradations the separation points need to be selected as the smallest size stone at each break in the gradation specified.

3.23.11.3 Standard Test Method for Gradation of Riprap, Graded Stone, and

**************************************************************************
NOTE: Alternative 2. The STANDARD TEST METHOD FOR GRADATION OF RIPRAP AND GRADED STONE gradation test method was developed to provide guidance to field personnel and Contractors so that the procedures would be uniform. This test procedure is provided as an example.

This test method should be presented in contract specifications that require riprap or graded stone. This test method should not be used in contract specifications that only cover stone, upper bank and stone, overbank.

**************************************************************************

a. Select a representative sample (Note No. 1), weigh and dump on hard stand.

b. Select specific sizes (see example) on which to run "individual weight larger than" test. (See Note No. 2). Procedure is similar to the standard aggregate gradation test for "individual weight retained".

c. Determine the largest size stone in the sample. (100 percent size)

d. Separate by "size larger than" the selected weights, starting with the larger sizes. Use reference stones, with identified weights, for visual comparison in separating the obviously "larger than" stones. Stones that appear close to the specific weight must be individually weighed to determine size grouping. Weigh each size group, either individually or cumulatively.

e. Paragraph d above will result in "individual weight retained" figures. Calculate individual percent retained (heavier than), cumulative percent retained, and cumulative percent passing (lighter than). Plot percent passing, along with the specification curve on ENG Form 4794-RM 4794-R.

NOTE NO. 1: Sample Selection: The most important part of the test and the least precise is the selection of a representative sample. No "standard" can be devised; larger quarry run stone is best sampled at the shot or stockpile by given direction to the loader; small graded stone is best sampled by random selection from the transporting vehicles. If possible, all parties should take part in the sample selection and agree before the sample is
run that the sample is representative.

NOTE NO. 2: Selection of Size for Separation: It is quite possible and accurate to run a gradation using any convenient sizes for the separation, without reference to the specifications. After the test is plotted on a curve, then the gradation limits may be plotted. Overlapping gradations with this method are no problem. However, it is usually more convenient to select points from the gradation limits, such as the minimum 50 percent size, the minimum 15 percent size, and one or two others, as separation points. For these types of stone gradations the separation points need to be selected as the smallest size stone at each break in the gradation specified.

3.7 PROTECTION OF WORK
3.8 QUALITY CONTROL TESTING

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for commercially available concrete block products for revetments.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: PART 2 PRODUCTS is based on commercial items, and does not address field casting of blocks or manufacturing custom blocks.

This guide specifications assumes the ACB is Government designed for issues such as hydraulic stability and geotextile filters. Maximum flexibility is desirable for Contractor product selection, installation sequence, construction equipment, and block orientation.

Notes before paragraphs are provided to present assumptions in preparation of the guide specification, make suggestions for conditions that warrant project revisions, and provide background technical information or references for further
information. They should be reviewed prior to revising wording for use in project specifications.

The drawings should show appropriate details for toe key-in, anchor trenches, revetment termination, transition to riprap, anchors, etc.

1.1 MEASUREMENT AND PAYMENT

Measurement of ACB revetment for payment will be made on the basis of the face area. The pay lines of ACB revetment will be neat lines taken off the approved shop drawings; and will include embedded blocks and anchor trenches. Work includes incidental grading and preparatory work, furnishing and installing the geotextile and ACB, filling the voids, securing cable fasteners, installing soil anchors, and seeding (where specified). Engineering services and product testing shall be incidental, if required. Placing cast-in-place concrete joints and cutting blocks shall be incidental, if required. Payment will be made at the respective unit price per square meter foot listed on the Bidding Schedule. Payment will be full compensation for all material, labor and equipment to complete the work.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

1.3 DEFINITIONS

1.3.1 Articulating Concrete Block (ACB) Revetment System

A matrix of interconnected concrete block units for erosion protection. Units are connected by geometric interlock and/or cables, geotextiles, or geogrids, and typically include a geotextile underlayment for subsoil retention.

1.3.2 Blocks

Articulating concrete block revetment units will be referred to as blocks.
1.3.3 Interlocking Blocks

Each pair of abutting blocks shall have interlocking keys that limit lateral expansion. The key and keyhole shall have an interference fit such that the joint movement has a minimum aperture at closure, and a maximum aperture when pulled apart. The joint freeplay shall allow articulation of each individual block.

1.3.4 Freeplay

Freeplay shall be the maximum lateral joint movement for interlocking blocks (difference between maximum and minimum aperture).

1.4 SUBMITTALS

**************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.](information only. When used, a designation following the "G"
designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

  Block Installation; G[, [____]]
  Geotextile Installation; G[, [____]]

SD-03 Product Data

  Articulating Concrete Block; G[, [____]]
  Geotextile; G[, [____]]
  Anchors; G[, [____]]

  Articulating Concrete Block

SD-06 Test Reports

  Flume Test

1.5 DELIVERY, STORAGE, AND HANDLING

Check products upon delivery to assure that the proper material has been received and is undamaged. For geosynthetics, the guidelines presented in ASTM D4873/D4873M shall be followed.

1.5.1 Blocks

Provide blocks which are sound and free of defects that would interfere with proper placement or that would impair the strength or longevity of the installation. Discard blocks with the following defects:

a. Broken appendages.
b. Chips larger than 50 mm 2 inches in any dimension.
c. Cracks wider than 0.5 mm 0.02 inches and longer than 33 percent of the nominal height.

Minor cracks, incidental to the usual method of manufacture, or chipping that results from customary methods of handling in shipping, delivery and placement will not be deemed grounds for rejection. Store blocks in a suitable location away from mud, paint, wet cement, and other contamination or disturbance.

1.5.2 Geotextiles

1.5.2.1 Labeling

Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.
1.5.2.2 Handling

Geosynthetic rolls shall be handled and unloaded by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Geosynthetic rolls shall not be dragged, lifted by one end, lifted by cables or chains, or dropped to the ground.

1.5.2.3 Storage

Protect geotextiles from cement, paint, excessive mud, chemicals, sparks and flames, temperatures in excess of 70 degrees C 160 degrees F, and any other environmental condition that may degrade the physical properties. If stored outdoors, the rolls shall be elevated from the ground surface and protected with an opaque waterproof cover. Geotextiles shall be delivered to the site in a dry and undamaged condition.

1.6 SCHEDULING

To limit ultraviolet light exposure of the geotextile, place the blocks within 7 days after placing the geotextile, and the void filler within 14 days after placing the geotextile.

PART 2 PRODUCTS

2.1 ARTICULATING CONCRETE BLOCK

*********************************************************************************************************************************************
NOTE: Hand placed (interlocking) ACB typically provides a neater, more pleasing appearance in parks and public areas. Cabled ACB can have superior hydraulic stability to interlocking products, it is more difficult to remove (such as by vandalism), and it has improved constructibility when placed in water.

The table of ACB requirements is comprehensive, and many of the properties are interrelated. Including all listed properties will be specification overkill for most projects. Renumber notes where properties are deleted.

The critical shear stress is preferred by the industry over critical velocity because the critical shear is relatively constant for a product. Critical velocity varies depending on flow characteristics (such as depth and turbulence); so that the critical velocity in the flume test is not comparable to the required critical velocity in the field.

The surface void area ratio, DCF, and curvature radius can be used to specify products best suited to placement on curved surfaces, and turf establishment. Some blocks are available with open cells or solid cores. Most products marketed specifically for ACB revetments are within reasonable limits for general use.

Modifying the requirements for a performance
specification may be considered for small low hazard projects or negotiated contracts, and may be preferred by some manufacturers. However, performance requirements for firm fixed price (low bid) contracts is not recommended for ACB's because of the price level jumps between product sizes, and because there is no control in how bidders incorporate risk for a low frequency design event.

Interface friction for soil/fabric and fabric/blocks should be considered by the designer. Because typical design values for soil/fabric are available in geosynthetic design guides, and because the Contractor generally has no control over the soil, the soil/fabric interface friction angle is not addressed in the specification (although for certain critical applications, this may need to be added to verify design assumptions). Interface friction for fabric/blocks is addressed in the specification because it is affected by geotextile and block combinations, it can affect installation, and because the interface friction for fabric/block is highly variable dependent on manufacturing characteristics of both products.

Submit descriptive technical data on the blocks, cables, cable fittings, soil anchors, and geotextile. Include all material properties specified under paragraph PRODUCTS. Catalog cuts, technical data sheets, or test data shall be submitted showing that the products meet the specifications. The submittal shall also include a copy of any standard manufacturer's warranties for the products. See below under "geotextile" for more requirements. The ACB shall meet the following criteria:

<table>

</table>
### TABLE 1. ACB Requirements

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Required Value</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Determine the weight of the mattress per unit area with the nominal joint spacing, in a non-submerged condition.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>b. The curvature radius shall be indicative of the ability of the assembled mattress to conform to one dimensional subgrade curves without binding, such as for anchor trenches and swales. The curvature radius shall be demonstrated, if requested by the Contracting Officer.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>c. The surface void area ratio shall be determined at the visible (with filled voids) surface of the blocks, with the joints spaced in a neutral position (50 percent), and shall be expressed as a percentage of the gross mat area. The void area shall include area between the blocks and open cells within the block.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>d. The drainage correction factor shall be the minimum void area ratio (usually taken at the base of the blocks), with the joints spaced in a neutral position (50 percent freeplay in each direction), and shall be expressed as a percentage of the gross mat area.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>e. The concrete surface shall be sufficiently rough to prevent sliding of the blocks on the geotextile. The interface friction must be matched with the selected block and geotextile combination, and shall be included with the ACB and Geotextile Data submittal. The block/geotextile interface friction angle shall be demonstrated, if requested by the Contracting Officer.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### 2.1.1 Hydraulic Stability

**************************************************************************
NOTE: The velocity and shear stress conditions derived from this test are critical state conditions, and do not represent allowable design values. The surface tolerances for block placement are generally better in the test than field conditions.

FHWA RD-89-199 is a research document, not a standard test method. ASTM committee D18.25.04 has a draft standard based on a flume test, similar to FHWA RD-89-199. The flume test is very expensive: testing expenses can be on the order of $30,000.

FHWA RD-89-199 included a 20 mm 3/4 inch Enkamat fabric below the blocks for the purpose of installing instrumentation to research block behavior. The Enkamat provided a very effective drainage layer that is not integral to the test method. A drainage layer provides a very significant improvement in the ACB stability in the flume test. Regardless of the flume test conditions, the designer should consider including a granular drainage layer in areas with high turbulence flow.

**************************************************************************
2.1.1.1 Flume Test

Submit a report of testing for the ACB in substantial conformance with FHWA RD-89-199, except that a drainage layer is not required, at the same time as the ACB and Geotextile Data submittal. The report shall clearly state if the critical shear stress associated with the stability threshold of the ACB system was derived from laboratory testing that included a sub-block drainage layer as a component of the tested system. The ACB product shall have been tested in a flume chamber in substantial conformance with FHWA RD-89-199. If the product was tested with a drainage layer, the installed product shall incorporate a similar drainage layer with adequate filtration design for the site soils. The flume test shall be based on conservative assumptions for field placement of the blocks (such as block orientation, and joint spacing within construction tolerances). The critical shear stress (and critical velocity) shall be indicated in the test report.

2.1.1.2 Extrapolation of Hydraulic Stability

**************************************************************************

NOTE: Preliminary research has indicated that extrapolation is conservative when extrapolating to thicker blocks, and unconservative when extrapolating to thinner blocks.

**************************************************************************

Extrapolation of critical shear stress for untested blocks within a similar family of ACB shall be subject to limitations. Extrapolation shall only be used for blocks having a similar footprint area and interlock mechanism, but with variable thickness or net weight/area. Extrapolation shall only be accepted if the following conditions are met:

a. The extrapolation is in strict accordance with hydraulic similitude methods commonly accepted by the industry, and includes quantitative treatment for a block overturning failure mode.

b. The tested block is the smaller product size in both thickness and net weight/area, and extrapolation does not extend the critical velocity more than 3 meters per second (10 feet per second) from the tested product size.

2.1.2 Matrix Assembly - Interlocking Blocks

Interlocking blocks are assumed to function without the use of cables or similar restraints. Void filler shall be placed to inhibit lateral movement and block pullout, cover the geotextile, and increase hydraulic stability.

2.1.3 Matrix Assembly - Cabled Systems

Cable tied concrete block shall be interconnected by flexible cables running through the blocks. Each block shall be penetrated by a cable that allows articulation of the blocks, but restrains removal of individual blocks. Void filler shall be placed to inhibit lateral movement, cover the geotextile, and increase hydraulic stability. [Articulating concrete block, cables, and fittings shall be fabricated into mattresses at the manufacturer's plant.]
2.1.4 Structural requirements

NOTE: Freeze-thaw Testing - The specifier should edit this paragraph based on the project's location. The default values correspond to the default values in ASTM C1372, Segmental Concrete Retaining Wall Units. The freeze thaw requirements for retaining wall blocks are referenced since they are similar products, ACB blocks can be produced by similar manufacturing methods, and retaining walls have been the subject of more freeze thaw durability research. The number of seasonal freeze thaw cycles for typical ACB's is likely less than for retaining walls. Chloride from deicing salts or sea water increases saturation of the concrete, and thus has a very pronounced affect on freeze thaw degradation.

Articulating concrete block shall be wet cast using concrete as specified herein, or dry-cast by a vibratory block forming machine. The blocks shall be manufactured to the following requirements:

2.1.4.1 Compressive Strength

The minimum compressive strength shall be 28 MPa 4000 psi for an average of 3 units, and 24 MPa 3500 psi for an individual unit. Compressive strength shall be determined by ASTM C42/C42M for wet cast blocks, or by ASTM C140/C140M for dry cast blocks.

2.1.4.2 Water Absorption for Dry Cast Units

The maximum water absorption for dry cast units shall be 145 kg/m$^3$ 9 pcf for an average of 3 units, and 195 kg/m$^3$ 12 pcf for an individual unit. Water absorption shall be determined by ASTM C140/C140M.

2.1.4.3 Saturated Surface-Dry Density

The minimum saturated surface-dry density shall be [140] [_____] for average of 3 units, and [140] [_____] for an individual unit.

2.1.4.4 Air Entraining

Wet cast concrete shall be air entrained to contain between 4 and 7 percent total air.

2.1.4.5 Freeze-Thaw Durability

For freeze-thaw durability tested in accordance with ASTM C1262/C1262M, specimens shall comply with either of the following: (1) the weight loss of each of 5 specimens after 100 cycles shall not exceed 1 percent; or (2) the weight loss of each of 5 specimens after 150 cycles shall not exceed 1.5 percent.

2.2 GEOTEXTILE

NOTE: The AASHTO M 288 table provides survivability requirements. Class 1 is recommended for harsh or
severe installation conditions where there is a potential for vehicular traffic, or where irregular sections may require removal and replacement of mattresses to achieve proper alignment. Class 2 is allowed where no vehicle traffic will occur on the installation, and where mattress placement is in regular, even reaches. Reference Protection of Work paragraph in Part 3.

Some manufactures require minimum geotextile properties for warranty coverage. Most manufacturers have recommended geotextiles, but these should be verified for compatibility with the subgrade soils.

Filters should not impede seepage. Clogging resistance is critical for uplift stability. Site specific design should be performed if any of the following problematic soil conditions are encountered: highly erodible soils such as non-cohesive silts, gap graded soils, or laminated sand/silt.

Some references for geotextile design include:
2. FHWA, "Geosynthetic Design and Construction Guidelines."

Geosynthetic Selection - The Federal Acquisition Regulations require full and open competition. Usually justification is not necessary if 3 products meet the specifications. In combining various material requirements, it is easy to specify a geosynthetic product that does not exist. Design utilizing geosynthetics should include a listing with the calculations that verify the specified products are commercially available. The Geotechnical Fabrics Report magazine publishes an annual specifiers guide that is ideal for this purpose.

**************************************************************************
Submit two samples of the proposed block at the same time as the ACB and Geotextile Data submittal. The samples shall be typical of the size, texture, color, and finish. If the Contracting Officer is familiar with the product, this submittal may be waived. Geotextile used as filters below the ACB shall be a [woven] [non-woven] fabric. The geotextile shall meet the material properties specified in AASHTO M 288 for Class [2] strength property requirements and for permanent erosion control. Filter requirements in AASHTO M 288 shall be based on in-situ soil with [less than 15 percent] [15 percent to 50 percent] [greater than 50 percent] passing the 0.075 mm sieve opening. Geotextile used as a filter below the ACB shall be a [woven] [non-woven] fabric, and shall meet the requirements specified in Table 2. The property values (except for AOS) represent minimum average roll values (MARV) in the weakest principal direction.

### 2.3 CABLE

#### 2.3.1 Installation Requirements for Cable

Cable used for preassembled mattresses shall be sufficiently sized and fastened for the size/weight of the assembled mattresses such that the assembled mattresses can be placed in compliance with OSHA standards. The manufacturer shall be responsible for determining the minimum cable strength compatible with the mattress size for safe handling. Cable strength shall be based on a minimum factor of safety of 5, and include appropriate reduction factors for mechanically crimped cable, and other fasteners. If applicable, loading conditions shall include the use of a spreader bar for placing the mattresses.

#### 2.3.2 Fasteners Other than Cable

Any systems which rely on geotextiles (or other fabric integral with the mattress) to maintain block-to-block interconnection shall meet the applicable portions of this specification for cables. Geosynthetics strength shall include appropriate factors of safety, with particular attention given to the grab points.

#### 2.3.3 Design Requirements for Cable

**************************************************************************

NOTE: The designer may need to research survivability of cables in the environment where the ACB will be placed. The installation requirements for cable strength usually govern, unless anchors are used.

**************************************************************************

ACB's that rely on cables to maintain block to block interconnection shall use ropes manufactured from polyester, stainless steel wire, or galvanized
steel wire. The cable shall have a minimum breaking strength of [_____] pounds. Polyester rope shall be constructed of high tenacity, low elongating, continuous filament polyester fibers; and shall consist of a core construction comprised of parallel fibers contained within an outer jacket or cover.

2.3.4 Anchors

**************************************************************************
NOTE: Anchors require a cabled system. Anchors should be used with caution. Control of mattress uplift may only be successful for short term, low frequency, overload. ACB mattresses that are locally uplifted, with or without anchors, may show significant subgrade distortion, which could be a precursor to failure. Anchors spaced throughout the revetment also require special details to maintain integrity of the geotextile filter.

Because anchors are not required for typical installations, this paragraph may commonly be deleted. Where anchors are used for specialized applications, add requirements for anchor materials, minimum property requirements, and design characteristics.

Drawings must detail location and spacing of anchors.
**************************************************************************

Submit calculations for the anchor pullout capacity. Tabulated manufacturer's data is acceptable, if the embedment soil conditions are applicable to the project site. Anchors shall be selected with an ultimate vertical pullout resistance for the project site soil conditions of at least [_____] pounds. Anchors shall be capable of being attached directly to the articulating concrete block mat in a manner which will achieve little or no slack in the cable system or gaps in the articulating concrete block mattress. Anchors shall be attached to the mat in such a manner that they will not be affected by tampering or vandalism. Anchors shall have the capability of being load-tested to the specified pull-out capacity.

2.4 VOID FILLER

2.4.1 Aggregate

**************************************************************************
NOTE: Aggregate is used below the normal water level, or where turf can not be established. Department of Transportation specifications for road base aggregate have been used, such as ASTM D1241, Gradation B.
**************************************************************************

Aggregate for filling the voids in the block shall meet the requirements of [______].

2.4.2 Topsoil and Seed

Topsoil for filling the voids in the block and seed for turf establishment shall meet the requirements of Section 32 92 19 SEEDING.
PART 3   EXECUTION

3.1   SUBGRADE PREPARATION

Place the ACB revetment on undisturbed native soils, or acceptably placed and compacted fill. Do not place the ACB on surfaces that contain mud, frost, organic soils, embankment that has not met compaction requirements, or where the Contracting Officer determines that unsatisfactory material remains in or under the subgrade.

3.1.1   Clearing

All vegetation shall be completely removed as specified in Section [31 00 00 EARTHWORK] [31 11 00 CLEARING AND GRUBBING]. Remaining roots from trees and brush shall be removed to a depth of 0.3 meters 1 foot below the subgrade surface. Loose roots and twigs, turf clods, stones larger than 13 mm 1/2 inch diameter, and other debris shall be raked and removed from the final surface. Rills and gullies from erosion shall be corrected.

3.1.2   Bank Grading

Grading shall be finished to a smooth surface, typical of that obtainable with a dozer and blade. A rough surface typically obtained with a backhoe or dragline will not be acceptable, except when ACB placement in water is shown on the drawings or approved by the Contracting Officer. [When natural shorelines require grading in preparation for ACB installation, the bank stratification shall be observed and documented in daily Contractor Quality Control reports. Grading practices shall avoid spreading fine grained soils over more pervious soils, particularly near the toe of slopes. If inadequate material is available to comply with this requirement, the Contracting Officer shall be notified.].

3.1.3   Compaction and Subgrade Finishing

[Fill soils shall be compacted to the specified density in Section 31 00 00 EARTHWORK.] Incidental grading (where embankment is not otherwise specified) shall be compacted by heavy equipment or by tamping with a bucket to a density characteristic of the surrounding soils. The final surfaces accessible by compaction equipment shall be compacted with a smooth drum roller or vibratory plate tamper until there is no further evidence of consolidation. Where slopes limit operation of compaction equipment, the final surface shall be back-dragged to a dense smooth surface with bladed equipment. Localized loose or soft zones shall be corrected.

3.1.4   Grade Tolerances

The grading tolerance shall be within 50 mm 2 inches from the prescribed elevations, with no abrupt variations that would cause unacceptable projections of individual blocks.

3.1.5   Subgrade Surface Tolerances

The subgrade shall be maintained in a smooth condition between installation of the geotextile and the blocks. Windrows, stones, clods of cohesive soil, and irregularities shall be raked smooth. Ruts, rills and gullies resulting from traffic, precipitation runoff, groundwater seepage, etc. shall be corrected prior to installation of blocks.
3.2 GEOTEXTILE INSTALLATION

3.2.1 General

See "block installation" paragraph for drawing requirements. The geotextile shall be laid flat and smooth so that it is in direct contact with the subgrade. The geotextile shall be free of tension, folds, and wrinkles. The number of seams and overlaps shall be minimized by selective orientation of geotextile panels, within the limitations of maintaining a consistent pattern. Geotextile shall be placed immediately prior to block installation, if necessary to limit damage to the geotextile from equipment or repeated pedestrian traffic and limit disturbance of the subgrade from precipitation or runoff.

3.2.2 Geotextile Seams

**************************************************************************

NOTE: Sewn, welded or glued seams are desirable for shoreline protection (or where flow reversal occurs). Substitute the following for sewn seams:

Seams shall be continuously sewn at the locations shown on the drawings. The minimum distance from the geotextile edge to the stitch line nearest to that edge shall be 75 mm 3 inches. Seam strength shall meet the minimum requirements specified in AASHTO M288 for a class 2 geotextile. Quality assurance samples shall be taken at the request of the Contracting Officer. The thread at the end of each seam run shall be tied off to prevent unraveling. Seams shall be on the top side of the geotextile to allow inspection. Skipped stitches or discontinuities shall be sewn with an extra line of stitching with a minimum of 450 mm 18 inches of overlap.

Pins/staples may not be desirable where filtration is critical.

**************************************************************************

Seams shall be overlapped a minimum of 450 mm 18 inches. Seams on slopes and butt end seams shall be shingled so that runoff and channel flow passes over the fabric. Geotextile panels shall be secured before block placement by adequate sandbags, spare blocks, or pins/staples.

3.3 BLOCK INSTALLATION

All placement of blocks shall be in accordance with the manufacturer's recommendations and the Contractor's approved shop drawings. Submit drawings showing details of the ACB and Geotextile Installation, including the block layout patterns in relation to the feature alignment, anticipated locations of cast-in-place concrete joints, mattress junction details, soil anchors, and proposed installation methods for void filling materials.

3.3.1 Placement of Pre-Assembled Mattresses

**************************************************************************

NOTE: The spreader bar may be deleted where

SECTION 35 31 19.20 Page 15
tolerances are a minor concern. The spreader bar may have associated cost when placing one end of the mattress in water, due to work in disconnecting the rigging on the wet end.

Placement of pre-assembled mattresses shall be done with mattresses attached to a spreader bar to aid in lifting, aligning and placing the mattresses. The mattresses shall be placed directly into position, with a maximum space or gap between mattresses of 75 mm 3 inches in excess of the nominal joint spacing of blocks within the mattress. Mattresses out of alignment shall be lifted and reset. Mattresses shall not be pushed or pulled laterally after they are in contact with the geotextile. No overlapping of mats will be accepted and no blocks shall project vertically more than 25 mm 1 inch beyond the adjacent blocks. (As adjacent mats are placed, they shall be secured to each other by fastening the protruding horizontal and vertical cable connections and end cable loops together along each side of the mats.)

3.3.2 Hand Placement of Interlocking Blocks

Space hand placed blocks to maximize the ACB ability to articulate. Use adequate alignment control, such as string lines, to keep the block pattern in alignment and the joint spacing consistent and uniform. Initially, no more than two working block rows shall progress simultaneously in the direction of placement. Additional working rows may be added after experience shows that true lines are maintained. The starting position for ACB placement shall be a convenient location for control of the block pattern alignment. The Contracting Officer shall approve of the starting position for placement of the ACB.

3.3.2.1 Target Joint Spacing

Interlocking blocks shall be installed with a uniform aperture in the interlocking connections. The target joint spacing shall be neutrally spaced with equal free-play for the joint to open and close.

3.3.2.2 Correction of Joint Spacing

If the block pattern becomes skewed to an extent that blocks bind, joints close, or blocks stickup, then the placed ACB that is determined to be out of tolerance shall be removed and replaced. Where the nonconformance of the joint spacing is due to project features, such as warped slopes or anchor trenches, then cast-in-place concrete joints shall be field located in concurrence with the Contracting Officer.

3.3.2.3 Maintenance of Joint Spacing

If the block pattern becomes skewed to an extent that the joint freeplay is not acceptable to the Contracting Officer, then cast-in-place concrete joints shall be field located as directed by the Contracting Officer.

3.3.2.4 Block Layout Pattern Dependent on Project Features

If the block pattern is shown to be maintained parallel and perpendicular to selected project features, such as the crest/toe of levee/channel slopes, then field location of cast-in-place concrete joints shall be implemented as needed, and as directed by the Contracting Officer.
3.3.3 Tolerances

Maximum acceptable block projections (vertical offset from adjacent blocks) for "installation in the dry" shall not exceed 0.5 inches for interlocking blocks 25 mm 1.0 inch for cabled systems. Typical block projections shall be less than half the maximum projections.

3.4 ANCHORS

Anchors shall be carefully positioned for attachment to the articulating concrete block. Rigid shafts shall align with the ACB cables. Flexible anchors (cables, etc.) shall be linear between the ACB fastener and the restraining device before tensioning. Penetrations in the geotextile to allow for penetration of the anchor shall be sealed [in accordance with the drawing details].

3.5 CONCRETE JOINTS

3.5.1 General Requirements

Use of cast in place concrete joints shall be minimized to the extent practicable. The Contracting Officer shall be informed of all concrete joints not shown on shop drawings prior to field placement. Joints that shall require concrete include:

a. Joints between cable tied mattresses where the joint is 75 mm 3 inches wider than the nominal joint.

b. Joints where block interlock is discontinuous.

c. Abutments where the ACB meets headwalls, pipe penetrations, or sidewalks.

c. Any areas where there are partial blocks (to avoid small blocks with reduced hydraulic stability).

Field placed concrete shall be proportioned for similar strength and durability properties as the ACB concrete[, and shall meet applicable portions of Section [03 30 00 CAST-IN-PLACE CONCRETE] [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE]]. All cable ties and anchoring shall be completed prior to placing concrete.

3.5.2 Abutments

The ACB shall abut pipe outlets, retaining walls, flood walls, head walls, sidewalks, and other abutments in a neat appearance. Unless a specific detail is indicated on the drawings, voids shall be filled with partial blocks and the gap shall be filled with cast-in-place concrete. The concrete shall be installed flush with the surface of the blocks, and shall be float finished.

3.6 VOID FILLER AND SEEDING

**************************************************************************
NOTE: Topsoil will consolidate in the voids.
Overfilling above the top of block is common to increase the topsoil fill level, but may increase sedimentation during turf establishment.
**************************************************************************
Broadcast seeding of ACB is difficult because it is difficult to rake the seed in. Hydroseeding of ACB is difficult because of channelization of runoff and susceptibility of the void filler to desiccation. In areas where establishment of quality turf is important, it has been successful to blend a rich mixture of seed (about 10 times the normal application rate, or about 0.5 to 1 kg/cubic m) into the topsoil prior to placing. Watering during establishment is more critical than typical turf due to the heat absorption of the concrete blocks and capillary break of the geotextile.

The voids of the articulating concrete block mats shall be filled with topsoil, except that voids below the normal water level shall be filled with aggregate void filler. All cable ties and anchoring shall be completed prior to filling voids. Seeding and maintenance shall be completed in accordance with Section 32 92 19 SEEDING.

3.7 PROTECTION OF WORK

Work shall be protected against damage from subsequent operations. Displaced or broken blocks shall be removed and replaced to conform to all requirements of this section. Damaged material shall not be incorporated. Equipment shall not be allowed on the ACB that could crack, cause abrasion, or otherwise damage the blocks. Vehicles shall not operate directly on geotextile, except that rubber tired vehicles may operate directly on short reaches of geotextile that meets or exceeds AASHTO M 288 survivability requirements for Class 1 geotextile, if there is no rutting, if the vehicle access is necessary to accomplish the work, and if the Contracting Officer observes the operation and approves. Vehicles shall not operate on the ACB until (during or after) placement of void filler. Vehicle traffic on the ACB shall be restricted to light weight rubber tired vehicles, and where intermittent access is necessary to accomplish the work. Routine haul routes shall not be established on the ACB. These allowances shall not waive the Contractor's obligation to maintain the installation until acceptance, and verify that vehicle access does not crack, or in any way damage, the ACB.

3.8 QUALITY CONTROL TESTING

NOTE: The manufacturer should have completed similar testing for it's own QC. The following testing is suggested as an acceptance check on a schedule typical for QA. The suggested frequency is on the order of 0.5 percent of construction cost.

The following testing shall be performed independent of the manufacturing process, by an agency other than the manufacturer. The ACB blocks shall be sampled and tested for compressive strength, water absorption and unit weight. The sample frequency shall be 3 specimens for each 2500 m² 3000 SY. Test methods shall be consistent with those specified in PART 2 PRODUCTS.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for levee construction. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections.

This guide specification includes paragraphs for construction activity that may have their own UFGS Guide Specifications. These include Section 31 00 00 EARTHWORK, Section 31 60 00 FOUNDATION PREPARATION and Section 31 11 00 CLEARING AND GRUBBING among others. If those Guide Specifications are to be referenced, remove the appropriate paragraphs from this section or those as is appropriate.

Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1   GENERAL

NOTE: This guide specification includes the installation of settlement gages for the determination of increases in quantities of embankment materials resulting from settlement of
the embankment foundation during construction and for payment to the Contractor for such increases in quantities. These provisions should be included in a project specification when it is determined that settlement in the range of 5 percent or more of the planned embankment height is anticipated over a considerable portion of the embankment foundation area. They will also be used when gages are needed for engineering control purposes, required in critical locations or called for if adverse contractual relationships are expected. When settlement gages are to be used the following information will be indicated on the plans:

1. The location of the gages as well as the stations at which zero settlement will be assumed.

2. The detail construction of the foundation settlement gages to be used. Any applicable type of gage may be selected.

The requirements for rock as prescribed herein are intended to be used on embankments involving rock fill sections. Where rock for slope protection is specified, Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES should be used.

Approval of testing laboratory is addressed in ER 1110-1-8100, dated 31 Dec 1997, Laboratory Investigations and Testing.

1.1 [LUMP SUM] [UNIT] PRICES

NOTE: If Section 01 22 00.00 10 (USACE) or Section 01 20 00.00 20 (NAVFAC) PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title ([LUMP SUM] [UNIT] PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10 or Section 01 20 00.00 20 as appropriate.

1.1.1 Clearing, Grubbing, and Stripping

NOTE: If Section 31 60 00 FOUNDATION PREPARATION or Section 31 11 00 CLEARING AND GRUBBING is included in the project specifications, this paragraph title Clearing, Grubbing, and Stripping should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 31 60 00 or Section 31 11 00 as appropriate.
1.1.1.1 Payment

Payment will be made for clearing, grubbing and stripping at the contract [lump sum] [unit price] for clearing, grubbing and stripping. This price will constitute full compensation for all equipment, labor, materials and incidentals necessary to complete the work specified herein. Payment for refilling of holes resulting from grubbing will be included in the contract [lump sum] [unit price] for clearing, grubbing and stripping. No separate or direct payment will be made for stockpiling and disposition of stripped materials. All costs in connection therewith will be considered as a subsidiary obligation of the Contractor. If regrowth of vegetation or trees occurs after clearing and grubbing and before placement of embankment, and the Contractor is required to clear and grub again prior to embankment construction, no payment will be made for this additional clearing and grubbing.

1.1.1.2 Measurement

**************************************************************************
Note: If clearing, grubbing, and stripping is to be paid for with a unit price bid item include the method of measurement. Delete this paragraph if payment is by lump sum.
**************************************************************************

Clearing, grubbing, stripping, stockpiling and the disposition of the materials from these operations will [not] be measured for payment. Refilling of grubbing holes will not be measured for payment.

1.1.1.3 Unit of Measure

Unit of measure: [lump sum] [unit price].

1.1.2 Demolition and Removal of Existing Structures

1.1.2.1 Payment

Payment will be made for demolition or removal of existing drainage structures, pavements, foundations, superstructure, walls, fences, or any other manmade object at the contract [lump sum] [unit price] for demolition and removal of existing structures. This price will constitute full compensation for all equipment, labor, materials and incidentals necessary to complete the work specified herein. Payment for refilling of holes resulting from removal of structures will be included in the contract [lump sum] [unit price] for demolition and removal of existing structures. No separate or direct payment will be made for stockpiling and disposition of removed materials. All costs in connection therewith will be considered as a subsidiary obligation of the Contractor.

1.1.2.2 Measurement

**************************************************************************
Note: If removal or demolition of existing drainage structures is to be paid for with a unit price bid item include the method of measurement. Delete this paragraph if payment is by lump sum.
**************************************************************************

Plugging or removal of existing structures required from these operations
will [not] be measured for payment.

1.1.2.3 Unit of Measure

Unit of measure: [lump sum] [unit price].

1.1.3 Excavation

**************************************************************************
NOTE: If Section 31 23 00.00 20 EXCAVATION AND FILL is used, this item should be deleted.

If excavation will not be measured or paid for separately, select the following paragraph and delete subparagraphs PAYMENT, MEASUREMENT, and UNIT OF MEASURE. Delete the following paragraph if excavation is to be measured and paid for separately. If significant quantities of rock excavation is anticipated measurement and payment for rock excavation should be addressed separately. A definition of rock excavation should also be included.
**************************************************************************

No separate measurement or payment will be made for Excavation. All costs in connection with excavation will be considered a subsidiary obligation of the Contractor.

1.1.3.1 Payment

Payment will be made for Excavation at the contract unit price which includes full compensation for all equipment, labor, materials, and incidentals necessary to complete the work specified. [No separate payment will be made for stockpiling.]

1.1.3.2 Measurement

Excavation will be measured for payment by use of the average end area method. The basis of measurement will be a survey of the area prior to the excavation [and clearing and grubbing] and a second survey of the same area after the completion of the excavation. For areas where lines and grades are shown on the drawings, measurement will be limited to those lines and grades. Slides caused by fault of the Contractor, over excavation, and excavation performed for will not be measured for payment.

1.1.3.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.4 Fill Material

**************************************************************************
NOTE: There are restrictions in guidance for the use of Hydraulic fill in levee construction. Designer should refer to EM 1110-2-1913 for guidance.
**************************************************************************
1.1.4.1 Payment For Embankment Fill

Payment will be made for material placed as required in embankments, backfills and ramps, and including additional material placed by reason of foundation settlement and by reason of soft material in the foundation being forced outward from the section during construction, for [Embarkment Material Type [_____] ], [Semicompacted Fill] [Uncompacted Fill] [Hydraulic Fill]. Payment will constitute full compensation for furnishing all plant, labor, equipment and material, [except earth material,] and performing all operations necessary for foundation preparation and placing and compacting the material [, materials testing,] [and moisture control]. [This payment is in addition to any payment for excavating and transporting of the material as required in paragraph EXCAVATION.]

1.1.4.2 Measurement of Fill Material

**************************************************************************
NOTE: The last sentence of the following paragraph (in brackets) should be deleted if surveys are taken "after" clearing and grubbing operations. The last sentence should be included if surveys are taken "prior" to clearing and grubbing operations.
**************************************************************************

Submit a copy of the records of each compliance survey the next work day following the survey.

1.1.4.2.1 Fill Materials Specified for Embankment

Fill materials specified for embankment will be measured for payment by the cubic meter yard, and quantities will be determined by the average end area method. The basis for measurement will be cross sections of the areas to be filled taken [prior to] [after] clearing, grubbing, and stripping operations and the [theoretical cross sections] [actual cross sections] of the embankments constructed within the specified tolerance[ plus additional fill placed as the result of displacement or settlement of foundation material as calculated below].[ Cross sections will be performed at significant breaks in grade except that the maximum distance between cross sections will not exceed [_____] meters feet.] Embankments not constructed to design grade and section including allowable tolerance as indicated on the Contractor's compliance survey will not be accepted.[ Volumes occupied by drainage structures will not be included in measurement of embankment for payment.] [ Material removed as a result of the clearing, grubbing, and stripping operations will not be included in measurement of embankment for payment.]

1.1.4.2.2 Fill Due to Soft Material in the Foundation

The basis for measurement of fill placed by reason of soft material in the foundation being forced outward from the section will be a survey of the area taken prior to fill placement and a second survey of the same area after completion of fill placement. The cross sections will extend [_____] meters feet beyond the toes of the fills.[ A cross section will be taken at each settlement measurement location.]

1.1.4.2.3 Levee Settlement

**************************************************************************
NOTE: The designer can choose to measure settlement
**************************************************************************
using settlement gages.

Measurement of additional fill material placed in each settlement measurement range, shown on the drawings by reason of foundation settlement, will be based on measurements [taken on the respective settlement gage] at the respective settlement measurement locations as specified and will be determined as follows:

a. The settlement measured at each settlement measurement location will be considered to apply to the foundation area throughout the length of the settlement ranges shown on the drawings.

b. The foundation settlement under the embankment at each transverse cross section within a settlement range will be considered to vary uniformly between break points in the cross section.

c. At each breakpoint, the settlement allowance will be based upon the proportion that the specified fill height at the break point bears to the specified fill height at the settlement measurement locations, in accordance with the following formula.

\[
S = h \times \frac{sm}{hm},
\]

where

<table>
<thead>
<tr>
<th>S</th>
<th>settlement to be computed at a break point</th>
</tr>
</thead>
<tbody>
<tr>
<td>h</td>
<td>specified gross fill height at S</td>
</tr>
<tr>
<td>sm</td>
<td>measured or adjusted vertical change at settlement measurement location</td>
</tr>
<tr>
<td>hm</td>
<td>specified gross fill height at settlement measurement location</td>
</tr>
</tbody>
</table>

d. Symbols used in the formula and the break points are [shown on a typical settlement cross section on the drawing] [included in these specifications].

1.1.4.2.4 Forfeiture of Payment for Settlement of Foundation

Failure to utilize settlement gages in strict accordance with the specifications and drawings will result in total forfeiture of any payment which will otherwise be due the Contractor for settlement of the foundation. Payment for settlement of the foundation will be totally forfeited for the reach attributable to each settlement measurement location in each case for the following reasons: embankment over a settlement measurement location is constructed to a height in excess of the specified construction lines plus the tolerance permitted; settlement plates have been set and cannot be found after completion of the embankment; failure to take the settlement measurement within [_____] hours after the final cross sections have been taken over the completed embankment.

1.1.4.3 Unit of Measure

Unit of measure: cubic meters yards.

1.1.5 Mortar and Concrete for Foundation Preparation
NOTE: If Section 31 60 00 FOUNDATION PREPARATION, specifically paragraphs DENTAL CONCRETE or DENTAL MORTAR is a part of the project specifications, this section should be deleted.

1.1.5.1 Payment

Payment will be made for costs associated with mortar and concrete used in foundation and abutment preparation, which includes full compensation for furnishing all labor, equipment, material, and incidentals, and performing all operations necessary for placement of concrete and mortar for foundation and abutment preparation.

1.1.5.2 Measurement

Mortar and concrete used in filling spaces beneath rock overhangs and around protrusions will be measured for payment as the actual volumes of such mortar and concrete in cubic meters yards as determined by field surveys made before and after placement of the mortar and concrete.[ No measurement will be made for the mortar used in filling the open joints and cracks in the rock surface.][ Measurement of mortar or concrete used in filling the open joints and cracks in the rock surface will be made by the square meter yard based on the horizontal projection of the area obtained from a survey performed before application.][ Measurement of mortar or concrete used in filling the open joints and cracks in the rock surface will be the bags of cement used.]

1.1.5.3 Unit of Measure

Unit of measure: cubic meters yards.

[1.1.6 Settlement Gages

No separate payment will be made for furnishing, installing, and maintaining settlement gages during embankment construction as specified herein, if used, including measurements required to be made by the Contractor, and will be at the expense of the Contractor. No separate payment will be made for compaction of fill around and over the settlement gages or for interference with the Contractor's operations resulting from the settlement gage installations.

]1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

### 1.3 DEFINITIONS

NOTE: Add applicable definitions.

#### 1.3.1 Clearing

Clearing consists of the removal and satisfactory disposal of all [above ground and below ground] trees, downed timber, snags, slash, brush, garbage, trash, debris, fencing, and other items occurring in the designated areas to be cleared.

#### 1.3.2 Grubbing

Grubbing consists of the removal and satisfactory disposal of stumps, roots larger than [_____] mm inches in diameter, and matted roots from the designated grubbing areas. Grubbing also includes filling of holes from the grubbing operation.

#### 1.3.3 Stripping

Stripping consists of the removal and satisfactory disposal of crops, weeds, grass, and other vegetative materials to the ground surface [and topsoil to a depth of [_____] mm inches].

#### 1.3.4 Satisfactory Materials

NOTE: Use of CH material should be avoided if possible. As a minimum, constraints should be set governing their use.
Satisfactory materials consists of materials classified in accordance with ASTM D2487 as CL, [CH], CL-ML, ML, SC, SP, SW, [_____] free from: roots and other organic matter; contamination from hazardous, toxic or radiological substances; trash, debris; and frozen materials. Not all satisfactory materials can be used in levee. Only the satisfactory materials stated above, meeting the additional or modified requirements of paragraph TYPES OF FILL MATERIALS, can be used for levee construction.

### 1.3.5 Unsatisfactory Materials

Do not use unsatisfactory materials in any levee or other required fill. Unsatisfactory materials includes all other materials that are not defined above as satisfactory materials. Materials which do not comply with the requirements for satisfactory materials are unsatisfactory. Unsatisfactory materials also include, man-made fills (unless excavated, sorted/separated/stockpiled, and tested); trash; refuse; backfills from previous construction; and material classified as satisfactory which contains root and other organic matter or frozen material.

### 1.3.6 Embankment

The term "embankment" as used in these specifications is defined as the earth [and rock ]fill portions of the levee structure or other fills related to the levee structure, including [cut-off trench] and includes all types of earth fill [and filter materials ]for the levee [and cut-off trench,] and all other fills within the limits of the levee as shown on the project drawings. [Stone and other rock materials used for slope protection are described in paragraph [____]].

### 1.3.7 Backfill

Backfill as used in this section is defined as that fill material which cannot be placed around or adjacent to a structure until the structure is completed or until a specified time interval has elapsed after completion.

### 1.3.8 Excavation

Excavation consists of removal of material to the lines and grades shown on the drawings, or as otherwise directed or approved by the Contracting Officer and as described in paragraph [____] EXCAVATION in PART 3 EXECUTION.

#### 1.3.8.1 Over-excavation

Excavation performed beyond lines and grades shown on the plans that is made at the convenience of contractor. No separate payment will be made for over-excavation or for additional embankment materials needed to backfill the over-excavation.

#### 1.3.8.2 Additional Excavation

Excavation performed beyond lines and grades shown on the plans that is performed at the direction of the Government, and to be paid at unit prices for excavation and backfill, or as negotiated.

### 1.3.9 Classification of Soils

Materials used to construct the embankments and for backfills will be
classified in accordance with ASTM D2487 (Unified Soil Classification System). Cohesionless materials include materials classified in ASTM D2487 as GW, GP, SW, and SP. Cohesive materials include materials classified as GC, SC, ML, CL, MH, and CH. Materials classified as GM and SM will be identified as cohesionless only when the fines are nonplastic.

1.3.10 Degree of Compaction

1.3.10.1 Cohesive Material

**************************************************************************
Note: If a higher compactive effort than is attainable by ASTM D698 is desired, ASTM D1557 may be utilized and references to ASTM D698, relative to compactive effort, should be changed to ASTM D1557.
**************************************************************************

Degree of compaction is expressed as a percentage of the maximum density obtained by the test procedure presented in [ASTM D698] [ASTM D1557], abbreviated hereinafter as percent laboratory maximum density.

1.3.10.2 Cohesionless Material

**************************************************************************
Note: Factors such as (but not limited to) site specific materials, availability of testing equipment and local practice may make it more practical to utilize methods other than ASTM D4253 and ASTM D4254 to control the degree of compaction of cohesionless material. If other methods are utilized the appropriate sections of the specifications should be modified to reflect method selected. The other methods used include comparison of in-place density to either the maximum Proctor density or the maximum density obtained by ASTM D4253 (if vibratory table is available).
**************************************************************************

Degree of compaction is expressed as a percentage of the relative density in accordance with ASTM D4253 and ASTM D4254.

1.4 SYSTEM DESCRIPTION

**************************************************************************
NOTE: This section should describe all appropriate activities to be performed to accomplish the completed projects as planned, including any special work items that must be conducted.
**************************************************************************

The work covered by this section consists of furnishing all equipment, labor, materials, and incidentals, and performing all operations necessary for the clearing, grubbing, and stripping of the areas specified herein or indicated on the drawings, and for the removal and disposal of cleared, grubbed, and stripped materials, [removal or plugging of existing drainage structures,] and refilling of holes resulting from grubbing; excavation of borrow areas [and existing levees,] and for all other required excavations or excavations incidental to the construction of levees[, channels] [, ditches] [, structures] [, and ponding areas] as specified and shown;
foundation preparation and the construction of levee embankments, including new levee, enlargement of existing levee, backfill of inspection trenches, cutoff trenches, berms, road crossings, backfill at drainage structures, and other incidental earthwork as may be necessary to complete the levee as specified herein and as shown on the drawings. All work under this section will comply with the requirements of EM 385-1-1.

1.4.1 Embankment and Backfill Materials

**************************************************************************
NOTE: All available sources of materials for embankment and backfill should be designated.
**************************************************************************

At least [30] [_____] days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material. Materials for embankment and backfill construction will be obtained from [the borrow sources] [sources provided by the Contractor] [required excavation]. Materials obtained from required excavation which meet or which can be processed to meet the requirements for each embankment material, or any other material required for this project, as specified herein, may be utilized [in the appropriate zone of] [in] the embankment or as backfill. Submit to the Contracting Officer the source or sources intended to provide materials for embankment construction. If a source is selected other than a commercial quarry or other commercial entity from which earth or rock material will be directly purchased and where the Contractor or his subcontractor will perform the borrow excavation, a written statement will be provided to the Contracting Officer indicating permission to utilize the area. It is the Contractor's responsibility to obtain Federal, State, and local permits which may be required for excavation and reclamation of the borrow area. A copy of the plan and procedures to be utilized for reclamation will be furnished to the Contracting Officer as required in Section [_____] paragraph [_____] The Contracting Officer will require material samples from any proposed borrow source to be submitted as indicated in paragraph FIELD QUALITY CONTROL.

1.4.2 Haul Roads

**************************************************************************
NOTE: Haul roads are highly project specific. Contractor should be given as much latitude as feasible to determine his traffic patterns. Haul roads must be safe, not interfere with public traffic, environmentally friendly and generally must be restored to preconstruction conditions.
**************************************************************************

Locate and construct haul roads [as indicated and] [as] [approved by the Contracting Officer] [within the project boundaries shown on the drawings]. [Prior to the commencement of construction submit for approval a site plan detailing the location of all haul roads within the project limits.] [Locate haul road[s] between the borrow site[s] and the levee embankment within the limits [shown on the drawings] [approved by the Contracting Officer].] [Mark the limits of the borrow haul road in the field using construction fencing or similar methods approved by the Contracting Officer. Areas on each side of the borrow haul road corridor must not be disturbed.] Construct haul roads to maintain the intended traffic, be free draining, and remain in good condition throughout the

SECTION 35 41 00 Page 12
contract period.[ Any haul road which crosses any creek or drainage channel must be constructed, and maintained so as to not flood either upstream areas by restricting stream flows or flood downstream areas by the release of any stored water in the event that the crossing fails for any cause.] Remove haul roads constructed during the contract duration after work is completed and the impacted area restored to its preconstruction conditions.[ Plow and/or scarify or otherwise loosen all access and haul roads other than existing roads to a minimum of [_____] mm inches deep and leave the surface in a smooth condition.] All haul roads within the right-of-way that will remain as public thoroughfares after construction must be cleaned daily and maintained in the preconstruction condition. Consider all costs associated with these haul roads as a subsidiary obligation of the Contractor.

1.4.3 Ramps and Crossings

Construct ramps and crossings at the locations shown on the drawings by placement of a fill as specified in paragraph [_____] . Construct ramps and crossings by adding material to the levee crown and slopes. Provide ramps that have a [_____] meter foot crown width, a grade not to exceed [_____] percent, and 1V on [_____]H side slopes.

1.4.4 Runways

**************************************************************************
NOTE: Runways are temporary haul roads over a levee.
**************************************************************************

Where material is hauled over an existing levee for construction, the Contractor, at no extra cost, will be permitted to construct temporary runways over the levee by the addition of material to the levee cross section. For the construction of runways, if the Contractor so desires, the existing levee may be cut, [but not to exceed a depth of [_____] meters feet below the crown] [not to exceed [_____] meters feet below the project flowline] [or 100-year level] [not to excavate below elevation [_____] or one half the height of the levee, whichever is less], and provided that the cut is made with side slopes not steeper than 1V on 1H, and with a minimum width of haul road of [_____] [7.6] m [_____] [25] feet for one-way traffic, and [_____] [18.3] m [_____] [60] feet for two-way traffic.

Cutting into the existing levee at intervals of less than [_____] [152] m [_____] [500] linear feet for the [_____] [7.6]-m [_____] [25]-foot bottom widths or less than [_____] [304] m [_____] [1,000] linear feet for the [_____] [18.3]-m [_____] [60]-foot bottom widths will not be allowed, and no more than [_____] runways will be open at one time. Stockpile, as directed by the Contracting Officer, sufficient suitable levee embankment material to construct emergency closure of the cuts.

1.4.5 Closure of Runways

Where runways have been cut through the levee, the Contracting Officer reserves the right to order their closure at no additional cost to the Government at any time that such runways may endanger the security of the levee. Just prior to restoration of the runway, the bottom of any cut made in the levee must be broken to a depth of [_____] [300] mm [_____] [6] inches and the side slopes thoroughly scarified. The restoration must be made with suitable embankment material, placed and compacted as provided in paragraph [_____]. Remove material used in the construction of the approach ramps of the runways and use for fill, if satisfactory. If not used for fill, dispose the material by placing it in abandoned portions of
the borrow areas or by any other method specified in paragraph disposal of material. No section of the levee will be degraded or weakened to provide runways nor will existing runways remain open during the nonwork season described in [GENERAL CONTRACT REQUIREMENTS], [paragraph] [Clause] EXCLUSION OF PERIODS IN COMPUTING COMPLETION SCHEDULES, unless otherwise approved in writing by the Contracting Officer.]

1.4.6 Stockpiling

**************************************************************************
NOTE: Cost of stockpiling embankment fill material should be included in the price for placing fill in the levee embankment.
**************************************************************************

Any on-site stockpiling of embankment materials will be in accordance with paragraph [_____] Stockpiles. No payment will be made for such stockpiling nor for the reloading and hauling of these materials to their final position.

1.4.7 Slides and Foundation Failures

When sliding occurs in any part of the embankment and backfills prescribed in this section after they have been placed, but prior to final acceptance of all work under the contract, either cut out and remove the slide from the embankment and then rebuild that portion of the embankment, or construct a stability berm of such dimensions, and place in such manner as prescribed by the Contracting Officer. When the slide is caused through the fault of the Contractor, the repair will be made at no cost to the Government.

1.4.8 Drainage Requirements

**************************************************************************
NOTE: Modify the following paragraph for specific job conditions such as fill placed in/under water.
**************************************************************************

Submit written evidence consisting of an authenticated copy of the [conveyance] [easement] under which the Contractor acquired the property rights and access thereto, prepared and executed in accordance with applicable State and local requirements. Do not block or restrict the flow in a natural drain, existing culvert, ditch or channel at any time without obtaining prior written approval from the Contracting Officer. This approval will not relieve the Contractor from responsibility for any damage caused by the operation. Monitor the [river] [canal] [stream] flow and provide sufficient free discharge areas so that conditions are not worsened upstream or downstream by possible floods during construction. Surface water will be directed away from excavations and construction sites so as to prevent erosion and undermining of foundations. Diversion ditches, dikes, and grading will be provided and maintained as necessary during construction. Protect excavated slopes and backfill surfaces to prevent erosion and sloughing. Perform excavation so that the site and the area immediately surrounding the site and affecting operations at the site will be continually and effectively drained. If private property is to be used for drainage, submit written evidence that the right has been obtained from the property owner for drainage on his property.
1.5 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for Contractor Quality Control approval. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Plan Of Operations; G[, [_____]]

Submit complete and detailed descriptions of proposed earthwork plan. This plan must include, but not be limited to, the Contractor's proposed sequence of construction for all earthwork.
including backfill and embankment items; methods and types of equipment to be utilized for all earthwork operations, including transporting, placing and compacting; quantity, type and final disposition of stockpiled materials; location and drainage of proposed stockpiles; proposed disposition of all excavated materials, including items which are anticipated to be disposed of off-site. Submit the earthwork plan to the Government not less than 30 days prior to initiating any earthwork operation.

**Embankment And Backfill Materials; G[, [____]]**

At least 30 days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material.

**Excavation; G[, [____]]**

Submit complete and detailed descriptions of proposed excavation plan. Obtain approval of the detailed plan from the Contracting Officer prior to starting the work. If necessary, modify the plan as required to meet field conditions, and the modifications must be approved prior to use. This plan must include:

a. Proposed methods for preventing interference with, or damage to, existing underground or overhead utility lines, trees designated to remain and other man-made facilities or natural features designated to remain within or adjacent to the construction rights-of-way.

b. Provision for coordinating the work with other Contractors working in the construction rights-of-way or on facilities crossing or adjacent to this work.

c. The proposed methods for controlling surface and ground water in the borrow areas and required excavations.

d. Stockpiling plan for embankment material before it is transported to the project site showing locations, stockpile heights, slopes, limits, and drainage around the stockpile areas.

e. A complete listing of equipment used for excavation and to transport the excavated material.

f. The proposed sequence of work for excavating the borrow areas with plan and cross sectional views showing starting and final work locations and clearing, grubbing and stripping limits.

g. The proposals for conserving arable land and for making optimum use of available borrow, including the Contractor's proposed methods for grading the bottom of the borrow areas after completing use of the borrow areas.

h. The proposed haul road and haulage patterns, and plan for implementing dust control measures.

i. Proposed disposition of all excavated materials, including items which are anticipated to be disposed of off-site.
1.6 PROJECT SITE CONDITIONS

**************************************************************************

NOTE: The following paragraphs are commonly included with Division 02, EXISTING CONDITIONS. If those sections are to be used, the following paragraphs should be deleted.

**************************************************************************

1.6.1 Protection of Man-Made Facilities and Natural Features

Trees within the clearing area will be felled in such a manner as to avoid damage to trees left standing and trees outside the clearing area, existing buildings, man-made facilities and natural features, with due regard to the safety of employees and others, and in compliance with EM 385-1-1. Excavation will follow the same requirements specified above for felling trees and will be in compliance with EM 385-1-1. Existing utility lines that are shown on the drawings or the locations of which are made known to the Contractor prior to excavation and that are to be retained will be protected from damage during excavation. When utility lines that are to be removed are encountered within the area of operations, notify the applicable utility companies in sufficient time for measures to be taken to prevent interruption of the services.

1.6.2 Historical, Archeological, and Cultural Resources

Historical, archeological, and cultural resources within the Contractor's work limits [are known to exist] [may exist]. If, during construction activities, the Contractor observes items that may have historical or archeological value, such observations will be reported immediately to the Contracting Officer so that appropriate authorities may be notified and a determination made as to their significance and what, if any, special disposition of the finds should be made. Cease all activities that may result in the destruction of these resources and prevent the workers from trespassing on or otherwise damaging such resources.
1.6.3 Subsurface Data

Subsurface soil boring logs are [shown on the drawings] [included in these specifications] [found in the Project Geotechnical Report]. Subsurface investigation reports and samples of materials obtained from subsurface investigations may be examined at the [_____] District Office. These data represent subsurface information at the boring locations; however, variations may exist in the subsurface between boring locations. The Contractor is ultimately responsible for subsurface interpretation across the entire project site. Groundwater levels indicated on the soil boring logs were levels found at the time of exploration. The groundwater table can vary significantly depending on time of year, variation from normal precipitation, and river stage or tide level. Contractor is ultimately responsible for subsurface interpretation across the entire project site.

1.7 MERCHANTABLE TIMBER

**************************************************************************
NOTE: The following paragraphs are commonly included with Division 02, EXISTING CONDITIONS. If those sections are to be used, the following paragraphs should be deleted.
**************************************************************************

Merchantable timber remaining within the areas to be cleared on or after the date of award of this contract may be disposed of as the Contractor sees fit, as long as such merchantable timber is either removed from the rights-of-way or is satisfactorily disposed of in accordance with the paragraph DISPOSITION OF CLEARED, GRUBBED, AND STRIPPED MATERIAL DISPOSITION OF EXCAVATED MATERIAL and the Contractor complies with all applicable State and local regulations and laws.

1.8 SEQUENCING

1.8.1 Clearing and Grubbing

**************************************************************************
NOTE: If the specification for this project includes Section 31 11 00, CLEARING and GRUBBING, the following paragraph should be deleted.
**************************************************************************

Complete all clearing and grubbing work at least [100] [_____] meters [300][_____] feet in advance of embankment construction. [In locations where work on drainage structures is performed prior to embankment construction, complete all clearing and grubbing for the structure at least [_____] meters feet on each side of the structure, measured along the levee centerline and [_____] meters feet perpendicular to the structure.] If regrowth of vegetation or trees occurs after clearing and grubbing and before placement of embankment, the Contractor will be required to clear and grub again prior to embankment construction.

1.8.2 Stripping

After inspection and acceptance of cleared and grubbed areas, stripping may proceed. All stripping work must be completed not more than [_____] meters feet in advance of embankment construction.
PART 2   PRODUCTS

**************************************************************************
NOTE: After "PART 2 PRODUCTS" above, insert the following "(NOT APPLICABLE)", if there are no subparagraphs in PART 2. PART 2 material requirements should be added for contracts in which the Contractor is required to supply materials.
**************************************************************************

2.1 HAUL ROAD MATERIALS
[____].

2.2 TYPES OF FILL MATERIALS

**************************************************************************
NOTE 1: The types of fill materials used for levee construction usually depend on the availability of materials from required construction excavation and the nearby borrow sources. The material types listed below as satisfactory materials are often used in levee construction.

2: Separate paragraphs, such as those below, should be included for EACH material type that is to be placed under a contract. The plans should clearly show, with labels, the location of the fill types. Embankment fills should include, but not be limited to, the levee, berms, inspection trench, cutoff trenches and any other specified fill or backfill. This allows the Designer and Specifications Engineer to use multiple fill types within the same contract and clearly indicate locations of each type. The types of satisfactory materials should be edited for each type of fill. The bid schedule should include a line for each type of fill. Where multiple fills are placed in layers or zoning, the measurement, payment and tolerance paragraphs should be edited to specify the interfaces of the multiple fill types.

Omit the following soil types which are not applicable to the specific project.
**************************************************************************

2.2.1 [Select Fill]

Obtain select fill embankment material from [the borrow site provided by the Government] [sources provided by the Contractor] [required excavation]. Provide select fill material consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.2 [Impervious Fill]

**************************************************************************
NOTES: Caution should be exercised regarding the use of high plasticity clay and silt (CH, MH) soils with Plasticity Indices greater than about 40 (30 in dry climates and 50 in humid climates). Spreading
and compacting CH or MH materials can also present constructability problems due to difficulty maintaining proper moisture content. These soils are susceptible to shrinkage and cracking upon drying. Seasonal cycles of swelling and shrinkage can also result in loss of shear strength, which may ultimately result in slope instability. Chemical treatment, such as lime, has been used to reduce the PI and potential for cracking.

Compact Impervious Fill material using self-propelled or towed sheeps-foot rollers.

Provide material consisting of satisfactory impervious material classified as lean clay (CL), fat clay (CH), low plasticity silt (ML), high plasticity silt (MH), sand containing more than 30 percent of clay (CL), and borderline clay and silt (CL-ML) in accordance with ASTM D2487.

2.2.3 Pervious Fill

NOTE: The designer should define the types of material which are acceptable as Pervious Fill.

Provide material consisting of satisfactory pervious material classified as well graded sand (SW), poorly graded sand (SP), poorly graded gravel (GP) or well graded gravel (GW) in accordance with ASTM D2487.

2.2.4 Random Fill

Provide random fill consisting of any satisfactory materials other than those classified in ASTM D2487 as [_____] [and any silt or sand with a uniformity coefficient (Cu) less than 6]. Random fill may consist of select fill, impervious fill, and pervious fill, or a combination of them.

2.2.5 Random Rock

NOTE: Random rock is sometimes used in levee construction to build up an underwater levee toe foundation or to buttress a slope in a constricted area. Due to its high permeability, random rock or pervious fill should not be used alone as levee fill material. The designer should select the types of acceptable rock material and the maximum allowable percent fines.

Provide random rock consisting primarily of [_____] (shale, siltstone, sandstone, granite or limestone) obtained from a source provided by the Contractor. Provide random rock that is free of silt, clay, or other earth material in quantities greater than [_____] [5] percent by weight, and containing no debris or organic material. Random rock must be reasonably well-graded and the largest stones must have a maximum dimension not exceeding [_____] [450] mm [_____] [18] inches. Control rock production at the source such that not more than 20 percent of the material has a maximum dimension between adjacent earth fill choke off with a layer of finer...
random rock material. Random rock placed within 1 meter 3 feet of any structure must have a maximum size of 125 mm 5 inches.

[2.2.6 Coarse Drainage Gravel

**************************************************************************

NOTE: It is important to use appropriate filter criteria in the design of the drainage features. Selection of the gradation for the coarse and fine drainage materials should be developed with consideration of filter compatibility with native soils and the materials to be obtained for use.

**************************************************************************

Obtain coarse gravel material for the [rectangular and trapezoidal] toe drains [landside seepage berms] [road stone] from a source [provided by the Contractor]. Provide coarse drainage gravel that is non-calcareous, composed of tough durable particles, and does not contain any organic material or soft, friable particles in quantities. Blast furnace slag will not be permitted. The gravel material in-place must meet the quality requirements of [AASHTO M 43, Size No. 57][ASTM C33/C33M No. 57].

[2.2.7 Fine Drainage Gravel

**************************************************************************

NOTE: Identify source of materials. It is important to use appropriate filter criteria in the design of the drainage features. Selection of the gradation for the coarse and fine drainage materials should be developed with consideration of filter compatibility with native soils and the materials to be obtained for use.

**************************************************************************

Obtain fine drainage gravel material for the [rectangular and trapezoidal] toe drains [landside seepage berms] [road stone] from a source [provided by the Contractor]. Provide fine drainage gravel material that is non-calcareous, composed of tough durable particles, and does not contain organic material. The fine drainage gravel in-place must meet the requirements of [AASHTO M 43, Size No. 8][ASTM C33/C33M].

[2.2.8 Filter Sand

**************************************************************************

NOTE: It is important to use appropriate filter criteria in the design of the drainage features. Selection of the gradation for the coarse and fine drainage materials should be developed with consideration of filter compatibility with native soils and the materials to be obtained for use.

**************************************************************************

At least [30] [_____] days prior to delivery of any Contractor-furnished material to the worksite, submit soil classification test results and a gradation curve for each of the proposed filter materials to be used. Fine aggregate for the filter sand in-place must meet the quality requirements of ASTM C33/C33M grading for fine aggregate with additional limits on the allowable percentage passing the No. 200 sieve as specified below.

SECTION 35 41 00 Page 21
<table>

</tr>
</tbody>
</table>

Additionally, the filter sand must not contain any organic matter or soft friable particles.

2.2.9 Bedding

Bedding material, placed as a backing layer must consist of satisfactory pervious fill material satisfying the material requirements presented in [Section 31 36 00 WIRE MESH GABIONS[ AND MATTRESSES]] and [Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES].

2.2.10 Topsoil

Provide topsoil consisting of organic soil and place on the levee slopes as shown on the contract drawings and as specified in Section [32 92 23 SODDING] [_____].

2.2.11 Semicompacted Fill

NOTE: The designer should list the material types that are acceptable for semicompacted fill, which can be defined in terms of previously defined fill types or basic material types.

Provide material for semicompacted fill consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.12 Uncompacted Fill

NOTE: The designer should list the material types that are acceptable for uncompacted fill, which can be defined in terms of previously defined fill types or basic material types.

Provide material for uncompacted fill consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].

2.2.13 Hydraulic Fill for Berms and Depressed Areas

**************************************************************************
NOTE: The designer should list the material types that are acceptable for hydraulic fill, which can be defined in terms of previously defined fill types or basic material types.
**************************************************************************

Provide material for hydraulic fill consisting of satisfactory materials classified in accordance with ASTM D2487 as [____].
NOTE: Caution should be used when specifying hydraulic fill. Hydraulic fill is to be used only in stability berms, pit fills, and seepage berms. Hydraulic fill will normally not be used in construction for levee embankment. In addition to requiring a large levee footprint, the levee embankment constructed by hydraulic fill is susceptible to soil liquefaction, and excessive seepage. Hydraulic fill also erodes quickly in a situation where a levee is overtopped or where an impervious covering is penetrated. See the appropriate Engineering Manuals for further guidance.

Tie this back to Section 01 45 00.00 10 01 45 00.00 20 01 45 00.00 40 QUALITY CONTROL requirement for inspection and validation of CQC laboratories by the government.

Place fill shown on the drawings as hydraulic fill by hydraulic methods in accordance with the plan of operations approved by the Contracting Officer. Thirty (30) days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, submit for approval a Plan of Operations for accomplishing all embankment and backfill construction and for the location and construction of haul roads. This plan must include, but not be limited to, the proposed sequence of construction for embankment and backfill items, and methods and types of equipment to be utilized for all embankment and backfill operations, including transporting, placing, and compaction. This plan must also include the names and addresses of the [commercial testing labs] [engineering firms] which will perform the soil testing and inspection and describe how all required soils testing will be performed. The dredged material must have, as placed, not less than [_____] percent by weight passing U.S. Standard Sieve No. [_____] and not less than [_____] percent by weight passing a U.S. Standard Sieve No. [____].

[2.3 MANUFACTURED PRODUCTS

**************************************************************************

NOTE: Add applicable requirements.

**************************************************************************

[____].

[2.4 GROUTS AND DENTAL CONCRETE

Provide grouts and dental concrete as specified in concrete Section [____] CONCRETE, except that the slump must be [____] mm inches for dental concrete.

[2.5 STABILIZERS

**************************************************************************

NOTE: Add applicable requirements.

**************************************************************************

[____].
2.6 INSTRUMENTATION

2.6.1 Piezometers and Observation Wells

Install piezometers and observation wells as shown.

2.6.2 Settlement Markers and Survey Monuments

Install survey monuments and settlement markers as shown.

2.6.3 Settlement Gages

Provide settlement gages as shown.

PART 3 EXECUTION

3.1 CONSTRUCTION

3.1.1 Lines and Grades

Construct embankment and backfill to the lines, grades, and cross sections indicated on the drawings, unless otherwise directed by the Contracting Officer. The Government reserves the right to increase or decrease the foundation widths and embankment slopes or to make such other changes in the embankment or backfill sections as may be deemed necessary to produce a safe structure. Changes in quantities resulting from such revisions will not constitute justification for change in contract unit prices, except as provided for in FAR 52.211-18 Variation in Estimated Quantities Clause. Increases in height of section, made to compensate for settlement or consolidation of the embankment material subsequent to the completion of the embankment, will not exceed [_____] percent of the height above the foundation at the levee centerline indicated. Provide end slopes and side slopes of partial fill sections no steeper than [one vertical on [_____] horizontal] [, unless otherwise shown on the drawings].

3.1.2 Conduct of the Work

Maintain and protect the embankment and backfill in a satisfactory condition at all times until final completion and acceptance of all work under the Contract. [If, in the opinion of the Contracting Officer, the hauling equipment causes horizontal shear planes or slicken sides, rutting, quaking, heaving, cracking, or excessive deformation of the embankment or backfill, limit the type, load, or travel speed of the hauling equipment on the embankment or backfill.] The Contractor may be required to remove, at no additional payment, any embankment material placed outside of prescribed slope lines. Replace approved embankment or backfill material which is lost in transit or rendered unsuitable after being placed in the embankment or backfill and before final acceptance of the work in a satisfactory manner and no additional payment will be made therefore.

Excavate and remove from the embankment or backfill any material which is unsatisfactory, dispose of such material, and refill the excavated area as directed, all at no cost to the Government.

3.2 CLEARING

Accomplish clearing within the [limits][construction limits shown on the drawings] of existing ground to receive embankment [and structures], together with strips [1.5] [_____] meters [5] [_____] feet wide, beyond and
contiguous thereto, existing levees to be degraded, ponding areas, ditches, structures, traverses, channels, riprap, revetment, borrow areas and ramps. Clear trees, downed timber, snags, slash, brush, garbage, trash, debris, fencing and other items ([_____] mm inches above) [flush with] the existing ground surface. Protect trees and vegetation designated to be left standing or to remain from damage from construction operations. Limit clearing of borrow areas to the minimum area required for construction operations.

3.3 GRUBBING

Accomplish grubbing within the [limits] construction limits shown on the drawings] of existing ground to receive embankment [and structures], together with strips [1.5] [_____] meters [5] [_____] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, ditches, structures, traverses, channels, riprap, revetment, borrow areas and ramps. Accomplish grubbing to a depth of at least [1] [_____] m [3] [_____] feet below the existing ground surface. Fill holes caused by grubbing operations and removal of pipes and drains, excluding holes in borrow areas, channels and ditches [above required grade], with satisfactory material as specified in paragraph [______]. Place material in [_____] mm inch layers to the elevation of the adjacent ground surface and each layer compacted to a density at least equal to that of the adjoining undisturbed material.

3.4 STRIPPING

The entire area within the [limits] construction limits shown on the drawings] of existing ground to receive embankment and structures, together with strips [1.5] [_____] meters [5] [_____] feet wide, beyond and contiguous thereto, existing levees to be degraded, ponding areas, and ditches [shown on the drawing must be stripped to remove crops, weeds, grass, and other vegetative materials to the ground surface [and topsoil to a depth of [_____] mm inches]].

3.5 DISPOSITION OF CLEARED, GRUBBED, AND STRIPPED MATERIAL

**************************************************************************
NOTE: Delete undesirable options for Disposition of Cleared, Grubbed, and Stripped Materials.
**************************************************************************

Except as otherwise specified or indicated on the drawings, dispose all materials resulting from clearing and grubbing operations at the Contractor's option, by windrowing or stockpiling within construction limits, burying within construction limits, burning, chipping, removal from the site, or a combination thereof. Do not bury or place any material resulting from clearing and grubbing operations within the levee foundation or any structural foundation. Make a reasonable effort to channel merchantable material into the commercial market and to make beneficial use of the materials resulting from clearing and grubbing. [Temporarily stockpile the topsoil material resulting from the stripping operations within the rights-of-way.]

3.5.1 Windrows

Place cleared, grubbed and stripped material [as shown on the drawings] in a neat windrow or in piles with tree limbs trimmed sufficiently to make the windrow as small as practicable. Do not extend cleared, grubbed or
stripped material beyond the construction limits.

3.5.2 Burning

Subject to applicable Federal, State and local burning restrictions, the Contractor may burn material within the contract rights-of-way. Conduct burning operations to prevent damage to adjacent man-made facilities and natural features. The Contractor is responsible for any damage to life and property resulting from fires that are started by the Contractor’s employees or as a result of the Contractor’s operations. Furnish, at the site of burning operations, adequate fire fighting equipment to properly equip personnel for fighting fires. Guard fires at all times and provide constant surveillance until they have been extinguished. Remove all unburned material (material not reduced to ash) from the site or dispose of by [_____].

3.5.3 Burying

Subject to applicable Federal, State and local burying restrictions, the Contractor may bury the cleared and grubbed material in the area(s) as shown on the drawings or in [______]. Do not bury material within [_____] meters feet of any standing timber. Cover all buried material with a minimum of [_____] mm inches of earth.

3.5.4 Chipping

All cut timber, down timber, dead timber, branches, and brush may be chipped. Haul the chips to stockpiles indicated on the drawings or to other locations approved by the Contracting Officer or remove from site of work. Deposit chips in these areas in piles or windrows [above] [below] elevation [_____] NGVD.

3.5.5 Removal from Site of Work

The Contractor may elect to remove all or part of the cleared and grubbed materials from the site of the work[ in accordance with Section 01 57 19 TEMPORARY ENVIRONMENTAL CONTROLS]. The Contractor may opt either to retain any such materials of value or dispose of them by sale or otherwise. The Government is not responsible for the protection and safekeeping of any materials retained by the Contractor. [Materials resulting from the clearing and grubbing operations must be removed from the site [weekly] [monthly].][ Remove such materials from the site of the work before the date of completion of the work.]

3.6 REMOVAL OR PLUGGING OF ABANDONED PIPE AND CONDUITS

**************************************************************************
NOTE: The terms and conditions in any permits and environmental commitments obtained by the Government must be made a part of the contract. The designer must include technical requirements necessary to comply with these terms and commitments.
**************************************************************************

Remove abandoned pipes and conduits to the limits shown on the drawings or abandon in place by grouting or filling with concrete as shown on the plans a minimum distance of [_____] meters feet from [_____]. Prior to plugging, clean the interior of the pipe to be plugged and place the concrete in such a manner as to insure a dense, well bonded plug.
3.7 SHORING, SHEETING, AND BRACING

**************************************************************************
NOTE: Add applicable minimum requirements for the shoring, sheeting and bracing plan based upon site specific conditions.
**************************************************************************

Submit a detailed shoring, sheeting and bracing plan [_____] days prior to the beginning of any excavation so supported. The plan for shoring, sheeting and bracing will be prepared and certified by licensed professional engineer, registered in [______]. All shoring must be designed so that it is effective to the bottom of the excavation, and must be based upon calculation of pressures exerted by the earthen materials to be retained, including the condition and nature of those materials as well as any surcharge loads imparted to the excavation by slopes, equipment, traffic, or stored materials. Include in the plan drawings and design computations of the proposed shoring, sheeting, and bracing, and documentation, showing details of the coordination and approval of shoring, sheeting, and bracing by the applicable parties. Obtain approval of the detailed plan from the Contracting Officer prior to starting the work. If necessary, modify the plan as required to meet field conditions, and the modifications must be approved prior to use. Install shoring, sheeting, and bracing where required for the protection of existing natural features and man-made facilities, for the safety of workers and the public, in compliance with EM 385-1-1, and to insure the integrity of the embankment. Design, furnish and install sheet piling, cribbing, bulkheads, bracing, shores or whatever means that may be necessary to support earthen material carrying structures and other improvements, and maintain such piling, cribbing, bulkheads, bracing, shores in position until they are no longer needed. Do not use shoring, sheeting and bracing in lieu of the required excavation slopes. Design and properly install shoring, sheeting, and bracing to withstand anticipated loads. Remove all shoring, sheeting and bracing as embankment and backfill operations progress so that the backfill is placed directly against the undisturbed excavation face. Shoring deemed necessary by the Contracting Officer must remain in place during the backfill operations. Remove shoring in such a manner as not to disturb or damage the completed work or any adjacent property. If any problems are encountered during excavation, stop excavation operation and notify the Contracting Officer.

3.8 DEWATERING AND DIVERSION

Accomplish surface and groundwater control in coordination with the required excavation and embankment construction. Surface and/or groundwater control may necessitate the use of temporary diversion ditches, cofferdams and/or dewatering by the use of pumping. Methods for care of surface water and for controlling the surface and groundwater levels will be subject to approval of the Contracting Officer. Borrow pits must be drained and kept dry during excavation, as excavation will not be permitted in water nor will excavated material be scraped, dragged or otherwise moved through water. Drain borrow areas by ditching, sump pumping, or other approved methods. Drain borrow areas excavated under this contract and flooded from rains or high river stages and allow to dry as quickly as practicable after the high river stage has passed.

Minimize surface runoff from entering the work areas. Complete the necessary ditching or earthwork shaping at the end of each workday or as
necessary to prevent surface runoff from entering the work area. Drain excess precipitation that collects in the work areas and allow to dry as quickly as practicable before work resumes.

3.9 **EXCAVATION**

Excavation will consist of removal of material in preparing the foundations to the lines and grades shown on the drawings, removal of material from ditches and channels to the lines and grades shown on the drawings, removal of objectionable materials and obtaining required fill materials from the borrow areas.[Blasting will not be permitted.] Over excavation will be backfilled to grade with satisfactory material and compacted to a density of at least that of the surrounding material. Backfill and compact excavation beyond the lines shown on the plans in accordance with adjacent materials as directed.

[3.9.1 Inspection Trench]

Excavate an inspection trench and maintain free of standing water to the dimensions and locations shown on the drawings or as indicated by the Contracting Officer. Excavate the trench at least [_____] meters feet in advance of but not more than [_____] meters feet in advance of construction. When the inspection trench excavation is complete, notify the Contracting Officer's representative in order to examine the foundation stratigraphy in the side walls and bottom of the inspection trench.

[3.9.2 Structures]

Provide excavations for structures conforming to the dimensions and elevations indicated for each structure and footing, except as specified hereinafter, and include trenching for utility and foundation drainage systems to a point [_____] meters feet beyond each structure and all work incidental thereto[except where the concrete for walls and footings is authorized to be deposited directly against excavated surfaces]. Excavation must extend a sufficient distance from walls and footings to allow for placing and removal of forms. Replace satisfactory material removed below the depths indicated without specific direction of the Contracting Officer at no additional cost to the Government and fill in accordance with paragraph OVER EXCAVATION above.[Backfill over excavation below required invert elevations or bottoms of footings with concrete at no additional cost to the Government. Do not construct footings on unsatisfactory material as determined by the Contracting Officer.] [Remove and replace excessively wet and/or soft material in subgrades resulting from water ponding in footing excavations with [lean concrete] [satisfactory material compacted to the density of the surrounding undisturbed material]].

3.9.3 **Channels**

Excavate channels at the locations and to the lines and grades shown on the drawings and in accordance with paragraph TOLERANCES.

3.9.4 **Ditches**

Excavate drainage ditches at the locations and to the lines and grades shown on the drawings and in accordance with paragraph TOLERANCES.
3.9.5 Slopes and Surcharges

Temporary excavation slopes for any channel, structure excavation, or other required excavation must not be steeper than the specified finished slope or the specified construction slope. Any field deviations from this provision must be approved by the Contracting Officer. Temporary slopes must be benched such that the average slope is not steeper than the specified slope. In addition, do not surcharge temporary, permanent, or construction slope with excavated or stockpiled material or with heavy construction equipment which would have the same effect as the surcharge material. Maintain the toe of stockpiled material a minimum distance back from the top of the finished excavation equal to the depth of the excavation. Determine the maximum height of such stockpile without causing instability of the excavation slope and provide justification for such in the Excavation Plan submittal.

3.9.6 Borrow Areas

Submit a written statement to the Government not later than [_____] days after receipt of Notice to Proceed indicating the Contractor's intention to use the specified Government-furnished borrow area(s), Contractor-furnished borrow area(s), dredged borrow areas, or a combination of these borrow areas.

3.9.6.1 Government-Furnished

Excavate borrow areas to the extent necessary to obtain satisfactory material within the lines and grades as shown on the drawings. When the material necessary for the construction of the embankment and berms cannot be obtained from adjacent borrow areas, obtain it from other Government-furnished borrow areas. [The permissible depth(s) in the borrow areas are indicated on the drawings.] Backfill any excavation below the depths and slopes specified herein or shown on the drawings, at the Contractor's expense, to the specified permissible excavation line, with satisfactory [material(s)] [cohesive material] [or] [other material] as specified by the Contracting Officer to a density of at least that of the surrounding material. Drain borrow areas and keep dry during excavation. In so far as is practicable, do not remove unsatisfactory materials in borrow areas unless otherwise directed by the Contracting Officer.

3.9.6.2 Contractor-Furnished

Proposed borrow areas will be subject to approval by the Contracting Officer. Any borrow sources proposed, accepted and approved by the Contracting Officer must meet all applicable Federal, State and local requirements including written evidence to the Contracting Officer that the Contractor has obtained property rights and access to the material therein. [Proposed sources located within [_____] meters feet landward and [_____] meters feet riverward of the levee between Stations [_____] and [_____] will not be permitted.] No payment will be made for Contractor-furnished borrow areas.

3.9.6.3 Dredged

Dredging operations may be conducted to obtain material for the pervious zones or the random zones subject to the requirements and the conditions specified herein. Dredging operations may be conducted at approved locations in the present stream bed of [_____] or as shown on the drawings. Dredging operations will not be permitted within [_____] meters
feet of the levee centerline and no material will be obtained within [_____] meters feet of any revetment, stabilized channel line, bridge pier and/or abutment.

3.9.7 Cut-Off Trenches

Excavate and maintain cutoff trench free of standing water to the dimensions and locations shown on the drawings. Excavate the trench at least [_____] meters feet in advance of but not more than [_____] meters feet of construction.

3.9.8 Existing Levees and Spoil Banks

Remove existing levees and spoil banks as shown on the drawings. In areas where the existing levee is located within the random or berm zone of the levee, incorporate it into the embankment. Remove portions of existing embankments which lie within the impervious zone of the levee. Utilize existing levees located within the rights-of-way landward of the levee and berms to be constructed, as borrow material, but only after equal protection has been provided by construction of the new levee. When excavated for borrow material, remove the existing levee to the adjacent ground surface in a uniform manner, and shape to maintain drainage in accordance with the adjacent natural drainage pattern. [When lower levels of flood protection would be caused by levee construction provide the Contracting Officer a plan to maintain existing levels of protection during the construction period.]

3.9.9 Toe Drains

Excavate toe drains to the dimensions and the locations indicated on the drawings.

3.9.10 Utilities

Shape excavations for pipe beds to fit the contour of the pipe over a width of not less than 0.6 of the pipe diameter, or as shown on the drawings.

3.9.11 Rock

Clean rock and other hard foundation materials of loose debris and cut to a firm surface, either level, stepped, or serrated, as shown on the drawings. Remove loose disintegrated rock and thin strata. Rock excavation will not be measured for payment. [Rock excavation will not be paid for as a separate bid item.]

3.9.12 Riprap and Bedding

Perform excavations for riprap and bedding at the locations and to the lines and grades shown.

3.10 TOLERANCES

Allow a tolerance of [_____] mm inches above or below the prescribed grade in the excavation for channels, ditches, inspection trenches, cutoff trenches, excavations for riprap and bedding, and mandatory borrow areas. Allow a tolerance of [_____] mm inches below the prescribed grade in the excavation for all other borrow areas.

Construct all embankments and backfills to the grades, lines, and
cross-sections shown on the drawings. At all points a tolerance of [100] \([_____]\) mm \([____]\) inches above or below the prescribed grade will be permitted in the final dressing, provided that any excess material is so distributed that the crown of the levee drains and that there are no abrupt humps or depressions in any surfaces. For topsoil, a tolerance of \([____]\) mm inches above the thickness as shown on the drawings will be permitted.

3.11 SLIDES

In case sliding or slope failure occurs in any part of the excavations prescribed in this section after they have been excavated, but prior to final acceptance of all work under the contract, repair the slide or slope failure as directed by the Contracting Officer. In case the slide or slope failure is caused through the fault or negligence of the Contractor, repair at no cost to the Government.

3.12 TRAVERSES

Leave traverses unexcavated between borrow areas at the locations \([and to the cross sections]\) shown on the drawings. \([\text{Provide traverses with minimum top widths of } [____] \text{ meters feet with side slopes no steeper than 1 on 3 or as shown on the drawings.}]\)

3.13 STOCKPILES

Provisions of paragraph SLOPES AND SURCHARGES are applicable to all stockpiled materials. Upon completion of construction operations, remove and dispose of all remaining stockpiled material by the disposal methods specified in paragraph DISPOSITION OF EXCAVATED MATERIALS.

3.14 SURFACE DRAINAGE OF COMPLETED AREAS

Grade the areas shown on the drawings designated as "GRADE FOR SURFACE DRAINAGE", the borrow areas, and the finished embankment areas to the lines and grades shown on the drawings. Provide surface that is free from sharp ridges, gullies, potholes, sinkholes, and any other surface irregularities. A tolerance of \([____]\) mm inches above or below the prescribed grade will be allowed provided that the surface drains in the direction as indicated on the drawings.

3.15 MAINTENANCE OF WORK

3.15.1 Debris Removal

Maintain all ditch and channel excavations free from leaves, brush, sticks, trash, and other debris until final acceptance of all work under the contract at no additional cost to the Government.

3.15.2 Sediment Removal

Prior to final acceptance of all work under this contract, remove sediments from ditch or channel excavations to restore design grade and section at no additional cost to the Government.

3.16 DISPOSITION OF EXCAVATED MATERIALS

3.16.1 Satisfactory Materials

Incorporate satisfactory excavated material in the appropriate zones of the
Provide satisfactory material consisting of material as defined in paragraph DEFINITIONS, subparagraph SATISFACTORY MATERIALS. When direct placement is not practicable, satisfactory material from the excavation [may] [must] be stockpiled for subsequent use in parts of the work for which it is specified herein and/or as indicated on the drawings. Dispose satisfactory materials in excess of the quantity necessary to construct backfills and embankments as specified for unsatisfactory materials.

3.16.2 Unsatisfactory Materials

Unsatisfactory materials will be as defined in paragraph DEFINITIONS, subparagraph UNSATISFACTORY MATERIALS. Permanently dispose unsatisfactory materials from the excavations prescribed in this section by [removal from the site to a Contractor-furnished disposal area] [placing in the disposal area shown on the drawings] [placing in abandoned portions of the borrow areas]. [Shape the material so that its surface is free from abrupt changes in grade and slope to drain.] [No additional payment will be made for Contractor-furnished disposal areas] [placing in abandoned portions of the borrow areas]. [Shape the material so that its surface is free from abrupt changes in grade and slope to drain.] [No additional payment will be made for Contractor-furnished disposal areas.]

3.17 PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS

******************************************************************************
NOTE: If Section 31 60 00 FOUNDATION PREPARATION is to be used, the following sections may be deleted or modified as appropriate.
******************************************************************************

3.17.1 Earth

******************************************************************************
NOTE: Modify and or add to this paragraph to be compatible with the embankment construction procedures. If uncompacted or semicompacted fill is being utilized major modifications may be required.
******************************************************************************

After excavation (as described in paragraph EXCAVATION) or stripping (as described in paragraph CLEARING, GRUBBING AND STRIPPING) of the embankment foundation [and excavation of the [cut-off trench] [inspection trench]] to the extent indicated or otherwise required, break down the sides of stump holes, test pits, and other similar cavities or depressions to flatten out the slopes, and scarify the sides of the cut or hole to provide bond between the foundation material and the fill. [Scarf the slopes and bottom of the cut-off trench as directed.] Perform all scarifying and breaking of ground surface parallel to the centerline of the levee. Unless otherwise directed, fill each depression with the same material type that is to be placed immediately above the foundation. Place the fill in layers, moistened, and compacted in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION for the specific material type. Compact materials which cannot be compacted by roller equipment because of inadequate clearances with power tampers in accordance with the paragraph COMPACTION for the specific material type.

After filling of depressions [and cut-off trench] and immediately prior to placement of compacted fill in any section of the embankment, thoroughly
loosen the foundation of such section by scarifying, plowing, discing or harrowing to a minimum depth of [_____] [150] mm [_____] [6] inches, and adjust the moisture content to the amount specified in paragraph MOISTURE CONTROL for the appropriate type of material. [After removal of roots or other debris turned up in the process of loosening, compact the entire surface of the embankment foundation area by [_____] complete coverages of the compaction equipment as specified for the appropriate type of fill.] Immediately prior to placement of compacted fill on or against the surfaces of any partial fill section, remove all soft or loose material, all material containing cracks or gullies, and all material that does not conform with the specified zoning of the embankment. Loosen the remaining surface of the partial fill by scarifying, plowing, discing or harrowing to a minimum depth of [_____] [150] mm [_____] [6] inches, and adjust the moisture content as specified in paragraph MOISTURE CONTROL for the appropriate type of material. Compact the surface of the partial fill section upon which fill is to be placed as specified for the appropriate type of fill. No separate payment will be made for loosening and rolling the foundation area, the abutment area, or the surfaces of partial fill sections, but the entire cost thereof will be included in the applicable contract price for fill.

3.17.2 Rock Foundation

Excavate all rock surfaces upon which or against which embankment materials are to be placed (as described in paragraph EXCAVATION) or strip (as described in paragraph CLEARING, GRUBBING AND STRIPPING).

Prior to the placement of embankment material upon or against a rock surface, fill all open joints and cracks in that surface with mortar to the depths cleaned. Fill those portions of such rock surfaces where, in the opinion of the Contracting Officer, the compaction of the embankment materials cannot be accomplished satisfactorily with power tampers or other specified compaction equipment, with mortar or concrete as directed to the extent necessary to permit satisfactory use of the compaction equipment. Do not leave a thin coat of mortar on smooth, intact rock surfaces[ as shown on Drawing No. _____ Foundation Preparation and Treatment]. Remove large rock overhangs and protrusions and lay back rock surfaces to a slope no steeper than 4V on 1H by the use of pre-splitting or line drilling techniques in such a manner as to minimize damage to the underlying rock, or fill the spaces beneath overhangs and around protrusions with tamped concrete so that satisfactory compaction of embankment materials can be accomplished. Rock surfaces must not be more than 0.67 m 2 feet in height, and provide benches of sufficient width as necessary so that the average slope of any rock face is not steeper than [_____] V on [_____] H. Mortar and concrete, including forming as necessary, must conform with the applicable provisions of Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE] [_____] .

3.17.3 Benching

Benching into existing levee embankment and abutments is required in order to place and compact the material in horizontal layers. The vertical face cut into the existing embankment or abutment resulting from the benching operation must be a minimum of [_____] mm inches in height but can not exceed [_____] mm inches in height.]

3.17.4 Preloading

**************************************************************************

SECTION 35 41 00 Page 33
NOTE: Insert applicable language for preloading as required. Identify the extent of the area over which preloading will be required by designating the stationing along the centerline of the levee. Indicate the length of time the preload will be left in place or define the settlement conditions which must occur before construction in the preloaded area can proceed. Address whether or not the preload embankment will become part of the permanent levee.

Preloading of the levee foundation will be required between Station [_____] and Station [_____]. The preload embankment will be constructed to the cross section shown on the drawings for the applicable location. No additional construction is permitted after completion of the construction of the preload embankment in the preloaded areas [for [_____] days] [until the required settlement has occurred].

3.17.5 [Settlement of Foundation]

NOTE: Modify the following as necessary for determining foundation settlement, which may be achieved by installing settlement gages.

The Contractor [must] [may elect to] furnish and install settlement gages, at the settlement measurement locations shown on the plans, for determination of settlement of the foundation during construction within the settlement measurement ranges shown on the drawings. [Locate each settlement measurement location on the prepared foundation at a point directly under the crown of the planned levee section prior to placing of fill material. Level gage beds by removing the minimum amount of earth necessary to produce an even foundation and in such manner that the density of gage beds will remain at the same density as the undisturbed adjacent ground. Leveling of gage beds by the addition of fill will not be permitted. Maintain gages and extend, if necessary, during the construction. The type and arrangement of the gages are as shown on the drawings. Make such measurements and determine such elevations on the gages prior to the placing of fill material and again within 72 hours [or longer] after final cross sections have been taken over the completed embankment at the locations of the gages.] [Perform a cross section at the settlement measurement location prior to the placing of fill material to establish the elevation of the foundation/embankment interface.] Settlement measurements will be [verified] [subject to verification] by the Contracting Officer.

3.18 TEST FILL STRIPS

NOTE: Test strips are needed when the volume of the project is large, the compaction requirement will be obtained by specifying the type of compaction equipment and the number of passes on each lift (i.e., a method or procedure specification is being utilized) and there is not sufficient information on the compaction characteristics of the proposed fill materials and equipment to be used for the project. On projects where the levees are small (no greater}
than 5 meters 15 feet high) and on levee raising projects where fill placement zones are narrow (3.3 meters 10 feet), some of the larger compaction equipment specified herein (such as 50-ton rubber tired roller and some tamping rollers) are not appropriate. Consistently Contractors propose using smaller equipment with shorter tamping feet. Test fills, therefore, may also be an appropriate means of evaluating performance and setting placement and compaction criteria to assure satisfactory result.

3.18.1 [General]

Before beginning embankment construction, construct test strip(s) for fill materials to demonstrate that the equipment and compaction procedure will achieve the moisture density relationship as specified. The test strips may be incorporated as part of the final embankment, if the fills meet the requirements of the specifications. Construct the test strips using materials from the borrow sources which have been approved by the Contracting Officer. Perform a test strip for each of the following type of fill materials [______]. Each test strip shall be of sufficient size to allow compaction equipment to achieve normal operating speed over a [______] meter [______] foot length. The test strip must be a minimum of two (2) times wider than the compaction equipment. Construct each test strip with a minimum of 4 lifts. Prior to the construction of the test strips, proof roll the foundation (subgrade) as specified in paragraph [______] and install a 200 mm 8 inch thick subbase layer. Provide a subbase layer consisting of the same material to be used in the test strip and spread and compact to the same requirements. Construct the test strips in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION for the specific material type. Place and spread the fill material in layers in accordance with the applicable provisions of paragraphs PLACEMENT AND SPREADING for the specific material type. Compact each layer of the fill with a minimum of four (4) complete coverages using the specified compaction equipment, and as many additional coverages as may be required to achieve the specified density. Even if the results from the test strips show that the required densities can be obtained with less than four coverages by the compaction equipment, compaction of the impervious and random fills with a minimum of (4) complete coverages is still required. If the use of the proposed compaction equipment causes shearing of the fill, laminations in the fill, or results in inadequate compaction, the Contracting Officer may direct that such roller be removed from the fill and that another appropriate tamping roller be used.]

3.18.2 Testing and Reporting Requirements for Test Strips

Prior to construction of the test strips, perform [_____] laboratory compaction test[s] for each type of material used in test strips. Perform compaction tests in accordance with the requirements specified in paragraph MATERIALS TESTING. Submit test results to the Contracting Officer before construction of the test strips. After placement and spreading of the fill in the test strip, but prior to compaction, obtain five samples from each lift for moisture content determination in accordance with ASTM D2216. Use nuclear density testing equipment in accordance with ASTM D6938. In addition, the following condition applies:

a. Prior to using the nuclear density testing equipment on the site,
submit to the Contracting Officer a certification that the operator has completed a training course approved by the nuclear density testing equipment manufacturer, the most recent data sheet from the manufacturer's calibration, and a copy of the most recent statistical check of the standard count precision.

b. Provide nuclear density testing equipment capable of extending a probe a minimum of 150 mm 6 inches down into a hole.]

After compaction of the fill, perform a minimum of [_____] [5] in-place nuclear density and moisture content tests (in accordance with ASTM D6938) and one (1) sand cone density test (in accordance with ASTM D1556/D1556M) on each lift. Obtain one sample from each test strip for classification testing as specified in paragraph MATERIALS TESTING. All testing and sampling locations will be determined by the Contracting Officer. The Contractor's QC personnel will monitor and document construction and testing of the test strips. Documentation must include weather conditions, soil type, spreading and compaction equipment type, lift thickness, number of coverages, moisture content, dry density, and a plan showing approximate location of sampling and testing. Provide documentation of the test strip construction procedures and results of all testing to the Contracting Officer. Do not commence full scale embankment construction until the equipment and placement methods are approved by the Contracting Officer.

3.19 PLACEMENT AND SPREADING

3.19.1 General

[Prior to beginning embankment placement on the levee foundation, notify the Government that the foundation is ready to receive fill.] [Do not place fill on any part of the embankment foundation until such areas have been inspected and given final approval in writing by the Contracting Officer.]

3.19.1.1 Gradation and Distribution

The gradation and distribution of materials throughout each zone of the levee must be such that the embankment will be free from lenses, pockets, streaks, and layers of material differing substantially in texture or gradation from surrounding material of the same class. If lenses, pockets, or layers of materials differing substantially in texture or gradation from surrounding material occur in the spread material, mix the layer by harrowing or any other approved method to blend the materials. During the placing and spreading process, maintain at all times a force of workers adequate to remove all roots, debris, and oversize stone from all embankment materials. Remove all stones and rock fragments larger than [2/3 of the placement lift thickness measured by the greatest dimension] [75 mm 3 inches in any dimension] [at the source prior to hauling to] [from] the fill. Do not place fill upon a frozen surface, nor incorporate snow, ice, or frozen earth in the embankment.

3.19.1.2 Foundations and Partial Embankment Fills

Keep the foundations and all partial embankment receiving fills thoroughly drained. Placing operations will be such as to avoid mixing of materials from adjacent sections as much as practicable.
3.19.1.3 Equipment Traffic

Route equipment traffic on any embankment zone to distribute the compactive effort as much as practicable. Ruts formed in the surface of any layer of spread material will be filled before that material is compacted. If, in the opinion of the Contracting officer, the compacted surface of any layer of material is too smooth to bond properly with the succeeding layer, loosen the surface by scarifying or other approved methods before material from the succeeding layer is placed.

3.19.2 Placement on Surfaces Containing Frozen Materials

Do not place embankment on a foundation which contains frozen material, [or which has been subjected to freeze-thaw action]. This prohibition encompasses all foundation types, including the natural ground, all prepared subgrades (whether in an excavation or on an embankment, and all layers of previously placed and compacted earth fill which become the foundations for successive layers of earth fill. Remove all material that freezes or has been subjected to freeze-thaw action during the construction work, or during periods of temporary shutdowns, such as, but not limited to nights, holidays, weekends, or winter shutdowns of earthwork operations, to a depth that is acceptable to the Contracting Officer and replace with new material. Alternatively, thaw, dry, rework and recompact the material to the specified criteria before placing additional material. The Contracting Officer will determine when placement of fill must cease due to cold weather. The Contracting Officer may elect to use average daily air temperatures, and/or physical observation of the soils for the determination. Levee embankment material must not contain frozen clumps of soil, snow or ice.

3.19.3 Placement of Embankment and Backfill Against Rock

Clean all rock surfaces upon which or against which embankment materials are to be placed in accordance with paragraph PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS, subparagraph ROCK. In restricted areas where material can not be placed in large lifts with normal spreading and compaction equipment, spread material in lifts not exceeding [_____] mm [inches] and compact with mechanical hand tampers, vibrating plates, or other approved methods and equipment.

3.19.4 Placement of Embankment and Backfill Against Structures

Do not place embankment or backfill on or against concrete less than [14][7] days after placement or 70 percent of the design strength, without prior approval of the Contracting Officer. Do not use crawler-type tractors, vibratory equipment and other similar compaction equipment within [_____] [1] meter [_____] [4] feet of any completed or partially completed structure. Accomplish compaction within [_____] [1] meter [_____] [4] feet of completed or partially completed structures by the use of mechanical hand tampers, vibrating plates, or other approved methods and equipment. Ensure that compaction operations do not damage any existing utilities. Any damage caused by the Contractor's operation must be repaired at the Contractor's expense.

3.19.5 Select Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than

SECTION 35 41 00 Page 37
subsequent layers, then the last bracketed sentence should be selected and the following should be substituted into the appropriate paragraphs below. [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

Place and spread select fill material in layers not more than 200 mm 8 inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [150] [_____] mm [6] [_____] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.6 Coarse Drainage Gravel and Filter Sand

3.19.7 Impervious Fill

NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.

Place and spread the impervious fill material in layers not more than [_____] [200] mm [_____] [8] inches in uncompacted thickness, except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [100] mm [4] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

3.19.8 Pervious Fill

NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.
Place and spread the pervious fill material in layers not more than [____] [200] mm [____] [8] inches in uncompacted thickness, except that within [____] [1] m [____] [4] feet of [____] structures, reduce the uncompacted layer thickness to [____] [150] mm [____] [6] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [____] fill in layers, the first layer not more than [____] mm inches in thickness and the succeeding layers not more than [____] mm inches in thickness prior to compaction.]

3.19.9 Random Fill

NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.

Place and spread random fill material in layers not more than [____] [200] mm [____] [8] inches in uncompacted thickness, except that within [____] [1] m [____] [4] feet of [____] structures, reduce the uncompacted layer thickness to [____] [150] mm [____] [6] inches. [Layers should be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [Place or spread the materials for [____] fill in layers, the first layer not more than [____] mm inches in thickness and the succeeding layers not more than [____] mm inches in thickness prior to compaction.]

3.19.10 Random Rock

Place random rock within the limits indicated on the drawings in such a manner as to produce a reasonably well graded mass of stone with a minimum percentage of voids. Place random rock in layers that will will produce a compacted [____] [600] mm [____] [24] inch thick layer as shown on the drawings. [Provide sufficient dewatering of the foundation beneath the random rock zone to allow the random rock material to be placed and compacted as specified herein to produce a firm, dense surface upon which to place select earth fill.] Grade the outside slope of the random rock zone to produce a reasonably even surface, within a tolerance of plus or minus [____] [300] mm [____] [12] inches measured [vertical] [normal] to the slope from the lines indicated on the drawings, upon which slope protection layers can be placed.

3.19.11 Fine Drainage Gravel Placed Around Structures

Place fine drainage gravel placed for drainage around [____] structures in horizontal layers not exceeding [____] mm inches in loose lift thickness, or within [____] [1] m [____] [4] feet when hand operated compactors are used. After placing, uniformly spread, moisten or aerate each layer as necessary to obtain the specified moisture content, thoroughly mix and compact as specified. Do not backfill until construction below finish grade has been approved, forms removed, and the excavation cleaned of trash and debris. Use power driven hand operated compactors along the closure.
structure for compaction within [_____] [0.7] m [_____] [2] feet of concrete structures. Do not place backfill against concrete prior to 7 days after placement. As far as practicable, bring backfill up evenly on each side of the structure and slope to drain away from the structure.

][3.19.12  Semicompacted Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the last bracketed sentence should be selected.
**************************************************************************

The location and extent of the semicompacted fill are as shown on the drawings. Do not place semicompacted fill in water. Place and spread semicompacted fill material in layers not more than [_____] [300] mm [_____] [12] inches in uncompacted thickness, [except that within [_____] [1] m [_____] [4] feet of [_____] structures, reduce the uncompacted layer thickness to [_____] [150] mm [_____] [6] inches]. Layers must be started full out to the slope stakes and must be carried substantially horizontal and parallel to the levee centerline with sufficient crown or slope to provide satisfactory drainage during construction. ] [ Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.]

][3.19.13  Uncompacted Fill

**************************************************************************
NOTE: If it is desired that the first layer of fill over the foundation be of a different thickness than subsequent layers, then the second bracketed sentence should be selected.
**************************************************************************

Place uncompacted fill in approximately horizontal layers not exceeding [_____] mm inches in thickness. Uniformly spread, distribute, and manipulate the layers during placement such that individual loads of material deposited on the fill will not remain intact, and large, open voids in the fill will be eliminated. Do not place lifts in a manner which causes shrinkage cracks and open voids from developing in previously placed lifts. Layers shall be started full out to the slope stakes and must be carried in lifts approximately horizontal and parallel to the centerline with sufficient crown or slope to provide satisfactory drainage during construction.] [ Place or spread the materials for [_____] fill in layers, the first layer not more than [_____] mm inches in thickness and the succeeding layers not more than [_____] mm inches in thickness prior to compaction.][ Compaction other than that obtained by the controlled movement of the hauling and spreading equipment over the area will not be required.][ Where material must be placed in water, dump therein until it reaches an elevation [_____] mm foot above the water surface, or until a stable fill surface is obtained before layer construction will be required. The material deposited under water must be placed in such a manner to ensure that any soft material will be forced progressively outward from the section and not be trapped within the base of the embankment.][ Do not place material containing more than [_____] [15] percent fines passing the No. 200 sieve below the water surface.]
3.19.14 Hydraulic Fill

3.19.14.1 Discharge Pipe

At all times when the dredge discharge pipe is being washed out or when the discharge consists of a high percentage of water with only a minimum amount of solid material being pumped, close all control plates at the bottom openings along the spill-pipe sections of the discharge pipe lines immediately and remain in a closed position until the pumping operation produces a minimum of [10] [_____] percent solid materials in the discharge.

3.19.14.2 Discharge Pipe Outlets

During placement operations of the fill, provide free outlets to conduct discharge water away from the embankment at intervals of not more than [610] [_____] m [2,000] [_____] feet, for 300-mm 12-inch dredges or smaller; [915] [_____] m [3,000] [_____] feet, for 325 to 400 mm 13- to 16-inch dredges; and [1219] [_____] m [4,000] [_____] feet, for dredges over 400 mm 16 inches. The size of dredges are determined by the minimum inside diameter of the discharge pipe. No obstruction to free flow will be permitted in these outlets or at any point in the fill area, between the end of the discharge pipe and the outlet. Construct a retaining dike, transverse to the fill area center line, immediately beyond each outlet and do not breach until the end of the discharge pipe has approached the retaining dike to within 76 m 250 feet, in the case of 300 mm 12-inch dredges or smaller; 114 m 375 feet, in case of 325 to 400 mm 13- to 16-inch dredges; or 152 m 500 feet, in the case of dredges over 400 mm 16 inches.

3.19.14.3 Control of Materials in Hydraulic Construction

In general, distribute the materials in the fill in a way to produce a section of relatively uniform permeability. In order to maintain uniform permeability of the fill, do not place strata and large pockets of gravel, not containing sufficient fines. Whenever they occur promptly blend with finer materials. Take necessary precautions to prevent damage from discharge water or other causes.

3.19.14.4 Rehandling Hydraulic Material

Rehandling of hydraulic material to bring the fill area to required grade and cross section must conform to paragraph [______]. If, in the opinion of the Contracting Officer, the rehandled material is too dry to permit its placement by compacted fill method, then the soil placement must conform to paragraph [______].

3.20 MOISTURE CONTROL

3.20.1 General

The materials in each layer of the fill must contain the amount of moisture, within the limits specified below or as directed by the Contracting Officer, necessary to obtain the required compaction. Rework material that is not within the specified moisture content limits after compaction to obtain the specified moisture content, regardless of density.

3.20.1.1 Insufficient Moisture for Suitable Bond

If the top or contact surfaces of a partial fill section become too dry to permit suitable bond between these surfaces and the additional fill to be
placed thereon, loosen the dried materials by scarifying or discing to such depths as may be directed by the Contracting Officer, dampen the loosened material to an acceptable moisture content, and compact this layer in accordance with the applicable requirements of paragraph COMPACTION.

3.20.1.2 Excessive Moisture for Suitable Bond

If the top or contact surfaces of a partial fill section become too wet to permit suitable bond between these surfaces and the additional fill to be placed thereon, scarify and dry the wet material, assisted by discing or harrowing, if necessary, to such depths as may be directed by the Contracting Officer. Dry the material to an acceptable moisture content, and compact in accordance with the applicable requirements of paragraph COMPACTION.

3.20.1.3 Drying Wet Material

Material that is too wet must [be spread on the embankment and permitted to dry,] [be dried in the borrow area prior to bringing to the levee embankment] be assisted by discing or harrowing, if necessary, until the moisture content is reduced to an amount within the specified limits.

3.20.1.4 Increasing Moisture in Dry Material

The moisture content of material that is too dry, [will be adjusted on the levee embankment] [will be adjusted in the borrow area prior to bringing to the levee embankment]. Add water to the fill material and by harrowing, or other approved methods, work the moisture into the material until a uniform distribution of moisture within the specified limits is obtained. Control the amount of water applied on a layer of fill on the levee embankment so that free water will not appear on the surface during or subsequent to rolling. Should too much water be added to any part of the embankment, delay the rolling on that section of the embankment until the moisture content of the materials is reduced to an amount within the specified limits. If it is impracticable to obtain the specified moisture content by wetting or drying the material on the fill, the Contractor may be required to pre-wet or dry back the material at the source of excavation or in the borrow area.

3.20.2 Select Fill

The moisture content after compaction must be within the limits of [_____] percentage points above optimum to [_____] percentage point below optimum moisture content as determined by ASTM D698.

3.20.3 Impervious Fill

The moisture content after compaction must be within the limits of [2] [_____] percentage points above optimum to [2] [_____] percentage point below optimum moisture content as determined by ASTM D698.

3.20.4 Pervious Fill

***********************
NOTE: Saturation of the pervious fill may not be appropriate if the fill is placed in a zone or area (trenches, etc.) which can not readily drain.
***********************

SECTION 35 41 00 Page 42
Place, work and compact each layer of material in a saturated condition.

3.20.5 Random Fill

**************************************************************************
NOTE: The moisture control of random earth must be conformed to the requirements of the material type it most closely approximates in behavior.
**************************************************************************

[The moisture content after compaction must be within the limits of [_____] percentage points above optimum to [_____] percentage point below optimum moisture content as determined by ASTM D698.] [The moisture content must be that which will facilitate obtaining the specified compaction.]

3.20.6 Coarse Drainage Gravel and Filter Sand

Control the moisture content such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill. If the material is too wet or too dry to facilitate proper compaction, wet or dry the coarse drainage gravel or filter sand as required by the procedures specified in paragraph [______].

3.20.7 Fine Drainage Gravel

Place, work, and compact fine drainage gravel in a saturated condition. The moisture content after compaction must be as uniform as practicable throughout any one layer of fine drainage gravel.

3.20.8 Semicompacted Fill

[Place semicompacted fill within plus or minus [_____] percent of optimum moisture content.] [Semicompacted fill will be placed at their in situ moisture content.] [Control the moisture content of semicompacted fill such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill.] [The moisture content must be that which will facilitate obtaining the specified compaction.]

3.20.9 Uncompacted Fill

Uncompacted fill will be placed at their in situ water content. [Control the moisture content such that hauling, spreading, and compacting equipment can operate with normal procedure without excessive rutting of the fill.]

3.20.10 Hydraulic Fill

No moisture control is required for Hydraulic Fill.

3.21 COMPACTION

**************************************************************************
NOTE: The designer should edit the following paragraphs to account for the use of either an end product specification (i.e., the Contractor is required to obtain a specified degree of compaction) or a method specification (i.e., when the Contractor is required to compact the embankment by a specified number of coverages of a specified/approved roller
and is not responsible for the obtained degree of compaction. If the method specification is used and the required degree of compaction is not achieved within the specified number of passes using the specified compaction equipment, the Contractor should be paid for additional rolling for compaction under a separate bid item as specified in paragraph ADDITIONAL ROLLING FOR COMPACTION.

NOTE: If an end-product (production) specification is to be used, the following paragraphs may not be necessary at the judgment of the designer and specification writer.

With reference to the use of compaction equipment in this paragraph, the following precautions should be noted:

1. Specifications should be written to ensure that the type of compaction equipment will be used is best suited to obtain the desired compaction of the material being used. When the size of the contract can justify the costs a requirement should be included in the specifications for the performance evaluation of each type of compaction equipment conforming with the specifications and intended for use by the Contractor at an early stage of embankment construction. This equipment evaluation should be accomplished through analysis of test fill areas that are carefully constructed under representative working conditions with materials and moisture contents as specified. Test fill areas may either be separate or part of the permanent work, and for clarity to prospective bidders, payment under a separate item is recommended to equitably cover costs of required variations in equipment coverages, possible changes in equipment loading or foot sizes, as well as intensified field soils testing. The following paragraphs are provided to serve as examples of the information that should be included within the specifications.

2. For tamping rollers that are either towed or self-propelled, with drums capable of being ballasted with fluid, the provision for a pressure relief valve and safety head is optional, and should be included at the discretion of the designer based on local experience and practice. Over-pressurization of fluid ballasted compaction drums to the level of a safety hazard has been rare, but has occurred on several occasions at locations of high elevation and temperature.

3. In compacting materials consisting of shales, sandstones, weathered rock and similar random
materials, consideration should be given to specifying sheepfoot-type tamping equipment that has been modified by replacing the standard feet with "chisel" point tamper feet generally referred to as "shale breakers". The end areas of these modified tamper feet range from 650 to 1000 square mm 1 to 1-1/2 square inches and tend to break up weathered rock to prevent the bridging effect sometimes created by large rock particles.

4. For compaction of sand and gravel fills or filter and drainage layers, equipment characteristics for both a large and small vibratory roller have been provided for optional selection by the designer, depending upon location, selected lift thickness, gradation, grain shape, and durability properties of the materials. The smaller roller, which utilizes an upper limit of 40 kN/m 9000 lbs. per foot of drum length applied force, should be specified for materials which exhibit degradation under compaction. Other options, based on construction experience may also be exercised. For example, it has been found that improved trafficability can often be achieved when compacting clean, fine grained, uniform sands by specifying a drum driven self-propelled vibratory roller.

**************************************************************************

Compaction equipment must conform to the following requirements and be used as prescribed in subsequent paragraphs.

3.21.1.1 Tamping Rollers

[3.21.1.1.1 Towed]

Provide tamping rollers consisting of a heavy duty double drum unit, with a drum diameter not less than 1.5 m 60 inches, and an individual drum length of not less than 1.5 m 60 inches. Provide drums that are capable of being ballasted with water or a combination of sand and water. Each drum must have staggered feet uniformly spaced over the cylindrical surface to provide approximately three tamping feet for each 0.19 square meter 2 square feet of drum surface. Provide tamping feet that are 175 to 225 mm 7 to 9 inches in clear projection from the cylindrical surface of the roller and have a face area of not less than 3226 square mm 5 square inches nor more than 4516 square mm 7 square inches. The roller must be equipped with cleaning fingers, designed and attached to prevent the accumulation of material between the tamping feet. Maintain these cleaning fingers at their full length throughout the periods of use of the roller. The weight of the roller must be a minimum of 5200 kg/m 3500 psf of linear drum length weighted, and no more than 2975 kg/m 2000 psf of drum length empty. Yoke the two drums comprising one roller unit such that they will oscillate when traversing uneven surfaces. The design and operation of the tamping roller will be subject to the approval of the Contracting Officer who has the right at any time during the prosecution of the work to direct such repairs to the tamping feet, minor alterations in the roller and variations in the weight as may be found necessary to secure optimum compaction of the earth fill materials. The Contractor may be required to add ballast to the roller to the maximum capacity specified by the manufacturer of the roller. Draw the roller by a crawler-type or a rubber-tired tractor at a
speed not to exceed 5.6 km 3.5 miles per hour. Discontinue the use of the rubber-tired tractor if the tires leave ruts that prevent uniform compaction by the tamping roller. If tamping rollers are used in tandem, not more than two rollers in tandem will be permitted and in such case, one trip of the tandem rollers over any surface will be considered as two passes. When tamping rollers are used in tandem, the tamper foot spacing must be offset so that the circumferential rows on the rear drums are in line with the mid-point of the circumferential rows on the forward drums.

3.21.1.2 Self-Propelled

[Conditioned upon satisfactory performance, self-propelled tamping rollers may be used in lieu of tractor-drawn tamping rollers. Self-propelled rollers exceeding the empty weight requirement may be used provided that by the substitution of tamping feet, having a face area not exceeding [_____] [9030 square mm 14 square inches], the nominal foot pressure on the tamping feet of the self-propelled roller can be adjusted to approximate the nominal foot pressure of the towed roller for the particular working condition required for the towed rollers. The tamping feet must be 175 to 225 mm 7 to 9 inches in clear projection from the cylindrical surface of the roller. For self-propelled rollers, in which steering is accomplished through use of rubber-tired wheels, the tire pressure must not exceed [____] [276 kPa 40 psi]. [Operate self-propelled rollers at a speed not to exceed 5.6 km 3.5 miles per hour.] [Self-propelled tamping rollers may be used in lieu of tractor drawn tamping rollers provided the foot pressure on the tamping feet of the self-propelled roller are approximately the same as the foot pressure on the towed roller.] For self-propelled rollers steered with rubber-tired wheels, the tire pressure must not exceed [____] [276 kPa 40 psi]. Operate self-propelled rollers at speeds not exceeding 5.6 km 3.5 miles per hour. The Contracting Officer has the authority to limit or eliminate the use of self-propelled rollers if they are found to cause shearing or laminations of the compacted fill.]

3.21.1.2 Vibratory Rollers

Equip vibratory rollers for compacting rock fills, pervious sand and gravel fills, or filter and transition drainage layers with a smooth steel compaction drum and operate at a frequency of vibration during compaction operations between 1100 and 1500 vpm. Vibratory rollers may be either towed or self-propelled with an unsprung drum weight that is a minimum of 60 percent of the rollers' static weight. Towed rollers must have at least 90 percent of their weight transmitted to the ground through the compaction drum when the roller is standing in a level position hitched to the towing vehicle. Rollers for compacting rockfill, [sand and gravel fills, or filter and drainage layers] must have a minimum static weight of 90 kN 20,000 pounds, a minimum dynamic force of 180 kN 40,000 pounds when operating at 1400 vpm, and an applied force not less than 130 kN/m 9,000 pounds per foot of compaction drum length. [Rollers for compacting sand and gravel fills or filter and drainage layers must have a minimum static weight of 36 kN 8,000 pounds, a minimum dynamic force of 71 kN 16,000 pounds when operating at 1400 vpm, and an applied force not less than 22 kN 5,000 pounds nor greater than 130 kN/m 9,000 pounds per foot of compaction drum length.] The level of amplitude and vibration frequency during compaction will be maintained uniform throughout the embankment zone within which it is operating. Operate rollers at speeds not to exceed 2.4 km/h 1.5 mph. The equipment manufacturer must furnish sufficient data, drawings, and computation for verification of the above specifications, and the character and efficiency of this equipment will be subject to approval.
3.21.1.3 Rubber-tired Rollers

Provide rubber-tired rollers that have a minimum of four wheels equipped with pneumatic tires. The tires must be of such size and ply as to be capable of being operated at tire pressures between 550 and 690 kPa (80 and 100 psi) at an 11,340 kg (25,000 pound) wheel load. The roller wheels must be located abreast and designed so that each wheel will carry approximately equal load in traversing uneven ground. The spacing of the wheels must be such that the distance between the nearest edges of adjacent tires will not be greater than 50 percent of the rated tire width of a single tire at the operating pressure for an 11,340 kg (25,000 pound) wheel load. The roller must have a body suitable for ballast loading such that the load per wheel may be varied, as directed by the Contracting Officer, from 8,165 to 11,340 kg (18,000 to 25,000 pounds). Tow the roller at a speed not to exceed 8 km (5 miles) per hour. The character and efficiency of this equipment will be subject to the approval of the Contracting Officer.

3.21.1.4 Hand Operated Compactors

Perform compaction of material, in areas where it is impracticable to use a roller or tractor compaction, using approved hand operated power compactors.

3.21.1.4.1 Power Tampers

Power tampers must be hand operated equipment capable of compacting material in confined areas. Provide compactors that are either an internal combustion or pneumatic activated tamper. Tampers must have sufficient weight and striking power to produce the specified compaction. The character and efficiency of this equipment will be subject to the approval of the Contracting Officer.

3.21.1.4.2 Vibratory Plate Compactor

Vibratory compactors operated by hand in confined areas must utilize the oscillating cam principal and must deliver an impact of not less than 9 kN (2000 lbf) at a rate of approximately 2000 impulses per minute. The character and efficiency of this equipment will be subject to the approval of the Contracting Officer.

3.21.1.5 Crawler-type Tractors

Crawler-type tractors used for spreading or compaction must have a minimum weight of [___] (9,070) kg (20,000) pounds, exert a minimum unit tread pressure of [___] (41.4) kPa (6) psi, and operate at a maximum speed of [___] (5.6) km (3.5) miles per hour.

3.21.1.6 Sprinkling Equipment

Provide sprinkling equipment consisting of tank trucks, pressure distributors or other equipment designed to apply water uniformly and in controlled quantities to variable width of surface.

3.21.1.7 Miscellaneous Equipment

Provide scarifiers, disks, spring-tooth or spike-tooth harrows, spreaders, and other equipment that is suitable for use in embankment construction and approved by the Contracting Officer. Equipment used for blending fill material must be capable of penetrating the full loose lift thickness of the specific material type.
3.21.2 Compaction of Select Fill

**************************************************************************
NOTE: Experience indicates that by the time the surface lift has been laid down, sufficient compactive effort has occurred due to hauling and spreading equipment such that one, two, or even three passes of a heavy disk plow is not sufficient for penetrating the full depth of lift. A harrow equipped with closely spaced spikes (teeth) has been found to effectively penetrate the semi-compacted surface lift in one pass, but this type of device has minimal ability to blend and mix the fill material. It was found that a suitably designed spiked-tooth harrow working in combination with a heavy disk plow can reliably produce the desired result. This note applies to all types of fill placement for which moisture and blending are required.
**************************************************************************

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. When the moisture content and the condition of the layer are satisfactory, compact the lift [to a minimum of [95] [_____] percent of the maximum dry density as determined by the Contractor in accordance with ASTM D698] [with not less than [six] [_____] complete coverages of an approved tamping roller or [four] [_____] complete coverages of an approved 45 metric ton 50-ton rubber-tired roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.3 Compaction of Random Fill

**************************************************************************
NOTE: Random fill must be compacted in accordance with the requirements of the material type it most closely approximates in behavior.
**************************************************************************

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer.[ If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose.] When the moisture content and the condition of the layer are satisfactory, compact the lift [to a minimum of [95] [_____] percent of the maximum dry density
as determined by the Contractor in accordance with ASTM D698] [with not less than [six] [_____] complete coverages of an approved tamping roller or [four] [_____] complete coverages of an approved 45 metric ton 50-ton rubber-tired roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] meter [_____] [3] feet.

3.21.4 Compaction of Impervious Fill

After a layer of material has been dumped and spread, harrow it to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. [If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose.] When the moisture content and the condition of the layer are satisfactory, compact the lift [with not less than [six] [_____] complete coverages of an approved tamping roller traversing in a direction parallel to the axis of the levee]. In areas which are not accessible by roller, place the fill in layers not more than 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.

3.21.5 Compaction of Pervious Fill

After a layer of material has been dumped and spread, harrow it as required to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. [If one pass of the harrow does not accomplish the breaking up and blending of the materials, additional passes of the harrow are required, but in no case will more than [_____] [three] passes of the harrow on any one layer be required for this purpose.] When the moisture content and the condition of the layer are satisfactory, compact the lift to a [minimum [80] [_____] percent relative density in accordance with ASTM D4253 and ASTM D4254] [with not less than [six] [_____] complete coverages of an approved vibratory roller]. In areas which are not accessible by roller, place the fill in layers not more than 100 mm 4 inches in uncompacted depth and compact with an approved hand operated compactor to a density equal to that obtained in other areas which are accessible to rollers. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously. Operate compaction equipment such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.
3.21.6 Compaction of Random Rock

After the random rock has been placed and spread to the thickness specified herein, and oversized rock has been removed or broken down, compact by not less than [_____] [3-6] complete coverages of the specified [crawler tractor] [vibratory roller]. [Each coverage of the tractor must consist of sufficient trips to provide complete coverage of the area by the treads of the tractor. The tractor coverages specified are in addition to spreading operations.] [Operate the vibratory roller such that the strip being traversed by the roller overlaps the rolled adjacent strip by not less than [_____] [1] m [_____] [3] feet.]

3.21.7 Compaction of Semicompacted Fill

After a layer of material has been dumped and spread, harrow it as required to break up and blend the fill materials to obtain uniform moisture distribution. Perform harrowing with a heavy disk plow, or other approved harrow, to the full depth of the layer. When the moisture content and the condition of the layer are satisfactory, compact the new layer of fill by the controlled movement of the hauling equipment over the area of the fill. Equipment will be routed so as to prevent excessive rutting of the fill surface. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously.

3.21.8 Compaction of Uncompacted Fill

No compaction other than that obtained by the controlled movement of the hauling equipment over the area of the fill is required. Route equipment to prevent excessive rutting of the fill surface.

3.21.9 Compaction of Hydraulic Fill

Hydraulic fill will be compacted as uncompacted fill. If the rehandled hydraulic fill is too dry to permit its placement by uncompacted full method, then compact the fill material using the method specified in paragraph [_____] [COMPACTION OF SEMICOMPACTED FILL].

3.21.10 Compaction of Random Fill Within the MSE Walls

Place and compact random earth fill within the limits of the Mechanically Stabilized Earth (MSE) walls in accordance with [the vendor’s requirements, subject to the approval of the Contracting Officer] [requirements specified in Section [_____]].

3.21.11 Compaction of Coarse Drainage Gravel and Filter Sand

Place coarse drainage gravel placed in the drains in maximum [_____] [300] mm [_____] [12] inch loose lifts and compact by not less than four (4) complete coverages with a [static] [vibratory] roller. Compact each lift of gravel within confined spaces which is not accessible to rollers by at least [_____] [3] complete coverages with a vibratory plate compactor [and as many additional coverages as necessary to achieve the same density obtained with full-size compaction equipment]. Compact filter sand placed along the existing rock fill in accordance with the requirements for the adjacent select earth fill material.
3.21.12 Compaction of Fine Drainage Gravel

Place fine drainage gravel placed in the drains in maximum [_____] [300] mm [_____] [12] inch loose lifts and compact by not less than four (4) complete coverages with a [static] [vibratory] roller. Compact each lift of gravel within confined spaces which is not accessible to rollers by at least three [_____] [3] complete coverages with a vibratory plate compactor [and as many additional coverages as necessary to achieve the same density obtained with full-size compaction equipment].

3.21.13 Compaction Adjacent to Structures and Utilities

3.21.14 Additional Rolling for Compaction

**************************************************************************
NOTE: Use the following paragraph only when a method specification is utilized. A bid item for "Additional Rolling for Compaction" should be included in the bid form so that payment can be made. Measurement and payment information should also be added to paragraph [UNIT][LUMP SUM] PRICES or Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES as applicable.
**************************************************************************

If the Contracting Officer determines that the desired compaction of any portion of the embankment is not achieved by the number of coverages specified, additional complete coverages will be made over the surface area as directed by the Contracting Officer. Payment for additional rolling directed by the Contracting officer will be made in accordance with Bid Item No. [_____] ADDITIONAL ROLLING FOR COMPACTION; however, no payment will be made for additional rolling not specifically directed by the Contracting Officer.

3.21.15 Topsoil

Place topsoil on the embankment surfaces as shown on the contract drawings and as specified in SECTION [32 92 23 SODDING] [____].

3.22 FIELD QUALITY CONTROL

**************************************************************************
NOTE: FAR 46.312 Construction Contracts establishes a requirement for Contractor Quality Control (CQC) in construction contracts and ER 1180-1-6 requires that a CQC section based on Section 01 45 00.00 10 01 45 00.00 2001 45 00.00 40 QUALITY CONTROL be included in contracts of $1,000,000 or more. Use of Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 for contracts of less than $1,000,000 is discretionary. This part of the specifications must be consistent with the CQC section.
**************************************************************************

Use caution when applying nuclear gages for in-place
density measurement of cohesive and cohesionless soils. Soils consisting of mica, halloysite, some other chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. The chemical composition and "non-free" water of the sample may also dramatically (sometimes over 10 percent) affect the measurement of moisture content (see the paragraph entitled "Interferences" in ASTM D2922 and D3017. Also see paragraph 5-10.d.(2).b. entitled "Nuclear Method" in EM 1110-2-1911). When water content can not be accurately measured using nuclear method, a computer controlled microwave oven system for water content measurement combined with nuclear method for wet density has been successfully used by some districts. Sand Cone or similar field density tests should be performed periodically at the same location as Nuclear Tests to assure nuclear testing is providing accurate information.

**************************************************************************

3.22.1 Clearing, Grubbing, and Stripping

Establish and maintain quality control for clearing, grubbing, and stripping operations to assure compliance with contract requirements, and maintain records of the quality control for all construction operations including but not limited to the items indicated below. Furnish these records, as well as the records of corrective actions taken, to the Government in accordance with Section 01 45 00.00 10 01 45 00.00 20 01 45 00.00 40 QUALITY CONTROL.

3.22.1.1 Clearing

Station to station limits, transverse clearing limits from applicable centerline; percentage of area complete; types of materials cleared.

3.22.1.2 Grubbing

Station to station limits, transverse grubbing limits from applicable centerline; percentage of area complete; type of material; filling of grubbed holes.

3.22.1.3 Stripping

Station to station limits, transverse stripping limits from applicable centerline; percentage of area complete; type of material; depth of stripping.

3.22.2 Excavation

Establish and maintain quality control for excavation operations to assure compliance with contract requirements, and maintain records of the Contractor's quality control for all construction operations including but not limited to the following:

a. Equipment; type, size, suitability for the work,

b. Lines, grades and tolerances,
c. Segregation/Disposition of materials,

d. Disposal and/or stockpiling of materials,

e. Unsatisfactory materials,

f. Conditions that may induce seepage or weaken the foundation or embankment,

g. Stability of excavations,

h. Quantity surveys.

Furnish records of inspections and tests, as well as the records of corrective actions taken, to the Government in accordance with Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL.

3.22.3 Embankment

3.22.3.1 General

As a part of the Contractor Quality Control (CQC) system required by SECTION 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL, establish and maintain field quality control for foundation preparation, embankment and backfill operations to assure compliance with contract requirements and maintain detailed records of field quality control for all operations including but not limited to the following:

3.22.3.1.1 Earthwork Equipment

Type, size, number of units and suitability for construction of the prescribed work.

3.22.3.1.2 Foundation Preparation

Methods of preparing the foundations in advance of embankment and backfill construction and methods for providing drainage of the foundation and partially completed fills.

3.22.3.1.3 Construction

Layout, maintaining existing drainage, moisture control, thickness of layers, spreading and compacting.

3.22.3.1.4 Grade and Cross Section

Crown width, crown slope, side slopes, and grades.

3.22.3.1.5 Roads and Ramps

Location of temporary roads to fields or buildings, location and placement of fills for ramps in accordance with specified dimensions and grades.

3.22.3.1.6 Grade Tolerances

Check fills to determine if placement conforms to prescribed grade and cross section.
3.22.3.1.7 Slides
Location and limits; methods and equipment used where remedial work has been directed.

3.22.3.1.8 Quantity Surveys
Accuracy and timeliness.

3.22.3.2 Materials Testing

**************************************************************************
NOTE: Types of tests and frequency of testing should be detailed below. Types of tests and frequency of testing will be dependent upon the types of materials utilized, configuration of foundation and embankment, placement and compaction procedures required, moisture control requirements etc. Testing requirements are material type specific rather than embankment fill type specific. It is desirable to present the testing frequency and type in tabular form.
**************************************************************************

Perform sufficient testing to insure that the fill is being constructed as specified. Consider the testing program specified below the minimum acceptable frequency of testing. This does not relieve the Contractor from the responsibility of performing additional testing, if required to ensure compliance with these specifications.

[3.22.3.2.1 Soil Classification Tests]

Perform soil classification tests in accordance with ASTM D2487. Perform one initial classification test for each different classification of material to be utilized as embankment fill or backfill. As prescribed in ASTM D2487, perform grain size analyses in accordance with ASTM D422 and Atterberg limits in accordance with ASTM D4318 on each different classification. Submit additional tests for every [(_____] cubic m)[20,000 cubic yards] of embankment or backfill material. Perform soil classification tests on foundation material as required to determine the acceptability of the in-situ soils. Additional tests will be required if noticeable changes in the material occur.

[3.22.3.2.2 Cohesive Material Testing]

**************************************************************************
NOTE: Edit the following to comply with the method selected to determine the optimum properties (i.e., density and moisture content, LL, PL, PI).
**************************************************************************

3.22.3.2.2.1 Moisture Density Relationships

Determine the moisture-density relations for each different classification of cohesive material utilized in accordance with [_____] [ASTM D698], [Method A] [Method B] [Method C]. Prior to placing any fill material containing cohesive material, perform a minimum of [_____] five-point [(_____) compaction test on representative samples of the material to be used as fill.] During fill placement perform a minimum of one additional
moisture-density test for every [_____] cubic m [20,000 cubic yard] placed. Additional tests will be required each time a new material is encountered. The moisture-density curves will be compiled to form a family of curves which will be utilized to estimate optimum properties (maximum dry density and optimum moisture content) to be used with field density test.

3.22.3.2.2 Water (Moisture) Content Tests

Perform determination of water content in accordance with ASTM D2216. ASTM D4643 may be used when rapid moisture content results are needed. Confirm all rapid results obtained by ASTM D4643 by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern. One water content test will be performed for each [_____] cubic m cubic yards of material placed [or each lift of material whichever is less]. These test will be in addition to the water content tests performed in conjunction with in-place density tests. Retest backfill and fills not meeting the required specifications for water content after corrective measures have been applied.

3.22.3.2.2.3 In-place Density Testing for Cohesive Materials

**************************************************************************
NOTES: The designer should pick the method or methods of In-place density which are acceptable. If uncompacted fill is specified density control may not be required.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of certain chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. When water content can not be accurately measured using nuclear method, a microwave oven system for water content measurement may be used.
**************************************************************************

Determine the in-place density of the cohesive materials in accordance with [ASTM D1556/D1556M], [ASTM D2167], [ASTM D6938], [ASTM D2937], [or] [ASTM D5195]. Perform at least one (1) in-place density test on [each lift of material][shift][day] or [every [_____] cubic m cubic yards of completed fill whichever is more frequent with the horizontal locations randomly staggered in the fill. At each field density test location, obtain soil samples and perform one [one-point] [two-point] compaction test, one moisture content, [one grain size analysis,] [and one Atterberg limits test,] [if applicable,] on the sample. The results of the [one-point] [two-point] compaction test and the moisture content test will be utilized to obtain the optimum properties to compare to the results of the in-place density test. [For use with the family of curves to determine the optimum properties of the material, perform a [one-point] [two-point] compaction test in conjunction with each in-place density. Use a portion of the soil from the in-place field density test and soil obtained immediately adjacent to the field density test location for a [one-point] [two-point] compaction test. The minus 19 mm 3/4-inch portion of the soil must be subjected to [_____] compactive effort using a 150 mm 6-inch compaction mold in accordance with the procedures presented in ASTM D [____] [ASTM D698] [ASTM D1557]. Retest fill not meeting the required specifications for
in-place density after additional compaction has been completed. When nuclear method is used for in-place density testing according to ASTM D6938, include a sand cone correlation test in accordance with ASTM D1556/D1556M for the first test and every fifth test thereafter for each material type. Perform the sand cone test adjacent to the location of the nuclear test, including a nominal 150 mm 6 inch diameter sand cone, and including a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Do not use nuclear density testing equipment during rain. Submit the density correlations with test results. For each transmittal including density test data, include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of Lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.
l. Pass/Fail.
m. Retest.
n. Comments.

3.22.3.2.3 Cohesionless Material Testing

3.22.3.2.3.1 Compaction Tests

Run not less than one relative density test for every [3,000] [_____] cubic m 3,900 [_____] cubic yards of cohesionless fill in accordance with ASTM D4253 and ASTM D4254.

3.22.3.2.3.2 In-Place Density Tests

Determine the in-place density of the cohesionless materials in accordance with [ASTM D1556/D1556M] [, ASTM D2167] [, ASTM D6938] [, ASTM D2937] [, or] [ASTM D5195]. Run not less than one (1) field in-place density test on [each lift of material or] every [_____] cubic m cubic yards of completed embankment fill or backfill whichever is less. Randomly stagger horizontal locations in the fill. When nuclear method is used for in-place density testing according to ASTM D6938, include a sand cone correlation test in accordance with ASTM D1556/D1556M for the first test and every tenth test thereafter for each material type. Perform the sand cone test adjacent to the location of the nuclear test, including a nominal 150 mm 6 inch diameter sand cone, and including a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Submit the density correlations with test results. For each transmittal including density test data, include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.

[3.22.3.2.3.3 Water (Moisture) Content Tests]

Perform determination of water content in accordance with ASTMD2216.[ASTMD4643 may be used when rapid moisture content results are needed. Confirm all rapid results obtained byASTMD4643 by a test on a duplicate sample performed in accordance withASTMD2216. In the event of disagreement between the results,ASTMD2216 will govern.] One water content test will be performed for each [_____] cubic m cubic yards of material placed[ or each lift of material whichever is less].[ These test will be in addition to the water content tests performed in conjunction with in-place density tests.] Retest backfill and fills not meeting the required specifications for water content after corrective measures have been applied.

[3.22.3.2.4 Additional Testing]

The Contracting Officer may request additional tests if there is reason to doubt the adequacy of the compaction, or special compaction procedures are being used, or materials change or if the Contracting Officer determines that the Contractor's testing is inadequate or the Contractor is concentrating backfill and fill operations in a relatively small area.

[3.22.3.3 Materials]

Suitability of materials for use in embankment and backfill.

3.22.3.4 Fill Placement

Layout, maintaining existing drainage, moisture control, thickness of layers, removal of oversized material, spreading and compaction for embankment and backfill.

3.22.3.5 Grade and Cross Section

Surveys to verify that the dimensions, slopes, lines and grades conform to those shown on the drawings.[ Surveys to monitor settlement gages to measure foundation settlement.]

3.22.3.6 Testing by the Government

During the life of this contract, the Government [or its Contractors] will perform quality assurance tests. The performance of such tests may temporarily delay the Contractor and must not be the basis for additional compensation and/or time. Make available to the government [or its Contractors] the equipment to perform these test.

3.22.3.7 Reporting

On a daily basis, furnish the inspection records and all material testing
results, [the quantity of fill placed,] as well as the records of corrective action taken, in accordance with Section 01 45 00.00 10 01 45 00.00 2001 45 00.00 40 QUALITY CONTROL.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for steepened soil slopes using geosynthetic soil reinforcement. It does not include soil reinforcements such as segmented type retaining walls, metal reinforcing strips, soil nails, and combi walls. This section was originally developed for USACE Civil Works projects.

Adhere to **UFC 1-300-02** Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a **Criteria Change Request (CCR)**.

PART 1  GENERAL

NOTE: This guide specification does not address requirements for dewatering, shoring, or earthwork below foundation level. Geometric requirements such as slope height, crest, toe, length, and construction limits should be shown on the drawings.

Notes before paragraphs are provided to present assumptions in preparation of the guide specification, make suggestions for conditions that warrant revisions, and provide background technical information or references for further information. They should be consulted prior to revising wording.
for project specifications.

1.1 MEASUREMENT AND PAYMENT

1.1.1 Excavation

The unit of measurement for excavation is the cubic meter (CM) yard (CY), computed by the average end area method from cross sections taken before and after the excavation operations. The volume to be paid for will be the material measured in its original position and removed from the excavation areas when the material is acceptably utilized or disposed of as herein specified. The excavation is unclassified and includes material of all types. The measurement will not include material excavated without authorization. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work. Shoring is incidental to excavation.

1.1.2 Fill

Material of all types not otherwise paid for is included under the unit price for fill. The unit of measurement for fill is the cubic meter (CM) yard (CY) computed by the average end area method from cross sections taken of the final slope and after the excavation operations. The volume to be paid for will be the material measured in its final position and placed within the designated areas when the material is acceptably placed and compacted as herein specified. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.3 Soil Slope Reinforcement

The unit of measurement for reinforcement is the square meter (SM) yard (SY). The pay lines of the reinforcement will be neat lines taken off the approved shop drawings. Overlaps for splicing (if allowed) and for the Contractors convenience will not be measured for payment. Overlaps in curved sections will be measured assuming the slope is linear. Payment will be made at the respective unit price listed on the bidding schedule. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.4 Soil Slope Drainage System

The drainage system, including associated pipe, geotextile, and aggregate will not be measured for payment and will be paid for on a job basis (JB), complete. Payment will be full compensation for furnishing all material, labor, equipment, supplies and incidentals to complete the work.

1.1.5 Soil Slope Facing and Seeding

Facing and seeding of the soil slope will be measured by the square meter (SM) yard (SY) of exposed face, measured in the plane of the slope face. The pay lines will be neat lines taken off the approved shop drawings. The work includes [seed, mulch, turf reinforcement mat, erosion control blankets, erosion control netting, and staples]. Payment will be made at the respective unit price listed on the bidding schedule, and will be full compensation for furnishing all material, labor, equipment, supplies and
incidental to complete the work.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO)

ASTM INTERNATIONAL (ASTM)

ASTM D448 (2012; R 2017) Standard Classification for Sizes of Aggregate for Road and Bridge Construction

ASTM D698 (2012; E 2014; E 2015) Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/cu. ft. (600 kN-m/cu. m.))

ASTM D1238 (2013) Melt Flow Rates of Thermoplastics by Extrusion Plastometer

ASTM D1557 (2012; E 2015) Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft³) (2700 kN-m/m³)

ASTM D2487 (2017; E 2020) Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)

ASTM D4355/D4355M (2014) Deterioration of Geotextiles from Exposure to Light, Moisture and Heat in a Xenon-Arc Type Apparatus

ASTM D4632/D4632M (2015a) Grab Breaking Load and Elongation of Geotextiles

ASTM D4884/D4884M (2014a) Strength of Sewn or Thermally Bonded Seams of Geotextiles

ASTM D5035 (2011) Breaking Force and Elongation of Textile Fabrics (Strip Method)

1.3 DEFINITIONS

**************************************************************************

NOTE: Subparagraph "Reinforcement" - This guide specification only applies to geosynthetic (extensible) reinforcement. There are differences in design and construction applicable to steel soil (inextensible) reinforcement.

**************************************************************************
1.3.1 Drainage Aggregate

Granular soil or aggregate which is placed in or around drains.

1.3.2 Fill

Soil or aggregate placed in, behind, or below the embankment or slope will be referred to as fill.

1.3.3 Reinforced Fill

Soil which is placed and compacted within the neat line volume of reinforcement as outlined on the plans.

1.3.4 Retained Fill

Soil which is placed and compacted behind the reinforced fill.

1.3.5 Reinforcement

Reinforcement consisting of a geogrid or a geotextile product manufactured for use as reinforcing. Reinforcement does not include steel products.

1.3.6 Long Term Design Strength

The long term design strength (LTDS) is:

\[ LTDS = \frac{T_{ult}}{(RF_D \times RF_{ID} \times RF_{CR})} \]

where:

- \( T_{ult} \) is the ultimate tensile reinforcement strength
- \( RF_D \) is the reduction factor for chemical and biological durability
- \( RF_{ID} \) is the reduction factor for installation damage
- \( RF_{CR} \) is the reduction factor for creep

1.4 SUBMITTALS

**************************************************************************

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Detailed Drawings; G[, [____]].

Shoring; G[, [____]]

SD-03 Product Data

Geotextile Reinforcement

Geogrid Reinforcement

Reinforcement Testing

Geotextile Filter

Calculations; G[, [____]].

SD-07 Certificates

Certificates of Compliance
1.5 QUALITY ASSURANCE

1.5.1 Manufacturer Representative

Provide a qualified and experienced representative from the reinforcement manufacturer available on an as-needed basis during the construction. Visit the site for consultation [at least once during construction] [as requested by the Contracting Officer].

1.5.2 Detailed Drawings

Submit the fabrication and installation drawings indicating fabrication and erection details for the slope, including sequencing and construction procedures. If approved by the Contracting Officer, shop drawings may consist of marked up contract drawings showing exact dimensions for the reinforcement supplied, and other minor revisions. The design and layout of the internal reinforcement are subject to the following:

a. Incorporate all features indicated in the contract documents in the final design and construction.

b. Run each reinforcement level as continuous as practical throughout the profile. If a geotextile filter is present, lay out the reinforcement so that interference with the geotextile is minimized.

c. Identify any reinforcement not placed with the machine direction as the design reinforcement direction on the shop drawings.

1.5.3 Classification of Soil Materials

Perform classification of soil materials in accordance with ASTM D2488. The Contracting Officer reserves the right to revise the Contractor classifications. In the case of disagreement, the Contracting Officer's classification will govern unless the soils are classified in accordance with ASTM D2487. All testing completed by the Contractor in conjunction with soil material classification is considered incidental to the contract work.

1.6 DELIVERY, STORAGE, AND HANDLING

Check products upon delivery to assure that the proper material has been received and is undamaged. Protect the materials from damage and exposure following the guidelines presented in ASTM D4873/D4873M.

1.6.1 Labeling

Label each roll with the manufacturer's name, product identification, roll dimensions, lot number, and date manufactured.

1.6.2 Handling

Handle and unload geosynthetic rolls by hand, or with load carrying straps, a fork lift with a stinger bar, or an axial bar assembly. Do not drag, lift by one end, lift by cables or chains, or drop geosynthetic rolls to the ground.

1.6.3 Storage

Protect geosynthetics from cement, paint, excessive mud, chemicals, sparks
and flames, temperatures in excess of 70 degrees C 160 degrees F, and any other environmental condition that can degrade the physical properties. If stored outdoors, elevate the rolls from the ground surface. Protect geosynthetics, except for extruded grids, with an opaque waterproof cover. Deliver geosynthetics to the site in a dry and undamaged condition. Do not expose geotextiles to direct sunlight for more than 7 days.

PART 2 PRODUCTS

2.1 REINFORCEMENT

**************************************************************************
NOTE: Polyester is susceptible to hydrolysis in alkaline conditions. A high molecular weight and low carboxyl end group number limit the hydrolysis. Normally, a mill certificate or certification of these properties is adequate. The molecular weight of polyester geosynthetics is determined from GSI GRI GG6, "Determination of the Number Average Molecular Weight of Polyethylene Terephthalate (PET) yarns Based on a Relative Viscosity Value", and ASTM D4603, "Determining Inherent Viscosity of Poly(Ethylene Terephthalate) (PET) by Glass Capillary Viscometer." The carboxyl end group number is determined from GSI GRI GG7, "Carboxyl End Group Content of Polyethylene Terephthalate (PET) Yarns."

Survivability - The AASHTO M 288 requirements are minimum requirements and will not normally control in the product selection. The AASHTO reference can be avoided by listing the grab, tear, burst, and puncture strengths. These properties are listed in AASHTO M 288. The puncture strength (ASTM D4833/D4833M), the trapezoidal tear strength (ASTM D4533/D4533M/D4533M) and the mullen burst strength (ASTM D3786) are recognized as important geotextile properties. For the intended application, the commonly specified values for puncture, burst and tear seldom control the product selection.

Geosynthetic Selection - The Federal Acquisition Regulations require full and open competition. Usually justification is not necessary if 3 products meet the specifications. In combining various material requirements, it is easy to specify a geosynthetic product that does not exist. Design utilizing geosynthetics should include a listing with the calculations that verify the specified products are commercially available. The Geosynthetics Fabrics Report magazine publishes an annual specifiers guide that is ideal for this purpose.

The geogrid sample is intended to be for visual demonstration prior to product delivery. Quality assurance testing, if performed, should be obtained from material actually delivered to the job. If testing is to be performed for pre qualification,
the minimum sample size should be 1 m 36 inches in length and the full roll width. Although 1 square meter yard will provide enough material for testing, the full roll width should be sampled since it provides a better selection of specimen locations, it clearly shows the machine and cross directions, and the difference in waste and shipping costs is negligible.

**************************************************************************

Submit Certificates of Compliance for the materials; and calculations of the long term design strength for the reinforcement in accordance with the NCMA TR127B or FHWA NHI-00-043. Submit an affidavit certifying that the reinforcement and seams meets the project specifications. Provide the certificates and affidavits a minimum of 30 days prior to delivery of materials. Have the affidavit signed by an official authorized to certify on behalf of the manufacturer and include a mill certificate that verifies physical properties were tested during manufacturing and lists the manufacturer's quality control testing. [If the affidavit is dated after award of the contract and/or is not specific to the project, attach a statement certifying that the affidavit addressed to the wholesale company is representative of the material supplied.] Include a statement confirming that all purchased resin used to produce reinforcement is virgin resin. Include the tensile strength tested in accordance with either ASTM D4595 or ASTM D6637 in the mill certificate. Base the ultimate strength or index strength on the minimum average roll value tensile strength of the product using the wide width strength test in ASTM D4595 or the single rib test in ASTM D6637. Itemize each reduction factor and include backup data to justify each reduction factor in the calculations. Demonstrate splice efficiency from testing, if used. Submit and label samples of each type of reinforcement with a minimum size of 200 by 250 mm 8 by 10 inches. Include at least 2 apertures in each direction for the geogrid.

2.1.1 Geogrid Reinforcement

Provide geogrid, which is a geosynthetic manufactured for reinforcement applications. The geogrid must be a regular network of integrally connected polymer tensile elements with aperture geometry sufficient to permit significant mechanical interlock with the surrounding soil, aggregate, or other fill materials. The geogrid structure must be dimensionally stable and able to retain its geometry under manufacture, transport and installation. Manufacture the geogrid with 100 percent virgin resin consisting of polyethylene, polypropylene, or polyester, and with a maximum of 5 percent in-plant regrind material. Polyester resin must have a minimum molecular weight of 25,000 and a carboxyl end group number less than 30. Stabilize polyethylene and polypropylene with long term antioxidants.

2.1.2 Geotextile Reinforcement

Submit descriptive technical data on the reinforcement and geotextile filter materials. Include all material properties specified under paragraph PRODUCTS. Geotextile must be a pervious sheet of polymeric material consisting of long-chain synthetic polymers composed of at least 95 percent by weight polyethylene, polypropylene, or polyesters. Manufacture the geotextile with 100 percent virgin resin, and with a maximum of 5 percent in-plant regrind material. Form geotextile into a network such that the filaments or yarns retain dimensional stability
relative to each other, including the selvages. Polyester resin must have a minimum molecular weight of 20,000 and a carboxyl end group number less than 50. Stabilize polyethylene and polypropylene with long term antioxidants. For survivability during installation, and in addition to installation damage used in calculating the long term design strength, the geotextile must meet the minimum requirements in AASHTO M 288 Class 1, and have a minimum mass per unit area of 270 g/m² 8 oz/sq.

2.1.3 Reinforcement Properties

**************************************************************************
NOTE: Permittivity - Reinforcement geotextiles should not puddle or impede infiltration or seepage. AASHTO M 288 provides some default guidance.
**************************************************************************

2.1.3.1 Primary Reinforcement Properties

Meet the property requirements listed in Table 1 for reinforcement shown on the contract drawings. Reinforcement strength requirements represent minimum average roll values in the machine direction.

### 2.1.3.3 Long Term Design Strength

Base the long term design strength on reduction factors for installation damage and durability that are applicable to the fill that will be used. Minimum reduction factors for durability include: 1.1 for polyethylene and polypropylene geosynthetics, 1.15 for coated polyester geogrids, and 1.6 for polyester geotextiles. Minimum reduction factors for creep include: 2.5 for polyester, 4 for polypropylene, and 2.6 for high density polyethylene.

Ranges for damage reduction factors in accordance with FHWA NHI-10-024 are listed in Table 3.

<sup>a</sup> Minimum weight 270 g/m² 8.0 oz/yd².

### 2.1.4 Reinforcement Splices

Provide reinforcement splices consisting of a standard method or device recommended and approved by the manufacturer of the reinforcing. Splices less than 90 percent efficient (width wide tensile strength of splice to mean average roll value tensile strength of reinforcing) are not acceptable.
Demonstrate and submit the splice efficiency. Splicing may consist of overlaps, fusion wedge welding, sewing, or bodkin connections. Splicing methods that are dependent on installer experience and skill level, such as hot air and torch-applied open flame, are not acceptable. Perform sewing by 2 lines of stitching with a Federal 401 double thread lock stitch with a thread of the same polymer type and UV protection as the geotextile. [Perform overlaps as indicated on the drawings.] [Overlaps must be a minimum of [300][600] mm [12][24] inches for linear runs along the slope face where the primary design strength axes of adjacent reinforcement panels are parallel.] The overlap is to be protected from folding and/or bunching during installation of fill.

2.1.5 Seams

Test seams in accordance with method ASTM D4884/D4884M.

2.2 GEOTEXTILE FILTER

Meet the requirements specified in Table 4. The property values (except for AOS) represent minimum average roll values (MARV) in the weakest principal direction. For survivability during installation, meet the minimum requirements in AASHTO M 288 Class 2, and have a minimum mass per unit area of 270 g/m² 8 oz/sy.

2.4 EROSION CONTROL BLANKET

Erosion control blanket (ECB) must consist of biodegradable open weave blankets used for establishing vegetation and have a minimum mass per unit area of [_____] g/m² oz/SY, determined in accordance with ASTM D5261.

2.5 SOILS AND AGGREGATES

Classify all material placed as fill by ASTM D2487 as GW, GP, GC, GM, SP, SM, SC, CL, ML, or SW and be free of ice; snow; frozen earth; trash; debris; sod; roots; organic matter; contamination from hazardous, toxic or radiological substances; or stones larger than 75 mm 3 inches in any dimension. Obtain each material entirely from one borrow source, unless the Contracting Officer determines that quality control is adequate and the alternate source produces material that is similar in gradation, texture, and interaction with the reinforcement. All materials must be of a character and quality satisfactory for the purpose intended.

a. Reinforced Fill. Soil placed in the reinforced fill zone must consist of [soils with less than 50 percent passing the 75 µm No. 200 sieve, maximum particle size of 1.9 cm 3/4-inch, and Plasticity Index less than or equal to 20] [alternate properties of available fill soils consistent with soil strengths and reinforcement damage assessment utilized in design]. The reinforced fill soils must have a minimum drained friction angle of 28 [_____] degrees.

b. Retained Fill. Soil in the retained fill zone [consists of existing in-situ soils][meets the material classification and requirements listed above].

c. Drainage Aggregate. Meet the requirements of ASTM D448, size No.7].
2.6 DRAINAGE PIPE

Corrugated polyethylene pipe meeting requirements of AASHTO M 252.

2.7 SEED

Provide state-certified seed of the latest season's crop in original sealed packages bearing the producer's guaranteed analysis for mixture percentage, purity, germination, weed seed content, and inert material. Provide labels that are in conformance with AMS Seed Act and applicable state seed laws. Proportion the seed mix by weight as follows: [____].

PART 3 EXECUTION

3.1 SHORING

Construct shoring in accordance with the safety requirements of EM 385-1-1. Submit drawings and calculations, certified by a registered professional engineer, describing the methods for shoring and sheeting of excavations at least 30 days prior to installation. Also include sequencing and methods of shoring installation and removal that will facilitate verification that the methods will not leave voids, seepage paths, or other deficiencies. The Contractor is responsible for design and maintenance of all shoring to be installed. Do not negatively impact existing and proposed work during installation. Unless otherwise authorized, remove all sheeting and bracing when backfill is completed. Do not negatively impact completed work during removal.

3.2 EARTHWORK

**************************************************************************
NOTE: Notification of the Contracting Officer - It is beyond the scope of a specification to provide remedies to all possible problems. If the specification indicates the Contracting Officer must be notified, it is assumed qualified assistance will be utilized to assess the situation when necessary.
**************************************************************************

Bear the reinforced fill zone on undisturbed native soils, or acceptably placed and compacted fill. In the event that it is necessary to remove material or place fill below the excavation lines shown on the drawings, or not otherwise provided for in the contract, notify the Contracting Officer prior to work and an adjustment in the contract price will be considered in accordance with the contract. It is at the Contractor's expense if additional work not authorized by the Contracting Officer is performed.

3.2.1 Excavation

Excavate to contours, elevation, and dimensions indicated. Reuse excavated materials that meet the specified requirements for the material type required at the intended location. Keep excavations free from water. Excavate soil disturbed or weakened by Contractor's operations, soils softened or made unsuitable for subsequent construction due to exposure to weather. Excavations below indicated depths will not be permitted except to remove unsatisfactory material. [____][Remove as directed] unsatisfactory material encountered below the grades shown. [Refill with backfill and fill material][satisfactory material][select material][porous fill] and compact to [95][____] percent of [ASTM D698][ASTM D1557] maximum
density.]} Unless specified otherwise, refill excavations cut below indicated depth with [backfill and fill material][satisfactory material][select material][porous fill] and compact to [95]\[_____] percent of [ASTM D698][ASTM D1557] maximum density.] Replace satisfactory material removed below the depths indicated, without specific direction of the Contracting Officer, with satisfactory materials to the indicated excavation grade; except as specified for spread footings. Determination of elevations and measurements of approved overdepth excavation of unsatisfactory material below grades indicated will be done under the direction of the Contracting Officer. Perform excavation and fill in a manner and sequence that will provide proper drainage at all times. The Contractor is responsible for disposal of surplus material, waste material, and material that does not meet specifications, including any soil which is disturbed by the work operations or softened due to exposure to the elements and water.

3.2.2 Stockpiles

Stockpile material for backfilling in a neat and orderly manner at a sufficient distance from the banks of the excavation to avoid overloading and to prevent slides or caving. Keep stockpiles of all material to be incorporated into the work in a neat and well drained condition, giving due consideration to drainage at all times. Clear, grub, and seal the ground surface at stockpile locations. Stockpile topsoil separately from suitable backfill material. Protect stockpiles of aggregates and granular soils from contamination which can destroy the quality and fitness of the stockpiled material. If the Contractor fails to protect the stockpiles, and any material becomes frozen, saturated, intermixed with other materials, or otherwise out of specification or unsatisfactory for the use intended, remove such material and replace with new material from approved sources at no additional cost to the Government.

3.3 SUBGRADE PREPARATION

Remove unsatisfactory material in surfaces to receive fill or in excavated areas and replace with satisfactory materials as directed by the Contracting Officer. Scarify the surface to a depth of \(150 \text{ mm } 6 \text{ inches}\) before the fill is placed. Plow, step, bench, or break up sloped surfaces steeper than \(1 \text{ vertical to } 4 \text{ horizontal}\) so that the fill material will bond with the existing material. When subgrades are less than the specified density, break up the ground surface to a minimum depth of \(150 \text{ mm } 6 \text{ inches}\), pulverized, and compacted to the specified density. When the subgrade is part fill and part excavation or natural ground, scarify the excavated or natural ground portion to a depth of \(300 \text{ mm } 12 \text{ inches}\) and compact as specified for the adjacent fill. Do not place material on surfaces that are muddy, frozen, or contain frost. Accomplish compaction by sheepsfoot rollers, pneumatic-tired rollers, steel-wheeled rollers, or other approved equipment well suited to the soil being compacted. Moisten material or aerate as necessary [to plus or minus [_____] percent of optimum moisture] [to provide the moisture content that will readily facilitate obtaining the specified compaction with the equipment used]. Minimum subgrade density is as specified herein. Smooth the surface to be free of windrows, sheepsfoot impressions, and rocks. Do not place reinforcement directly on native soil unless the upper \(0.3 \text{ meter } 1 \text{ foot}\) of soil meets specification of fill materials.

3.4 PROOF ROLLING
NOTE: Specify proof rolling when the quality of the existing subgrade is questionable. Proof rolling can be used to verify that no unsatisfactory material is present (no bid quantity required, location shown or specified) or to locate suspected unsatisfactory material (indicate a bid quantity to be removed).

Perform proof rolling on an exposed subgrade free of surface water at near optimum, or at the moisture content that was used to achieve the required compaction. If proof-rolling is performed after installation of pipe underdrains, do not use the proof-roller within 0.5 m 1-1/2 feet of the underdrains. Perform proof-rolling with a 22,680 kg 25 ton pneumatic-tired tandem axle roller with at least three wheels on each axle, a minimum tire pressure of 5.2 kg per square centimeter 75 pounds per square inch, and a minimum rolling width of 1.9 m 75 inches. Operate proof-rolling equipment at a speed between 2.4 to 4.8 km per hour 1.5 to 3 miles per hour. Notify the Contracting Officer a minimum of 3 days prior to proof rolling. Carry out proof-rolling in two directions at right angles to each other with no more than 60 cm 24 inches between tire tracks of adjacent passes. Operate the proof-roller in a pattern that readily allows for the recording of deformation data and complete coverage of the subgrade.

Take the following actions based on the results of the proof-rolling activity in accordance with FHWA NHI-10-025:

1. Rutting less than 6 mm 1/4 inch – The grade is acceptable.
2. Rutting greater than 6 mm 1/4 inch and less than 38 mm 1-1/2 inches – Scarify and re-compact the grade.
3. Rutting greater than 38 mm 1-1/2 inches – Remove and reconstruct the compacted area.
4. Pumping (deformation that rebounds, or materials that are squeezed out of a wheel’s path) greater than 25 mm 1 inch – Remediate the area as directed by the Engineer.

3.5 REINFORCEMENT INSTALLATION

a. Place reinforcement at the elevations and to the extent shown on the construction drawings and the approved shop drawing submittal. Orient the reinforcement with the design strength axis perpendicular to the slope face. Place reinforcement strips as indicated on the drawings to provide 100 percent coverage of the reinforced area. Keep reinforcement from being exposed to direct sunlight after installation. [This can be accomplished by requiring coverage with reinforced fill material during the same work shift.]

b. Install the reinforcement in tension. Pull the reinforcement taut and anchor with pins, staples, or stakes prior to placing the overlying lift of fill. Maintain uniform tension along the length of the slope and consistent between layers.

c. Where the slope bends, place a veneer of fill to a nominal thickness of 75 mm 3 inches to separate overlapping reinforcement. [Overlap a minimum of 150 mm 6 inches along the edges perpendicular to the slope for wrapped face structures.] [With grid reinforcement, clip or tie the
edges together.][When reinforcements are not required for face support, no overlap is required and edges should be butted.]

d. Splicing. Splicing is not allowed unless identified on the shop drawings. Limit splicing to only one splice per reinforcing strip and do not include a splice with two consecutive reinforcing. Place splices randomly without a pattern. Discard individual reinforcing lengths less than 3 meters 10 feet. Place seams facing upward for inspection purposes.

3.6 FILL PLACEMENT

******************************************************************************

NOTE: Subparagraph "b." below - Studies have documented rubber tired heavy equipment traveling on geogrids with minimal or no damage. However, it is regarded as poor practice and usually unnecessary. Problematic conditions include coarse crushed gravel and coated geogrids. The intent of the specification is to minimize equipment on the geogrid so that it occurs only when necessary.

******************************************************************************

a. Place reinforced fill from the slope face back toward the fill area to ensure that the reinforcement remains taut. Place, spread, and compact fill in such manner that minimizes the development of wrinkles in or movement of the reinforcement.

b. A minimum fill thickness of 150 mm 6 inches is required prior to operation of vehicles over the reinforcement. Avoid sudden braking and sharp turning. Do not turn tracked equipment within the reinforced fill zone to prevent tracks from displacing the fill and damaging the reinforcement. Do not operate construction equipment directly upon the reinforcement as part of the planned construction sequence. Rubber tired equipment can operate directly on the reinforcement if the travel is infrequent, equipment travels slow, turning is minimized, and no damage or displacement to the reinforcement is observed.

c. At the end of each day, slope the last lift of fill away from chimney drains in a manner that will allow drainage and direct runoff away from aggregate.

3.7 COMPACTION

Do not place fill on surfaces that contain mud, frost, organic soils, fill soils that have not met compaction requirements, or where the Contracting Officer determines that unsatisfactory material remains in or under the fill. Spread fill and compact in lifts[ not exceeding the height of the face wrapping].

3.7.1 Degree of Compaction

Degree of compaction required is expressed as a percentage of the maximum density obtained by the test procedure presented in ASTM D698 or ASTM D1557. The maximum density is hereafter abbreviated as the "Standard Proctor" or "Modified Proctor" value.
3.7.2 Moisture Control

NOTE: Moisture content limits for compaction should be included in these paragraphs when necessary for obtaining strength and stability in embankments and fill, for controlling movement of expansive soils and when, in the opinion of the project geotechnical engineer, moisture control is required for the soils being used. Specify an acceptable variation from the optimum moisture if justified from experience with similar soils or where demonstrated from moisture-density tests for the borrow material during planning.

Maintain control of moisture in the fill to provide acceptable compaction. In the stockpile, excavation or borrow areas, a minimum of two tests per day per type of material or source of materials being placed is required during stable weather conditions. During unstable weather, perform tests as dictated by local conditions and test approved moisture content in accordance with ASTM D2216. Include moisture content test results in daily report. Disking and plowing will not be allowed in the reinforced fill zone. Adjust moisture content of cohesive soils at the borrow source before placement. Only conduct adding water directly to the reinforced fill zone under conditions where the soil has sufficient porosity and capillarity to provide uniform moisture throughout the fill during compaction. Ensure that moisture content is within plus or minus [2][_____] percentage points of optimum moisture content as determined in ASTM D698 or ASTM D1557.

3.7.3 Compaction

Compact reinforced and retained fill to 95[_____] percent of the Standard Proctor as determined in ASTM D698.

3.8 SOIL TESTING

3.8.1 General

All testing expenses is the Contractor's responsibility. Prior to sampling and testing the work, inspect testing laboratories and approve in accordance with Section 01 45 00.00 1001 45 00.00 2001 45 00.00 40 QUALITY CONTROL. The Contracting Officer reserves the right to direct the location and select the material for samples to be tested and to direct where and when moisture-density tests are to be performed.

3.8.2 Transmittal

Inform the Contracting Officer of test results daily for direction on corrective action required. Provide draft copies of field testing results to the Contracting Officer on a frequent and regular basis, as directed. Submit testing data specific to the reinforcement to be supplied:

a. Establish the coefficient for direct shear of the reinforcement on a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone in accordance with ASTM D5321/D5321M.
b. Establish the coefficient of interaction for pull-out resistance of the reinforcement in a soil similar in gradation and texture to the material that will be used for fill in the reinforced zone in accordance with ASTM D6706.

3.8.3 Corrective Action

Tests of materials which do not meet the contract requirements (failed test) will not be counted as part of the required testing. If testing indicates material does not meet the contract requirements, do not place the material represented by the failed test in the contract work or recompact or remove. Determine the quantity of material represented by the failed test by the Contracting Officer up to the quantity represented by the testing frequency. The Contractor may increase testing frequency in the vicinity of a failed test in order to reduce removal requirements, as approved by the Contracting Officer. Such increases in testing frequency are at the Contractor's expense and at no additional cost to the Government.

3.8.4 Testing Schedule

a. Moisture-Density Relations (ASTM D698 or ASTM D1557)

One test for each material variation[, not less than [____] tests total].

b. In-Place Densities (ASTM D1556/D1556M or ASTM D6938)

**************************************************************************
NOTE: Density test frequency can vary from one test per 10 square meter 100 square feet for small areas up to one test per 900 square meter 10,000 square feet. The following table will also help establish test frequency for various situations:

<table>
<thead>
<tr>
<th>Borrow</th>
<th>Any</th>
<th>One test per lift per 400 cubic m placed.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Material Type</th>
<th>Location of Material</th>
<th>Test Frequency</th>
</tr>
</thead>
<tbody>
<tr>
<td>Undisturbed native soil</td>
<td>Structures</td>
<td>Two random tests in native soil building footings and two tests on subgrade within building line.</td>
</tr>
<tr>
<td>Fills and backfills</td>
<td>Structures</td>
<td>One test per structure per 2,000 sq. ft taken 12 inches below finished grade.</td>
</tr>
</tbody>
</table>
Material Type | Location of Material | Test Frequency
---|---|---
Subgrades | Site (except airfields) | One test per lift per 2,500 sq. ft
Embankments or borrow | Any | One test per lift per 500 cubic yds placed.
Native soil subgrade other than structures and parking | Any | One test or one test per 10,000 sq. ft whichever is greater.
Borrow | Any | One test per lift per 500 cubic yds placed.

c. Sieve Analysis, (ASTM C136/C136M)

Drainage Aggregate, 1 test for each source.

3.9 REINFORCEMENT TESTING

NOTE: Primary reasons for testing geosynthetics include verification of quality control by the manufacturer, detecting degradation during shipping and storage, and verifying the correct product is supplied. Verification of quality control by the manufacturer and detecting degradation during shipping and storage is not economically justified for small jobs. Unlike reinforcing steel for concrete, geosynthetics are difficult to identify in the field, and even experienced personnel can sometimes mistake the product identity of unlabeled material. Testing after delivery to verify the correct product was supplied may be advisable for critical structures. The strength is usually the most critical property to verify an acceptable product is furnished.

It is the Contractor's responsibility for all testing expenses. Perform testing by a commercial testing laboratory selected by the Contractor and approved by the Contracting Officer or performed by the Contractor if approved by the Contracting Officer. The Contracting Officer reserves the right to direct the location and select the material for samples.
### TABLE 6. REINFORCEMENT TESTING

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>TEST DESIGNATION</th>
<th>FREQUENCY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wide Width Strip Tensile Strength (Geotextiles)</td>
<td>ASTM D4595</td>
<td>[_____]</td>
</tr>
<tr>
<td>Single Rib Tensile Strength (Geogrids)</td>
<td>ASTM D6637</td>
<td>[_____]</td>
</tr>
<tr>
<td>Specific Gravity (HDPE only)</td>
<td>ASTM D1505</td>
<td>[_____]</td>
</tr>
<tr>
<td>Melt Flow Index (PP &amp; HDPE)</td>
<td>ASTM D1238</td>
<td>[_____]</td>
</tr>
</tbody>
</table>

Modify ASTM D4595 for geogrids considering recommendations in GSI GRI GG6; and express the tensile strength on a unit length basis by substituting \( n \times a \) for \( W_s \), where:

\[
W_s = \text{specimen width, (mm inches)} \\
\text{n = number of ribs in the sample (must be a whole number)} \\
\text{a = nominal rib spacing for the product tested, (mm inches)}
\]

#### 3.10 DRAINAGE PIPE

Place drain pipe as indicated on the drawings. Lay drain lines to true grades and alignment with a continuous fall in the direction of flow. Keep the interior of the pipe clean from soil and debris; and temporarily cap open ends as necessary.

#### 3.11 EROSION CONTROL

Install erosion control in accordance with the manufacturer's recommendations. Clear the ground surface of vegetation, cobbles, rubbish, or debris prior to placement.

#### 3.12 SEEDING

Apply seed at the rate of 18 square m/kg 10 square yards per pound of seed. Evenly distribute the seed by hand or using broadcast seeders. Cover seed to a nominal 13 mm 1/2 inch depth by rakes.

#### 3.13 CONSTRUCTION TOLERANCES

a. Horizontal: Ensure the slope crest and toe are within 150 mm 6 inches of the plan location.

b. Vertical: Ensure the slope crest elevations are within 90 mm 0.3 feet above to 90 mm 0.3 feet below the prescribed elevations shown on the drawings.

#### 3.14 PROTECTION OF WORK

Protect work against damage from subsequent operations.

Figure 3
NOTE: This guide specification covers the requirements for vertical axial-and mixed-flow impeller-type pumps, having a pump discharge diameter up to and including 2100 mm 84 inches, for flood control and hurricane protection projects. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

TO DOWNLOAD UFGS GRAPHICS
Go to http://www.wbdg.org/ffc/dod/unified-facilities-guide-specifications-ufgs/forms

PART 1 GENERAL

NOTE: Figure 1, System Loss Curve (May be provided by the Designer). The Specifier should insert Figure 2 and Figure 3 at the end of this section as applicable to the design. (See paragraphs BEARING HEAT SENSORS, TEST SETUP, and VALUE OF NPSHR.)

This specification is written to obtain reliable, long-lasting pumps that are suited for the purpose...
intended at the most economical price. It requires the use of grease-, water- or oil-lubricated bearings and packing glands, and permits the manufacturer to use his standard castings for the suction bell and the bowls.

Avoid locating vanes in the water passage above the diffuser bowl should be avoided; however, on pumps with long columns where the use of intermediate bearings is necessary, spiders or external supports for the bearing housing may be permitted. A shaft-enclosing tube, by itself, may not furnish the needed support.

Alternate specifications for the "FACTORY TEST" have been provided in this specification. Alternate 1 gives the manufacturer the option of testing either the prototype pump or a homologous model of the pump. This alternative should be used for all pumps having a diameter up to and including 1200 mm 48 inches. Alternate 2, which requires a homologous model of the pump be tested for performance and NPSHR characteristics, should be used for pumps having a diameter greater than 1200 mm 48 inches. Alternate 2 can also be used for pumps smaller than 1200 mm 48 inches in diameter if the expected annual operating time is greater than 500 hours per year or for the special case when there is no published NPSHR curve available.

If this guide specification is used for a supply contract, the flexible mechanical couplings and harness bolts should be obtained under the construction contract, except when the pump manufacturer is required to furnish the discharge piping.

With a construction contract, it is the prime Contractor's responsibility to have equipment delivered when ready for installation. Inevitably, delays occur. Some storage will most likely be required. These requirements may be modified as required, but in no case should they be deleted when the storage of equipment is contemplated.

With a supply contract, the delivery of the equipment being furnished should be arranged to coincide with the date of installation, when possible. This will obviate the need for long-term storage of the equipment in Government-furnished space.

This specification has been prepared on the basis that it will be used in construction contracts. If this guide specification is to be used for supply contracts, paragraphs to be included in Part IV - TECHNICAL PROVISIONS should be arranged to follow the format listed below. Section 5 should be deleted when a reduction gear is not to be
furnished, and the word "DELETED" should be substituted in lieu thereof. Section 1 should include appropriate provisions of Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES, Section 05 50 14 STRUCTURAL METAL FABRICATIONS and Section 05 50 15 CIVIL WORKS FABRICATIONS.

Section 1   Materials and Fabrication
Section 2   Vertical Pumps
Section 3   Factory Test
Section 4   Electric Motor or Diesel Engine
Section 5   Reduction Gear
Section 6   Services of Erecting Engineer

**************************************************************************
1.1 PRICES

**************************************************************************

NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below be inserted into Section 01 22 00.00 10.

**************************************************************************

1.1.1 Vertical Pumps, Axial-Flow and Mixed-Flow Impeller-Type

1.1.1.1 Payment

Payment will be made for costs associated with [furnishing][furnishing and installing][installing] the vertical pumps, axial-flow and mixed-flow impeller-type, as specified.

1.1.1.2 Unit of Measure

Unit of measure: lump sum.

1.1.2 Erection Engineer(s)

1.1.2.1 Payment

Payment will be made for costs associated with the services of erection engineer(s) for the period of time that erecting engineers are in service of the Government within the Continental United States, including time required by them to travel. No payment will be made for days the erecting engineers are absent from the jobsite, except for non-work days, National Legal Holidays, and authorized travel time. No additional or overtime payment will be made to the Contractor when the erecting engineers are required to work in excess of 8 hours per calendar day or 40 hours per week. If delays occur during periods of assembly, erection, or testing, wherein services of erecting engineers are not required, the Contracting Officer may direct the engineers to return to their home station, in which case they will not be paid for time they are not at the site of work, except for travel time; or direct engineers to remain at the site of work, in which case they will be paid as provided by contract.
1.1.2.2 Measurement

Services of erection engineer(s) will be measured for payment based upon contract unit price per calendar day for the number of calendar days that their services are required, including Sundays and National Legal Holidays. Time for travel will be measured for payment by the most direct commercial airline or rail route from their home station or port of entry, or from their duty station when travel time from the duty station is less than that required from home station or port of entry, to site of erection and return. When travel time from the duty station is greater than that required from home station or port of entry, only time from home station or port of entry will be allowed. Travel time will be allowed only from time of the first available transportation after release for return to home station or port of entry.

1.1.2.3 Unit of Measure

Unit of measure: per calendar day.

1.1.3 Transportation Expenses of Erecting Engineer(s)

1.1.3.1 Payment

Payment will be made for costs associated with the travel and transportation expenses of the erecting engineer(s). No payment will be made for daily commuting expenses or subsistence or other personal expenses while in route or at the jobsite. Also, no payment will be made for fare and transportation expenses outside of continental limits of the United States. Payment may be made for travel by privately owned conveyance if used in lieu of travel by common carrier.

1.1.3.2 Measurement

Travel and other necessary transportation expenses of the erecting engineer(s) will be measured for payment based upon the travel fare by scheduled airline using less than first class accommodations, when available, or railroad and sleeping car fare when air travel accommodations are not available. Payment for travel by privately owned conveyance is made at the applicable mileage rate of [_____] cents per km mile, provided that such payment do not exceed the constructive cost of air coach accommodations, including consideration of the cost to the Government for the rate per calendar day bid for the services of the erecting engineer and regardless of whether space would have been available. When air accommodations are not available, the mileage reimbursement will be limited to the constructive cost of first class rail, when the elapsed time of rail travel is more than 4 hours; coach class when the elapsed time of rail travel is 4 hours or less; or when neither air nor rail accommodations are provided, the mileage reimbursement will be limited to the constructive cost of bus transportation.

1.1.3.3 Unit of Measure

per km mile.

1.2 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide
specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

1.3 SUBMITTALS

*****************************************************************************************************************************************
NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.
Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings
- Detail Drawings; G[, [_____]]
- Pump Base Plate And The Anchoring Bolts; G[, [_____]]

SD-03 Product Data
- Humidity-Controlled Storage Materials; G[, [_____]]
- Spare Parts
- Total Head; G[, [_____]]
- Shipping Bills
- Pump Curves; G[, [_____]]
- Preliminary Pump Curves; G[, [_____]]
- Installation and Erection Instructions Manual
- Field Tests
- Impeller Weight

SD-04 Samples
- Materials; G[, [_____]]

SD-05 Design Data
- Dynamic Analysis; G[, [_____]]
- Stress-Relieving Procedure; G[, [_____]]
- FSI Connection; G[, [_____]]
- Centralized Pressure Lubrication System; G[, [_____]]
- Piping; G[, [_____]]
1.4 QUALITY ASSURANCE

Furnish one or more competent erecting engineers who is knowledgeable about the installation of vertical pumps and associated drive machinery. Erecting engineers provided by this section include those from the Contractor's suppliers. When so requested, erecting engineers must provide and be responsible for providing complete and correct direction during initial starting and subsequent operation of equipment until field tests are completed. The erecting engineer must initiate instructions for actions necessary for proper receipt, inspection, handling, uncrating, assembly, and testing of equipment. The Erecting Engineer(s) must also keep a record of measurements taken during erection, and furnish one copy to the Contracting Officer on request or on completion of installation of the assembly or part. The erecting engineer must instruct the Contracting Officer in operation and maintenance features of work.

1.4.1 Detail Drawings

**************************************************************************
NOTE: Select appropriate alternate paragraph "d".
The first paragraph (Alternate 1) may be used for pump with discharge diameters up to and including 1350 mm 54 inch. The second paragraph (Alternate 2) should be used for pumps with discharge diameters above 1350 mm 54 inch.
**************************************************************************

Submit drawings of sufficient size to be easily read, within [90] [_____] days of notice of award of contract. Submit information in the English language. Provide with English (IP) dimensions[, or metric with English conversion]. [Submit drawings requiring changes as a result of model test within 45 days after approval of model test.] Drawings must consist of complete designs of the pump, pump installation instructions, performance charts, brochures, and other information required to illustrate that the entire pumping system (including the pump, [engine] [motor] [and speed reducer] has been coordinated and will function as a unit.
a. Outline drawings of the pump showing pertinent dimensions and weight of each component of the pump. Prepare drawings to scale.

b. Drawing showing details and dimensions of pump mounting design or layout including any embedded items and the FSI.

c. Cross-sectional drawings of the pump showing each component. Show major or complicated sections of the pump in detail. Indicate on each drawing an itemized list of components showing type, grade, and class of material used and make and model number of standard component used.

d. Alternate 1) Detail and assembly drawings required for manufacturing showing dimensions, tolerances, and clearances of shafts, bearings, including dimensions of grooving, couplings, and packing gland, and diameter and tip clearance of propeller.

d. Alternate 2) Detail and assembly drawings of entire pump. Include all dimensions required to manufacture pump.

e. Drawings covering erection and installation, that are intended to be furnished to the erecting engineer.

f. Drawings of the pump; base plate showing its dimensions. Include calculations used in the design of the thickness of the pump base plate and the anchoring bolts to ensure that the proper forces (shear, torsion, etc.) have been considered.

1.4.2 Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, procedures and welders must be qualified in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. Perform the qualification tests at the work site if practical. The welder or welding operator must apply their assigned symbol near each weld made as a permanent record.

The names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, and standards tested to.

1.5 DELIVERY, STORAGE, AND HANDLING

1.5.1 General

Furnish major pump components with lifting lugs or eye bolts to facilitate handling. Design and arrange lugs or bolts to allow safe handling of pump components singly or collectively as required during shipping, installation, and maintenance. Submit copies of certified shipping bills to the Contracting Officer or memorandums of all shipments of finished pieces or members to designated site, giving designation mark and weight of each piece, number of pieces, total weight, and if shipped by rail in carload lots, car initial and number.
1.5.2 Processing for Storage

Prepare pumps (and spare parts) for storage indoors. Indoor storage consists of a permanent building that has a leak-proof roof, full walls to contain stored equipment, and a concrete floor or temporary trailers. A temporary structure may also be built at the job site for equipment storage that will contain features of the permanent building above except that provision for ventilation will be provided and floor may be crushed rock. A vapor barrier will be provided below the crushed rock. Crushed rock will be of sufficient thickness so that settlement of equipment will not occur. Equipment stored on crushed rock will have cribbing under each support location so that equipment does not come in contact with crushed rock. A plastic barrier will be placed between equipment and wood cribbing. Submit a list of equipment and materials requiring humidity-controlled storage to the Contracting Officer no later than 30 days prior to shipment of pumping units. Store long term (greater than 6 months) in accordance with pump manufacturer's recommendations.

1.6 PROJECT/SITE CONDITIONS

1.6.1 Datum

Elevations shown or referred to in specifications, are above [plus] or below [minus] [mean sea level] National Geodetic Vertical Datum (NGVD) [_____].

1.6.2 [Static][Pool-To-Pool][Bowl] Head

**************************************************************************
NOTES: Select appropriate alternate paragraph.

Static head (1st alternate) is generally used for pumping stations having discharges over the protection, free discharge or a discharge chamber type pumping station. If this alternate is selected, the Specifier should attach FIGURE 1, SYSTEM LOSS CURVE to the end of this section.

Pool-to-pool heads (2nd alternate) are usually specified when the discharge and suction systems are complex and total head is found by model test or determined by the Contractor.

Bowl Head (3rd alternate).
**************************************************************************

[ Static head is the difference, in meters feet, between water surface elevation in the [sump bay] [sump] [immediately inside trash rack] and [top of discharge pipe at highest elevation] [water surface elevation of [river] [lake] [discharge chamber] [centerline of discharge flap gate in discharge chamber] [_____]]. Total head includes static head, friction losses outside of equipment being furnished, plus velocity head loss. [A curve showing friction losses plus velocity head for pumped capacities is included at the end of this section.]

[ Pool-to-pool head is the difference in meters feet between the water surface elevation in the [sump bay] [sump] and water surface elevation in [discharge chamber] [discharge channel] [river] [______]. The pump manufacturer must determine total head. Submit computations of total head]
and losses. Total head includes losses from the water surface on the
suction side of the pump to discharge water surface.]

[ Bowl head is the difference in meters feet between the water surface
elevation in the [sump bay] [sump] [immediately inside of trash rack] and
the elevation of the diffuser exit plus head of water occurring at the
diffuser exit. Pump manufacturer must determine total head. Total head
includes losses beyond the pump diffuser plus velocity head loss.]

1.7 MAINTENANCE

1.7.1 Special Tools

**************************************************************************
NOTE: Add applicable sections for drive units used.
**************************************************************************

Furnish one set of all "special tools" required to completely assemble,
disassemble, or maintain the pumps. "Special tools" refer to oversized or
specially dimensioned tools, special attachments or fixtures, or any
similar items. If required, provide a device for temporarily supporting
the pump shaft and impeller during assembly, disassembly, and reassembly of
the [motor] [gear reducer] when the thrust bearing is not in place.
Furnish lifting devices required for use in conjunction with [the overhead ]
[a truck] crane. Provide a portable steel cabinet large enough to
accommodate all "special tools" furnished under this paragraph and as
required by Section(s) [26 29 01.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL
INDUCTION TYPE] [26 29 02.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL
SYNCHRONOUS TYPE], [41 00 10.00 10 [DIESEL] / [NATURAL GAS FUELED] ENGINE
PUMP DRIVES] and [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS].
Mount the cabinet on four rubber-tired casters. Provide drawers to
accommodate tools. Fit front of cabinet with doors hinged to swing
horizontally. Furnish doors with necessary stops, catches, and hasps for
completely securing the cabinet with a padlock. Furnish the padlock
complete with three keys. Pack "special tools" in wooden boxes if the size
and weight do not permit storage in the tool cabinet. Provide slings if
the box and tools are heavier than 34 kg 75 pounds.

1.7.2 Extra Materials

**************************************************************************
NOTE: Spare parts should be required if estimated
station operating hours are greater than 500 hours
per year. Spare parts should also be considered for
pumps located in remote locations and for pumps with
unusual design. Spare parts for pumping stations
having more than three pumps of identical
construction should be considered, since acquisition
of these spares will be more economical when
purchased with the pumping units. Decisions on
requiring spare parts can also be based on
furnishing spare parts for stations in remote areas
or having unusually designed pumps where parts could
take considerable time to obtain. When spare parts
are included as part of the original supply
contract, their cost would probably be half of their
cost if obtained after original construction. When
spare parts are included as part of the original
purchase of the pumping units, their cost could be
less than one half of the cost when obtained at a later date.

Select appropriate alternate paragraphs for subparagraphs "d" and "f", below.

Furnish the following spare parts:

a. One complete replacement set of bearings, bearing shells, journal sleeves, shaft coupling, if applicable, and seals for each size pump.

b. One complete replacement set of wearing parts for the packing gland for each size pump, and sufficient packing for all pumps.

c. Fifty percent of each size and length of bolt, nut, and washer used on each size pump assembly.

d. [One lube pump, complete with motor and timer control, for the centralized lubrication system.] [One complete manually operated centralized lubrication system.] [One oil storage container including drip device and solenoid oil valve.]

e. One complete main pump shaft, including keys and thrust collars.

f. [One complete pump impeller for each size pump.] [One complete main pump impeller bowl assembly for each size pump, consisting of the impeller bowl, diffuser bowl, suction bell if so equipped, impeller shaft with sleeves, bearings, impeller, and all fasteners required to make a complete assembly.] All spare parts must be duplicates of the original parts furnished and be interchangeable therewith. Pack spare parts in crates as specified in paragraph PROCESSING FOR STORAGE, subparagraph GENERAL. Provide slings if the crates and parts are heavier than 34 kg 75 pounds.

g. Provide copies of manufacturer's complete parts list showing all parts, spare parts, and bulletins for each size pump. Clearly show all details and parts, and adequately describe parts or have proper identification marks.

] [1.8 Warranty

**************************************************************************
NOTE: Consider including an extended warranty for the pumping equipment if there is a likelihood that the pumping equipment will be operated very little during the first years due to a lack of water, ongoing interconnected projects, or permitting issues.
**************************************************************************

The manufacturer of the axial-flow impeller-type vertical pumps must provide a warranty all equipment furnished under this section against defective workmanship, materials, design, and performance for a period of [_____] years from the date the equipment is accepted. If the equipment or any part thereof does not conform to these warranties, and the Government so notifies the manufacturer within a reasonable time after its discovery, the manufacturer must thereupon promptly correct such nonconformity by repair or replacement. Coordinate the down time for the equipment with the Government, and be kept to a minimum duration that is mutually agreed to by
the manufacturer and the Government. The manufacturer is liable during the warranty period for the direct cost of removal of the equipment from the installed location, transportation to the manufacturer's factory or service shop for repair and return, and reinstallation on site. The manufacturer will be given the opportunity to perform the removal and reinstallation and to select the means of transportation. The expense of removing adjacent apparatus, installing spare equipment, costs of supplying temporary service, is not included in this warranty provision.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION

Design, furnish, and install [_____] [identical] vertical [axial-flow] [or] [mixed-flow], single [or two-]stage impeller-type pumps, as indicated. The pumping systems include pumps, [diesel engine pump drives], [electric motor pump drives], [and reduction gears]. The pump manufacturer is responsible for the equipment of the entire pumping systems. Therefore, the [diesel engines], [electric motor], [and reduction gears] should be selected by the pump manufacturer.

2.1.1 Design Requirements

**************************************************************************

NOTE: Delete the reference to the pump operating in the dry if the pump is product-water lubricated.
Select appropriate alternate paragraph for subparagraph "d". A discharge line is used for all applications, except for stations that have the discharge system integral with the wall of the pumping station.
**************************************************************************

a. Pumps are for the purpose of pumping [_____] from [_____] into [______]. Water pumped will not exceed [_____] degrees C F, will be relatively turbid, and may contain sand, silt, and vegetative trash capable of passing through the trash rack. Trash racks will have [_____] mm inch clear openings. [Design pumps to operate in the dry.]

b. Drive the pumps with the [vertical] [horizontal] [induction] [synchronous] [motors described in Section [26 29 01.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL INDUCTION TYPE] [26 29 02.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL SYNCHRONOUS TYPE] [horizontal crankshaft diesel engines described in Section [41 65 10.00 10 [DIESEL] / [NATURAL GAS FUELED] ENGINE PUMP DRIVES],] [through right angle, vertical shaft, reducers described in Section [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS]] as indicated.

c. Design pumps so that no major modifications, alterations, or additions will be required to the pumping station or suction bays to accommodate them. However, requests for changes in setting of pump, supports, and accessories that would involve only minor modifications, will be considered. Design pump so that pump parts will fit within the limiting horizontal and vertical dimensions shown and that installation and maintenance can be accomplished by the [interior; overhead traveling crane,] [truck crane using hatch in roof.] Pumps, [or pump parts assembled at pumping station] must be capable of being lowered through floor openings shown with a minimum of 25 mm 1 inch clearance around each side.
[ d. Each pump must discharge into discharge system shown. System loss
curve, which includes friction losses from pump discharge elbow to [end
of discharge line], [beginning of down [riverward] leg of discharge
line], including bend losses, exit loss, and velocity head, is included
as Figure 1 at end of this section to permit determination of total
head. Determine losses within the pump.]

[ d. Each pump discharge system downstream of pump [discharge elbow]
[diffuser] must be designed by the pump manufacturer. It must be of
type shown and fit within limiting dimensions and elevations shown.
Determine all losses for discharge system and submit for approval.]

[ d. Each pump must discharge into discharge chamber shown. System loss
curve(s) furnished includes all losses beyond the discharge elbow.
Determine losses within the pump.]

[ e. Accomplish priming of siphon [with] [without] assistance of vacuum
equipment.]

[ f. Design the pump and column to be installed and removed using the [_____]
kg ton overhead crane indicated. Design the pump and column section
lengths with the indicated crane lift as a limiting factor.]

g. The design (drawings, computations, etc.) must be signed and sealed by
a professional engineer.

2.1.2 Capacities

**********************************************************************************************************
NOTE: Select appropriate alternate paragraphs.
Capacities are those determined from earlier design
studies for the station. If hydrology/hydraulic
studies indicate that gross over-capacity may cause
a problem, as in certain discharge chambers, a
maximum capacity should be specified. If a siphon
discharge system is to be used, there should be a
minimum of two design points listed; one for the
priming condition and one for the design operating
condition.
**********************************************************************************************************

Each pump must:

[ a. Discharge not less than [_____] m³/s cfs] [_____] L/s gal/min] against
total head corresponding to a [pool-to-pool][static][bowl] head of
[_____] m feet with water surface in sump at Elevation [_____] m feet.]

[ b. Discharge not less than [_____] m³/s cfs] [_____] L/s gal/min] against
total head corresponding to a [pool-to-pool][static][bowl] head of
[_____] m feet with water surface in sump at Elevation [_____] m feet.]

[ c. Discharge not less than [_____] m³/s cfs] [_____] L/s gal/min] against
total head corresponding to a [pool-to-pool][static][bowl] head of
[_____] m feet with water surface in sump at Elevation [_____] m feet.]

[ d. Be capable of constant-speed operation from a total head corresponding
to a [pool-to-pool][static][bowl] head of [_____] m feet down to total
head corresponding to a [pool-to-pool][static][bowl] head of [_____] m
feet[ with water surface in the sump at Elevation [_____]].]

[ Operation of pump at condition "a" may be at the rotative speed, which is the same as or different from that required to meet condition(s) "b", "c", and "d".]

[2.1.2.1 Primed Condition

Each pump must discharge not less than [[_____] m3/scfs [_____] L/gal/min] against a total head corresponding to a [pool-to-pool][static][bowl] head of [_____] mfeet. This rated condition is based on an intake canal elevation of [_____] m ft and a discharge pool elevation of [_____] mfeet. These pumps must be capable of constant speed operation from a pool-to-pool head of [_____] m feet down to and including a pool-to-pool head of [_____] m feet with water surface in the intake sump ranging from elevation [_____] to elevation [_____] m feet. Once the system is primed, the water level in the discharge impoundment can range from elevation [_____] m feet to elevation [_____] m feet.

][2.1.2.2 Start-Up Condition

Upon startup, each pump must discharge sufficient water for the pumps to become primed and siphon recovery to begin. Since the head conditions will be higher prior to the pump discharge pipe becoming filled, the pump may be operated at a higher speed for a short period of time. The pump flow must be sufficient to result in a flow velocity in the discharge pipe of no less than 2 m per second 7 feet per second. The pump speeds may be changed during the pump priming period, but after priming is accomplished, the pumps will operate as constant-speed pumps. Siphon breaker valves will be used to help prime the pumps.

][2.1.3 Pump Curves

Indicate on the pump curves for the submitted pumps that the pumps are capable of operating over the entire total head corresponding to the [full pool-to-pool] [static head range]. [Also provide pump curves for the startup condition for pumps that are operated at a different speed during startup.]

Submit preliminary pump curves with the initial pump submittal. Indicate the pump’s expected total head, static heads, brake horsepower, and efficiency, as ordinates. Plot against the pump discharge as the abscissa. The curves must indicate that the pump meets all specified conditions of capacity, head, brake horsepower, and efficiency.

2.2 MATERIALS

**************************************************************************
NOTE: The Designer should discuss materials and design details for specific site application with pump manufacturers; and the Designer should edit Sections 05 50 14, 05 50 15, and 08 31 00 as appropriate.
**************************************************************************

If not specified, materials and fabrication must conform to the requirements of Section [08 31 00 ACCESS DOORS AND PANELS] [05 50 14 STRUCTURAL METAL FABRICATIONS] and Section 05 50 15 CIVIL WORKS FABRICATIONS. Material selection not specified is guided by HI 9.1-9.5 for
corrosion, erosion, and abrasion resistance. Submit copies of purchase orders, deviations from the specified materials, mill orders, shop orders for materials, and work orders, including orders placed or extended by each supplier. Furnish a list designating materials to be used for each item at time of submittal of drawings. Furnish, within 60 days of notice of award, names of manufacturers of machinery and other equipment contemplated to be incorporated in the work, together with performance capacities and other relevant information pertaining to the equipment. Submit samples of materials as directed. Equipment, materials, and articles installed or used without the approval of the Contracting Officer are at risk of subsequent rejection.

a. Identify each pump by means of a separate nameplate permanently affixed in a conspicuous location. The plate must bear the manufacturer's name, model designation, serial number if applicable, and other pertinent information such as wattage horsepower, speed, capacity, type, direction of rotation, etc. Make the plate of corrosion-resisting metal with raised or depressed lettering and a contrasting background.

b. Equip each pump with suitably located instruction plates, including any warnings and cautions, describing any special and important procedures to be followed in starting, operating, and servicing the equipment. Make the plates of corrosion-resisting metal with raised or depressed lettering and contrasting background.

c. Provide safety guards and/or covers wherever necessary to protect the operators from accidental contact with moving parts. Make guards and covers of sheet steel, expanded metal, or another acceptable material and removable for disassembly of the pump.

2.3 METALWORK FABRICATION

2.3.1 Designated Materials

Designated materials must conform to the following specifications, grades, and classifications.

<table>

</table>
2.3.2  Bolted Connections

2.3.2.1  Bolts, Nuts, and Washers

Bolts, nuts, and washers must conform to requirements of paragraph MATERIALS AND METALWORK FABRICATION, subparagraph DESIGNATED MATERIALS, and paragraph VERTICAL PUMPS, subparagraph PUMP COLUMN AND DISCHARGE ELBOW, subparagraph NUTS AND BOLTS for types required. Use beveled washers where bearing faces have a slope of more than 1:20 with respect to a plane normal to bolt axis.

2.3.2.2  Materials Not Specifically Described

Materials not specifically described must conform to latest ASTM specification or to other listed commercial specifications covering class or kinds of materials to be used.

2.3.3  Metalwork

2.3.3.1  Flame Cutting of Material

Flame cutting of material other than steel is subject to approval of the Contracting Officer. Shear accurately, and neatly finish all portions of work. Steel may be cut by mechanically guided or hand-guided torches, provided an accurate profile with a smooth surface free from cracks and notches is secured. Prepare surfaces and edges to be welded in accordance with AWS D1.1/D1.1M. Chipping and/or grinding will not be required except where specified and as necessary to remove slag and sharp edges of mechanically guided or hand-guided cuts not exposed to view. Visible or exposed hand-guided cuts must be chipped, ground, or machined to metal free of voids, discontinuities, and foreign materials.

2.3.3.2  Alignment of Wetted Surfaces

Exercise care to assure that correct alignment of wetted surfaces being joined by a flanged joint is being obtained. Where plates of the water passage change thickness, transition on the outer surface, leaving inner surface properly aligned. When welding has been completed and welds have been cleaned, but prior to stress relieving, carefully check joining of plates in the presence of the Government inspector for misalignment of adjoining parts. Localized misalignment between inside or wetted surfaces of an adjoining flange-connected section of pump or formed suction intake cannot exceed the amount shown in Column 4 of Table 1 for the respective radius or normal distance from the theoretical flow centerline. Correct misalignments greater than the allowable amount by grinding away offending metal, providing the maximum depth to which metal is to be removed does not exceed amount shown in Column 5 of Table 1. Do not remove metal until assuring the Contracting Officer that no excessive stresses will occur in the remaining material and that excessive local vibration will not result from removal of the material. Where required correction is greater than the amount in Column 5 of Table 1, reject pipe for use. Proposed procedure for all corrective work, other than minor grinding, must be approved by the Contracting Officer prior to start of corrective work. Finish corrective work by grinding corrected surface to a smooth taper. Length of the taper along each flow line element must be 10 times the depth of the offset error at the flow line. Wetted surface irregularities that might have existed in an approved model cannot be reason for accepting comparable surface irregularities in the prototype pump.

### 2.3.3.3 Stress-Relieving Procedure

After all fabrication welding is completed, and prior to any machining, stress-relieve the bell and the impeller (if it is fabricated) by heat treatment. Submit proposed stress-relieving procedure.

### 2.3.4 Examination of Castings

Clean and carefully examine all castings for surface defects. Further examine all defects by nondestructive means. Examination personnel must be qualified/certified in accordance with applicable ASTM requirements. Submit the examination procedure and qualification of the examiner. Conduct examination tests in the presence of the Contracting Officer. Choose the examination procedure best suited for the application.

#### 2.3.4.1 Examination Procedures

##### 2.3.4.1.1 Ultrasonic

Conform inspection to the applicable provisions of ASTM A609/A609M.

##### 2.3.4.1.2 Magnetic Particle

Conform inspection to the applicable provisions of ASTM E709.

##### 2.3.4.1.3 Liquid Penetrant

Conform inspection to the applicable provisions of ASTM E165/E165M.

#### 2.3.4.2 Acceptance and Repair Criteria

Acceptance and repair criteria must be in accordance with Section [08 31 00](#)
2.4 VERTICAL PUMPS

2.4.1 Speed

NOTE: Select appropriate alternate paragraph. Alternate 1 is used when cavitation testing is part of the contract. Alternate 2 is used when the pump will not be tested to determine the cavitation characteristics and the designer has determined the maximum speed to be specified based on the NPSHA. The following criteria should be used by the designer in determining the maximum rotative speed:

\[
\frac{(SS) \times (NPSHA)^{3/4}}{Q^{1/2}} = N_{ss}
\]

where:

- \( N_{ss} \) = pump rotative speed, in revolutions per minute
- \( SS \) = suction-specific speed
- \( Q \) = flow, in gallons per minute
- \( NPSHA \) = net positive suction head available

Maximum value of \( SS \) to be used in the formula:

\( SS = 8,500 \)

A more conservative value of suction specific speed may be used when operating for extended periods of time above or below the optimum efficiency point.

Rotative speed of pump must be no greater than [_____] r/min rpm. Verify that rotative speed of pump at which the NPSH is produced is no less than required, as determined by cavitation tests specified in paragraph FACTORY TESTS (Alternate 2).

2.4.2 Reverse [Rotation] [Flow]

NOTE: Select appropriate alternate paragraph:
Reverse Rotation (1st alternate) and Reverse Flow (Alternate 2). 1st alternate (bracketed paragraph) is used when the pumping unit does not have a non-reverse device. 2nd alternate (bracketed paragraph) is used when the pumping unit is equipped with a non-reverse device.

Each pump must withstand, with no damage, full rotative speed caused by subjecting the pump to reverse flow. The head used to determine this reverse rotative speed is calculated from specified highest discharge side water elevation and lowest pump intake side water elevation.
and its connected electric motor must be capable of full reverse rotative speed when acting as a turbine by reverse water flow. Use the highest head specified in paragraph [STATIC][POOL-TO-POOL][BOWL] HEAD to determine the reverse speed.][ Furnish drive systems containing reduction gears or engines with a non-reverse device.]

Pump must withstand, with no damage, the full force exerted on it, with the impeller subjected to reverse flow and the upper end locked in place by a backstop. Calculate the head to determine the force developed by this reverse flow from the specified highest discharge side water elevation and lowest pump intake side water elevation. Reverse rotative speed must be [0.0][____] with instantaneous activation of the backstop.

2.4.3 Efficiency

**************************************************************************

NOTES: Select appropriate alternate paragraph.

All pump specifications should require some minimum efficiency at the primary or normal operating design point. This minimum efficiency should be based on the pump selections made during pump station layout and design.

Alternate 1 is used when pool-to-pool head is specified in paragraph PROJECT/SITE CONDITIONS, and the pump manufacturer is required to model the discharge system (Alternate 2). Alternate 2 is a measure of pump efficiency as defined in HI ANSI/HI 14.6. The stated efficiency is based on the pump selection made during station layout and design.

**************************************************************************

[Pool-to-pool efficiency at head-capacity condition(s) specified in paragraph CAPACITIES must not be less than [____] percent when calculated as follows:

\[
\text{Efficiency} = \frac{Q \times H}{366 \times \text{BKW}} \times 100
\]

Where: 
\[Q = \text{Discharge, cubic meter/hour}\]
\[H = \text{Pool-to-pool total head, meters}\]
\[\text{BKW} = \text{Pump brake kilowatt}\]

\[
\text{Efficiency} = \frac{Q \times H}{3960 \times \text{BHP}} \times 100
\]

Where: 
\[Q = \text{Discharge, gallons per minute}\]
\[H = \text{Total head, feet}\]
\[\text{BHP} = \text{Pump brake horsepower}\]

] [Pump efficiency, as defined in HI ANSI/HI 14.6, must include losses from the suction bell to the discharge elbow outlet and must not be less than [____] percent at the head-capacity condition(s) specified in paragraph CAPACITIES.]
2.4.4 Suction Bell

NOTE: The recommended minimum thickness of steel pipe to be specified is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER</th>
<th>MINIMUM THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mminch</td>
<td>mm inch</td>
</tr>
<tr>
<td>Up to and including 750 30</td>
<td>103/8</td>
</tr>
<tr>
<td>Above 750 30 and up to and including 1200 48</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 1200 48 and up to and including 2100 84</td>
<td>165/8</td>
</tr>
</tbody>
</table>

If a formed suction inlet (FSI) is specified, this paragraph should be deleted.

Make each suction bell of [either cast iron, cast steel, or welded steel plate,] [stainless steel plate]. Provide a flanged connection for mating with the impeller bowl with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. [Steel plate, if used,] [Stainless steel plate] must have thickness of not less than [_____] mm inch. Each suction bell must be [made in one piece] [split vertically with bolted flanges joining the two pieces together]. Maintain alignment by use of dowels. Support each suction bell entirely by the pump casing. Supports from sump floor will not be acceptable, [except those that are part of a formed suction intake]. [Support umbrellas, if used, by the suction bowl. Construct the umbrella in two pieces if a single piece umbrella could not be removed using the pump opening in the operating floor. Provide bolted flanges on each half of the umbrella and provide for and easily removable bolted connection to the suction bowl. Provide sufficient lifting lugs on the umbrella to aid in handling.]

2.4.5 Impeller Bowl

NOTE: The recommended minimum thickness of steel plate to be specified is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER</th>
<th>MINIMUM THICKNESS</th>
</tr>
</thead>
<tbody>
<tr>
<td>mminch</td>
<td>mm inch</td>
</tr>
<tr>
<td>Up to and including 750 30</td>
<td>131/2</td>
</tr>
<tr>
<td>Above 750 30 and up to and including 1200 48</td>
<td>165/8</td>
</tr>
<tr>
<td>Above 1200 48 and up to and including 2100 84</td>
<td>193/4</td>
</tr>
</tbody>
</table>

Make each impeller bowl of [either cast iron, cast steel, welded steel plate or a combination of cast steel and steel plate] [stainless steel
Steel plate, if used, must have thickness of not less than [_____] mm inch after machining is completed. Heat-treat and stress-relieve welds before final machining. Provide flanges for mating with the suction bell and the impeller bowl or two-piece construction of the impeller. Provide flanged connections with the suction bell and the diffuser or split construction with a rabbet fit or four equally spaced dowels installed in the vertical position for initial alignment purposes and to maintain concentric alignment of the pump. Machine finish the impeller-swept area in the impeller bowl to at least 3.2 µm 125 microinch rms and concentric with the impeller axis. For mixed-flow impellers, the angle in the impeller bowl must equal the outside angle of the impeller blade tips. Tolerance for concentricity of the impeller with the impeller axis is not greater than 20 percent of the operating clearance between the impeller and the impeller bowl.

2.4.6 Diffuser Bowl

**************************************************************************
NOTE: Use the same thickness for the steel plate as specified in paragraph IMPELLER BOWL.
**************************************************************************

Make each diffuser bowl of [cast iron, cast steel, welded steel plate, or a combination of cast steel and steel plate][stainless steel plate][cast stainless steel]. Steel plate, if used, must have a thickness of not less than [_____] mm inch after machining is completed. The diffuser must contain support for the upper impeller shaft bearing and have vanes to guide the pumped flow. Equip the diffuser bowl with a bypass drain, if required, to outside of the pump from the diffuser cavity located between the enclosing tube connection and the impeller. Furnish throttle bushing located in the cavity immediately above the impeller. Design bypass drain and throttle bushing to reduce water pressure on the lower seal. Impeller back-wear rings can also be used to reduce water pressure on the lower seal.

2.4.7 Pump Column and Discharge Elbow

2.4.7.1 Column and Discharge Elbow

**************************************************************************
NOTE: Use the same thickness for the steel plate as specified in paragraph IMPELLER BOWL, above. For most pumps, space should be provided for using a long radius type elbow. Unless the elbow is made of cast materials, the elbow will be the mitered type. The roundness tolerance should be specified when the flexible coupling is not part of the contract. Turning vanes shall be used in pumps having an access door to inspect/remove trash.

The following tolerance should be used for specifying the tolerance for the plain end of the elbow.
<table>
<thead>
<tr>
<th>NOMINAL PIPE SIZE</th>
<th>TOLERANCE ON ACTUAL O.D.</th>
</tr>
</thead>
<tbody>
<tr>
<td>mminch</td>
<td>mm inch</td>
</tr>
<tr>
<td>Less than or equal to 400 16</td>
<td>Plus/minus 1.5 0.06</td>
</tr>
<tr>
<td>Above 400 16 and up to and including 600 24</td>
<td>Plus/minus 2.0 0.08</td>
</tr>
<tr>
<td>Above 600 24 and up to and including 1050 42</td>
<td>Plus/minus 2.5 0.10</td>
</tr>
<tr>
<td>Greater than 1050 42</td>
<td>Plus 3.0 0.12/Minus 1.5 0.06</td>
</tr>
</tbody>
</table>

Make each column and discharge elbow of [either cast iron, cast steel, or welded steel plate] [stainless steel plate]. [Steel plate, if used,][Stainless steel plate] must have a thickness of not less than [_____] mm inch after machining is completed. Provide elbow of [short radius type][long radius type][mitered type].[ Do not use turning vanes.][ Space turning vanes, if used, at least twice the space of clear space of the trash rack.] If turning vanes made of welded steel plate are used, provide an access door in the discharge elbow to allow personnel to inspect turning vanes and remove trash if necessary. Design column and discharge elbow to withstand internal pressures and external loadings associated with various conditions of pump operation. Provide flanges for mating individual segments together and for mating the pump column to the diffuser bowl. Flanges must have rabbeted fits or four equally spaced dowels installed in flanges for initial alignment purposes and to maintain concentric alignment. Terminate the elbow in a plain-end circular section. Diameter tolerance of plain end is [_____] mm inch. Provide diameter of discharge end of elbow as indicated and allow standard diameter flexible couplings to be used. Use adjustable thrust rods and thrust lugs to transfer the load by bridging the coupling between the pump discharge elbow and discharge piping. Determine the size and number of thrust rods needed for the expected loading. Use a minimum of four thrust rods. Maintain complete access to the discharge piping until the discharge pipe installation is complete, inspected, and approved.

2.4.7.2 Column and Discharge Elbow Support

******************************************************************************

NOTE: Select appropriate alternate paragraph. Pump Column and Discharge Elbow (1st alternate) is used for conventional pumps supported from the base-plate. Design Pump Unit (2nd alternate) is used for large stations having pumps over 1800 mm 72 inches in discharge diameter and supported from different floors.

******************************************************************************

[ Design pump column and discharge elbow for suspension from a baseplate assembly specified in paragraph BASE-PLATE AND SUPPORTS and located at operating floor level.]

[ Design each pumping unit for installation as indicated. Install the baseplate for supporting the [electric motor] [gear reducer] at elevation of operating floor, EL [_____]]. Support the pump casing at intermediate
floor, EL [______]. Furnish the [support system] [support system consisting of columns extending from baseplate to intermediate floor]. The support system must transfer the entire load on the baseplate to the intermediate floor. Design the support system to maintain proper alignment of the pumping unit and propeller blade setting. Include the support system in the dynamic analysis.]

2.4.7.3 Pumps Discharge Diameter

**************************************************************************
NOTE: A manhole is used if the pump has a shaft enclosing cover that can be removed without disassembly of the pump.
**************************************************************************

Pumps having a discharge diameter greater than 1500 mm 60 inches must contain a manhole. Provide a structural steel bracket with a platform of raised-pattern floor plate similar to the one(s) indicated as a support for maintenance personnel for access to the pump through a manhole. Provide a manhole 600 by 750 mm 24 by 30 inches, or largest practicable size with a gasketed cover, in the column above the diffuser bowl. Provide jack bolts in the cover together with eye bolts to facilitate removal.

[2.4.7.4 Formed Suction Intake

**************************************************************************
NOTE: Select appropriate alternate paragraph.
**************************************************************************

Alternate 1 should be used when a rectangular sump is designed using criteria established by U.S. Army Engineer Research and Development Center (ERDC).

The use of a Formed Suction Intake (FSI) (Type 10), Alternate 2, is determined during the design phase of the station/pump. The Government will furnish all dimensions and be responsible for the design. The FSI was developed by ERDC and is now included in HI ANSI/HI 9.8.

The sump floor elevations should be determined in the design of the pumps/station. The impeller datum elevation should allow the necessary submergence as determined by the computations in EM 1110-2-3105, and verified with pump manufacturers' data.

The Designer should contact at least 3 pump manufacturers early in the project design phase to verify the Designer's pump size estimate. Normally the eye of the impeller is located at minimum sump elevation, and the geometry of the FSI determines sump floor elevation. The early verification is important for the pump house structural design FSI hydraulics are very sensitive to change, and the pump diameter determines the dimensions of the FSI.

In designs where the FSI is not constructed of concrete, it is recommended that all materials indicated, or combination of these materials, should be specified. A hatch in the operating floor is
generally provided in each pump bay to permit the placement of the FSI sections into the sump. If the station design/size does not have space for a hatch, then the opening for the pump is used for placement and removal of the FSI or is designed so that it can be removed using the sump gates and trash rack. The minimum thickness of fabricated material for the FSI should be:

<table>
<thead>

**************************************************************************

[ Sump has been designed using information obtained by sump model testing. Changes to sump layout will not be permitted.]

[ Formed Suction Intake (FSI):

a. Provide the FSI water passage with the pump, sized to fit within the limiting elevations and dimensions indicated. Do not locate bearing below the impeller when an FSI is used.

b. Dimensions of the intake elbow and conical transition section of the FSI are relative to the diameter at the top of the cone, as defined on the drawings. The diameter at top of the cone and related dimensions are determined to accommodate the size of pump, providing limiting values for discharge and submergence are not exceeded, the floor of the FSI remains at elevation [______], and impeller datum is set no higher than elevation [______]. The rectangular transition section of the FSI upstream of the elbow can be modified in length to match the width of the individual pump bay or sump intake. Any modification must be limited to surfaces and dimensions indicated, and must be approved.]
c. Construct each FSI of [fabricated steel,][ cast iron,][ cast steel,][ or a combination of these materials embedded in concrete][formed concrete as indicated]. Stiffeners used must be on the outside of the FSI to allow smooth flows in the FSI. Size subassemblies of the FSI, unless constructed of formed concrete, to permit placement and removal through [a hatch in operating floor] [the pump opening in the operating floor] [through the sump gate and trash rack]. Bolts used to connect flanges must be stainless steel with bronze nuts. Minimum thickness of fabricated material must be [10][13][16][19] mm [3/8][1/2][5/8][3/4] inch for fabricated portions. Provide grout holes in floor of the FSI to permit full grouting. [FSIs formed in concrete must meet the surface requirements specified in Section [03 30 00 CAST-IN-PLACE CONCRETE] [03 30 00 CAST-IN-PLACE CONCRETE]] and conform to the construction tolerances given in TABLE 1.[ FSIs constructed of iron or steel must conform to the construction tolerances given in Section 05 50 14 STRUCTURAL METAL FABRICATIONS.]

SECTION 35 45 01 Page 30
Machine flanges and drill bolt holes concentric with pump shaft vertical centerline, having a tolerance of plus or minus one fourth of the clearance between the bolt and bolt hole. When fabricated from steel plate, flanges must not be less than 25\([\text{mm]}\)\(\,1\)-\(\frac{1}{2}\)\(\text{inch}\) thick after machining. Flange thickness after machining cannot vary more than 10 percent of greatest flange thickness. Provide external stiffeners, if needed. Construct fabricated flanges, as a minimum, to the dimensions of AWWA C207, Class B. Design flanges on major components of pump casing (suction bell, impeller bowl, diffuser bowl, and column and elbow piping) such that blind holes necessitating use of cap screws or stud bolts are not used. Design flanges for connection to column pipe by at least two continuous fillet welds. Connect the inside diameter of the flange to pump column with one weld, and connect the outside diameter of the pump column to the flange with the other weld. Final design of welds rests with the manufacturer, and specified welds are the minimum requirement. Parallel machine, when provided on each end of the same component, and mount parallel to a plane that is normal to pump shaft centerline. Flanges on each end of the same component must have parallel tolerance of 0.051 mm \(\,0.002 \text{ inch}\). Finish machine mating surface on flange to 3.2 µm \(\,125 \text{ microinch}\) finish or better. Provide flanges with a minimum of three jacking bolts to aid in disassembly of the pump.

### 2.4.7.6 Flanged Joints

Design flanged joints to be air-and water-tight, without the use of preformed gaskets, against positive and negative operating pressures that will be experienced, except that permanent gasketing compound will be permitted. Provide mating flanges, unless of the male-female rabbet type, with not less than four tapered dowels equally spaced around each flange. If rabbeted fit is not used, then provide the method used to determine concentricity of connected pieces.

### 2.4.7.7 Nuts and Bolts

Use 300 series stainless steel for bolts used in assembling the pump and its supporting members, including anchor bolts and dowels. Use only bronze nuts and hexagonal bolts and nuts. Also use 300 series stainless steel washers.

### 2.4.7.8 Galvanic Protection

**************************************************************************

NOTE: Select appropriate alternate paragraph.

**Alternate 1 should be used for pumps having discharge diameters of 500 mm 20 inches or less.**
Alternate 2 should be used for pumps having a discharge diameter greater than 500 mm 20 inches. This may also be used for pumps with side discharge diameters of 500 mm 20 inches or less when manufacturers' information indicates that this method will be the least expensive. The total weight of anodes to be used for each pump is:

<table>
<thead>
<tr>
<th>DISCHARGE DIAMETER mm inch</th>
<th>MINIMUM NUMBER OF ANODES USED</th>
<th>TOTAL WEIGHT OF ANODES USED kg lbs</th>
</tr>
</thead>
<tbody>
<tr>
<td>From 500 20 up to and including 900 36</td>
<td>2</td>
<td>1840</td>
</tr>
<tr>
<td>Above 900 36 up to and including 1200 48</td>
<td>4</td>
<td>3680</td>
</tr>
<tr>
<td>Above 1200 48 up to and including 2100 84</td>
<td>7</td>
<td>68150</td>
</tr>
</tbody>
</table>

**************************************************************************

[When dissimilar metals are used, electrically isolate dissimilar parts. Verify isolation by checking joint with an ohmmeter.]

When dissimilar metals are used, use zinc anodes. Provide machined mounting pads and install anodes on carbon steel or cast iron parts. Fasten anodes to bare material on the pump so that continuity is obtained between the anode and the pump. Verify continuity by checking the joint with an ohmmeter. Locate anodes on the exterior of the pump below normal sump level. Total weight of anodes used per pump must be [18][36][68] kg [40][80][150] pounds. Electrically bond pump joints at the joints.]

2.4.7.9 Harnessed Coupling

**************************************************************************

NOTE: This alternative is used when the flexible coupling is to be furnished by the pump Contractor. The applicable connection should be stated.

**************************************************************************

Provide a flexible mechanical coupling or split-sleeve type coupling that either conforms to ASTM F1476, Type II, Class 3, stainless steel (as manufactured by Teekay or Straub Couplings), ASTM F1476, Type 1 (as manufactured by Victaulic), or Dresser Couplings style 38 or approved equal, to connect the pump discharge elbow to the [transition section] [wall thimble] [discharge piping]. Install a minimum of four harness bolts (sized by the pump manufacturer) at each coupling.

2.4.7.10 Wall Thimble

**************************************************************************

NOTE: This alternative is used when the discharge piping includes the piece that will be embedded in the wall of the station. The size of vent to be used is determined from information in EM 1110-2-3105.

**************************************************************************
Provide each wall thimble with one plain end to accommodate the flexible mechanical coupling and one flanged end to mate with the [flap gate] [multiple shutter gate] [discharge piping]. The plain end must match the pump discharge elbow in thickness and diameter and drill the flanged end to match, and be capable of supporting without distortion, the [flap gate] [multiple shutter gate]. Provide the seal ring on the wall thimble located so that it is centered in the wall when embedded. In addition, furnish a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 Standard 125 pound flange and locate where indicated. Fabricate the wall thimble from steel plates.

2.4.7.11 Discharge Piping

**************************************************************************
NOTE: Include applicable discharge pipe description.
**************************************************************************

Install the discharge piping as indicated. Match the plain end of each discharge pipe with the pump discharge elbow in thickness and diameter and be able to allow a flexible mechanical coupling to connect it to the pump discharge elbow. [Terminate the discharge piping in a flanged end to mate with a flap gate. Drill the flanged end to match, and be capable of supporting the flap gate without distortion.] [Terminate the discharge piping in an open end.] Provide the discharge pipe with pipe supports or cradles as recommended by the pump manufacturer. Locate the supports between the flexible coupling and the wall, as indicated. Provide suitably-sized thrust restraints at each flexible coupling as indicated. The supports must provide support for the weight of the pipe, the water that will pass through the pipe, and any dynamic forces that may develop due to water flowing through the pipe. Furnish a minimum [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 standard 125 pound flange and locate where indicated. The discharge pipe must be non-galvanized piping of welded or seamless pipe or welded steel plate. Use steel pipe conforming to AWWA C200 with dimensional requirements as given in ASME B36.10M. Provide fittings in compliance with AWWA C208.]

2.4.7.12 Flap Gate

Design the flap gate for pump discharge service with flange-frame with a resilient seat of neoprene or BUNA-N to prevent closing shock. Make the size of the flap gate the same as the discharge pipe size. [Use cast iron for the body of the valve and the flap in compliance with ASTM A126. Use high-tensile bronze ASTM B584- CA 865 for the hinge arms. Design the hinge
pins in double shear and of silicon bronze, ASTM B98/B98M- CA 655.
[Fabricate the flap gate entirely of stainless steel. Use only stainless
steel hardware.] Provide lubrication fittings on the hinge arms. Extend
the grease lines to a convenient location for lubricating. Provide an
anti-locking bar to prevent excessive rotation about the lower hinge pin.
Provide a stainless steel leaf spring with rubber pad to safely limit the
travel of the flap gate during pumping.

2.4.8 Impeller

**************************************************************************
NOTE: Cast steel and aluminum bronze are normally
used when pumps are less than 2100 mm 84 inch.
Fabricated steel impellers are used with pumps
having discharge diameters 2100 mm 84 inch or
greater. Cast stainless steel is used for pumps
where the difference between pump NPSHA and NPSHR is
small (less than 600 mm 2 feet) or, when severe
corrosion is expected.
**************************************************************************

Make the impeller of [cast steel, ] [cast stainless steel, ] [aluminum
bronze] or [fabricated of welded steel plate].

2.4.8.1 Removal and Prior To Finishing

After removal from mold, and prior to finishing of surface imperfections,
the Contracting officer will inspect castings. Fill and grind minor
surface imperfections as necessary to preserve correct contour and outline
of impeller and to restore surface imperfections to the same degree of
finish as surrounding surfaces. Correct surface pits, depressions,
projections, or overlaps showing greater than 2 mm 1/16 inch variation from
the general contour for that section. Method and procedure for
accomplishing repair must be as required in Section [08 31 00 ACCESS DOORS
AND PANELS] [05 50 14 STRUCTURAL METAL FABRICATIONS]. Castings that
exhibit surface imperfections (as defined above) covering an area of more
than 10 percent of blade surface will be rejected.

2.4.8.2 Balance

**************************************************************************
NOTE: The maximum operating speed is used for
driver/pumps which operate at different speeds. The
rated operating speed is used with a single speed
driver. The g-mm oz-inch used in this paragraph are
determined from ISO 1940-1 for grade G6.3.
Impellers for pumps having a discharge diameter
greater than 600 mm 24 inch shall have the impeller
weighted. The amount of allowable unbalance or the
level of balance in the acceptable standards must be
chosen and included in this guide specification.
This includes choosing acceptable standard(s). A
suggested standard is balance quality grade G6.3 in
accordance with ISO 1940-1.
**************************************************************************

Balance each impeller by the two-plane balancing technique. Balance each
impeller at [maximum] [rated] operating speed. Check the balance at 110
percent of balance speed, and make needed corrections. Amount of allowable
unbalance is in accordance with grade G6.3 of ISO 1940-1. Securely fasten weights needed to obtain the required level of balance to the inside cavity of the impeller hub. In no case can portions of the impeller be removed or weights be added to the outside of the hub, vanes, or water passages. Submit balancing procedure at least four weeks prior to the date of balancing. Weigh each finished impeller and weight stamped on the bottom of the hub with weight accurate to 0.5 percent of the total weight of the impeller. Weighing and balancing will be witnessed by the Contracting Officer. Submit all impeller weights and the results of impeller balancing.

2.4.9 Shafting

2.4.9.1 Shaft

**************************************************************************
NOTE: Stainless steel shafting should be used when the potential for corrosion is high such as a pump used in a station where the pump/station sump is not capable of being dewatered. The shaft lengths are limited in length by the headroom available. Shaft sections are usually less than 3000 mm 10 feet in length. Vertical adjustment of the shaft should be performed above the operating floor. The motor and gear reducer are normally specified to be hollow shaft type to allow the pump shaft to pass concentrically through the reducer and motor allowing finite impeller elevation adjustments.
**************************************************************************

Each impeller shaft must be stainless steel and intermediate shaft(s) must be [cold-rolled carbon steel] [same material as the impeller shaft]. Design shafting so that [shaft sections do not exceed [_____] mm feet in length and that] any necessary vertical adjustment of the impeller can be made [from the operating room floor] without interfering with shaft alignment. Also provide for removal of the impeller from below without disassembly of the pump above the impeller bowl. If the pump is multi-staged, design to permit the lower bowls and impeller to be easily removed for in-place inspections of upper propeller and bowl. Design shafts for two different design cases. The first uses a factor of safety of 5 based on ultimate tensile strength of the shaft material and rated wattage horsepower of the [motor] [engine]. The second uses 75 percent of the yield strength of the shaft material and [the locked rotor torque of the motor] [maximum wattage horsepower of the engine].

2.4.9.2 Couplings

**************************************************************************
NOTE: Rigid flange couplings should be specified only for pumps having discharge diameters greater than 1800 mm 72 inch. The rigid flange coupling may be specified as an option for all pumps less than 1800 mm 72 inch. Sleeve type couplings should be used for pumps having discharge diameters from 600 mm 24 inch to 2100 mm 84 inch. Threaded shaft couplings can be used for pumps with discharge diameters less than 600 mm 24 inch.
**************************************************************************

Couple the pump and [motor] [gear reducer] shafts[ and pump shaft sections]
together using rigid flanged coupling capable of transmitting the forces and torques involved. Bolt coupling halves together and maintain concentric with each other, by means of a rabbet fit, to within 500 µm 0.002 inch. Retain a shaft coupling nut, if used, by fitted bolts, and comply with all tolerances specified for the coupling. Finish machine the flange and bore in one setup to insure that the flange of the coupling is true to the bore. Each flange must be concentric to the centerline of the shaft to within 500 µm 0.002 inch. Each flange must be concentric to the centerline of the shaft to within 0.50 mm 0.002 inch. Join together pump shaft sections with sleeve-type couplings capable of taking rotation in either direction. Threads, except on fasteners, cannot be employed in construction of sleeve-type couplings. Construct couplings, including keys and fasteners, of stainless steel materials. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The finished shaft assembly must be concentric about the shaft centerline to within 100 µm 0.004 inch. Shop assemble couplings and the pump shaft, and inspect for compliance with contract requirements. After inspection, matchmark parts, including fitted bolts, to their mating pieces.

2.4.9.3 Journals

**************************************************************************
NOTE: Select the appropriate alternate paragraph.
The first alternate is used when plain steel shafting is used for the intermediate shafting. The second alternate is used when all the shafting is stainless steel.
**************************************************************************

Provide replaceable stainless steel one-piece journal sleeves at each guide bearing, packing gland and seal locations. Finish sleeves at all bearings and packing gland locations to at least 32 rms and finish sleeves at seal locations to 16 rms. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness of the sleeves at the bearing and packing gland locations must be as recommended by the pump manufacturer.

Finish the shaft journal at all guide bearing and packing gland locations to at least 32 rms and finish the shaft at seal journal locations to 16 rms. The option exists to install replaceable stainless steel one-piece sleeves at each bearing, packing gland, and seal locations with the finishes stated above. Securely fasten sleeves to the shaft to prevent movement. Make keys and fasteners, if used, from corrosion resisting steel; fastening by adhesive or welding is not acceptable. All keys and keyseats (keyways) must meet the requirements of ASME B17.1. The surface hardness at the seal locations must be as recommended by the seal manufacturer.

2.4.9.4 Circumferential Line

**************************************************************************
NOTE: The circumferential line with pointer should be used for pumps having 1200 mm 48 inch and greater discharge diameters. The following information will be used for determining whether the pump driver is
specified as using a hollow or solid shaft.

Pump drivers with rating less than 745 kW 1000 horsepower are equipped with hollow shafts permitting vertical shaft adjustment from the top of the driver.

Pumps drivers over 745 kW 1000 horsepower are equipped with hollow shafts whenever possible but as a minimum the pump will have a means of vertical adjustment above the operating floor.

Inscribe or etch a circumferential line on the shaft above the stuffing box and mount an adjustable pointer opposite this line in order to indicate a change in vertical position of shaft and to permit realignment after [motor] [gear reducer] removal.

2.4.10 Shaft Enclosure

NOTE: Shaft enclosure tubes are tensioned for pumps with discharge diameters less than 1350 mm 54 inch. Rigid enclosing tubes are used on pumps having discharge diameters 1350 mm 54 inch and greater. External supports or bracing located in the pump water passage are used for pumps with tensioned enclosing tube of 6000 mm 20 ft in length or greater. Self-supported enclosing tubes 4500 mm 15 feet length or greater should have external supports. The enclosing tube is split when pump size is 1800 mm 72 inch or larger. Select appropriate bracketed statements based on the type of pump lubrication being called for.

Provide a shaft enclosure to cover the intermediate shaft and coupling. It [must be placed in tension or ] must be rigid enough to be self-supporting.[ Do not use external supports or bracing located in the pump water passage for support of the enclosing tube unless necessary to support intermediate bearings or indicated to be necessary or advantageous by the dynamic analysis required in paragraph DYNAMIC ANALYSIS. Consider the effect of external supports, including rubber inserts, in the dynamic analysis required in paragraph TEST, INSPECTIONS, AND VERIFICATIONS, subparagraph DYNAMIC ANALYSIS.] Design each enclosure [to be watertight and] for easy assembly and disassembly in the field.[ Split each enclosure longitudinally to permit easy removal without removing or disassembling the pump shaft.] [Perforate each enclosure tube sufficiently to allow a free flow of pump discharge water (i.e., product water) to lubricate the shaft bearings.] Construct enclosing tubes, constructed with screw type joints and using tension in the tube to hold alignment, to prohibit the tension tube from unscrewing when the packing gland adjustments are made. [Provide a shaft enclosure for grease-lubricated pumps with a drain having a shut-off valve located outside of the pump to permit draining the enclosure between operation periods. Locate the drain at the bottom of the shaft enclosure.] [On oil-lubricated pumps, fit the enclosing tube below the lowest bearing and above the oil seals with an oil/water drain line to the outside of the pump. The drain line must have a check valve outside of the pump to preclude the entrance of sump water.]
2.4.11 Guide Bearings and Seals

**************************************************************************
NOTE: Grease lubrication can be used with all size pumps. Oil lubrication may be used in pumps having discharge diameters of 900 mm 36 inch or smaller. Select appropriate bracketed statements based on the type of pump lubrication being called for. The first water-lubricated bearing alternative is for product lubricated bearings. The second water-lubricated alternative if for externally-provided water.
**************************************************************************

2.4.11.1 Guide Bearings

[ Provide each pump with sleeve-type bearings designed for [grease] [oil] lubrication. Each bearing must have a bronze lining in contact with shaft journal and must be replaceable type. Arrange the bearing liner for maximum distribution of [grease] [oil] for lubrication of journal surface. Bearings must have a surface finish of 0.80 µm 32 microinches rms or better to match the journal finish. Since pumped water may contain some fine sand and silt in suspension, give special attention to the design and selection of bearing parts, especially seal rings, to preclude entrance of foreign material between the bearing and journal due to differential water pressure.

][Provide elastomeric polymer alloy bearings, sealed in the shaft enclosure. Use Thordon SXL or TENMAT T12, or approved equal bearings. Support the bearings in threaded bronze sleeves acting as an enclosing tube. Ensure the bearings are submerged in water when the pump is in operation. Accomplish lubrication by pump discharge water (product water) free-flowing through perforations in the shaft enclosure tube.

][Provide each pump with bearings that are grooved and continuous. Machine the bearings to marine clearances for strained canal water lubrication and of sufficient length and diameter to keep bearing pressure to the allowable design. Select bearing thicknesses and marine clearances to allow for material swell from water submergence. The pump manufacturer may locate the shaft bearings as the manufacturer's design dictates with the following exceptions. Furnish no fewer than three bearings in the pump with a maximum bearing spacing of 1.5 m 5 feet. Locate bearings at the top of the diffuser section, above the impeller, and near the baseplate. Bearings in the right angle gear, other than the thrust bearing, are not acceptable for use as pump shaft support. Support the line shaft bearing by the diffuser inner cone fabricated assembly. Use Thordon SXL or TENMAT T12, or approved equal pump impeller bearings, and size to accommodate forces from the pump impeller. Secure tubing for bearing lubrication water to and routed on the outside of the casing for each bearing. The tubing must be continuously welded to a diffuser vane or bearing support to cross from the outside of the casing to the bearing mounting assembly.

Bearings must be easily removable for servicing in the field.

]2.4.11.2 [Oil][Grease] Lubrication Shaft Seals

**************************************************************************
NOTE: Select appropriate alternate paragraph.
**************************************************************************
Pumps designed for oil lubrication must have a shaft seal system located below the upper pump shaft bearing. The seal system consists of a seal containing two lip elements. The element facing the bearing must have a stainless steel garter spring back-up and be constructed of TFE (Teflon). The secondary element faces the impeller and is constructed of TFE. Use a bullet-shaped assembly tool or other special tool over the end of the shaft or grooves in the shaft to preclude damage to the lip element during assembly. Assembly tools used are considered a special tool and must be furnished to the Government as part of special tools specified in paragraph SPECIAL TOOLS. Pumps having two stages must have seals to protect the extra bearings required by two stages of construction.

Pumps designed for grease lubrication must have a shaft seal consisting of lip seals. The seal system consists of a lip-type seal located on each end of the bearing. Each seal must contain a lip element having a stainless steel garter spring back-up and be constructed of TFE (Teflon). Face the lip element out, away from the bearing to keep water from intruding into the bearing chamber. The lowest bearing must have an additional grease seat with the lip facing away from the bearing. Use a bullet-shaped assembly tool or other special tools over the end of the shaft and shaft grooves to preclude damage to the lip element during assembly. The assembly tool used is considered a special tool and must be furnished to the Government as part of special tools specified in paragraph SPECIAL TOOLS.

2.4.12 Bearing Heat Sensors

**************************************************************************

NOTE: Bearing heat sensors may be used in pumps having a discharge diameter larger than 600 mm 24 inches. Pumps with large discharge diameters should be furnished with heat sensors for the impeller bearings only, when the estimated annual operation is less than 100 hours per pump. Pumps with greater operating hours per year may be equipped with bearing heat sensors for all bearings in the pump. Schedule 80 guard pipes shall be used when the unsupported length is 450 mm 18 inches or less. Schedule 120 should be used for greater unsupported lengths.

**************************************************************************

Fit [the impeller shaft bearings] [each bearing] with temperature-sensing elements, inserted in the bearings to within 3 mm 1/8 inch of shaft. Provide these temperature-sensing elements with temperature readouts mounted [on the [engine] [motor] instrument board] [at a central location as shown]. Provide a visual and audible alarm system to warn of bearing overheating. Provide temperature indicator with dual outputs that have setpoints that are separately adjustable. Support leads and protect them from water and mechanical damage. Terminate the leads outside of the pump casing in a waterproof connection head, Minco CH 339 or equal, and cap until final connections are made in the field. The connection head must be rated watertight to 175 kPa 25 psi. Lead protection consists of pipes fastened to the pump with brackets using bolts and nuts to permit their removal, and constructed with enough unions to be completely disassembled. Leads passing through the pump water passage in the pump must either be contained in a guide vane or be protected by [Schedule 80] [Schedule 120] pipe. Make protection pipe removable if connected to the shaft-enclosing...
Install bearing heat sensors as [shown in Figure 2 at end of the section] indicated. Run leads and wiring to a junction box located on the baseplate. Provide a terminal strip in the junction box for connection of wiring to temperature readouts.

2.4.13 Thrust Bearing

Provide a thrust bearing in the [speed reduction gear] [motor] to carry total thrust load [as specified in [_____]].

2.4.14 Packing Gland

Provide [grease-] [water-] lubricated packing gland split longitudinally to facilitate removal or renewal. Arrange it to permit inspection, repair, removal, or replacement of packing without entering pump from below operating room floor. Provide eye bolts and tapped holes in each half of the split gland if halves weigh over 14 kg 30 pounds each.

2.4.15 Siphon Breaker Valve

Provide a siphon breaker valve assembly for each of the vertical axial-flow pumps. Provide [mechanical, self-actuating] [electrically-operated] valves. Install each assembly at the top (summit) of the discharge pipe and must vent air from the discharge pipe when the pump is started. The assembly must also permit air to enter the discharge pipe through the siphon breaker valve to prevent reverse siphoning of water when the pump is stopped. Size the valves based on the pumping conditions (flow, head, discharge pipe diameter, etc.) of the specific system. If a mechanically-actuated valve is chosen, size the valve to allow air to relieve at a maximum of 90 m per second 300 feet per second. Provide a means to operate the valve manually to stop back-siphoning through the pump in case the normal operator of the siphon breaker valve should fail.

2.5 LUBRICATION SYSTEM

**************************************************************************
NOTE: Select appropriate alternate paragraph. Oil lubrication may be used for pumps with discharge diameters up to and including 900 mm 36 inch. Grease lubrication may be used for all size pumps. The centralized pressure lubrication system will be used when grease lubrication is selected. Select the water-lubricated bearings bracketed information if this type of lubrication is being used.
**************************************************************************

Oil lubrication of shaft bearings consists of introducing oil at the top line shaft bearing and allowing oil to run down the shaft for the lubrication of the lower bearings. Oil lubrication consists of an oil reservoir mounted on the pump baseplate or pump driver at such height to permit gravity flow of oil to the highest lubrication point of the pump shaft. Construct the reservoir of transparent material to permit observation of the quantity of oil in the reservoir. The oil reservoir must have a minimum capacity of 1 L 1 quart. The reservoir must have a solenoid valve to permit oil flow whenever the pump driver is in operation. The flow rate from the oil reservoir must be adjustable from five drips per minute to constant flow. The reservoir valve must permit manual flow of oil when the pump driver is not operating for prelubrication of the shaft bearing. Construct the oil line from the oil reservoir to the
pump line shaft of stainless steel tubing and support at sufficient locations to preclude vibration of tubing when the pump is operating. If the pump has a bearing located below the impeller, this bearing must be grease-lubricated. Provide a grease line with a grease fitting from this bearing to a location on top of the baseplate. Provide a grease reservoir with this bearing configuration for containing extra grease. Lubricate shaft packing by grease. Run the grease lines to a location outside of the driver pedestal and provide with a fitting for manual lubrication.

Support grease lines to each bearing and protect them from water and mechanical damage. Grease line protection consists of channels fastened to the pump with brackets, using bolts and nuts to permit removal. Grease lines passing through the pump water passage must either be contained in a guide vane or be protected by Schedule [80] [120] pipe. This protection pipe must be removable if connected to the shaft-enclosing tube. Prefill grease lines before connection to bearings. Terminate grease lines above baseplate for connection to the lubricating grease pump.

Provide lubrication for the bearings from the water being pumped (i.e., product water) by means of perforations in the shaft enclosure. Design the perforations such that the shaft tube is constantly filled with water during pump operation, thereby continually covering the contact surfaces of the bearings. If upper bearings will not receive sufficient pumped water for lubrication, use another means to provide sufficient water to these bearings using either product water or water from the intake canal. Provide a means to indicate visually that the upper bearing(s) and packing gland are obtaining sufficient lubrication water.

2.5.1 Supplemental Lubrication Water

If it is determined that the pumped product water cannot be lifted sufficiently to lubricate the upper bearing(s), it is the pump manufacturer's responsibility to design and provide a complete water lubrication system. Provide a separate water lubrication system for each pump. The water cannot come from the potable/well water system. This water lubrication system must include a means for providing sufficient lubrication water to the upper bearing(s). The supplemental lubrication water system must include an alarm and shutdown in case of low- or no-flow to the upper bearing(s), along with electrical input to the [engine] [motor] control panel and SCADA/PLC systems as needed. Provide any necessary filtering, flow switches, time delays, to ensure that the upper bearings are satisfactorily lubricated. Coordinate any additional electrical power and controls requirements with Section 26 20 00 INTERIOR DISTRIBUTION SYSTEM and other electrical sections. The supplemental lubrication water system must be fully maintainable. If the supplemental lubrication water system is needed, provide shop drawings, operations and maintenance data, and as-built drawings as required.

2.5.2 Centralized Pressure Lubrication System

2.5.2.1 General

Provide each pump with its own individual electric motor-driven centralized pressure lubrication system, designed to deliver the proper predetermined or metered quantity of lubricant to each individual bearing and stuffing box. Positively indicate proper or improper functioning of any individual metering device. Mount the pressure pump, individual metering devices, and any required auxiliary operating accessories on the baseplate. Furnish the
system complete and ready for operation, including sufficient lubricant to fill each pressure pump lubricant reservoir. Submit the complete centralized pressure lubrication system for review and approval. Furnish the lubricant recommended by the pump manufacturer, subject to approval of Contracting Officer.

2.5.2.2 Pumping Unit

Provide an electric motor-driven central pumping unit as a complete assembly, consisting of a positive displacement type pump, flow-directing valve (if required), lubricant reservoir, suitable pressure gage to indicate pump discharge pressure, operation counter, pressure protective device, and other auxiliary accessories as required to give a complete and workable unit conforming to the requirements specified. The pump must be of multiple individual piston, positive displacement type utilizing hardened steel pistons, closely fitted to the cylinder bores to eliminate the need for packing. Spring-actuated check valves is not be required for its operation. The pump must deliver not less than 100 mL 6 cubic inches of lubricant per minute against a pressure of not less than 13.8 MPa 2000 psi measured at the most remote bearing connection. The lubricant reservoir must be of a suitable metallic construction, with a capacity of not less than 11 kg 24 pounds of lubricant, and provided with a means that will ensure positive priming of the pump at all times (such as an atmospheric or spring-loaded follower plate), an indicator to show quantity of lubricant in the reservoir, and a screened fill connection to permit filling the reservoir by a transfer pump without exposing the lubricant to the atmosphere. Provide the pump unit with a fully automatic control system, capable of suitable or proper scheduling by an adjustable synchronous motor-driven timing device, and other required auxiliaries necessary to give a complete and workable system. Provide the controller with a "Hand Off-Automatic" selector master switch to permit selection between push button manual and automatic time clock operation, and to deenergize the system. Supply electric power at 115 volts single phase, 60 cycles. Use the time clock setting recommended by the main pump manufacturer.

2.5.2.3 Metering Valves

Provide a metering or measuring valve for each bearing and stuffing box. It must be fully hydraulic in its operation, requiring no internal springs or check valves. The valve size is determined by the pump manufacturer.

2.5.2.4 Piping

The system piping must be stainless steel tubing (ASTM A269/A269M, Type 410 or equal) using flared or compression-type connectors. Adequately protect and rigidly support the piping located below the operating room floor in a manner approved by the Contracting Officer. Provide each individual grease line with a "Tee" fitting, located immediately below the respective metering valve and accessible from the operating room. Provide the piping with a standard 6 mm 1/4 inch grease fitting so that each individual line may be fully charged without using the lubricating system pump. The size, strength of pipe, and type and strength of fittings must be as recommended and guaranteed by the lubrication system manufacturer, but in no case can the bursting pressure of the pipe or tubing used be less than three times the maximum working pressure. Provide a check valve located between the discharge outlet of the measuring valve and the "Tee" fitting specified above in each bearing lubricating line that is exposed to water pressure to prevent entrance of water into the respective measuring valves.
2.5.3 Lubrication System Accessories

2.5.3.1 Grease Gun

Provide a hand operated, heavy duty lever grease gun for charging lubrication lines and for emergency lubrication. Provide grease as recommended by the vertical pump manufacturer.

2.5.3.2 Service Facilities

Provide a service facility consisting of a portable hand operated transfer pump, a hand-towed dolly, and a 55 kg 120 pound drum of lubricant, all assembled and ready for operation. The pump must be self-contained and designed for mounting on the grease drum to protect the contents from the entrance of foreign matter. The pump must deliver not less than 0.45 kg one pound in not more than eight strokes of the pump handle under normal temperature conditions. Furnish the necessary hose and quick disconnect coupling for a complete system. The hand-towed dolly must have a rigid platform with four anti-friction bearing mounted wheels, a towing handle, and a provision for securing the lubricant barrel. Use the type of lubricant recommended by the vertical pump manufacturer.

2.6 PAINTING

**************************************************************************
NOTE: The painting paragraph refers to Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES. Edit UFGS Section 09 97 02 to require the use of System No. 21-A-Z Formula 151 for ferrous parts of the pump located above the finish floor. For the interior and exterior surfaces of the pump located below the baseplate, except for stainless steel or galvanized, the required paint system should be System No. 6-A-Z. Contact the CERL Paint Lab for all painting questions.
**************************************************************************

Perform painting in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

2.7 TESTS, INSPECTIONS, AND VERIFICATIONS

2.7.1 [Critical Speeds] [Dynamic Analysis]

**************************************************************************
NOTE: Select appropriate alternate paragraph.

Alternate 1, Critical Speeds is used when the estimated operating hours for the pumping station is less than 50 hours per year.

Alternate 2, Dynamic Analysis is used when operating hours are greater than 50 hours per year and the pump is driven by an electric motor. The motor described is a vertical shaft type without a speed reducer. If the decision is made to use a horizontal shaft motor, then Alternate 2 needs to be revised to include the speed reducer in the analysis.
as described in Alternate 3. Select the first and second bracketed paragraphs for Alternate 2.

Alternate 3, Dynamic Analysis, is used when operating hours are greater than 50 hours per year and the pump is driven by a diesel engine/gear reduction unit or when an FSI is used. Select the first bracketed paragraph and the TORSIONAL ANALYSIS and LATERAL FREQUENCY ANALYSIS paragraphs.

The assembled pumping unit, consisting of the [motor] [,] [engine] [,] [speed reducer] and pump must be free from critical speeds or harmful torsional vibrations at all speeds encountered within the operating range. Before the pump and motor, furnished under Section(s) [26 29 01.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL INDUCTION TYPE] [26 29 02.00 10 ELECTRIC MOTORS, 3-PHASE VERTICAL SYNCHRONOUS TYPE], [41 65 10.00 10 [DIESEL] / [NATURAL GAS FUELED] ENGINE PUMP DRIVES] and [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS] are released for manufacture, the pump/motor structure must be analyzed by the pump manufacturer for harmful natural frequencies in the lateral and torsional directions. A natural frequency that occurs within 25 percent above or below normal operating speed is unacceptable. Construct a dynamic analysis model using a commercially available program such as Ansys, Cosmos/M, or equivalent, which utilize finite element methods. Incorporate effects of column pipes, cover pipes, shafts, bearings, mass concentrations, and other such features as necessary to accurately model the pump structure. Analyze the structure in the run (wet) condition and consider the effect of water mass in the column and damping effect of water in the sump (vertical units only) at highest and lowest sump water levels. Incorporate Reed critical frequency and mass elastic diagram information provided by the motor manufacturer. If the motor manufacturer cannot demonstrate to the satisfaction of the Contracting Officer (based on impact tests of similar units) that the Reed critical frequency value is accurate, the motor manufacturer must conduct a dynamic analysis using finite element methods as described to determine motor Reed critical frequency for use by the pump manufacturer. Submit the complete detailed dynamic analysis report including the following information:

a. Computer program used.

b. Schematic diagram of the model depicting nodes and elements.

c. Input data consisting of node coordinates, element types, material properties, element characteristics, element connectivities, and specified displacements.

d. Motor mass elastic and Reed critical information (or dynamic analysis, if required).

e. Analysis results, including significant natural frequencies.

f. Interpretation of results.

Impact the test motor furnished before shipment to determine actual Reed critical frequency of motor. Include results of impact tests included in motor test data to be submitted. The pump manufacturer must address any discrepancy between calculated and actual motor Reed critical frequency.
values to determine whether design changes are required to prevent harmful natural frequencies in the pump/motor structure. If any design changes are required, incorporate them at no cost to Government.]

[2.7.1.1 Torsional Analysis

Before the pump, gear drive, and engine are released for manufacture, the engine supplier must analyze the system for harmful torsional natural frequencies using mass elastic information provided by the pump and gear drive manufacturers. A natural frequency that occurs within 25 percent above or below [normal operating speed][any of the operating speeds required for pump operating conditions] is considered to be unacceptable.

[2.7.1.2 Lateral Frequency Analysis

Before each pump, engine, and gear drive furnished under Section(s) [41 65 10.00 10 [DIESEL] / [NATURAL GAS FUELED] ENGINE PUMP DRIVES][, ] [35 45 03.00 10 SPEED REDUCERS FOR STORM WATER PUMPS], respectively, are released for manufacturing, the pump/gear drive structure must be analyzed by pump manufacturer for harmful natural frequencies in the lateral directions. A natural frequency that occurs within 25 percent above or below [normal operating speed] [any operating speeds required for pump operating conditions] is considered to be harmful. Construct the dynamic analysis model using a commercially available program such as Ansys, Cosmos/M, or equivalent that utilizes finite element methods. Incorporate effects of column pipes, cover pipes, shafts, bearings, mass concentrations, and other such features in the model as necessary to accurately model the pump structure. Analyze the structure in the run (wet) condition and consider the effect of water mass in the column and the damping effect of water in the sump at the highest and lowest sump water levels. The model must incorporate Reed critical frequency and mass elastic diagram information provided by the gear drive manufacturer. If the gear drive manufacturer cannot demonstrate to the satisfaction of the Contracting Officer (based on impact tests of similar units) that the Reed critical frequency value is accurate, a dynamic analysis using finite element methods as described herein must be conducted by the gear drive manufacturer to determine gear drive Reed critical frequency for use by pump manufacturer. Submit the complete dynamic analysis report including the following information:

a. Computer program used.

b. Schematic diagram of the model depicting nodes and elements.

c. Input data consisting of node coordinates, element types, material properties, element characteristics, element connectivities, and specified displacements.

d. Gear mass elastic and Reed critical information(or dynamic analysis, if required).

e. Analysis results including all significant natural frequencies.

f. Interpretation of results.

Impact-test the gear drive before shipment to determine the actual Reed critical frequency of the drive. Submit results of impact tests. The pump manufacturer must address any discrepancy between calculated and actual gear drive Reed critical frequency values as to whether or not design
changes are required to prevent harmful natural frequencies in the pump/gear drive structure. If any design changes are required, incorporate at no cost to the Government.

2.7.2 Lubricating System Tests

**************************************************************************
NOTE: Delete these paragraphs if water-lubricated pumps are called for.
**************************************************************************

Test the complete lubricating system for each pumping unit, as deemed necessary by the Contracting Officer, to determine that the system meets the operational requirements specified. Test at least one valve of each size furnished with the lubrication line removed from its bearing and fitted with a pressure relief valve and pressure gage. Adjust the pressure relief valve to discharge it at the operating pressure specified and operate the system through one or more cycles as required to obtain an accurate measurement of the quantity of lubricant delivered. This must be within plus or minus 20 percent of the theoretical delivery of the respective valve. Replace, reinstall, and retest any component parts that are damaged as the result of these tests or that fail to meet the requirements of the specification.

2.7.3 Factory Test

**************************************************************************
NOTE: Test each different size pump for performance.
**************************************************************************

Alternate specifications for the “Factory Test” have been provided in this specification. Alternate 1 gives the manufacturer the option of testing either the prototype pump (first pump produced) or a homologous model of the pump. This alternative should be used for all pumps having a diameter up to and including 1200 mm 48 inch. Alternate 2, which requires a homologous model of the pump be tested for performance and NPSHR characteristics, should be used for pumps having a diameter greater than 1200 mm 48 inch. Alternate 2 can also be used for pumps smaller than 1200 mm 48 inch in diameter if the expected annual operating time is greater than 500 hours per year or for the special case when there is no published NPSHR curve available.

2.7.3.1 General

**************************************************************************
NOTE: Select the appropriate alternate paragraph.
**************************************************************************

In the second alternate, the inclusion of the discharge water passage is based on the complexity of the passage and should be decided in earlier design documents.

[ Performance of [the] [each size] pump to be furnished will be accepted on the basis of the factory test. Conduct this test using either a scale

SECTION 35 45 01 Page 46
model of [pump or first pump produced for this contract.] [each size of pump or one of each size of pump produced for this contract.] Perform cavitation testing in accordance with HI ANSI/HI 14.6 if no published NPSHR curves are available.

[Determine the performance and cavitation limits of the proposed pump[ and the shape of the discharge water passage] by a series of tests made on a scale model of the pump[ and discharge water passage]. Complete the model test within [180] [240] days after the date of notice to proceed.

1.5.3.2. Test Setup

**************************************************************************
NOTE: Select the appropriate alternate paragraph.
First paragraph, Alternate 1; second paragraph, Alternate 2.

If an FSI is used that does not use the dimensions/ratios as furnished by the Government, a complete pump should be tested.
**************************************************************************

Alternate 1) [A model pump, if used, must be homologous to the proposed prototype pump, installed with the shaft in the vertical position, and have an impeller inlet diameter of not less than 275 mm 11 inches. Complete the model test within [150] [180] days after date of notice of award. Include a model of the[[ sump] [ including sump closure gate] [ and discharge water passage]] [[ manufacturer's standard sump] [ and discharge water passage]]. [Install a model of the formed suction intake (FSI) specified on the model pump that is tested.]

Alternate 2) [The model pump must be homologous to the proposed prototype pump, and mounted with the shaft in the vertical position. Equip the sump where the pump suction occurs with windows strategically located for viewing those areas where separation is likely to occur. Windows may be rings of transparent material approximately 100 to 125 mm 4 to 5 inches wide securely anchored between flanges.] The impeller inlet diameter and the datum for this test specification must be as indicated on Figure 3 at the end of this section. The inlet diameter must be not less than 275 mm 11 inches. [If a formed suction intake (FSI) is specified for the pump, include the complete FSI, including the [gate][bulkhead] slot, in the model test.] The FSI used in the model test must be geometrically the same as that used for the proposed pump.]

**************************************************************************
NOTE: Delete paragraph below. if Alternate 2, above, is selected.
**************************************************************************

[Prototype Pump(s) - Set prototype (first pump built) pump(s), if selected, with the shaft in the vertical position. A factory test elbow may be used in lieu of the prototype elbow for testing purposes, providing test results are adjusted to reflect the difference in losses. Complete tests prior to assembling any pump except the [one] [ones] to be tested. (Install the FSI specified on the prototype pump that is tested.)]
2.7.3.3 Instrumentation and Procedures

Describe each instrument in detail, giving all data applicable, such as manufacturer's name, type, model number, certified accuracy, coefficient, ratios, specific gravity of manometer fluid to be used, and smallest scale division. Provide calibration data on each of the instruments used. When necessary for clarity, include a sketch of the instrument or instrument arrangement. Include fully detailed narrative description of each proposed method of instrumentation, procedures to be used, and a sample set of computations. State the lowest equivalent static head that is obtainable with the testing when operating along the head-capacity curve of the proposed pump. Perform test procedures, except as specified, in accordance with applicable provisions of **HI ANSI/HI 14.6**.

2.7.3.3.1 Head Measurements

Make head measurements using either a direct reading water column, mercury-air, mercury-water, a Meriam fluid manometer, or a pressure transducer. Measure vacuums with either a mercury-air manometer, a mercury-water manometer, or a pressure transducer. Dampen fluctuations sufficiently to permit column gages or a differential pressure transducer to be read to either closest 2 mm 0.01 foot of water or Meriam fluid or 2 mm 0.1 inch of mercury. Use manometers as indicated by **ISA RP2.1**. When pressure transducers are used, check their accuracy with a manometer.

2.7.3.3.2 Capacity

Determine capacity by a calibrated venturi flowmeter or long-radius ASME flow nozzle. Do not use orifice plates. Connect the venturi or nozzle taps to the column gages equipped with dampening devices that permits differential head to be determined to either the closest 2 mm 0.01 foot of water or Meriam fluid or 2 mm 0.1 inch of mercury. Magnetic flowmeters and flowmeters utilizing ultrasonic flow measurements will be acceptable if calibration of flowmeter has been completed within the last 6 months.

2.7.3.3.3 Rotational Speed of Pump

Measure the rotational speed of the pump in accordance with "Method of Rotary Speed Movement" in **HI ANSI/HI 14.6**, except that revolution counters cannot be used. Non-contacting hand-held electronic tachometers are acceptable. The device used must permit the speed to be determined to 1 rpm.

2.7.3.3.4 Power Input

Measure power input to the pump in accordance with "Power Measurements" in **HI ANSI/HI 14.6**. Use a method to permit pump brake wattage horsepower to be determined to the closest 0.5 kW 0.5 horsepower.

2.7.3.3.5 Cavitation Tests

**************************************************************************
NOTE: Alternate 2.
**************************************************************************

Use instruments suited for cavitation testing. However, do not use instruments that yield results less accurate than those obtained with the performance test.
2.7.3.4  Pump Test

Demonstrate that the proposed pump complies with the specified performance. The pump must be capable of operation without instability over the entire range of heads specified in paragraph CAPACITIES. Tolerances must be in accordance with HI requirements. Instability is defined, for this specification, as when one or more of the following conditions occur:

a.  the pump has two or more flow rates at the same total head;

b.  The head-capacity curve has a dip (region on curve where change in flow rate produces an abnormally low head);

c.  When any point in the usable range of head-capacity curve cannot be repeated within 3 percent.

Rerun the test if this occurs. Compliance with specifications will be determined from curves required by paragraph TEST RESULTS. Test procedures, except as specified, must be in accordance with applicable provisions of HI ANSI/HI 14.6. The acceptance grade is 1U as described in HI ANSI/HI 14.6. Use water at approximately the same temperature for all tests run and record the temperature during test runs.

2.7.3.5  Test Procedure

**************************************************************************
NOTE: The suction water elevation is that level indicated in paragraph CAPACITIES.
**************************************************************************

2.7.3.5.1  Performance of The Pump

Determine the performance of the pump by a series of test points sufficient in number to develop a constant-speed curve over the range of total heads corresponding to the [static] [pool-to-pool] [bowl] heads in paragraph CAPACITIES. The performance/test range must include additional testing at total heads 600 mm 2 feet higher than the total head determined in paragraph CAPACITIES. The lowest total head for testing must be, as a minimum, the total head determined from paragraph "CAPACITIES". If the test setup permits testing at lower total heads, extend the range of total heads 600 mm 2 feet lower. Testing must be inclusive for [each] [the] speed(s) involved with the sump at elevation[s] [_____] [and [_____] NGVD feet]. Conduct tests using prototype [total] [pool-to-pool] heads. Head differentials between adjacent test points cannot exceed 900 mm 3 feet, but in no case may fewer than 10 points be plotted in the pumping range. If the plot of the data indicates a possibility of instability or dip in the head-versus-capacity curve, a sufficient number of additional points on either side of instability must be made to clearly define the head-capacity characteristics. When a scale model of the pump is tested, consider the efficiency of the prototype pump to be the efficiency of the model. No other computation or adjustment of model efficiency to prototype conditions will be permitted.

2.7.3.5.2  Sump Elevations

Conduct tests at two different sump elevations (approximately a 1500 mm 5 foot differential) to determine the effect of test sump geometry on the performance of the pump. Should the test results indicate that the
performance is not the same in all respects for both sump conditions, take whatever corrective action is necessary to produce congruent results.\footnote{One of the two sump elevations used may be at the specified elevation.} \footnote{Use the sump elevations specified in paragraph CAPACITIES.} The test results with this sump elevation must meet all specified conditions of capacity, head, and brake $\text{kw}$ horsepower. Submit curves indicating test results.

2.7.3.5.3 Tests Results

Plot results of tests to show total head, [[static] [pool-to-pool] [bowl] heads], brake $\text{kw}$ horsepower and efficiency as ordinates; all plotted against pump discharge as the abscissa. Plot curves showing prototype performance to a scale that will permit reading head directly to [60] [150] mm [0.2] [0.5] foot, capacity to [190] [380] [760] [1900] L/min [50] [100] [200] [500] gpm, [0.14] [0.28] [1.4] m$^3$/s [5] [10] [50] cfs, efficiency to 1 percent, and power input to [3.7] [7.5] [18.6] [37.2] $\text{kw}$ [5] [10] [25] [50] horsepower.

2.7.3.5.4 Demonstration

Demonstrate to the Government witness that the blade templates fit the tested pump. Perform the demonstration immediately after testing is completed. Retain all templates for the tested pump, and furnish them to the Government upon request of the Contracting Officer, to permit the Government to verify geometric similarity with the manufacturer's pump. In addition to providing templates, furnish dimensioned drawings of the impeller that contain all dimensions needed to manufacture it. Stamp the tested impeller with identification marks. Provide necessary facilities and instruments needed to permit the Government to verify that pump[s] [is] [are] in complete geometric similarity with the tested pump.

2.7.3.6 Cavitation Tests

**************************************************************************

NOTE: Alternate 2.
**************************************************************************

2.7.3.6.1 Model Test

The model test must include the determination of net positive suction head required (NPSHR) at five or more points on [the constant speed curve][each constant speed curve when more than one speed is involved]. Determine NPSHR, as a minimum, for five or more capacities corresponding to prototype capacities over the total range of specified operating conditions. If the pump has a capacity greater than that specified for the lowest and/or highest operating condition, then use these over-capacity conditions. Equally space the other test capacity points between the highest and lowest capacities.

2.7.3.6.2 NPSHR

Determine NPSHR on a constant-capacity, constant-speed basis, using arrangement Figure F.3 or F.4 as described under paragraph "Net Positive Suction Head Required Test" in \textit{HI ANSI/HI 14.6}. Vary suction conditions to produce cavitation. NPSHR must be the maximum value at which any one or all of the plotted curves, head, $\text{kw}$ horsepower, and efficiency depart from the constant values (point of tangency). Obtain a sufficient number of points to accurately locate the departure point.
2.7.3.6.3 Value of NPSHR

NOTE: The amount head margin used to determine adequacy of NPSHR is determined during the design of the pumping station as indicated in Engineering Manual EM 1110-2-3105.

The value of NPSHR must be [300] [600] [900] mm [1] [2] [3] feet less than the corresponding available net positive suction head available (NPSHA). Determine NPSHA using the temperature of the water in the model at the time the tests are run and the datum shown on Figure 3 at the end of this section. Use the water elevations specified in paragraph CAPACITIES to determine the NPSHA for the pumps.

2.7.3.6.4 Plotting Test Results

Plot the test results to the scales determined by the Contracting Officer at the time of the test. Draw curves showing [static] [pool-to-pool] [total] head, brake kW horsepower, and [pool-to-pool] efficiency as ordinates and NPSH as the abscissa. In addition, draw curves showing NPSHR versus capacity with NPSH as the ordinate and capacity as the abscissa. Show NPSHA points on the curves.

2.7.3.6.5 Curves

Should it be considered necessary by the Contractor to take into account measurement inaccuracies when drawing the curve needed to determine NPSHR in accordance with paragraph NPSHR, use the following method. No other method is acceptable. Determine the inaccuracy for each parameter, and furnish the calculations to the Contracting Officer for approval. Using the calculated inaccuracy as the radius and the test point as the center, draw a circle for each test point. Draw two curves, one a maximum and the other a minimum, and pass through or touch each circle. The maximum curve must touch the top and the minimum curve must touch the bottom of as many circles as is practicable while maintaining smooth curves. Should the plot indicate that a test point is obviously erroneous, it may be ignored by mutual consent or the test may be rerun. Halfway between the maximum and minimum curves, draw another curve (the mean). The point at which the mean curve departs from the constant values (point of tangency) is considered to be the NPSHR of the pump for the capacity at which the test was run.

2.7.3.7 Witness Test

NOTE: The time to review test data should be 2 weeks. Longer times may be used when the District has staffing difficulties or special arrangements are required to have data reviewed by others. The shortest period is preferred since this may permit the pump tested to remain in place during the review period. If the pump/test instruments are not moved, then the possibility of changes to the test results for the witness test are less likely to occur. The cost of the tests would be less also.

When the Contractor is satisfied that the tested pump performs in
accordance with the requirements of the specifications and the guaranteed values, notify the Contracting Officer that the witness tests are ready to be run and furnish copies of the curves required in paragraph PUMP TEST [AND CAVITATION TESTS] along with a set of sample calculations with constants and conversion factors. Also, provide instrument calibration data in this report. [Two] [Three] [Four] weeks will be required to review this data before the Contracting Officer will be available to visit the Contractor's laboratory for witnessing the test. Should the results of the witness test reveal that the tested pump does not perform in accordance with the requirements of the specification and the guaranteed values, make such changes as are required to make it acceptable before again notifying the Contracting Officer that the witness tests are ready to be run. Immediately upon completion of each witness test, submit copies of all data taken during the test to the Contracting Officer witnessing the test. Furnish computations of test results and plotted preliminary curves to the witness.

2.7.3.8 Test Report

**************************************************************************
NOTE: Delete item "o" if water passage is not included in the contract.
**************************************************************************

Submit, within 30 days of receipt of approval of the witness test, to Government [3] [4] [7] [hard bound] [digital] copies of a report covering completely the test setup and performance[ and cavitation] tests. Include, as a minimum, there following in each test report:

a. Provide a statement of the purpose of the test, the name of the project, contract number, and design conditions. Also provide where guaranteed values differ from specified values.

b. A resume of preliminary studies, if such studies were made.

c. A description of the test pump and motor, including serial numbers, if available. Information required under "b" may be included here.

d. A description of the test procedure used, including dates, test personnel, any retest events, and witness test data.

e. A list of all test instruments with model numbers and serial numbers.

f. Sample computations (complete).

g. A discussion of test results.

h. Conclusions.

i. Photographic evidence in the form of either multiple color photographs of test equipment, test setup, and representative test segments, and a digital recording on optical disc, at least 30 minutes in length, covering the same information as photographs. Label all photographic evidence with the Contract number, location, date/time, and test activity. Voice annotate the digital recording with the same information.

j. Copies of instrument calibration.
k. Copies of all recorded test data.

l. Curves required by paragraph TESTS RESULTS.

m. Curves showing the performance of the test pump.

n. Drawings of the test setup showing all pertinent dimensions and elevations and a detailed dimensioned cross section of the pump.

[ o. Drawings including cross sections of water passages that must be incorporated in the construction contract.]

p. The name and credentials of the Erecting Engineer(s) who was(were) responsible for the pump testing.

2.7.4 Intake Tests

**************************************************************************
NOTE: Delete this paragraph if a model test of the intake to the pumping system(s) is not required.
**************************************************************************

Provide complete performance model testing of the pump intake systems. Use the model testing to confirm the configuration of the intake systems, including the proposed intake conduit, hydraulic losses to the pump, the position of the pump in the intake bay, and to confirm the selection of the pump. The Contracting Officer will witness the final tests confirming the geometry for the intake conduit. Furnish the Contracting Officer with not less than 14 days written notice of the time and location for the final tests.

2.7.4.1 Qualifications

Perform the modeling work in a hydraulic laboratory located within the United States where this type of work has been performed for a period of at least ten years. The individual in responsible charge of the modeling work must be a registered professional engineer in Florida or in the U.S. state where the model testing will be performed with at least ten years' experience in pump and intake modeling work for similar projects. The engineer must seal and sign all reports and data documents generated as a part of the test work prior to submitting them.

2.7.4.2 Intake Model Setup and Objectives

The model intake setup must be of the intake system, custom designed for this installation and suitable for operation at atmospheric pressure for observation of the intake basin performance. The intake model must be suitable for use with a model pump. Use clean and clear water for the test to allow proper observation. The temperature of the water during any test cannot exceed 30 degrees C 85 degrees F.[ For the PSI, provide a setup to determine flow patterns in the suction basin approaching the intake, along with losses to the pump. Provide further tests to identify flow patterns in the intake itself and approach patterns at the entrance to the pump.] In the intake model, include all items in the intake path, including, but not limited to: models of the trash rack, stoplog slots, access ladders, and the stilling wells in the intake bays.
2.7.4.3 Intake Model Tests

The objective of the modeling work is to define the performance of the proposed pumping unit and to confirm the geometry to be used for the pump intake. The model must have a model-to-prototype Froude number ratio of 1, based upon the pump impeller diameter. Arrange the model in the same relative orientation as the prototype structure and include the bay configuration and screening system. Perform all testing with the same model.[

Intake Tests: For the formed suction intake geometry shown on the drawings, use the model setup to determine flow characteristics in the suction basin intake bay and at the entrance to the FSI at all specified operating conditions. In addition, use the model to determine the effect of the intake system on pump operating characteristics. Use a siphon generated by a separate pump to examine flow characteristics in the intake bay using Froude relationships to model intake operation in the first set of tests. Use second test to develop information on the effect of the intake on pump operation. Use these values to forecast the performance of the pump-intake conduit combination.]

Alternate Intake Geometry: If an intake geometry differing from that indicated is proposed, or other modifications such as baffling, test the proposed intake and/or modifications to demonstrate its suitability for use in the project and compliance with Appendix I in EM 1110-2-3105. For that reason, design the laboratory setup specifically to monitor free and sub-surface vortices, swirl and pre-rotation approaching the pump impeller, flow separation at hydraulic surfaces in the intake conduit and at the hydraulic surfaces approaching the pump impeller, and axial velocity distribution at the entrance to the impeller.]

a. The intake conduit and pump inlet must contain several clear windows and similar appurtenances and adequate lighting at all critical areas to allow visual determination of the presence of vortices, turbulence, and other defects. Make provisions to insert dye at intervals in the intake conduit and at the entrance to the impeller during operation of the test. Reynolds and Weber numbers for all model runs must be greater than 30,000 and 120, respectively. The manufacturer must develop scale factors for velocity, flow, and time for use in evaluation of model results. Scale factors are subject to review by the Contracting Officer. In addition to model runs at all specified operating conditions, conduct no fewer than five runs at 1.5 times Froude-scaled flows after final geometrics for the intake conduit and intake bays have been established, keeping the submergences at the geometrically scaled values. Track and document circulation contributing to development of vortices.

b. Determine vortex formation in the model every 15 seconds extending over a period of 10 minutes. Classify vortices in accordance with the strength classification system in HI ANSI/HI 9.8 for both surface and subsurface vortices, using dye wand injection to assist in classification. The manufacturer must provide both photographic and video documentation of vortex formation. Direct particular attention to subsurface vortex formation at the intake conduit entrance and on intake conduit surfaces leading to the impeller entrance.

c. Provide a swirl meter or other satisfactory device to determine liquid rotation (swirl) at the entrance to the impeller. Obtain swirl readings at intervals of 20 seconds for a period of not less than 10
minutes after the model has achieved steady-state operation at any specified operating condition. Swirl angle is defined by the relationship:

\[
\text{swirl angle} = \frac{1}{(\tan)(\pi d n)} u
\]

Where:
- \( u \) = average axial velocity at the swirl meter.
- \( d \) = diameter of the conduit at the swirl meter.
- \( n \) = revolutions/second at the swirl meter.

d. Headloss Measurements: Measure headloss from the upstream model boundary to just upstream of the pump inlet for each documentation test and include a minimum of the following conditions:

<table>
<thead>
<tr>
<th>Pump No.</th>
<th>Avg On/Off El. (m) (feet)</th>
<th>Individual Pump Q (cubic m per second) (fps)</th>
<th>Total Pump Q (cubic m per second) (fps)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*****************************************************************************************************************************************

NOTE: Provide an expected order of pump operations and expected intake elevations at start-up for each pump.

*****************************************************************************************************************************************

e. Also record the head loss from just upstream of the FSI to the throat of one model pump for a minimum of 10 flow rates after the model Euler number is determined to be constant and at least one point (near the middle of the data) must be within 2 percent of the scaled rated flow of the pump. Measure head loss with a differential manometer or differential stilling basin. Install a minimum of four pressure taps around the pump throat measurement point and joined to form an average pressure reading. Calculate a dimensionless head loss coefficient for the formed inlet that includes the entrance loss into the formed inlet.

f. Determine the velocity profile in the channel cross section approaching the intake and performing the velocity traverses on perpendicular axes at the intake throat, just upstream from the impeller. Velocity measurement instruments must be capable of an accuracy of plus or minus 2 percent.

g. Use the following as criteria for acceptance of the proposed design:

1. Free surface and sub-surface vortices entering the pump intake must be less severe than Type 1, as defined in HI ANSI/HI 9.8, unless dye core vortices appear for less than 10 percent of the time or only for pump operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.

2. Swirl angles, both maximum and average, indicated by swirl meter readings, must be less than 5 degrees. Swirl angles as great as 7 degrees will be accepted if occurring less than 10 percent of the time or for operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.
(3) Velocities at points of equal radii at the throat of the intake conduit must be within 10 percent of each other.

(4) Determine NPSHR on the basis of a one percent reduction of efficiency.

(5) Time-varying velocity fluctuation (turbulence) levels as defined by a standard deviation over average velocity at a point within the pump throat must be less than 10 percent.

h. Unless otherwise specified, conform accuracy of all measurements to the levels established in HI ANSI/HI 14.6.

2.7.4.4 Recommendations from the Model Test

If the results of the intake model testing indicate that any features of the design are deficient, report this to the Contracting Officer in writing immediately. If the intake modeler has recommendation for improving the flows in the pumps, provide them in the Intake Model Test Report. Flag these as important information that requires the Contracting Officer's immediate attention. Note all recommendations considered major changes. Provide any minor recommended changes to the intake as variations in the shop drawings.

2.8 BASEPLATE AND SUPPORTS

Proportion the baseplate to support the entire pump assembly, the [reduction gear] [motor] and the loads (including the results of the dynamic analysis) to which it may be subjected during operation. Support and anchor is as indicated. Furnish lifting lugs or eye bolts, special slings, strongbacks, or other devices necessary to handle the pump during loading, unloading, erection, installation, and subsequent disassembly and assembly. Provide a sole plate [as indicated] under the baseplate. Install, level and grout the sole plate in accordance with API RP 686, Chapter 5 - Mounting Plate Grouting. Provide [leveling nuts][jacking bolts] for leveling the baseplate assembly. Provide an anchor bolt layout to aid in placement of anchor bolts. Back off all leveling jacking bolts after grouting so that they do not support any of the load. The pedestal supporting the [motor][right-angle reduction gear] must contain a 25 mm 1-inch lip to contain water leakage from the shaft packing. Provide a threaded drain to the sump. Seismic requirements must be in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC. Provide the calculations used in the design of the baseplates and the anchoring bolts to ensure that the proper forces (shear, torsion, etc.) have been considered. The baseplates must be structural steel plate of adequate thickness to support the weight of the pump and right angle hear or motor (as applicable) plus the maximum hydraulic thrust of the pump. Provide
plates of the length and width indicated, and the thickness as determined by the pump manufacturer.

2.9 PUMP DRAINAGE

Provide drain holes for all parts of the pump to eliminate trapped water. These drain provisions must be self-draining without any requirement to enter the sump.

2.10 FACTORY ASSEMBLY

The pump must be assembled at the manufacturer's plant\[ in a vertical position\] to assure proper fitting and alignment of all parts. Tolerances cannot exceed those specified or shown on the the manufacturing drawings. Check rotating elements for binding. The suction bell, impeller housing, diffuser, and the discharge elbow must be properly match marked and have their centerlines clearly marked on the outside of all flanges to facilitate erection and alignment in the field. Notify the Contracting Officer sufficiently in advance to permit a representative of the Contracting Officer to inspect and witness the pump assembly. Matchmark all parts disassembled for shipment.

PART 3 EXECUTION

3.1 INSTALLATION

3.1.1 Equipment

a. Install the equipment furnished under this section and related drive machinery furnished under other sections of this specification in accordance with the approved Installation and Erection Instructions Manual; no later than time of pump delivery, submit a typed or printed, and bound, \[digital\] manual describing procedures to be followed by the erecting engineer in erecting, assembling, installing, and dry-and wet-testing the pump. To the extent necessary or desirable, coordinate and consolidate description of the pump with similar descriptions specified for the \[gear reducer and diesel engine\] \[motor\] \[gear reducer\].

(1) The description must be a complete, orderly, step-by-step explanation of operations required, and also include such things as alignment procedures, bolt torque values, permissible blade/bowl clearances; permissible bowl out-of-roundness; permissible shaft misalignment; recommended instrument setups; recommended gages and instruments; bearing clearances; and similar details.

(2) Complement and supplement the description with drawings, sketches, photos, and similar materials to whatever extent necessary or desirable, resulting in a description that may be comprehended by an engineer or mechanic without extensive experience in erecting or installing pumps of this type.

b. The erection engineer(s), familiar with the equipment to be installed, must supervise the handling, installation, start-up and testing of the equipment as required by paragraph QUALITY ASSURANCE.

c. Submit \[digital\] copies of Operation and Maintenance Instructions Manual containing complete information on operation, lubrication, adjustment,
routine and special maintenance, disassembly, repair, reassembly, and trouble diagnostics for the pump and auxiliary units. [Print the operation and maintenance manual and both parts lists on good quality ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper, bound separately between flexible, durable covers.] [Provide the operation and maintenance manual and both parts lists on optical disc, formatted to print on ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper.] Drawings incorporated in manual or parts lists, may be reduced to page size provided they are clear and legible[, or may be folded into the manual to page size]. Photographs or catalog cuts of components may be included for identification. [Submit operation and maintenance data in accordance with section 01 78 23 Operation and Maintenance Data.]

3.1.2 Pipes and Joints

Install pipes and joints in accordance with AWWA M11.

3.2 FIELD TESTS

**************************************************************************
NOTE: Select appropriate bracketed statement.
**************************************************************************

Prior to proceeding with construction of the [test setup but not later than [60] [90] days after date of notice to proceed, submit a description of the test setup and test procedure proposed. Include dimensioned drawings and cross-sectional views of the setup and pump, respectively, with location of instruments and points of their connection shown.] [model, but not later than 90 days after the date of notice to proceed, submit a description of the proposed model and test procedure. Include dimensioned drawings and cross-sectional views of the model pump showing with the location of all instruments and the point of their connection to the model.]

3.2.1 Dry Tests

**************************************************************************
NOTE: A four hour operating field test is preferred. It allows adequate time to make all required observations and test measurements. Vibration measurements should be specified when the designer feels certain that water will not be available to do wet testing or as a preliminary check of the installation. Dry tests cannot be conducted on pumps that are lubricated with product water.
**************************************************************************

Test each pumping unit, consisting of a pump [and motor] [and gear reducer] [right-angle gear reducer, and diesel engine] in the dry to determine whether it has been properly erected and connected. [Conduct such test when, and as, directed by Contracting Officer.] [After each pumping unit has been completely assembled, including all rotating elements and the lubrication system, operate at the full rated speed for [three 15-minute periods] [a period of 2 hours], to assure proper alignment and satisfactory operation.]

[ a. Take vibration measurements of the assembled pumping units in both the axial and radial direction at the pump operating speed. Measure vibration as displacement in mils and do not exceed the maximum]
displacement (mils-peak-to-peak) shown in the "good" range of General Machinery Vibration Severity Chart. Obtain this chart from Entek IRD, 1700 Edison Drive, Cincinnati, Ohio 45150.

] b. Take vibration measurements in accordance with HI 9.6.4. Vibration limits cannot exceed those recommended by HI Figure 9.6.4.2.5.16. If it is not possible to operate the pump at its best efficiency point, vibration limits may be adjusted in accordance with the requirements of the stated standard.

] c. Operate each pumping unit at full-rated speed until the temperature rate of rise has stabilized for all bearings. Consider the bearings' temperature stabilized when the rate of rise does not exceed [0.5 degree Celsius in five minutes] [1 degree Fahrenheit in five minutes] [(____) degree(s) in (____) minutes].

] d. Repeat the dry test run if it is necessary to interrupt the test before all bearing temperatures have become stable. [If after a run of reasonable duration] [If after a test run of [____] hours] the temperature rate of rise for any bearing has not stabilized, terminate the test until the cause of overheating is determined and corrections are made. Then repeat the dry test run. Should tests reveal that there is a design deficiency or a manufacturing error in the pumping unit components, promptly correct the problem.

3.2.2 Wet Tests

******************************************************************************
NOTE: The longest period should be used if water for testing will be available. The estimated water available and the number of pumps requiring tests should be considered when specifying length of tests. Sound testing, if required would only establish a base line for future reference. Consult HI 9.1-9.9.
******************************************************************************

Test each pump unit under load, at or near normal operating conditions, for at least [____] hours or as directed by the Contracting Officer; the test will be witnessed by the Government. Provide all supplies and equipment required to conduct the test. During the test Observe, measure and record the operation of the pumps during the test for sound and bearing temperatures. Without additional costs to the Government, make all changes and correct any errors. The Contracting Officer may waive or postpone the test if sufficient water is not available.

FIGURE 1

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirement for submersible axial-flow and mixed-flow pumps for a turbid water pumping station. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification is for use in construction contracts. It may be used in supply contracts, but should be changed as appropriate. Differences between the technical paragraphs written for Contractor-supplied pumps versus Corps supply specification should be minimal.

This pump specification will be used with the design criteria in EM 1110-2-3102, "General Principles of Pumping Station Design and Layout", and EM 1110-2-3105, "Mechanical and Electrical Design of Pumping Stations", and the references listed in those publications. To the extent possible the Hydraulic Institute (HI) Standards, 2000, has been
referenced as the primary reference standard, and the minimum for manufacturers' compliance, for the manufacture, material, design, test, and performance specifications. The vibration analysis often required of pumps is eliminated and a vibration limit specified.

The pumps described are so short coupled that their resonant frequencies are far above the source frequencies. Furthermore, thousands of these pumps are operating worldwide. The pumps are of the pre-engineered (catalog) type, used at flood control and storm water projects. Over specifying can prove costly and even double the cost of an otherwise inexpensive pump. In general, the two most important attributes to a successful specification will be to obtain a qualified, experienced manufacturer and to properly specify the pumping conditions so that the correct pump is obtained.

The United States now recognizes European Common Market (ECE) products as equal to American manufacture; however, the American Standards quoted are minimal. Foreign manufacturer's contacted stated that the use of American Standards was not a problem.

This guide specification is performance based to comply with memorandum to USACE commands, dated 16 February 1995, stating a preference to use performance-based standards. In the case of pre-engineered pumps that requirement is appropriate and agrees with the way engineering firms presently specify these pumps. It further facilitates the engineer's ability to use the technical expertise available from the pump manufacturers.

Model testing is not included as an alternative for these pumps. Manufacturers assemble and performance test the pumps at the factory. The pumps are shipped assembled.

Witness tests and factory visits have been limited to one visit during the performance test and a pump inspection at the time of the test.

1.1 SUMMARY

NOTES: Insert the name of the Pumping Station.

The other elements of the pumping unit designed for this project should be stated; e.g., electric submersible motor, reduction gear (if needed), and controls.

Coordinate the bar spacing in the trash rack with the structural designer and with pump manufacturers.
The planetary gear reduction unit, on rare occasion, may be required in the larger volume propeller pumps such that a smaller, high-speed motor can be used. The design of the gear is an integral part of the design of the pumping unit.

Design, furnish, and install [_____] identical pumping units for the [_____] Pumping Station shown. Water pumped will not exceed [_____] degrees C F, will be relatively turbid, and may contain sand, silt, and trash capable of passing the trashrack, having 41 mm 1-5/8 inch clear openings.

1.2 LUMP SUM PRICE

a. Payment will be made for costs associated with [furnishing] [furnishing and installing] [installing] the submersible pump, axial-flow or mixed-flow type, as specified.

b. Unit of measure: lump sum.

1.3 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the
District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.]

When used, a designation following the "G" designation identifies the office that will review the submittal for the Government. Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 QUALITY ASSURANCE

1.5.1 Pump Supplier Qualifications

**************************************************************************
NOTE: Submersible pumps are designed as a single machine even though specifications may not always recognize that unity. Clearly state that a single manufacturer is to design and supply all parts of the pump unit including pump, motor, discharge tube, reduction gear, and cables. That manufacturer should also have demonstrated capability in sump design for pumps of the larger size.
**************************************************************************

The pump manufacturer has overall responsibility to supply the pumping unit (submersible pump/motor, [reducing gear (if needed)], discharge tube, [discharge elbow,] cables, and related [instrumentation and accessories]) that meet the requirements of this specification. Thus, during start-up, installation, and performance evaluation, the pump manufacturer is the sole responsible party. The pump manufacturer must supply a list of installations at which pumps of his manufacture, and ones similar to those specified, have been operating for at least 2 years. The components and materials of the pumping unit may occur at different facilities, and be the product of other manufacturers.

1.5.2 Installation and Start-up Engineer

Furnish a competent installation engineer (including those from Contractor's suppliers) who is knowledgeable and experienced with the installation and start-up procedures for submersible pumps and the associated equipment specified. Submit the installation and start-up engineer’s qualifications. When so requested, the installation engineer is responsible for providing complete and correct direction during installation, initial starting, and subsequent operation of equipment until field tests are completed. The installation engineer initiates instructions for actions necessary for proper receipt, inspection, handling, uncrating, assembly, and testing of equipment. The installation engineer must also keep a record of measurements taken during erection and furnish one copy to the Contracting Officer upon request or upon the completion of the installation of assembly or part. The erecting engineer conducts training on the operation and maintenance features of the pump units. Submit the installation report.

1.5.3 Detail Drawings

Submit drawings of sufficient size to be easily read, within [90] [_____]
days of Notice of Award. Submit information in the English language. Dimension in the metric (SI) with English conversion inch-pound-second system. Furnish the following:

a. Outline drawings of the pump showing dimensions and weight of the pump/motor.

b. Drawings showing details and dimensions of pump mounting design and layout including any embedded items and lifting connections.

c. Cross-sectional drawings of each different size of pump, showing each component, and major or complicated sections of the pump in detail. On each drawing indicate an itemized list of components showing type, grade, class of material used, and make and model of the standard component used. Include detail and assembly drawings of entire pumping unit assembly.

d. Provide drawings covering the installation that is intended for the erecting engineer.

e. Indicate efficiency, kW bhp, and NPSHR with the capacity-head curve.

f. Motor characteristic curves or tabulated data (test or calculated) to indicate the speed, power factor, efficiency, current, and kilowatt input, all plotted or tabulated against percent load as abscissas.

1.5.4 Welding

Weld structural members in accordance with Section 05 05 23.16 STRUCTURAL WELDING. For all other welding, qualify procedures and welders in accordance with ASME BPVC SEC IX. Welding procedures qualified by others, and welders and welding operators qualified by a previously qualified employer may be accepted as permitted by ASME B31.1. Perform welder qualification tests for each welder whose qualifications are not in compliance with the referenced standards. Notify the Contracting Officer 24 hours in advance of qualification tests. Perform the qualification tests at the work site if practical. The welder or welding operator must apply their assigned symbol near each weld made as a permanent record.

Submit the names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, standards tested to.

1.6 DELIVERY, STORAGE, AND HANDLING

Inspect each pump for damage or other distress when received at the project site. Store each pump and associated equipment indoors as recommended by the pump manufacturer, protected from construction or weather hazards at the project site. Provide adequate short-term storage for each pump and equipment in a covered, dry, and ventilated location prior to installation. Follow the manufacturer's instructions for extended storage. Supply proper equipment for handling the pump and consider the equipment as special tools if not completely standard. Follow the manufacturer's recommendations for handling of the pump.

1.7 EXTRA MATERIALS

******************************************************************************
NOTE: The spare parts noted herein are from other

SECTION 35 45 02.00 10 Page 9
Corps documents. For any specific project, it would be appropriate to discuss an adequate spare parts list during the designer's plant visitations or discussions with the end user as suggested by EM 1110-2-3105.

**************************************************************************

a. Furnish the following spare parts:

   (1) One complete set of bearings and seals for each size pump.
   (2) Replacement wearing rings and O-rings for each size pump.
   [3) One impeller for each size pump.]

b. Furnish one set of all special tools required to completely assemble, disassemble, or maintain the pumps. Special tools refers to oversized or specially dimensioned tools, special attachments or fixtures, or any similar items. Furnish lifting devices required for use in conjunction with the [overhead] [truck] crane. Provide the tools in a toolbox or toolboxes.

c. Submit copies of manufacturer's complete parts list showing all parts, spare parts, and bulletins for each pump. Clearly show all details, parts, and adequately describe parts or have proper identification marks. Provide the parts lists [on good quality 216 by 279 mm 8-1/2 by 11 inch paper] [on optic disk with default letter print size of, 8-1/2 by 11 inch], bound separately of the Operation and <Maintenance manual [with a flexible, durable cover]. Drawings incorporated in the parts lists may be reduced to page size provided they are clear and legible[, or they may be folded to page size and inserted into the bound lists]. Photographs or catalog cuts of components may be included for identification.

1.8  WARRANTY

**************************************************************************

Consider including an extended warranty for the pumping equipment if there is a likelihood that the pumping equipment will be operated very little during the first years due to a lack of water, ongoing interconnected projects, or permitting issues.

**************************************************************************

Provide a manufacturer's warranty for the submersible pumps and all equipment furnished under this section against defective workmanship, materials, design, and performance for a period of [_____] years from the date the equipment is accepted. If the equipment or any part thereof does not conform to these warranties, and the Government so notifies the manufacturer within a reasonable time after its discovery, the manufacturer must thereupon promptly correct such nonconformity by repair or replacement. Coordinate the down time for the equipment with the Government, and keep to a minimum duration that is mutually agreed to by the manufacturer and the Government. The manufacturer is liable during the warranty period for the direct cost of removal of the equipment from the installed location, transportation to the manufacturer's factory or service shop for repair and return, and reinstallation on site. The manufacturer must be given the opportunity to perform the removal and reinstallation and
to select the means of transportation. The expense of removing adjacent apparatus, installing spare equipment, costs of supplying temporary service, etc., is not included in this warranty provision.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS

**************************************************************************
NOTE: The designer should include in this section those factors of the project design that relate to the specification of the pump. These are factors that will be data inputs to the manufacturer, and are examined during the pump selection procedure. The specifications as written are for water of normal chemistry and abrasive quality. The Contractor must be informed in the specification of any unusual project conditions.
**************************************************************************

2.1.1 Pumping Unit Description

**************************************************************************
NOTE: Provide a pumping plant design that will accommodate the available pumps and their structural and hydraulic requirements. Pumps are designed to be contained in a discharge tube and able to be lifted from the discharge tube for maintenance and repair.
**************************************************************************

Each pumping unit includes a pump/motor, discharge tube, [discharge elbow], air vent, [lifting chain], cable, and controls. Each pump must be of the vertical, axial, or mixed-flow submersible type for [storm water,] [flood control,] [attached to the same shaft with a submersible electric motor] [direct coupled through a reducing gear to a submersible motor]. Use an electrically operated pump/motor installed in a discharge tube. Except as otherwise stated or noted, the terms pump and pump/motor both refer to a pump/motor integral unit.

2.1.2 General Design Requirements

a. Provide the pump meeting head, capacity, speed, efficiency, pump sump design, range of operation, cavitation, and vibration requirements as specified. [Reduction gears or adjustable impeller blades may be utilized to meet the specification performance requirements.]

b. Design the pump for runaway speed as calculated for the system shown and specified. Include water hammer calculations when long discharge lines exist. Calculate the reverse speed assuming a power failure and the discharge valves fail to close.

c. The pump must, as a minimum, meet the applicable design, materials, and manufacturing requirements of HI 1.3, HI 2.3, HI 9.1-9.5 and these specifications.

d. The pumping unit design and performance must have been demonstrated by previous successful operation of pumps of the required type and of equal design complexity by the manufacturer.
e. Operate the pump in a discharge tube that fits within the dimensions shown, and so that installation and maintenance can be carried out by an [overhead bridge] [jib] [mobile] crane. The weight of the pump/motor integral unit must not exceed [_____] kg lb.

f. Design the pump for the calculated hydraulic pressure including a water hammer to which the pump parts are exposed.

g. In addition to the specified head, take into account the pump losses when computing the pump system output.

h. The pump must have a continuously rising head characteristic with decreasing capacity over the required range of operation specified. The pump must not have an unstable operating characteristic over the required range of operation.

i. The pump must meet all requirements for net positive suction head required (NPSHR) and operate without surging.

j. Use associated pumping equipment including, but not limited to, electrical controls, instrumentation, [and pump control center] that is suitable for [indoor] [outdoor] operation.

2.1.3 Design of Discharge System

**************************************************************************
NOTE: A number of installation designs are possible depending on the project site conditions. The designer normally designs the discharge system but, has the option to allow the Contractor to design as much of the discharge system as desired. The calculations shall be in accordance with EM 1110-2-3105, with the hydraulic definitions as stated in the HI standards. It is the designer's responsibility to develop FIGURE 1.
**************************************************************************

a. [Discharge the pumping unit into the discharge system indicated. The system loss curve is included as FIGURE 1 at the end of this section to permit determination of total head. Determine losses within the pumping unit.] [The pump discharge system downstream of the pumping unit must be designed by the pump manufacturer; of the type indicated and fitting within limiting dimensions and elevations indicated. Determine all losses for the discharge system and submit the design head loss computations. Provide sufficient hydraulic computations to substantiate pump selection and demonstrate that the selected pump can meet the project design and operating requirements as specified. Determine losses within the pumping unit.] [Discharge the pumping unit into the discharge chamber indicated. The system loss curve(s) furnished includes all losses beyond the pumping unit. Determine Losses within the pumping unit.]

[ b. Accomplish priming of the siphon without the assistance of vacuum equipment.]

2.1.4 Operating Conditions

a. The pump must be capable of operating in the dry (for the purpose of
maintenance and operating checks) for short periods of time as stated in the manufacturer's operating instruction.

b. The pump manufacturer establishes and states in the operating manual the procedures for starting and stopping the pumps, including setting of valves or any sequential operations.

2.1.5 Performance Requirements

a. When operated in the dry, the maximum level of vibration of the assembled pumping unit cannot be greater than the value of the lower limit of the good range of the "General Machinery Vibration Severity Chart". This chart can be obtained from Entek IRD, 1700 Edison Drive, Cincinnati, Ohio 45150. Take measurements at pump operating speed during the Factory Test and the field start-up test.

b. The pump must be capable of operating without instability over the required range of head.

2.1.6 Capacities

**************************************************************************

NOTES: The Corps' policy and procedures for plant design and pump selection are explained in detail in EM 1110-2-3102 and EM 1110-2-3105. Using the data from hydrology and hydraulic studies, the designer will establish the performance requirements of the pumps. Using the manufacturers' catalogs that tabulate the characteristics of their pre-engineered units, select a pump. The designer should then locate other pumps with the described characteristic and establish contact with manufacturers.

Any pump selected results from careful analysis of the relationships of speed, net positive suction head (NPSH) (cavitation), head-capacity, range of plant operation, sump design requirement, and to a lesser extent, efficiency. During the selection process the manufacturer's input to the design is obtained and integrated into the selection.

The specification will then state specific values to be attained so that a pump with the desired performance can be obtained. It is necessary to state the requirements so that more than one manufacturer can respond. All manufacturers must meet the previous experience and manufacturing standards requirements.

Compliance with the performance requirements will be established using procedures stated in the HI Standards and at the time when the pump is assembled and tested at the factory. Efficiency, heads, and other hydraulic values for purpose of specification should conform to HI definitions, even though Corps manuals are used for the purpose of design criteria.

Each pump installation will be uniquely different and may require a slightly different head-capacity
specification to establish that the correct pump will be obtained. During the pump selection procedure, the designer will establish certain capacities that must be met over a range of heads. The designer may state more than one operating point on the performance curve or utilize different points on the curve such as rated head, design head best efficiency point (BEP), maximum head, and minimum head. The heads defined are as stated in EM 1110-2-3105.

[a. Discharge cannot be less than [_____] L/s gpm against total design head of [_____] m ft with water surface in the intake sump at elevation [_____] m ft.]

[b. Discharge cannot be less than [_____] L/s gpm against total rated head of [_____] m ft with water surface in the intake sump at elevation [_____] m ft.]

c. The pump must deliver a minimum capacity of [_____] L/s gpm at a total minimum head of [_____] m ft, plus pump losses with water surface in the sump at elevation [_____] m ft.]

d. The pump must deliver a minimum capacity of [_____] L/s gpm at a total maximum head of [_____] m ft, plus pump losses with water surface in the sump at elevation [_____] m ft.]

e. Discharge cannot be less than [_____] L/s gpm through the discharge at invert elevation of [_____] m ft with water surface in the intake sump at elevation [_____] m ft.]

[f. The pumps must continuously pump water without signs of distress, including cavitation, with a water surface in the intake sump at elevation [_____] m ft.]

g. The pump must be able to operate at any condition between condition "e" and condition "f".]

2.1.7 Efficiency

NOTES: The selection of pumps for flood and storm water projects will not usually depend on the economics of efficiency. However, a low efficiency can usually be correlated with poor pump hydraulics resulting in a shortened pump life. Therefore, an efficiency relating to the values from the manufacturer's catalog curves should be specified.

In the last bracketed option, specify the point at which the efficiency percentage should be reached.

The pump must have an efficiency of not less than [_____] percent at [_____].
2.1.8 Equipment

Submit, within 60 days of Notice of Award, a list of equipment as specified, the names of the manufacturers, performance capacities, and other relevant information for the machinery and other equipment contemplated to be incorporated into the work.

2.2 MATERIALS

**************************************************************************
NOTE: The designer usually establishes communication with pump manufacturers concerning materials and design details appropriate for a specific site. The designer should utilize HI Standards, AWWA Standard 101-88, and paragraph DESIGNATED MATERIALS for guidance. Also, Sections 05 50 15 and 08 31 00 (referenced below) need to be included and edited.
**************************************************************************

Submit a list designating materials to be used for each pump part along with the submittal of the drawings. If deviation from specified materials is desired, submit complete specifications for the proposed deviating materials after award of the contract.

a. Provide pumps designed and manufactured by a firm that is regularly engaged in the manufacture of the type of pump described in these specifications. Provide materials and fabrication conforming to the requirements specified herein and to Section 08 31 00 ACCESS DOORS AND PANELS and Section 05 50 15 CIVIL WORKS FABRICATIONS and to additional specified requirements. Classifications and grade of material incorporated in the work must be in accordance with designated specifications. Submit deviations from the specified materials in accordance with paragraph SUBMITTALS.

b. Identify the pumping unit by means of a separate nameplate permanently affixed in a conspicuous location; bearing the manufacturer's name, model designation, serial number, if applicable, and other pertinent information such as horsepower, speed, capacity, type, and direction of rotation. Make the plate of corrosion-resistant metal with raised or depressed lettering and a contrasting background.

c. Equip the pumping unit with suitably located instruction plates, including any warnings and cautions, describing any special and important procedures to be followed in starting, operating, and servicing the equipment. Make plates of corrosion-resistant metal with raised or depressed lettering and a contrasting background.

2.3 METALWORK FABRICATION

The materials of construction must comply with the following:

<table>

2.3.2 Bolted Connections

2.3.2.1 Bolts, Nuts, and Washers

Bolts, nuts, and washers must conform to requirements herein specified and paragraphs SUBMERSIBLE PUMP, DISCHARGE TUBE [AND DISCHARGE ELBOW], and subparagraph, NUTS AND BOLTS for types required. Use beveled washers where bearing faces have a slope of more than 1:20 with respect to a plane normal to bolt axis.

2.3.2.2 Materials Not Specifically Described

Conform materials not specifically described to the latest ASTM specification or to other listed commercial specifications covering class or kinds of materials to be used.

2.3.3 Flame Cutting of Material

Flame cutting of material, other than steel, is subject to Contracting Officer approval. Accurately perform shearing, and neatly finish all portions of work. Steel may be cut by mechanically guided or hand-guided torches, provided an accurate profile with a smooth surface free from cracks and notches is secured. Prepare surfaces and edges to be welded in accordance with Section 3 of AWS D1.1/D1.1M. Chipping and grinding are not required except where specified and as necessary to remove slag and sharp edges of technically guided or hand-guided cuts not exposed to view. Chip, grind, or machine visible or exposed hand-guided cuts to metal free of
voids, discontinuities, and foreign materials.

2.3.4 Alignment of Wetted Surfaces

Exercise care to ensure that the correct alignment of wetted surfaces being joined by a flanged joint is being obtained. Where plates of the water passage change thickness, provide a transition on the outer surface, leaving the inner surface properly aligned. When welding has been completed and welds have been cleaned, but prior to stress relieving, carefully check joining of plates in the presence of a Government inspector for misalignment of adjoining parts.

2.4 SUBMERSIBLE PUMP

2.4.1 Design and Manufacture

**************************************************************************
NOTE: Under paragraph PUMP SUPPLIER QUALIFICATIONS the Contractor is required to submit names of previous installations where the selected manufacturer has documented the operating performance for pumps of this design. While the general venturi configuration of the pumps built by different suppliers is similar, the details (e.g., number of bearings, wearing ring design, cast versus fabrication, impeller design, and materials) can be different. Based on design details available, there seems to be little justification to prefer one manufacturer's design over another. The pump portion of the specification is a low tech design compared with the motor and housing internal design, 70 to 80 percent of the cost may be contained in the motor. The emphasis on the pump portion should be on rugged, reliable, long-lasting components that are trouble-free.

The design elements described in this section are taken from drawings, manuals, catalogs, and brochures requested from two manufacturers, one domestic and one foreign. Both have over 30 years of experience and thousands of operating pumps worldwide. A primary concern in the specification was to avoid making it restrictive and yet to ensure that only qualified manufacturers would respond.

**************************************************************************

The submersible pump may be either of cast or fabricated construction. The level of manufacture skill must be consistent with the standards referenced in the specifications. All work performed in the manufacturing of the pumps must be in a skillful and workmanlike manner in accordance with the best modern shop practice and manufacturing of finished products similar in nature to those specified herein. The Government reserves the right to observe and witness the manufacturing of the pumps and to inspect the pumps for compliance with contract requirements during factory assembly.

2.4.2 Speed

**************************************************************************
NOTE: HI 2000 bases the maximum operating pump
speed calculations on a value of suction-specific speed of 8500. EM 1110-2-3105, Appendix B uses 8000. When calculating the maximum specified pump speed use the more conservative value of suction-specific speed for application where pumps will operate continuously or for extended periods of time above or below point of optimum efficiency.

2.4.2.1 Pump Speed
Rotative speed of the pump cannot be greater than [_____] rpm.

2.4.2.2 Runaway Speed
Design the pump to sustain full runaway speed without damage at maximum head difference across the pump. Based on the system design as indicated, the manufacturer must compute the maximum reverse runaway speed, and design the pump and motor to sustain that reverse rotation without damage.

2.4.3 Pump Construction
2.4.3.1 General
The major pump components must be of materials as described in Table 1. Design the entire support assembly in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC. All the exposed nuts and bolts must be stainless steel. Machine and fit all mating surfaces where watertight sealing is required with nitrile rubber O-rings. The fitting must be such that the sealing is accomplished by metal-metal contact between machined surfaces which results in controlled compression of the O-rings. Sealing compounds, grease, or secondary devices are not acceptable.

2.4.3.2 Pump Lifting Handle And Lifting Lugs
Design the lifting handle to bear the entire weight of the pumping unit at a conservative factor of safety. Provide lifting lugs where the weight of the separate part requires a lug.

2.4.3.3 Pump and Motor Bearing Arrangement
The pump and motor bearings must be the standard design of the manufacturer for the pump supplied under this specification. The type and number must be of proven design as used in previous operating units supplied by the manufacturer. Provide bearings of the grease lubricated and sealed type; having a minimum B-10 bearing life of 50,000 hr. Each bearing must be of the correct design to resist the radial and thrust loads applied. Provide enough bearings to ensure the pump rotating elements are supported so that the possibility of excessive vibration is eliminated. Conform ball and roller bearings life and load ratings to ABMA 9 and ABMA 11.

2.4.3.4 Mechanical Seals
provide a mechanical rotating shaft seal system between the impeller and motor to ensure the motor housing is sealed properly. The mechanical seals must be in tandem, lapped and face type seals running in lubricant reservoirs for cooling and lubrication. The mechanical seals must contain both stationary and rotating tungsten carbide face rings unless otherwise
specified. In order to avoid seal failure from sticking, clogging, and misalignment from elements contained in the mixed media, only the seal faces of the outer seal assembly and its retaining clips can be exposed to the mixed media. Contain all other components in the lubricant housing. All seal faces must be solid material capable of being relapped. The seals must require neither maintenance nor adjustment, but be easy to check and replace. Shaft seals without positively driven rotating members are not considered acceptable or equal.

2.4.3.5 Lubricant Housing

Provide an oil housing with oil, as recommended by the pump manufacturer, to lubricate the shaft sealing system and to dissipate the heat generated by the motor and bearings.

2.4.3.6 Impeller

The impeller design and manufacture must be the manufacturer's standard. The impeller surface must be smooth, without holes and fabrication offsets. The attachments to shaft must be with keys or other fasteners that are made of stainless steel, and of sturdy construction designed to not loosen, but be easily removed for maintenance. The impeller construction may be cast or fabricated. At the time of assembly the impeller clearances must be those shown on assembly drawings and may be checked in the field or at the factory at the Contracting Officer's option. Balance the impeller at the design operating speed. The standard balance quality grade is G6.3 in accordance with ISO 1940-1. Balance in accordance with the procedure in HI 9.6.4, except that a two-plane balance is required. Submit the results of impeller balancing.

2.4.3.7 Shaft

The shaft must be [one piece integral with the motor] [two piece with gear reduction] of high-strength cold-rolled carbon steel or stainless steel with a factor of safety of five measured against the ultimate strength. Design the shaft for all torque conditions during normal operation and for runaway speed during reverse flow.

2.4.3.8 Bowl Assembly

**************************************************************************
NOTE: This portion of the pump is composed of the venturi section and consists of the suction bell, pump bowl, and discharge bowl. The entire unit acts as a venturi to hydraulically guide and stabilize the flow as it passes through the pump. Heads and stresses are low, and its major design consideration is for rugged, reliable, and long-lived materials.
**************************************************************************

The bowl assembly may be of cast or fabricated manufacture. The hydraulic design must be the manufacturer's standard design as used in previous operating installations. The general manufacture quality relating to flange design, drilling, bolts, alignments, must be in accordance with industry standard practice.

2.4.4 Motor

The motor must be submersible and conform to the requirements of NEMA MG 1.
Size the motor to avoid overload when operating at any point along the characteristic curve of the pump. Provide 3-phase, 60-Hz, [_____] V, squirrel cage induction type motors, NEMA Design B Type. Insulate the stator windings and stator leads with a moisture-resistant Class F insulation with temperature resistance of 155 degrees C 311 degrees F. Use the service factor of 1.0. The temperature rise above ambient for continuous full load rated conditions and for the class of insulation used cannot exceed the values in NEMA MG 1. The motor must be rated for continuous duty when submerged and also be capable of operation in the dry for short periods of time for testing and maintenance purposes.

2.4.4.1 Torque

Starting torque must be sufficient to start the pump, but in no case less than 60 percent of full-load torque. Break-down torque cannot be less than 150 percent of full-load torque.

2.4.4.2 Support

Provide thrust bearing support of sufficient strength and rigidity to support the weight of the entire rotating element of the motor, pump impeller and shaft, and the hydraulic thrust.

2.4.5 Cable

a. Specifically design power and instrumentation cable for use with a submersible pump application and conform to the requirements of NEMA WC 70 and NEMA WC 72. Use submersible cable suitable for continuous immersion in water at the maximum depth encountered. Cable must have an ampacity of not less than 125 percent of the motor full load current. The cable length must be determined by the pump manufacturer for the installation shown [but cannot be less than [_____] m ft].

b. Power and instrumentation cables must enter the motor through a sealing system that prevents water entry into the unit and provides strain relief. The cable entry may be comprised of rubber bushings, flanked by stainless steel washers, having a close tolerance fit against the cable outside diameter and the entry inside diameter for sealing by compression of the bushing, or the entry may be sealed by other gland compression methods.

2.4.6 Pump Control and Monitoring

Provide a self-contained pump control and monitoring system. Provide pump controls and control panels in accordance with [Section [_____] [____]]. Provide independent local indication of the alarm and separate contacts for the remote indication of each alarm and local reset. Sensors must alarm and shut down the pump at an abnormal operating condition. Provide separate red alarm indicator lamps and green pump running lamps and label in the enclosure specified in [Section [_____] [____]]. Provide the following sensors:

[2.4.6.1 Thermal Sensor]

A thermal sensor in the gear reduction unit (if used) to monitor oil temperature.
2.4.6.2 Temperature Sensor

Temperature sensors in the stator windings to protect the motor against overheating.

Temperature sensors to monitor the main and support bearings.

2.4.6.3 Float Switch Sensor

Float-switch sensor positioned between the bearings and the stator-end coils to detect if liquid penetrates the stator housing.

2.4.6.4 Detectors

A junction box leakage detector and a water-in-oil detector.

2.4.7 Gear Reducer

Design the pump, when required, with a planetary gear unit connecting the pump shaft to the motor shaft. Lubrication must be of the permanent type, and cooling accomplished by the water flowing over the pump/motor unit. Provide a dual independent mechanical rotating shaft seal system between the motor, planetary gear system, and the impeller.

2.4.8 Air Vent

Provide an air vent, located as indicated, and a combination air and vacuum valve type. The valve must be a minimum 862 kPa 125 lb class and sized for the design flow rate. Provide an isolation valve at the valve's inlet. Materials of construction must be cast iron for the valve body; stainless steel for the internal linkage, float, and float stem; and Buna-N for the needle and seat. The valve must provide a dual function to release air during pump start-up and to permit air to re-enter to break the vacuum during pump shutdown.

2.5 DISCHARGE TUBE [AND DISCHARGE ELBOW]

2.5.1 General

a. Design, manufacture, and install the discharge tube [and discharge elbow] in accordance with the pump manufacturer's instructions. For purposes of performance and this specification it is treated as part of the pumping unit. Provide the discharge tube of such size to accommodate the dimensions of the pump supplied in accordance with the manufacturer's requirements. Furnish the discharge tube with lifting points to aid in the handling and installation of the tube. Permanently install it in the pump sump as indicated.

b. Design such that the pumps are automatically and firmly connected to the discharge tube when lowered into place and in accordance with the pump manufacturer's instructions. Provide a locking device that prohibits rotational movement of the pump within the tube.

c. The pumps must be easily removable for inspection or service without need to enter the pump sump. The pumps must not require any bolts, nuts, or fasteners for connection to the discharge housing. Provide stiffening, guides, or other features at the pump support to ensure concentric positioning of the pump in the discharge tube. Provide means such that an effective seal is obtained between the pump and
discharge tube. Power cable penetrations must be watertight.

[ d. Install a sole plate as indicated. Design the entire support assembly to the requirements of UFC 3-301-01 and Sections 13 48.73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05.48.19 [SEISMIC] BRACING FOR HVAC.]

2.5.2 Flanged Joints

Design flanged joints to be airtight and watertight, without the use of preformed gaskets, except that the use of a gasketing compound will be permitted. Mating flanges must be male/female rabbet type or doweled with not less than four tapered dowels equally spaced around the flange. Machine flanges and drill bolt holes concentric with the centerline, having a tolerance of plus or minus 1/4 of the clearance between the bolt and the bolt hole. When fabricated from steel plate, flanges must not be less than 40 mm 1-1/2 inch thick after machining. Flange machining must not vary more than 10 percent of the greatest flange thickness. Construct fabricated flanges, as a minimum, to the dimensions of AWWA C207, Class B. Connect flanges to the column tube [and discharge elbow] with two continuous fillet welds, one at the inside diameter of flange-to-pump-tube and the other at the outside diameter of pump-tube-to-flange. Weld design is the pump manufacturer's responsibility. Machine mating flanges parallel to a tolerance of 0.05 mm 0.002 inch. Finish the machine mating flange surface to 125 microns or better.

2.5.3 Nuts and Bolts

Use hexagonal type nuts and bolts; with bolts, including assembly, anchor, harness, and dowels of 300 stainless steel. Provide bronze nuts and 300 series stainless steel washers.

[2.5.4 Bolted Lid

Provide a watertight lid, hinged and bolted to the top of the discharge tube.

][2.5.5 Harnessed Coupling

Provide a flexible mechanical coupling or split-sleeve type coupling that either conforms to ASTM F1476, Type II, Class 3, stainless steel (as manufactured by Teekay or Straub Couplings), ASTM F1476, Type 1 (as manufactured by Victaulic), or Dresser Couplings style 38, or approved equal, to connect the pump discharge elbow to the [transition section] [wall thimble] [discharge piping]. Finish the middle ring without pipe stop to facilitate the installation and removal of the coupling. Install a minimum of four harness bolts (sized by the pump manufacturer) at each coupling.

2.5.6 Wall Thimble

*************************************************************************
NOTE: This alternative is used when the discharge piping includes the piece that will be embedded in the wall of the station. The size of vent to be used is determined from information in EM 1110-2-3105.
*************************************************************************
Each wall thimble must have one plain end to accommodate the flexible mechanical coupling and one flanged end to mate with the [flap gate] [discharge piping]. Match the plain end with the pump discharge elbow in thickness and diameter and drill the flanged end to match, and be capable of supporting without distortion, the [flap gate] [multiple shutter gate]. Provide the seal ring on the wall thimble located so that it is centered in the wall when embedded. In addition, furnish a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 Standard 125 pound flange and locate where indicated. Fabricate the wall thimble from steel plates.

2.5.7 Discharge Piping

**************************************************************************
NOTE: Include applicable discharge pipe description.
**************************************************************************

[Provide discharge piping consisting of a transition section and a wall thimble. Transition section must have one plain end and one flanged end, and provide a change in cross section from round to [square] [rectangular]. The plain end must match the pump discharge elbow in thickness and diameter. Arrange the wall thimble for embedment and with the flanges on each end. One end mates with the flange on the transition section and the other end mates with flap gate. Fabricate the discharge flange with a minimum dimension of AWWA C207, Class D, and drill to match. The discharge flange must be capable of supporting, without distortion, the multiple shutter gate. Provide a seal ring on the wall thimble and locate it so that it is centered in the wall when embedded. In addition, furnish a [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 Standard 125 pound flange and locate where shown. Fabricate discharge piping from steel plate.]

[Install the discharge piping as indicated. Match the plain end of each discharge pipe to the pump discharge elbow in thickness and diameter, and configured to allow a flexible mechanical coupling to connect it to the pump discharge elbow. [Terminate the discharge piping in a flanged end to mate with a flap gate. Drill the flanged end to match, and configure to be capable of supporting the flap gate without distortion.] [Terminate the discharge piping in an open end.] The discharge pipe must have pipe supports or cradles as recommended by the pump manufacturer. Locate the supports between the flexible coupling and the wall, as indicated. Provide suitably-sized thrust restraints at each flexible coupling as indicated. The supports must provide support for the weight of the pipe, the water that will pass through the pipe, and any dynamic forces that may develop due to water flowing through the pipe. Furnish a minimum [_____] mm inch flanged vent nozzle equipped with an ASME B16.5 standard 125 pound flange and locate as indicated. The discharge pipe must be non-galvanized piping of welded or seamless pipe or welded steel plate. The steel pipe must conform to AWWA C200 with dimensional requirements as given in ASME B36.10M. Fittings must comply with AWWA C208.]

2.5.8 Flap Gate

Design the flap gate for pump discharge service with flange-frame with a resilient seat of neoprene or BUNA-N to prevent closing shock. Size the flap gate to be the same as the discharge pipe size. [The body of the valve and the flap must be cast iron ASTM A126. The hinge arms must be high-tensile bronze ASTM B584- CA 865. Design the hinge pins in double shear and of silicon bronze, ASTM B98/B98M- CA 655.] [Fabricate the flap
gate entirely of stainless steel. Use only stainless steel hardware.]
provide lubrication fittings on the hinge arms. Extend the grease lines to a convenient location for lubricating. Provide an anti-locking bar to prevent excessive rotation about the lower hinge pin. Provide a stainless steel leaf spring with rubber pad to safely limit the travel of the flap gate during pumping.

2.5.9 Dissimilar Metals

When dissimilar metals are used in intimate contact, apply suitable protection against galvanic corrosion. Protect the anodic member by proper electrical insulation of the joint.

2.6 INTAKE DESIGN

**************************************************************************
NOTE: Information on intake design is available in EM 1110-2-3105, Hydraulic Institute standards, manufacturers' catalogs, and model tests from the U.S. Army Engineer Research and Development Center (ERDC). The designer should be aware of net positive suction head available (NPSHA) and NPSHR from pump performance curves and the plant design operation. If the approach inlet conditions to the pumping station are unique or unusual, the designer should consider having the contractor perform a model intake test, or the contractor may consult ERDC about the need for a model test or to learn about results from previous testing.

Detailed design information about using a formed suction intake is available in EM 1110-2-3105.
**************************************************************************

2.6.1 General

The intake sump design will be provided by the Government. Supply a pump that will meet the performance requirements without undue modifications to the sump as indicated on the drawings. Any such modifications are at no cost to the Government and must receive prior approval.

[2.6.2 Formed Suction Intake (FSI)]

Provide an FSI for each pump to the dimensional requirements and arrangement shown on the drawings. Connect the FSI to the inlet of the discharge tube. Use flanged joint as specified in paragraph FLANGED JOINTS as the method of connection. Assume the FSI has a K value of 0.15 for head loss calculations. Construct the FSI of [fabricated steel], [cast iron], [or a combination of these materials]. Any stiffeners used must be on the outside of the FSI to allow smooth flow within. Use stainless steel bolts with bronze nuts. The minimum thickness of fabricated material must be [10 mm 3/8 inch] [12 mm 1/2 inch] [16 mm 5/8 inch] [19 mm 3/4 inch]. Provide grout holes in the floor [and sides] of the FSI to permit grouting during installation.

]2.7 INTAKE TESTING

**************************************************************************
NOTE: Delete this paragraph if a model test of the
intake to the pumping system(s) is not required.

**************************************************************************

Provide complete performance model testing of the pump intake systems. Use the model testing to confirm the configuration of the intake systems, including the proposed intake conduit, hydraulic losses to the pump, the position of the pump in the intake bay, and to confirm the selection of the pump. The Contracting Officer will witness the final tests confirming the geometry for the intake conduit. Furnish the Contracting Officer with not less than 14 days written notice of the time and location for the final tests.

2.7.1 Qualifications

Perform the modeling work in a hydraulic laboratory located within the United States where this type of work has been performed for a period of at least ten years. The individual in responsible charge of the modeling work must be a registered professional engineer in Florida or in the U.S. state where the model testing will be performed with at least ten years' experience in pump and intake modeling work for similar projects. The engineer must seal and sign all reports and data documents generated as a part of the test work prior to submitting them.

2.7.2 Intake Model Setup and Objectives

The model intake setup must be of the intake system, custom designed for this installation and suitable for operation at atmospheric pressure for observation of the intake basin performance. The intake model must be suitable for use with a model pump. Use clean and clear water for the test to allow proper observation. The temperature of the water during any test cannot exceed 30 degrees C / 85 degrees F. [For the FSI, provide a setup to determine flow patterns in the suction basin approaching the intake, along with losses to the pump. Provide further tests to identify flow patterns in the intake itself and approach patterns at the entrance to the pump.] In the intake model, include all items in the intake path, including, but not limited to: models of the trash rack, stoplog slots, access ladders, and the stilling wells in the intake bays.

2.7.3 Intake Model Tests

The objective of the modeling work is to define the performance of the proposed pumping unit and to confirm the geometry to be used for the pump intake. The model must have a model-to-prototype Froude number ratio of 1, based upon the pump impeller diameter. Arrange the model in the same relative orientation as the prototype structure and include the bay configuration and screening system. Perform all testing with the same model. [Intake Tests: For the formed suction intake geometry shown on the drawings, use the model setup to determine flow characteristics in the suction basin intake bay and at the entrance to the FSI at all specified operating conditions. In addition, use the model to determine the effect of the intake system on pump operating characteristics. Use a siphon generated by a separate pump to examine flow characteristics in the intake bay using Froude relationships to model intake operation in the first set of tests. Use second test to develop information on the effect of the intake on pump operation. Use these values to forecast the performance of the pump-intake conduit combination.][
Alternate Intake Geometry: If an intake geometry differing from that indicated is proposed, or other modifications such as baffling, test the proposed intake and/or modifications to demonstrate its suitability for use in the project and compliance with Appendix I in EM 1110-2-3105. For that reason, design the laboratory setup specifically to monitor free and sub-surface vortices, swirl and pre-rotation approaching the pump impeller, flow separation at hydraulic surfaces in the intake conduit and at the hydraulic surfaces approaching the pump impeller, and axial velocity distribution at the entrance to the impeller.

a. The intake conduit and pump inlet must contain several clear windows and similar appurtenances and adequate lighting at all critical areas to allow visual determination of the presence of vortices, turbulence, and other defects. Make provisions to insert dye at intervals in the intake conduit and at the entrance to the impeller during operation of the test. Reynolds and Weber numbers for all model runs must be greater than 30,000 and 120, respectively. The manufacturer must develop scale factors for velocity, flow, and time for use in evaluation of model results. Scale factors are subject to review by the Contracting Officer. In addition to model runs at all specified operating conditions, conduct no fewer than five runs at 1.5 times Froude-scaled flows after final geometrics for the intake conduit and intake bays have been established, keeping the submergences at the geometrically scaled values. Track and document circulation contributing to development of vortices.

b. Determine vortex formation in the model every 15 seconds extending over a period of 10 minutes. Classify vortices in accordance with the strength classification system in HI ANSI/HI 9.8 for both surface and subsurface vortices, using dye wand injection to assist in classification. The manufacturer must provide both photographic and video documentation of vortex formation. Direct particular attention to subsurface vortex formation at the intake conduit entrance and on intake conduit surfaces leading to the impeller entrance.

c. Provide a swirl meter or other satisfactory device to determine liquid rotation (swirl) at the entrance to the impeller. Obtain swirl readings at intervals of 20 seconds for a period of not less than 10 minutes after the model has achieved steady-state operation at any specified operating condition. Swirl angle is defined by the relationship:

\[
\text{swirl angle} = \frac{1}{(\tan)} \left( \pi d n \right) / u
\]

Where:
\[
\begin{align*}
u &= \text{average axial velocity at the swirl meter.} \\
d &= \text{diameter of the conduit at the swirl meter.} \\
n &= \text{revolutions/second at the swirl meter.}
\end{align*}
\]

d. Headloss Measurements: Measure headloss from the upstream model boundary to just upstream of the pump inlet for each documentation test and include a minimum of the following conditions:
### Table

<table>
<thead>
<tr>
<th>Pump No.</th>
<th>Avg On/Off El. (m) (feet)</th>
<th>Individual Pump Q (cubic m per second) (fps)</th>
<th>Total Pump Q (cubic m per second) (fps)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### NOTE: Provide an expected order of pump operations and expected intake elevations at start-up for each pump.

**e.** Also record the head loss from just upstream of the PSI to the throat of one model pump for a minimum of 10 flow rates after the model Euler number is determined to be constant and at least one point (near the middle of the data) must be within 2 percent of the scaled rated flow of the pump. Measure head loss with a differential manometer or differential stilling basin. Install a minimum of four pressure taps around the pump throat measurement point and joined to form an average pressure reading. Calculate a dimensionless head loss coefficient for the formed inlet that includes the entrance loss into the formed inlet.

**f.** Determine the velocity profile in the channel cross section approaching the intake and performing the velocity traverses on perpendicular axes at the intake throat, just upstream from the impeller. Velocity measurement instruments must be capable of an accuracy of plus or minus 2 percent.

**g.** Use the following as criteria for acceptance of the proposed design:

1. Free surface and sub-surface vortices entering the pump intake must be less severe than Type 1, as defined in HI ANSI/HI 9.8, unless dye core vortices appear for less than 10 percent of the time or only for pump operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.

2. Swirl angles, both maximum and average, indicated by swirl meter readings, must be less than 5 degrees. Swirl angles as great as 7 degrees will be accepted if occurring less than 10 percent of the time or for operating conditions that are expected to be infrequent, such as the listed maximum or minimum operating conditions.

3. Velocities at points of equal radii at the throat of the intake conduit must be within 10 percent of each other.

4. Determine NPSHR on the basis of a one percent reduction of efficiency.

5. Time-varying velocity fluctuation (turbulence) levels as defined by a standard deviation over average velocity at a point within the pump throat must be less than 10 percent.

**h.** Unless otherwise specified, conform accuracy of all measurements to the levels established in HI ANSI/HI 14.6.
Recommendations from the Model Test

If the results of the intake model testing indicate that any features of the design are deficient, report this to the Contracting Officer in writing immediately. If the intake modeler has recommendation for improving the flows in the pumps, provide them in the Intake Model Test Report. Flag these as important information that requires the Contracting Officer's immediate attention. Note all recommendations considered major changes. Provide any minor recommended changes to the intake as variations in the shop drawings.

2.8 SHOP ASSEMBLY

Assemble the discharge tube [and discharge elbow] in the manufacturer's plant to ensure the proper fitting and alignment of all parts. Prior to disassembly, match-mark all parts to facilitate the correct assembly in the field.

2.9 FACTORY TESTS

**************************************************************************
NOTE: The designer should specify performance testing of the assembled pump in the factory to check that the requirements of the specification have been met. Cavitation testing is recommended but may not always be required. The designer should include cavitation testing whenever the cavitation characteristics of the proposed pump have not been determined (by test) by any one of the prospective suppliers. Testing should be conducted on a full-scale (prototype) pump. It should also establish the structural and operating integrity of the complete pumping unit. The prototype pump would be the first pump built.
**************************************************************************

Submit a description of the factory test setup and test procedure proposed. Submit sufficient data and drawings to demonstrate that testing is in compliance with HI ANSI/HI 14.6

2.9.1 Performance Test

Test the pump at the manufacturer's shop to demonstrate that the proposed pump operates without instability and complies with specified performance. Instability is defined when any point in the usable range of the head-capacity curve cannot be repeated within 3 percent. When this occurs, rerun the test. Compliance with specifications will be determined from curves required by paragraph TEST RESULTS. Test procedures, except as herein specified, must be in accordance with applicable provisions of HI ANSI/HI 14.6, with an acceptance grade of 1U. Use water for testing at approximately the same temperature for all tests run and record it during test runs.

2.9.1.1 Performance of the Pump

Determine performance of the pump by a series of test points sufficient in number to develop a constant speed curve over the range of total heads corresponding to the requirements of paragraph CAPACITIES. The test range must include additional testing at total heads of 0.6 m 2 ft higher than...
that specified. The lowest total head for testing must be, as a minimum, the total head determined from the referenced paragraph. If the test setup permits testing at lower total heads, extend the range of total heads 0.6 m 2 ft lower. Testing must be inclusive for the speed involved. Perform tests using the heads and suction water elevation specified in paragraph CAPACITIES. Test results with this sump elevation must meet all specified conditions of capacity, head, and bkW bhp. Head differentials between adjacent test points cannot exceed 0.9 m 3 ft, but in no case fewer than 10 points be plotted in the pumping range. If the plot of data indicates a possibility of instability or a dip in the head-capacity curve, a sufficient number of additional points on each side of the instability must be made to clearly define the head-capacity characteristics.

2.9.1.2 Test Results

Plot test results to show the total head, static heads, bkW bhp, and efficiency as ordinates. Plot the results against pump discharge in L/s gpm as the abscissa. Plot curves showing pump performance to a scale that will permit reading the head directly to 0.15 m 0.5 ft, capacity to 30 L/s 500 gpm, efficiency to 1 percent, and power input to 20 bkW 25 bhp. Establish that the performance requirements of these specifications and the warranties under this contract have been fulfilled. Perform the performance test with the pump and motor assembled as an operating unit to simulate field installation unless otherwise approved in writing by the Contracting Officer. Readings must include one point each within 2 percent of the rated total head, minimum expected head, and maximum expected head. Conduct the test in accordance with accepted practices at full speed; and, unless otherwise specified, conform to HI ANSI/HI 14.6 procedure and instruments.

[2.9.2 Cavitation Test

Use the testing procedures provided in HI ANSI/HI 14.6 to determine the net positive suction head required (NPSHR) by the pump. Select the test arrangement and procedure, from the choices provided in HI ANSI/HI 14.6, that best suits the test facility. NPSHR must, as a minimum, be determined for five or more capacities over the total range of the specified operating conditions. Plot the test results and define NPSHR as the point where a 3 percent drop in performance occurs. The value of NPSHR must be 0.6 m 2 ft less than the corresponding net positive suction head available (NPSHA). Use the temperature of the water at the time the tests are run in determining the NPSHR. Use the water elevations specified in paragraph CAPACITIES to determine the NPSHA for pumps.

]2.9.3 Instrumentation and Procedures

Describe each instrument in detail, giving all data applicable, such as manufacturer's name, type, model number, certified accuracy, coefficient, ratios, specific gravity of manometer fluid to be used, and smallest scale division. When necessary for clarity, include a sketch of the instrument or instrument arrangement. Include a fully detailed narrative description of each proposed method of instrumentation, procedures to be used, and a sample set of computation. State the lowest equivalent static head that is obtainable with the testing when operating along the head-capacity curve of the proposed pump.

2.9.3.1 Head Measurements

Make head measurements using either a direct reading water column,
mercury-air, mercury-water, a Meriam fluid manometer, or a pressure transducer. Measure vacuums with either a mercury-air manometer, a mercury-water manometer, or a pressure transducer. Dampen fluctuations sufficiently to permit column gauges or a differential pressure transducer to be read to either the closest one one-hundredth (0.01) of 300 mm 1 ft of water or Meriam fluid or one-tenth (0.1) of 25 mm 1 inch of mercury. Use manometers as indicated by ISA RP2.1. When pressure transducers are used, check their accuracy with a manometer.

2.9.3.2 Pump Capacity

Determine capacity by a calibrated venturi flowmeter or a long-radius ASME flow nozzle. Do not use orifice plates. Connect venturi or nozzle taps to column gauges equipped with dampening devices that permit the differential head to be determined to either the closest 3 mm one-hundredth (0.01) of 1 foot or water or 2.5 mm one-tenth (0.1) of 1 inch of mercury. Magnetic flowmeters and flowmeters utilizing ultrasonic flow measurements will be acceptable if the calibration of the flowmeter has been completed within the last 6 months.

2.9.3.3 Rotational Speed of Pump

Measure rotational speed of the pump in accordance with measurement of speed in HI ANSI/HI 14.6, except do not use revolution counters. The device used must permit the speed to be determined to 1 rpm.

2.9.3.4 Power Input

Measure power input to the pump in accordance with power measurements in HI ANSI/HI 14.6. Use a method to permit kW bhp to be determined to the closest 0.5 bW 0.5 bhp.

2.9.4 Witness Test

Perform factory tests in the presence of the Contracting Officer. When satisfied that the pump performs in accordance with the specified requirements, notify the Contracting Officer, two weeks in advance, that the witness tests are ready to be run and furnish two copies of curves required in paragraph TEST RESULTS above. If the tests reveal that the pump does not perform in accordance with the specifications, make necessary changes before again notifying the Contracting officer that witness tests are ready to be run. Provide copies of all data taken during the testing and plotted preliminary curves to the Contracting Officer with the factory test report.

2.9.5 Factory Test Report

Submit, within 30 days of receipt of approval of the witnessed factory test, [bound] [digital] copies of a report covering test setup and performance tests. Include the specified information in the factory test report and, as a minimum, the following:

a. Statement of the purpose of the test, name of the project, contract number, and design conditions. Highlight and explain instances where guaranteed values differ from specified values.

b. Resume of preliminary studies, if such studies were made.

c. Description of pump and motor, including serial numbers, if available.
d. Description of test procedure used, including dates, test personnel, any retest events, and witness test data.

e. List of all test instruments with model numbers and serial numbers.

f. Sample computations (complete).

g. A discussion of test results.

h. Conclusions.

i. Photographic evidence in the form of either color photographs of test equipment, test setup and representative test segments, or a digital recording, at least 30 minutes in length, covering the same information as photographs. Label all photographic evidence with the contract number, location, date/time, and test activity. Voice annotate digital recordings with the same information.

j. Copies of instrument calibration.

k. Copies of all recorded test data.

l. Curves required by the paragraph TESTS RESULTS.

m. Curves showing the performance of the prototype pump.

n. Drawings of the test set-up showing all pertinent dimensions, elevations and cross section of the pump.

PART 3   EXECUTION

3.1 INSTALLATION

Perform correct installation and assembly of the pumping unit in accordance with the drawings and with the manufacturer's installation instruction manual. Submit, no later than 30 days prior to time of pump delivery, three copies of a typed and bound manual describing procedures to be followed by the installation engineer in assembling, installing, and dry- and/or wet-testing the pump. Coordinate and consolidate the description of the pump with similar descriptions for other specified pump parts. The description must be of such a nature that it may be comprehended by an engineer or mechanic without extensive experience in erecting or installing pumps of this type. The description must be a step-by-step explanation of operations required, and include, where applicable, such things as alignment procedures, bolt torque values, recommended instrument setups, recommended gauges and instruments, and similar details. Furnish all bolts, shims, tools, and other devices necessary for installing the pumping units. The manufacturer's representative(s) familiar with the equipment being installed must supervise the handling, installation, start-up, and testing of the equipment as required in the paragraph INSTALLATION AND START-UP ENGINEER.

3.2 CLEANUP PRIOR TO START

After the pumping unit is installed and prior to start-up, completely clean the sump area of any accumulated construction debris. This final cleaning of the sump area will be witnessed by a representative of the Government. Correct any damage to the pumping units or related equipment during initial
start-up due to foreign objects left in the sump areas.

3.3 PUMP FIELD TESTS

**************************************************************************
NOTES: Compliance with specification performance has been made a part of the factory tests; therefore, field tests are for the purpose of baseline measurements. Pump integrity, vibration, and inspection of manufacturing quality are witnessed at the factory.

Perform field testing to ensure proper alignment and installation, start-up and shutdown procedures, checking out controls, and establishing baseline measurements. Two field test methods are available, dry or wet testing, depending on availability of water. Wet testing is preferred, but dry testing may be all that is possible when the pumps are prepared for initial start-up.

If a wet test cannot be conducted at the time of initial start-up because of a lack of water, it should be conducted at a later time, if possible, and does not unduly extend the contract period.
**************************************************************************

Submit a field test plan prior to field testing. Field testing must be conducted by an experienced field test engineer and will be witnessed by the Contracting Officer. Before initially energizing the pump/motors, ensure that all pumping plant control, monitoring, and protective circuits have been successfully tested. This thorough electrical checkout procedure must follow a detailed step-by-step approved test plan. Also check the motor and other pumping unit elements undergoing tests at this time. Field test the plan prior to field testing.

3.3.1 Dry Test

Test each pumping unit in the dry in accordance with the pump manufacturer's instructions to determine whether it has been properly installed. Conduct such test when, and as, directed by Contracting Officer. Operate the pump at full rated speed. If tests reveal a design or installation deficiency or a manufacturing error in pumping unit components, promptly correct the problem.

3.3.2 Wet Test

Test each unit under load for a period of at least [_____] hours or as directed by the Contracting Officer. Conduct the tests to be witnessed by the Government. During the tests, observe, measure, and record the operation of the pumping units [noise (in accordance with HI 9.1-9.5), motor-bearing temperatures, voltage, and current for each pump. Measured parameters must be within the pump manufacturer's published limits. make vibration measurements at the top of the discharge tube [and flange of the discharge elbow] for each pump. Vibration limits must not exceed those recommended by HI 9.6.4.
3.3.3 Field Test Report

Prepare and submit the field test report and a manual of Operating and Maintenance Instructions for the completed system. Submit the Instructions containing complete information on operation, lubrication, adjustment, routine and special maintenance disassembly, repair, reassembly, and trouble diagnostics of pump and auxiliary equipment. [Print the operation and maintenance manual and both parts lists on good quality ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper, bound separately between flexible, durable covers.] [Provide the operation and maintenance manual and both parts lists on optical disc, formatted to print on ANSI size A 216 by 280 mm 8-1/2 by 11-inch paper.] Drawings incorporated in manual or parts lists, may be reduced to page size provided they are clear and legible[, or may be folded into the manual to page size]. Photographs or catalog cuts of components may be included for identification.

3.4 PAINTING

Paint the pump/motor in accordance with the pump manufacturer's standard coating system. Paint the discharge tube [and discharge elbow] and appurtenances in accordance with Section 09 97 02 PAINTING: HYDRAULIC STRUCTURES.

NOTES: This guide specification covers the requirements for speed reducers used with vertical impeller pumps. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification, as written, is for use in construction contracts for the building of pumping stations. If it is to be used in supply contracts, it should be changed as appropriate.

The pump, motor, base, electrical power, engine, and clutch (if used) are all related components but are not included in this specification.

The epicyclic reducer is reliable and especially well suited to high power applications. It should not normally be deleted as an option if the prime mover has a vertical shaft.
1.1 UNIT PRICES

**************************************************************************
NOTE: If Section 01 22 00.00 10 PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10.
**************************************************************************

1.1.1 Speed Reducers for Storm Water Pumps

Payment will be made for costs associated with [furnishing] [furnishing and installing] [installing] the speed reducers for storm water pumps as specified.

1.1.2 Measurement

Speed reducers for storm water pumps will be measured for payment based upon each speed reducer [furnished] [furnished and installed] [installed].

1.1.3 Unit of Measure

Unit of measure: each.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.
**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN BEARING MANUFACTURERS ASSOCIATION (ABMA)

ABMA 9 (2015) Load Ratings and Fatigue Life for Ball Bearings

ABMA 11 (2014) Load Ratings and Fatigue Life for
1.3 SYSTEM DESCRIPTION

1.3.1 General Product Requirements

****************************************************************************************************
NOTES: Where possible to meet the required pump speed with the given prime mover speed, and when the prime mover has a horizontal shaft, a single reduction spiral bevel gear reducer should be chosen. Reduction ratios of up to 7:1 are practical. Ratios of up to 10:1 are possible but should be used only after consultation with manufacturers. Double reduction reducers may be required when required reduction ratios are too high. Where a vertical shaft prime mover is to be used, the designer should choose between a parallel
shaft reducer or an epicyclic reducer. In some cases, this choice may be left to the supplier to allow them to make the most economical selection. Both of these types of reducers will provide reliable service. Epicyclic reducers become the preferred choice for high wattage horsepower vertical shaft prime movers (above approximately 750 kW 1,000 hp). Again, single reduction reducers should be used where feasible.

This section is intended to be used along with Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE. The designer is responsible for determining whether a speed reducer is required or whether a direct drive vertical induction motor can be used to drive the pump. Guidance for making this decision is EM 1110-2-3105, MECHANICAL AND ELECTRICAL DESIGN OF PUMPING STATIONS. An additional section for the prime mover, an electric motor or diesel engine, is also normally added. The intention is for these components to be purchased and installed by the Construction Contractor. Purchase of the three components in a single contract allows the supplier to obtain the most optimum combination of components thus reducing costs while not sacrificing reliability. This also makes it feasible for the Contractor to perform dynamic analysis as described in Section 35 45 01 and be solely responsible for acquiring the necessary data to perform such analysis. The dynamic analysis is important to ensure the pump, reducer, and motor or engine combination is free of detrimental vibration. If the reducer and prime mover are purchased separately, the designer is responsible to provide additional plans and specifications covering reducer instrumentation. Provisions for a pump, reducer, and Provisions for a pump, reducer, and prime mover base plate are described in Section 35 45 01. Pump and reducer alignment is described in Section 35 45 01. The "Buy American Act" which will be included in the non-technical portion of the contract will preclude the use of nondomestic reducers and appurtenances.

**************************************************************************************************************************

The speed reducers shall be designed and manufactured by a firm that is regularly engaged in the manufacture of speed reducers of the type utilized for these installations. Submit complete computations, design loads, and catalog data. The reducer shall display the certified manufacturer's ANSI/AGMA insignia as evidence of conformance to these standards. The nameplate shall bear the manufacturer's name, model designation, serial number, unit rating, application factor, reduction ratio, and other applicable information. The speed reducer shall be [single reduction spiral bevel] [spiral bevel primary, helical secondary stage] [single reduction parallel shaft] [double reduction parallel shaft] [epicyclic] gear type equipped with thrust bearings to make the speed reducer suitable for use with a vertical impeller pump. Where upthrust is possible during pump startup or shutdown, the thrust bearing shall be designed to resist
The speed reducer shall be able to withstand all of the specified operating conditions without damage. A backstop shall be provided to pre-vent reverse rotation of the pump. The gear reducer shall conform to the requirements of ANSI/AGMA 6113, AGMA 6013 or AGMA 6123 as applicable.

1.3.2 Design Conditions

1.3.2.1 Operating Conditions

**NOTES:** The speed reducer, pump, and prime mover are intended to be purchased together; responsibility for establishing operating loads should be placed on the Contractor. If the speed reducer is purchased separately, the designer must determine the operating loads from pump and prime mover data.

For motor stall torque, 350 percent of rated load should be used for induction motors. For diesel engines, the maximum torque should equal the slip torque of the overload protection device. An air actuated clutch should be used as overload protection.

Obtain the operating conditions from the pump and prime mover suppliers. Operating conditions which shall be considered include (as a minimum): maximum input power, motor or engine speed, speed reducer ratio, maximum pump reverse overspeed, low-speed shaft downward thrust including weight, low-speed shaft momentary upward thrust during startup or shutdown (if applicable), high-speed shaft direction of rotation, low-speed shaft direction of rotation, overhung load, motor stall torque, or maximum engine overload torque transmitted through the clutch, reverse torque load on the backstop.

1.3.2.2 Runaway

**NOTE:** Delete this paragraph for engine-driven units. If emergency closure might not be achieved within 30 minutes, this time period must be increased.

The speed reducer shall be designed to withstand backstop failure and maximum pump reverse runaway speed for a period of \[30\] \[_____] minutes.

1.3.2.3 Critical Speeds

**NOTE:** Dynamic analysis of the pump, reducer, and engine or motor assembly will be performed by the pump manufacturer as described in Section 35 45 01 VERTICAL PUMPS, AXIAL-FLOW AND MIXED-FLOW IMPELLER-TYPE. If the reducer is purchased separately from the pump, this paragraph will be deleted and responsibility for dynamic analysis, if done, is that of the designer.
Dynamic analysis of the pump, reducer, and motor (engine) assembly shall be performed by the pump manufacturer. The reducer manufacturer shall coordinate with the pump manufacturer in performing the dynamic analysis. The reducer manufacturer shall make any design modifications to the reducer which are necessary to avoid resonances in the system. A torsional or lateral natural frequency within 25 percent of normal operating speed of any shaft or gear mesh frequency is unacceptable.

1.3.3 Arrangement

NOTE: In making choices as to the reducer arrangement, the designer must coordinate with the pump (Section 35 45 01) and prime mover specifications. These contain statements on shaft configuration. The hollow output shaft arrangement is preferred for ease of installation. If the reducer is purchased separately from the pump and prime mover, the designer is responsible for determining input and output shaft details and ensuring the reducer will be compatible. For reducers driven by a diesel engine, an air actuated clutch is recommended. The clutch should be part of the diesel engine specification.

[The arrangement shall use a true hollow low-speed shaft where the pump shaft passes concentrically through the reducer shaft allowing finite impeller elevation adjustment.] [The speed reducer output shaft shall be connected to the pump using a rigid coupling.] [The speed reducer input shaft shall be connected to the motor shaft by a flexible coupling.] [The speed reducer input shaft shall be connected to the engine with two universal joints and an intermediate shaft.] [The speed reducer input shaft shall be connected to the engine with a flexible coupling.] Ensure compatibility and fit of the reducer high- and low-speed shafts with that of the pump and prime mover. The speed reducer mounting shall be designed to permit removal of the reducer and reinstallation without requiring realignment of the reducer and shafting. Before assembly, each gear and shaft assembly shall be dynamically balanced.

1.4 SUBMITTALS

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.
For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.][information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.5 DELIVERY, STORAGE, AND HANDLING

Material and equipment shall be protected from weather, humidity, temperature variation, dirt, dust, and other contaminants during delivery and storage.

1.6 EXTRA MATERIALS

******************************************************************************
NOTE: The designer is responsible for providing a list of spare parts requirements. This should be based on consideration of whether the purchase of a complete spare reducer is justified and the consequences of downtime of one or more units. Spare parts might otherwise include spare gears, bearings, seals, lubrication system parts, instrumentation components, or heat exchanger. The designer should consult with the end user of the system to determine spare parts requirements.
******************************************************************************

Submit the following: [____]

PART 2 PRODUCTS

2.1 MATERIALS AND EQUIPMENT

******************************************************************************
NOTE: Application factors of 1.25 (electric motor) and 1.50 (diesel engine) are the values recommended by EM 1110-2-3105 MECHANICAL AND ELECTRICAL DESIGN OF PUMPING STATIONS. These are suitable for most applications. Where reducer operating conditions are considered severe, the application factors of 1.75 (electric motor) and 2.0 (diesel engine) may be used to increase reliability.
******************************************************************************

Provide materials and equipment which are the standard products of manufacturers regularly engaged in the production of gear reducers for vertical pump drives and that essentially duplicate products which have
been in prior satisfactory use for at least 2 years prior to bid opening. All products shall be new. Submit detail drawings of sufficient size for easy reading and consisting of a complete list of equipment and materials, including manufacturer's descriptive and technical literature; performance charts and curves; catalog cuts; and installation instructions. Show on the drawings proposed layout and anchorage of equipment and appurtenances, and equipment relationship to other parts of work including clearances for maintenance and operation. The reducer assembly shall be rated in accordance with ANSI/AGMA 6113AGMA 6013 or AGMA 6123 as applicable. The unit rating shall be equal to or exceed the maximum input power times an application factor. The application factor shall be [1.25][1.75] for reducers driven by electric motors and [1.5][2.0] for reducers driven by diesel engines.

2.2 BEARINGS

**************************************************************************
NOTE: The selection of thrust bearing type should be left to the reducer manufacturer. The selection of bearing type is based upon thrust load. For very high thrust loads, a hydrodynamic fluid film thrust bearing may be needed. If the designer has specific experience which relates to which bearing type is best for the application, one of the options for thrust bearing type may be omitted.
**************************************************************************

2.2.1 Thrust Bearings

Provide thrust bearings which are either hydrodynamic fluid film type or antifriction type. Antifriction thrust bearings shall be either tapered roller or spherical roller type. The thrust bearing shall be sized for the pump thrust plus the weight of the impeller and shaft. The thrust bearing size and arrangement shall be coordinated with the pump supplier. The bearings shall be able to sustain continuous operational load as well as startup and shutdown loads. Hydrodynamic fluid film thrust bearings shall use pivoted segmental shoes with the babbitted face surfaced as recommended by the bearing manufacturer to maintain an optimum oil film.

2.2.2 Radial Bearings

Radial bearings for spiral bevel and parallel shaft reducers shall be antifriction type. Radial bearings for epicyclic reducers shall be either hydrodynamic fluid film type or antifriction type.

2.2.3 Hydrodynamic Fluid Film Bearings

Design the bearings to have a minimum oil film thickness of 12.5 µm 0.0005 inch under the most severe operating conditions. The bearing loads shall not exceed 2400 kPa 350 psi for the maximum load. Where hydrodynamic fluid film thrust bearings are used, suitable hydrostatic lift provisions shall be made if required to prevent bearing damage during startup. Thrust bearings shall be provided with either spring loaded or embedded instrumentation to monitor operating temperatures.

2.2.4 Antifriction Bearings

Antifriction bearings shall be rated for an L-10 life of 100,000 hours at the operating load of the reducer. Ball bearing load ratings shall conform
to ABMA 9. Roller bearing load ratings shall conform to ABMA 11.

2.3 **GEARS**

**************************************************************************

NOTE: Designer must delete inapplicable statements which pertain to the gear types not used.
**************************************************************************

[Epicyclic gearing shall be of the double helical design.] [Parallel shaft gearing shall be of the helical design.][Right angle gearing shall be of the spiral bevel design.] Spiral bevel, helical, and double helical gears shall be gas nitrided or carburized, hardened and ground. For epicyclic gearing the annulus ring may be shaper cut. The pinion or gear of each helical set shall be crowned to eliminate end loading. For helical gears, standard normal diametral pitches shall be used. In addition to rating the gears according to ANSI/AGMA 6113 or AGMA 6123 as applicable, gear stresses shall not exceed 80 percent of yield strength for any overload, motor stall, or engine overload condition. No less than 350 percent of motor rated torque shall be used for the motor stall condition.

2.4 **SHAFTS**

Each shaft shall be heat treated alloy steel. Input shaft size and configuration shall be compatible with the motor or engine and clutch. Output shaft size and configuration shall be compatible with the pump. Welded shafts are not acceptable.

2.5 **[COUPLINGS] [UNIVERSAL JOINTS]**

**************************************************************************

NOTE: The designer must delete inapplicable statements. Couplings are to be used with electric motor prime movers. Universal joints are to be used with diesel engine prime movers. In some cases, flexible couplings may be used with diesel engines.
**************************************************************************

The speed reducer shall be connected to the motor (engine) by [flexible coupling] [universal joints]. The [couplings] [universal joints] shall have a service factor of 2 based on maximum rated load. In addition, at maximum overload conditions, stresses shall not exceed 80 percent of yield strength. [Couplings shall transmit torque by means of a steel grid spring fitted into groves in the periphery of the coupling hubs or by means of external gears on hubs engaging in internal gears on the coupling sleeves or by hubs engaged with flexible self-lubricating members. Couplings with sleeves held in place by snap rings are not acceptable.] [Universal joints shall have forged steel yokes and spiders and shall have sealed needle roller bearings. Universal joints shall be installed in pairs. The angles between each shaft and the intermediate shaft shall be equal and shall not exceed the manufacturer's recommendation. The driving pins on the yokes attached to the intermediate shaft shall be set parallel to each other.] [Couplings shall be enclosed and sealed to exclude contaminants and retain the lubricant under both static and operating conditions.] The [couplings] [universal joints] shall be dynamically balanced to ANSI/AGMA balance classification 7 or better and shall be grease lubricated unless self-lubricated.
2.6 BACKSTOPS

NOTE: Mounting of the backstop with the inner member and rollers stationary will decrease wear and heat generation and consequently increase the life of the backstop. The outward radial load on the rollers is decreased in this mounting situation. This mounting method can be obtained without undue cost but is not the standard mounting method for these backstops. The designer may opt for the standard method (inner member and rollers rotating) but is advised that better life has been obtained with the inner member stationary. For smaller wattage horsepower units (375 kW (500 hp and below), the drop-pin type backstop is a satisfactory alternative and may be added to the specification. Spragtype backstops perform adequately in many installations but have been more prone to problems such as wear and excessive heat generation than the other types and are not listed as an option here. If a diesel engine is used, the idle speed and duration should be listed for proper consideration during backstop sizing.

Provide a backstop on the output shaft to prevent reverse rotation of the pump. For double reduction reducers, the backstop may be mounted on the output or intermediate shaft. Size the backstop for the resulting torque at the reducer during maximum reverse flow at pump and a service factor of 2.0 shall be applied to the manufacturer's published rating. In addition the backstop shall be suitable for continuous operation at engine idle speed of [800] [_____] rpm. The backstop shall be of a type with cylindrical rollers on inclined cam planes or drop-pin type. The backstop shall be mounted with the outer race moving and the inner race fixed. The backstop shall operate at a temperature of less than 70 degrees C 160 degrees F under all operating conditions with an ambient temperature up to 40 degrees C 100 degrees F. The backstop shall be provided with a circulating oil lubrication system and shall have sufficient flow rate to provide the required cooling. The lubrication system may be part of the gear reducer lubrication system.

2.7 HOUSING

2.7.1 General

The housing shall be cast or fabricated steel, stress relieved prior to machining, and reinforced to carry all applied loads and to maintain gear alignment. A sole plate [as shown on the drawings] shall be provided under the reducer. The sole plate shall be installed, leveled and grouted in accordance with API RP 686, Chapter 5 - Mounting Plate Grouting. Jacking bolts shall be provided for leveling the sole plate. All leveling jacking bolts shall be backed off after grouting so that they do not support any part of the load. An anchor bolt layout shall be provided to aid in placement of the anchor bolts. The housing bottom shall be machined. The interior of the reducer shall be painted with an oil compatible coating. The exterior shall be painted with the manufacturer's standard coating system. Color shall be light gray. The housing shall have an oil fill connection and a drain connection with a magnetic plug. Lifting lugs shall
be provided for lifting the entire reducer assembly and any subassembly or component which cannot be lifted using web slings.

2.7.2 Seals

Vertical down output shafts shall have a drywell design seal. The input shaft shall have a lip seal to prevent leakage of oil and exclude dirt. Lip seals shall utilize hardened steel wear sleeves to preclude shaft repair or replacement if the seal wears the shaft.

2.7.3 Inspection Covers

The housing shall have inspection holes with cover plates located above the maximum oil level to permit viewing of gear teeth allowing evaluation of the contact patterns of each gear mesh and to allow inspection of internal features of the lubrication system.

2.8 LUBRICATION SYSTEM

2.8.1 General

The speed reducer shall be provided with an oil lubrication system that will provide continuous lubrication to the gears, bearings, and oil lubricated-type backstop. The system shall consist of an oil circulating pump, [oil-to-water][air] heat exchanger, piping, filters, and controls. Each reducer shall be provided with its own system. The oil circulating pump shall be driven directly from the speed reducer shaft. The maximum oil sump temperature at rated speed and load shall be 70 degrees C 160 degrees F at an ambient temperature of 40 degrees C 100 degrees F. If a hydrodynamic thrust bearing is used, its lubrication system may be part of the gear reducer lubrication system, or a separate lubrication system may be provided.

2.8.2 Oil Pumps

The oil pumps shall be positive displacement type. Each pump shall have a relief valve which discharges to the sump. The pump shall be reversible so it continues to function during a runaway condition.

2.8.3 Prelubrication Pump

**************************************************************************
NOTE: An electric motor-driven prelubrication pump is recommended where hydrodynamic thrust bearings will be used to ensure an optimum oil film is developed prior to startup. Many applications with hydrodynamic thrust bearings do not use electric motor-driven pumps. The designer has the option of omitting the requirement for an electric motor-driven pump.
**************************************************************************

The reducer shall be prelubricated prior to startup. The prelubrication pump shall be positive displacement, hand-operated type where antifriction thrust bearings are used. Where hydrodynamic thrust bearings are used, the prelubrication pump shall be an electric motor-driven positive displacement type. The electric motor-driven pump shall deliver sufficient pressure to lift the thrust bearing runner from the shoes. The pump shall operate in manual and automatic modes. In automatic mode, the prelubrication pump
shall supply oil prior to reducer startup, shall continue operation at least 30 seconds after reducer startup, then shall automatically shut down. In manual mode, the prelubrication pump shall be started and stopped from a local push button station. Available power for the pump and controls will be 480 V, 3 Ph, 60 Hz and 120 V, 1 Ph, 60 Hz. The pump shall supply oil through the lubrication system prior to reducer startup. The pump shall utilize zero-leakage check valves to isolate it from the lubrication system during operation of the reducer. The prelubrication system shall not require valve operation to execute the prelubrication cycle or to return to normal operation.

2.8.4 Oil and Breather Filters

The lubricating system shall have two oil filters on the pump outlet side. One filter shall be for removing particles and the other for water removal. The filter for particles shall have a Beta rating of B6 greater than 75 at 400 kPa 60 psi differential tested in accordance with ISO 16889. The reducer manufacturer may propose an alternate Beta rating by submitting proof that B6 greater than 75 is unsuitable for the lubricant to be used. Each filter shall incorporate an oil-filled differential pressure gauge to indicate the pressure drop across the filter. The filter shall have an internal magnetic element. The water removal filter shall maintain a water content in the oil of no greater than 200 ppm. All filter assemblies shall be sized so the pressure drop across the clean filter is no greater than 30 kPa 4 psi. The particle filter shall be sized to avoid bypass at a startup oil temperature of 25 degrees C 80 degrees F. Filters shall have a bypass setting of 300 to 400 kPa 45 to 60 psi. Element collapse rating shall not be less than 1050 kPa 150 psi. The breather filter shall have a Beta rating of B6 greater than 75 and a desiccant chamber to remove water.

2.8.5 Heat Exchanger

NOTES: When using an oil-to-air heat exchanger, use the second bracketed paragraph.

The designer must consider the water source. Where possible, potable water is the first choice. When flows are excessive, other sources must be used. Depending on the turbidity of the water, different methods will be needed to clean the water such as a cyclonic separator. If the water through the heat exchanger tubes is turbid, velocities should be kept above 2 m/s 7 fps to prevent clogging. Where the water is brackish or otherwise highly corrosive, 70-30 tube material should be used. Plate heat exchangers should be left as an option as they are generally easier to maintain. Where suitable cooling water is unavailable or may cause maintenance problems, an oil-to-air heat exchanger should be used.

[ The heat exchanger shall be either a water-cooled shell and tube type, water-cooled plate type, or internal water-cooled coils within the reducer sump. Heat exchanger tubes shall be [90-10 Copper Nickel Alloy][70-30 Copper Nickel Alloy]. Heat exchanger plates shall be type 316 corrosion resistant steel. Minimum tube thickness shall be 1.519 mm 0.0598 inch (16 gauge) and shall be adequate for the specified pressure rating. Water]
shall be circulated through the tubes or plates and the design shall be such that the tubes or plates can be cleaned. Cooling water will be provided at a maximum temperature of [25 degrees C 80 degrees F][_____] at a pressure of [550 kPa 80 psi][_____] at a maximum flow rate of [0.6 L/s 10 gpm][_____]. The cooling water shall be strained to a maximum [3 mm 1/8 inch][_____] particle size. The pressure drop through the clean heat exchanger shall not exceed [55 kPa (gage) 8 psig][_____] The heat exchanger shall be designed for a working pressure of [550 kPa (gage) 80 psig][_____]. The heat exchanger shall withstand a test pressure of 150 percent of the design pressure for a period of 4 hours during which time the heat exchanger shall be checked for leakage. Any leakage will be cause for rejection.

[The heat exchanger shall be an oil-to-air type with size based upon a maximum ambient temperature of 40 degrees C 100 degrees F. Heat exchanger tubes and fins shall be copper or copper alloy. Working pressure shall exceed the oil pump working pressure. The heat exchanger shall withstand a test pressure of 150 percent of the design pressure held for a period of 4 hours during which time the heat exchanger shall be checked for leakage. Any leakage shall be cause for rejection. The oil-to-air heat exchanger system shall include a fan, motor, and controls for maintaining the specified oil temperature.]

2.8.6 Cooling Water Control Valve

**********************************************************************************************************************************************
NOTE: Delete if an oil-to-air heat exchanger is used.
**********************************************************************************************************************************************

A thermo-mechanical control valve shall be provided to adjust the flow rate of water through the heat exchanger to maintain a minimum oil temperature of 50 degrees C 120 degrees F in the housing sump.

2.8.7 Piping and Tubing

Oil lines up to 50 mm 2 inches o.d. shall be seamless steel tubing with 37 degree flare or flareless fittings. Where pipe sizes of 50 mm 2 inches and over are required, steel pipe with welded fittings shall be used. Water piping shall be copper or copper alloy with brazed or 95-5 soldered joints. All piping, tubing, and fittings shall conform to ASME B31.1. Vibration isolating tubing and piping supports shall be used. Oil tubing or ports shall be kept within the gear case where feasible. Dissimilar metals shall be electrically isolated to prevent corrosion.

2.8.8 Oil Heater

**********************************************************************************************************************************************
NOTE: In regions where the temperature during flood season is rarely below 10 degrees C 50 degrees F, consideration may be given to omission of the oil heater. However, omission of the oil heater is generally not recommended because it results in poor oil circulation at startup and it is impractical to size the filter to avoid a bypass condition at temperatures below 20 to 25 degrees C 70 to 80 degrees F. Accumulated contaminants can be passed at unacceptable concentrations during a bypass condition. The oil heater should be used since it

SECTION 35 45 03.00 10  Page 14
will help ensure adequate oil flow during unit startup. Caking of the oil on the heater is prevented by using a low watt density heater, 9300 watts per square meter 6 watts per square inch.

A thermostatically operated oil heater shall be installed to maintain the oil at a temperature of 25 degrees C 80 degrees F. The heater shall be sized based on a minimum ambient temperature of [minus 10 degrees C 15 degrees F] [____]. The heater shall be capable of being shut off if the unit is to be out of service for an extended period. The heater shall have a watt density no greater than 9300 W/square m 6 W/inch squared.

2.8.9 Lubricating Oil

NOTE: Ambient temperature range shall be limited to one of the standard temperature ranges listed in ANSI/AGMA 6113 (AGMA 6013) or AGMA 6123 and should be limited to the actual temperature range in which the reducers are expected to operate. The selection of EP (extreme pressure) and other additives should be left to the manufacturer. EP oil is normally necessary. Lubricant shall also be suitable for use with the oil lubricated hydrodynamic fluid film-type backstop. EP oils will work acceptably in roller-inclined ramp backstops. The oil must also be compatible with the hydrodynamic thrust bearing if one is used. Generally, gear oil is not optimum for these bearings but is acceptable. The manufacturer should generally not be precluded from utilizing a separate lubrication system for this bearing if the bearing requires a lighter oil.

Lubricating oil shall be mineral oil or synthetic hydrocarbon as recommended in ANSI/AGMA 6113AGMA 6013 or AGMA 6123 for an ambient temperature range of [minus 10 to plus 50 degrees C 15 to 125 degrees F] [____]. The lubricant shall be suitable for the entire temperature range without change of lubricant. Lubricant additives shall be used as recommended by the reducer manufacturer. Lubricant shall also be suitable for use with the backstop. Lubricant used for the hydrodynamic thrust bearing shall be suitable for the bearing. Catalog data of the proposed lubricant shall be submitted for approval in accordance with paragraph SUBMITTALS.

2.9 INSTRUMENTATION

NOTE: Provided that the prime mover and reducer are purchased and installed under a single contract, the Contractor must deliver the instrumentation as a complete working package. If the reducer is purchased separately, the designer is responsible for taking care of additional plans and specifications for the instrumentation. On noncritical applications, consideration may be given by the designer to delete the high temperature switch, flow switch, and vibration switch. The
**UFGS**

designer would then delete all electrical requirements for instrumentation.

**************************************************************************

Instrumentation for the reducer shall be supplied and installed as a complete working package, coordinated with the pump and prime mover supplier. All electrical work shall conform to NFPA 70. Electrical enclosures shall be NEMA 250, Type 4. An electrical termination cabinet shall be provided. Available power is 120 V, 1 ph. The speed reducer shall have the following devices as a minimum:

a. High oil temperature switch in unit sump.
   (1) Alarm at 80 degrees C 180 degrees F.
   (2) Shut down prime mover at 95 degrees C 200 degrees F.
   (3) Lower settings may be used if recommended by the reducer manufacturer.

b. Oil pressure gauge.
   (1) After oil pump.
   (2) Electric motor-driven prelubrication pump (if used).
   (3) Gauges shall be oil or glycerin filled and shall have snubbers and isolation valves.

c. Thermometer. Mercury shall not be used in thermometers.
   (1) Sump
   (2) Oil line after heat exchanger
   (3) Backstop

d. Oil Level Sight Gauge, with built in reflector.

e. Resistance Temperature Detector (RTD), Hydrodynamic Thrust Bearing, if used.
   (1) Alarm at 80 degrees C 180 degrees F.
   (2) Shut down prime mover at 95 degrees C 200 degrees F.
   (3) Lower settings may be used if recommended by the reducer and bearing manufacturers.

f. Oil Flow Switch.
   (1) Alarm at 80 percent of design flow.
   (2) Shut down prime mover at 60 percent of design flow.

g. Vibration Switch - Alarm at 13 mm/s 0.5 inch/sec or at baseline level recommended by the reducer manufacturer.
PART 3 EXECUTION

3.1 TESTS, INSPECTIONS, AND VERIFICATIONS

3.1.1 Shop Testing

Submit a shop test report fully documenting the test. In addition to or as part of the Contractor's normal shop testing procedure, the reducer shall be tested at rated speed, no load to check for potential problems which shall be eliminated prior to field testing. Gear contact patterns, sound level, lubrication and cooling, and all other operational characteristics shall be checked. The sound pressure level of the speed reducer and prime mover used in the shop test shall not exceed 90 dBA measured at a distance of 1 m (3 feet) from the equipment. Sound shall be measured in accordance with ANSI/AGMA 6025. Provide any preventative measures to control background noise. Notify the Contracting Officer 2 weeks prior to performing the shop test.

3.1.2 Installation

**************************************************************************
NOTE: If the reducer is not furnished installed, this paragraph must be modified or eliminated.
**************************************************************************

Install the speed reducer and ensure all features and systems are operational. The speed reducer shall be installed under the supervision of the reducer manufacturer's representative. The speed reducer shall be designed for ease of handling and installation. All necessary lifting devices, attachments, and special tools required for maintenance shall be provided by the Contractor. Submit an Operation and Maintenance Manual which provides detailed startup and operating procedures, lubrication instructions, installation and alignment procedures, routine maintenance requirements and procedures, complete detailed procedures for disassembly and assembly of the reducer, parts list for all parts detailed, assembly drawings of the reducer showing all parts, suppliers for all parts, settings and adjustment for protective devices, and a list of all tools, handling devices, and spare parts furnished.

3.1.3 Field Testing

Field test the speed reducer at rated speed and load to demonstrate that reducer operation, lubrication, cooling, and instrumentation meet contract requirements. The duration of the testing shall be sufficient to develop verifiable gear contact patterns. Gear contact patterns shall be inspected and shown to the Contracting Officer. Gear contact patterns for helical gears shall be at least 70 percent of face width. Spiral bevel gears shall have a central toe contact pattern with contact of 50 percent of face width at full load. Gear contact patterns shall be photographed and included as part of the field test report. The report shall document all data collected for load and speed measurement, lubrication, oil temperature and flow, ambient temperature, cooling water temperature and flow, gear contact patterns, and any other data required to show compliance with specifications. Should there be insufficient water available to perform the test, the Contracting Officer may delay the test for up to 9 months or waive the test.

NOTE: This guide specification covers the requirements for precast non-prestressed concrete floating piers and associated hardware and accessories.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.
The publications listed below form a part of this specification to the extent referenced. The publications are referred to in the text by the basic designation only.

1.2 MODIFICATIONS TO REFERENCES

In the ACI publications, the advisory provisions shall be considered to be mandatory, as though the word "shall" has been substituted for "should" wherever it appears; reference to the "Building Official," the "Structural Engineer" and the "Architect/Engineer" shall be interpreted to mean the Contracting Officer.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability
eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.] [for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Drawings of Precast Floats; G[, [_____]]

Gangways

[ Receptacle Stations; G[, [_____]]

] SD-03 Product Data

Gangway Design

Concrete Mix Design

SD-06 Test Reports

Contractor-Furnished Mix Design

Submit copies of test reports showing that the mix has been successfully tested to produce concrete with the properties specified and will be suitable for the job conditions. Obtain approval before concrete placement.

SD-07 Certificates

Fabrication

Rubbing Surface
Paint Coating System

Submit quality control procedures established in accordance with PCI MNL-116 by the precast manufacturer.

1.4 PRECAST FLOATS

The work includes the provision of precast, non-prestressed concrete floating pier modules herein referred to as precast floats, and all other items relating to the precast floating pier system. Precast floats shall be the product of a manufacturer specializing in the production of precast concrete floats with a minimum of 10 years experience in the manufacture of precast concrete floating piers.

1.5 QUALITY CONTROL

1.5.1 Precast Concrete Float Design

ACI 318M, ACI 318 and the PCI MNL-120. Design precast floats (including connections) for the design load conditions and spans indicated, and for additional loads imposed by the work of other trades. Design precast floats for handling without cracking in accordance with the PCI MNL-120.

1.5.1.1 Pier Loading

Float and anchorage systems shall be designed for the following load conditions as a minimum. Load cases shall be combined based upon their probability of simultaneous occurrence, and in accordance with applicable codes and standards. Wind and current exposure areas shall be based on average vessel profile and draft, respectively. To account for sheltering effects, 15 percent of the full load shall be applied to all vessels sheltered by the vessels exposed to full load. Calculations shall be performed for wind and current loads both parallel and perpendicular to the pier.

**************************************************************************

NOTE: Designer should consult with a manufacturer of precast concrete floats to determine maximum allowable loadings for a given float size. The use of values exceeding the recommended default maximums should be confirmed with a reputable manufacturer prior to inclusion.

Environmental loadings (wind, wave, current & tide surge) will be site specific.

Default values for berthing and mooring loads are recommended maximum values, based on limitations of the precast modules. Berthing load is vessel and pier configuration specific. Mooring load is maximum, based on anchorage strength of (default) cleat size (confirm with manufacturer). The designer should input berthing and mooring loads based on the actual vessels berthed.

**************************************************************************

a. Dead load, including all work of other trades (utilities, etc.)

b. Live load: [_____] [3.83] kPa [80 PSF]
c. Wind pressure: As indicated on drawings
Acting on the projected area of the pier and moored vessels, assuming
full occupancy. For vessel area, assume an average height of [_____] m
feet above the waterline.

d. Minimum current pressure: [_____] kPa [PSF][FPS velocity]
Acting on the projected area of the pier and moored vessels, assuming
normal occupancy.

e. Berthing load: [_____] [136] N/m [100] PLF horizontal

Line pull acting in any direction at a 45 degree angle from the
horizontal.

g. Vertical wave load: As determined from a [_____] [0.9] m [3] ft. wave
height

h. Lateral wave load: As determined from a [_____] [0.9] m [3] ft. wave
height

i. Lateral pile loads at maximum surge level: For surge level indicated on
drawings

1.5.1.2 Performance

a. Precast float modules shall be sized so that a single module (excluding
walers) is used to attain the indicated pier width. The use of more
than one module connected side by side to attain pier width is
unacceptable.

b. Freeboard under dead load only shall not be less than [_____] 610mm 24
in. nor exceed [_____] 762mm 30 in. Precast floats shall be designed
to float level under dead load only. Maximum out of level tolerance
for transverse and longitudinal slope is [_____] 25mm per 3m 1 in. per
10 ft. Freeboard under dead and live load shall not be less than
[_____] 203mm 8 in.

c. Special precast floats must be designed to support the additional
concentrated loads as imposed by gangways, transformers, or other
equipment. Modules with special loadings shall have the same freeboard
as standard modules without special loading, so that there will be no
residual stresses or tilting when modules are interconnected.

d. Floation units shall be located within the structure so as to be
capable of supporting a [_____] 136 kg 300 lb moving point load in any
area on a module without causing excessive rolling or tilting of the
pier. The pier shall be capable of supporting a [_____] 181 kg 400 lb
point load at 305mm 1 ft from the offshore end of the pier and loose no
more than 101mm 4 in of freeboard; and supporting a [_____] 136 kg 300
lb point load applied to the corner of the offshore end of the pier and
loose no more than 51mm 2 in of freeboard differential per 914mm 3 ft
of pier width between the offshore corners.

[e. Precast floats shall have PVC sleeves and pull boxes embedded as
required for electrical and communications systems. Pull boxes shall
have a nominal 25mm 1 in concrete bottom with a light brushed, slip
resistant finish. All bolts and inserts for pull box lids shall be 316
stainless steel. Pull box lids shall be flush with the deck surface and rated for the pier deck loading. Sleeves shall remain above water surface under dead load conditions and shall be designed to facilitate installation, removal, and servicing of utilities. Pull boxes and access openings shall be sized and located as indicated on the drawings.

1.5.2 Gangway Design

Provide gangways of prefabricated aluminum for floating pier access, including connections at the bulkhead and bearing on the floating pier. Gangway shall be designed in accordance with "Specifications for Aluminum Structures", AA, latest edition, using allowable stresses for bridges.

1.5.2.1 Gangway Loading

Gangways shall be subject to the same load conditions identified in the paragraph titled "Pier Loading", except for berthing, mooring, current, wave, and pile loading conditions. Additionally, the gangway bulkhead end connections shall be designed to withstand a lateral force equal to 20 percent of the total dead load and 50 percent of the live load acting simultaneously with the dead and live loads. Handrails shall be designed for the following independent load cases: 1) a continuous horizontal load of 27.1 N/m 20 PLF applied along the full length of the top rail, and 2) a horizontal point load of 113.4 kg 250 lbs acting at any point along the top rail.

1.5.2.2 Performance

a. Gangways shall have a minimum clear walkway width of [_____] 1.07m 3.5 ft, and an overall outside width not to exceed [_____] 1.37m 4.5 ft. Length of gangways shall be as indicated on the drawings. Gangways shall have continuous handrails that are a minimum of 1.07m 3.5 ft above the walking surface, but not to exceed 1.14m 3.75 ft.

b. Walking surface shall be skid resistant.

c. Gangway pier end connections shall allow unrestricted vertical movement through tidal variation. Gangway bearing on floating piers shall be fitted with UHMW polyurethane rollers of adequate bearing area. Gangways shall be fitted with hinged apron plates to assure a safe uniform transition between gangway and deck surfaces. Apron plates will be designed so as to not damage or mar the floating pier surface.

d. Maximum midspan deflection under live load shall not exceed L/240.

e. Contact between aluminum and dissimilar metals or concrete shall be avoided, except for the use of compatible stainless steel pins. Where potential for galvanic corrosion exists, the aluminum shall be isolated from direct contact with other metals or concrete by use of suitable non-conducting insulators or bushings.

1.5.3 PCI Quality Certifications

**************************************************************************************************************************************************************************************************************************************************************************************
NOTE: For normal routine projects, use the first paragraph. For complex or large precast/prestressed projects, use the second paragraph. Note that use of the second paragraph may limit competition. Verify the availability of certified PCI precasters

SECTION 35 51 13.00 20  Page 10
in the bidding area.

************************************************

PCI MNL-116. At the precast manufacturer's option, in lieu of core samples, ACI 318M and ACI 318, full scale load tests may be performed. Perform on randomly selected precast floats, as directed by the Contracting Officer.

[1.5.3.1 Product Quality Control

PCI MNL-116 for PCI enrolled plants. Where precast floats are manufactured by specialists in plants not currently enrolled in the PCI "Quality Control Program," provide a product quality control system in accordance with PCI MNL-116 and perform concrete and aggregate quality control testing using an approved, independent commercial testing laboratory. Submit test results to the Contracting Officer.

]1.6 DELIVERY AND STORAGE

Lift and support precast floats at the lifting and supporting points indicated on the shop drawings. Store precast floats off the ground. Separate stacked precast floats by battens across the full width of each bearing point. Protect from weather, marring, damage, and overload.

1.7 FACTORY INSPECTION

At the option of the Contracting Officer, precast floats shall be inspected by the QC Representative prior to being transported to the job site. The Contractor shall give notice 14 days prior to the time the units will be available for plant inspection. Neither the exercise nor waiver of inspection at the plant will affect the Government's right to enforce contractual provisions after units are transported or erected.

1.8 QUALITY ASSURANCE

1.8.1 Drawing Information

Submit drawings indicating complete information for the fabrication, handling, and erection of the precast floats and gangways. Drawings shall not be reproductions of contract drawings. Design drawings of precast floats and gangways (including connections) shall be prepared and sealed by a registered professional engineer, and submitted for approval prior to fabrication. The drawings shall indicate, as a minimum, the following information:

a. Floating pier system layout
b. Marking of floats for assembly
c. Connections between floats, and connections between floats and other construction
d. Location and anchorage of mooring fittings
e. Waler size and splice pattern
f. Guide pile size, length, location and connection to pier
g. Reinforcing details
h. Material properties of all materials used
i. Lifting and assembly inserts and embedded items
j. Dimensions and surface finishes of each float
k. Erection sequence and handling requirements
l. All loads used in design (such as live, dead, wind, current, berthing, handling, and erection)
m. Bracing/shoring required
n. Gangways

[ o. Utility routing and connections for work of other trades

1.8.2 Design Calculations

Submit calculations reflecting design conforming to requirements of paragraph entitled "Precast Concrete Float Design" and "Gangway Design". Design calculations of precast floats and gangways (including connections) shall be prepared and sealed by a registered professional engineer, and submitted for approval prior to fabrication. In addition to member sizing calculations, submit calculations for the pier system which include:

a. Anchorage attachment points to insure reactions shall be appropriately and rationally distributed throughout the system
b. Overall system loads under full occupancy, with consideration for shielding factors, and deflection of the system and its effects on anchor loading
c. Anchorage system capacity for individual and overall load considerations
d. Guide pile size, length, cross section, and minimum embedment

1.8.3 Concrete Mix Design

Thirty days minimum prior to concrete placement, submit a mix design for each strength and type of concrete. Include a complete list of materials including type; brand; source and amount of cement, pozzolan, and admixtures; and applicable reference specifications.

1.8.4 Paint Coating System

Submit IEEE C57.12.29 coating system performance requirements test on "test specimens" of the same material used in fabrication of the receptacle stations.

PART 2 PRODUCTS

2.1 CONTRACTOR-FURNISHED MIX DESIGN

****************************************************************************************
NOTE: Normal precast design is based on concrete having a compressive strength of 35 MPa 5000 psi at 28 days. Some precast manufacturers like to speed up production by using Type III (high early
strength) concrete.

**************************************************************************

NOTE: Delete air entraining requirements when the project is located in a nonfreezing climate.

**************************************************************************

ACI 211.2, using weight method. The minimum compressive strength of concrete at 28 days shall be [_____] [35] MPa [5000] psi with a unit weight of 1800 kg/m³ 115 pcf dry. Mix shall contain a corrosion inhibitor[ and air-entraining admixtures at the mixer to produce between 5 to 7 percent air by volume]. The use of foaming agents is prohibited.

2.2 PRECAST FLOAT MATERIALS

2.2.1 Cement

**************************************************************************

NOTE: For normal precasting (not requiring sulfate resistance), use the first bracketed item. If sulfate resistance is required, use the second bracketed item.

**************************************************************************

ASTM C150/C150M, Type [I][II]; or ASTM C595/C595M Type IP(MS) or IS(MS) blended cement, except as modified herein. The blended cement shall consist of a mixture of ASTM C150/C150M cement and one of the following materials: ASTM C618 pozzolan or fly ash, or ASTM C989/C989M ground iron blast furnace slag. The pozzolan/fly ash content shall not be less than 20 percent nor exceed 40 percent by total mass of cementitious material. The content of ground granulated blast-furnace slag shall not exceed 50 percent of the mass of cement. The minimum amount of portland cement is 50 percent of the total mass of cementitious material. For exposed concrete, use one manufacturer for each type of cement, ground slag, fly ash, and pozzolan.

2.2.1.1 Fly Ash and Pozzolan

ASTM C618, Type N, F, or C, except that the maximum allowable loss on ignition shall be 6 percent for Type N and F.

2.2.1.2 Ground Iron Blast-Furnace Slag

ASTM C989/C989M, Grade 100 or 120.

2.2.2 Water

Water shall be fresh, clean, and potable.

2.2.3 Aggregates

2.2.3.1 Aggregates Selection

**************************************************************************

NOTE: Select gradation(s) based on job requirements and constraints. The maximum aggregate size shall not exceed three-quarters the minimum cover over reinforcing. Aggregate grading sizes with their general grading ranges are as follows: Size 57 (

SECTION 35 51 13.00 20   Page 13
mm one inch to No. 4 sieve), Size 67 (20 mm 3/4 inch to No. 4 sieve), and Size 7 (12 mm 1/2 inch to No. 4 sieve).

ASTM C330/C330M, Size 8 (3/8 inch), except as modified herein. Obtain aggregates for exposed concrete surfaces from one source. Aggregates shall not contain any substance which may be deleteriously reactive with the alkalies in the cement.

2.2.4 Grout

2.2.4.1 Nonshrink Grout

ASTM C1107/C1107M.

2.2.4.2 Cementitious Grout

NOTE: Delete air entraining requirements when the project is located in a nonfreezing climate.

Shall be a mixture of portland cement, sand, and water. Proportion one part cement to approximately 2.5 parts sand, with the amount of water based on placement method. [Provide air entrainment for grout exposed to the weather.]

2.2.5 Admixtures

2.2.5.1 Air-Entraining

NOTE: Delete air entraining requirements when the project is located in a nonfreezing climate.

ASTM C260/C260M.

2.2.5.2 Accelerating

ASTM C494/C494M, Type C or E.

2.2.5.3 Water Reducing

ASTM C494/C494M, Type A, E, or F.

2.2.5.4 Corrosion Inhibitor

Calcium nitrite, ASTM G109. Add at the rate of 22.25 l per cubic meter 4.5 gallons per cubic yard.

2.2.6 Reinforcement

All reinforcement shall be hot-dipped galvanized, ASTM A123/A123M or ASTM A153/A153M.
2.2.6.1 Reinforcing Bars

**************************************************************************
NOTE: Specify ASTM A706/A706M reinforcing where welding or bending of reinforcement bars is important.
**************************************************************************
ASTM A615/A615M[A706/A706M], Grade 420 [40] [60].

2.2.6.2 Welded Wire Fabric

ASTM A1064/A1064M. Provide flat sheets of welded wire fabric, rolled fabric is not acceptable. Maximum fabric grid is 50mm x 50mm 2 in. x 2 in.

2.2.7 Metal Accessories

Provide ASTM A123/A123M or ASTM A153/A153M, hot-dipped galvanized.

2.2.7.1 Inserts

ASTM A47/A47M, Grade 22010 32510 or 35018, or ASTM A27/A27M Grade 415-205 U-60-30.

2.2.7.2 Structural Steel

ASTM A36/A36M.

2.2.7.3 Bolts

ASTM A307 and ASTM A36/A36M. Waler rods shall be continuous laterally through the pier, with a minimum diameter of 19 mm 3/4 in. All continuous waler rods shall be placed within PVC sleeves cast into the precast float modules.

2.2.7.4 Nuts

ASTM A563M ASTM A563.

2.2.7.5 Washers

ASTM F844 washers for ASTM A307 bolts.

2.2.7.6 Cleats

Provide [_____] 457 mm 18 in boat cleats spaced at approximately [_____] 6100 mm 20 ft.

2.2.8 Foam Core

Closed cell, expanded polystyrene (EPS), ASTM C578. Foam core laminations shall be glued with a low solvent glue. Core shall not be made from more than four laminated sections. Horizontal laminations in the upper 254mm 10 in are not permitted. Core shall be strapped to prevent de-lamination during transportation and handling. Core shall not contain more than 10 percent reground EPS foam material. Reground foam pieces shall not exceed 10mm 3/8 in diameter.

Unit Weight: 12 - 48 kg/m³ 0.70 - 3.00 pcf
Water absorption (ASTM C272/C272M): 3 percent (by volume)

Dimensional tolerance: plus or minus 3mm 1/8 in

2.3 FABRICATION

PCI MNL-116 unless specified otherwise.

2.3.1 Precast Floats

Precast floats shall be cast monolithically, cold joints of any type are not acceptable. Modules shall have a minimum deck and wall thickness of 51mm 2 in. Precast float decks shall be constructed to drain freely and there shall be no floodable enclosed spaces.

2.3.2 Forms

Brace forms to prevent deformation. Forms shall produce a smooth, dense surface. Chamfer exposed edges of floats 13 mm 1/2 inch, unless otherwise indicated. Form tolerance shall not exceed 3mm 1/8 in dimensions indicated on shop drawings. When measured diagonally, floats more than 13mm 1/2 in out of square shall be rejected.

2.3.3 Reinforcement Placement

ACI 318M and ACI 318 for placement and splicing. Reinforcement may be preassembled before placement in forms.

2.3.4 Concrete

2.3.4.1 Concrete Mixing

ASTM C94/C94M. Mixing operations shall produce batch-to-batch uniformity of strength, consistency, and appearance.

2.3.4.2 Concrete Placing

ACI 304R, ACI 305R for hot weather concreting, ACI 306.1 for cold weather concreting, and ACI 309R, unless otherwise specified. Concrete shall be vibrated internally and/or externally to assure a smooth, dense finish.

2.3.4.3 Concrete Curing

Commence curing immediately following the initial set and completion of surface finishing. Provide curing procedures to keep the temperature of the concrete between 10 and 90 degrees C 50 and 190 degrees F. When accelerated curing is used, apply heat at controlled rate and uniformly along the casting beds. Monitor temperatures at various points in a product line in different casts. Cure for a minimum of seven days prior to transporting, launching and assembly.

2.3.5 Surface Finish

Precast floats containing hairline cracks which are visible and are less than 0.5 mm 0.02 inches in width, may be accepted, except that cracks larger than 0.1 mm 0.005 inches in width for surfaces exposed to the weather shall be repaired. Precast floats which contain cracks greater than 0.5 mm 0.02 inches in width shall be approved by the Contracting Officer,
prior to being repaired. Any precast float that is structurally impaired or contains honeycombed section deep enough to expose reinforcing shall be rejected.

2.3.5.1 Unformed Surfaces

Provide a steel troweled and broomed finish for pier deck surface. Slip resistant broomed deck finish shall be transverse to pier orientation. All deck edges shall have a 10mm 3/8 in tooled radius with a minimum 38mm 1 1/2 in wide, smooth, hard steel finished face.

2.3.5.2 Formed Surfaces

******************************************************************************

NOTE: PCI MNL-116 different grades of formed surface finishes:

Commercial Grade: Concrete produced in forms that produce a rough finish. Fins are removed and large surface blemishes filled. Sharp edges that will be visible in the finished structure are ground down.

Standard Grade: Same finish as commercial grade, except the forms do not produce a texture on the concrete. Surface can be painted, but will have surface voids.

Finish Grade B: Same as standard grade, except all surface blemishes should be filled or finished to provide a smooth surface or uniform appearance if painted.

Finish Grade A: Same as Finish Grade B, except that the components of the completed structure, where exposed, shall be reasonably color matched. This finish is difficult to obtain.

******************************************************************************

PCI MNL-116 (Appendix A - Commentary), Chapter 3, for grades of surface finishes. Provide a standard grade surface finish for both exposed and unexposed areas.

2.3.6 Float Identification

All precast floats are to be clearly identified on one side and one end, between the bottom of the waler and the waterline. Identification shall include name of manufacturer, date of manufacture, specific float type, and job number.

2.4 TIMBER AND WOOD PRODUCTS

All walers shall be fabricated from parallel strand lumber (PSL) engineered structural beams. PSL structural beams shall be in accordance with ASTM D5456. All other structural lumber shall be No. 1 Southern Yellow Pine.

2.4.1 Preservative Treatment

Treat wood to be used in contact with salt water or salt water splash in
accordance with AWPA C2 (Material Subject to Marine Borer Exposure) with waterborne preservative AWPA P5, (ACA - Ammoniacal Copper Arsenate, ACZA - Ammoniacal Copper Zinc Arsenate, CCA - Chromated Copper Arsenate) to 0.6 pcf retention. For wood continuously immersed, treat in accordance with AWPA C1 and AWPA C18 as applicable, to 2.5 pcf retention. For glue laminated engineered structural beams treat in accordance with AWPA C28 and AWPA C33 as applicable.

2.5 **RUBBING SURFACE - ULTRA-HIGH MOLECULAR WEIGHT POLYETHYLENE (UHMWPE)**

Materials including additives shall be traceable by original lot number. Materials used shall be FDA approved or otherwise harmless to marine life. Fabricated form shall be from virgin resin.

2.5.1 Resin

**ASTM D4020.** Virgin resin shall be homopolymer of ethylene and have an intrinsic viscosity (IV) between 22.0 and 28.0 d1/g. No reprocessed resin shall be used. Resin shall be oil and moisture free (0.2 percent weight maximum).

2.5.2 Composition and Fabricated Form

Resin shall comprise a minimum 95.0 percent by weight concentration in the formulation. The finished form shall maintain ultraviolet stability for a minimum of 25 years and be free of saltwater or petroleum product leachable materials. No unfused areas or light patches greater than 300 micrometers No. 50 sieve shall be in the final fabricated form. Form shall be 38mm 1 1/2 in thick, depth equal to design depth of waler, and length as required but not less than 3m 10 ft. Exterior edges shall be rounded to 19mm 3/4 in radius. Color shall be black. The fabricated form shall have the following properties:

<table>

2.6 GUIDE PILES

Guide piles shall be prestressed concrete piles; fabricated and installed in accordance with section 31 62 13.20 PRECAST/PRESTRESSED CONCRETE PILES. Pile size, length, cross section and embedment shall be determined by pier manufacturer's design. [Recommended pile butt elevation is [_____] [1.5] m [5.0] ft above [extreme] high water.] Pile quantity and location shall be as indicated on the drawings. Relocation of pile layout and additional piles required by the manufacturer's design to resist the indicated design loads, shall be subject to approval by the government.

2.6.1 Guide Pile Caps

Provide heavy UV-resistant, low density polyethylene piling caps with an estimated life in excess of 10 years. Caps shall be cone or pyramid shaped and attached to the piling top with stainless fasteners.

2.7 GANGWAYS

2.7.1 Aluminum

2.7.2 Stainless Steel

Type 316 L.

2.7.3 Castings

F-214 Cast aluminum. Castings shall be true to pattern, structurally sound and free from blow holes or other defects.

2.7.4 Insulators

MIL-I-24768/14. Bushings or separation sheets shall be a minimum of 1.5mm 1/16 in thickness.

2.7.5 Rollers

CID A-A-55619, UHMW polyurethane, with UV inhibitors added. Color shall be black.

2.8 Receptacle Stations

Receptacle stations shall include enclosure, mechanical interlocks, and related wiring and devices as indicated.

2.8.1 Enclosure

Enclosure shall be NEMA ICS 6, type 3R, fabricated of 12 gauge stainless steel. Paint ASTM D1535 light gray No. 61. Paint coating system shall comply with IEEE C57.12.29.
2.8.2 Mechanical Interlocks

UL 231, UL 1686, UL 98. Mechanical interlock devices shall incorporate a fused disconnect safety switch and IEC receptacle in a non-metallic, watertight, enclosure. The interlock mechanism shall prevent making and breaking of power under load. Enclosure shall be rated NEMA 4X and also rated IP67 in accordance with CENELEC EN 60529. Include matching plug for each mechanical interlock provided. Plugs and receptacles shall be classified to EN 60309-1 and EN 60309-2.

2.8.3 Circuit Breakers

UL 489. Individual molded case circuit breakers with voltage and continuous current ratings, number of poles, overload trip setting, and short circuit current interrupting rating as indicated.

2.8.4 Ground-Fault Circuit Interrupter Receptacles

**************************************************************************
NOTE: For NAVFAC LANT projects, use GFI terminology in lieu of GFCI. NAVFACENGCOM has established these GFCI/GFI safety standards at a higher level of protection than NFPA 70's minimum requirements as a result of a GAO report and DOD concern about health and safety.
**************************************************************************

UL 943, duplex type for mounting in standard outlet box. Device shall be capable of detecting current leak of 6 milliamperes or greater and tripping per requirements of UL 943 for Class A GFI devices. Provide screw-type, side-wired wiring terminals or pre-wired (pigtail) leads. Provide in nonmetallic box with gasketed, weatherproof, nonmetallic cover plate and gasketed cap over each receptacle opening. Provide caps with a spring-hinged flap. Receptacle shall be UL listed for use in "wet locations with plug in use."

PART 3 EXECUTION

3.1 SURFACE REPAIR

Prior to erection, and again after installation, precast floats shall be checked for damage, such as cracking, spalling, and honeycombing. As directed by the Contracting Officer, precast floats that do not meet the surface finish requirements specified in Part 2 in paragraph entitled "Surface Finish" shall be repaired, or removed and replaced with new precast floats.

3.2 LAUNCH AND ASSEMBLY

Precast floats shall be launched after the concrete has attained the specified compressive strength, unless otherwise approved by the precast manufacturer. Assemble in accordance with the approved shop drawings. PCI MNL-116 and PCI MNL-120 (Chapter 8), for tolerances. Brace precast floats, unless design calculations submitted with the shop drawings indicate bracing is not required. Follow the manufacturer's recommendations for maximum construction loads.
3.3 ANCHORAGE

Provide anchorage for fastening work in place. Conceal fasteners where practicable. Make threaded connections up tight and nick threads to prevent loosening.

3.4 WELDING

AWS D1.4/D1.4M for welding connections and reinforcing splices. Protect the concrete and other reinforcing from heat during welding. Weld continuously along the entire area of contact. Grind smooth visible welds in the finished installation. Welding of epoxy-coated reinforcing is not allowed.

3.5 OPENINGS

Holes or cuts requiring reinforcing to be cut, which are not indicated on the approved shop drawing, shall only be made with the approval of the Contracting Officer and the precast manufacturer. Drill holes less than 300 mm 12 inches in diameter with a diamond tipped core drill.

3.6 GALVANIZING REPAIR

Repair damage to galvanized coatings using ASTM A780/A780M zinc rich paint for galvanized surfaces damaged by handling, transporting, cutting, welding, bolting, or acid washing. Do not heat surfaces to which repair paint has been applied.

3.7 GROUTING

Clean and fill indicated areas, solidly with nonshrink grout or cementitious grout. Provide reinforcing where indicated. Remove excess grout before hardening.

3.8 SEALANTS

Provide as indicated and as specified in Section 07 92 00 JOINT SEALANTS.

ATTACHMENTS:
NOTE: This guide specification covers the requirements for prestressed concrete fender piling.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: The extent and location of the work to be accomplished should be indicated on the project drawings or included in the project specification.

NOTE: Refer to NFESC TM 53-89-03, "Prestressed Concrete Fender Piling User Data Package" for details of these fender piles. The following information shall be shown on the drawings:

1. Locations and design loads of piles.
2. Size, shape, and length of piles.
3. Locations, sizes, and number of prestressing steel strands. Unit stresses for prestressing strands or wire.
4. Details of reinforcement and tendons.
5. Soil data, where required.

6. Embedment depth.

1.2 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident
Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Piles

Driving helmets, capblocks, and pile cushions

SD-05 Design Data

Concrete mix design

Submit a concrete mix design before concrete is placed, for each type of concrete used for the piles.

SD-06 Test Reports

Aggregates

Fly ash and Pozzolan

Ground Slag

Silica fume

Concrete

Submit concrete cylinder compressive strength test results.

SD-07 Certificates
Precasting manufacturer's quality control procedures

Suitability of pile driving equipment

[ Curing of piles

][ Silica fume manufacturer's representative

] Prestressing steel

Portland cement

Concrete mix design

Reinforcing steel

[ Rubbing surface

] Bolts, nuts, and washers

1.3 REQUIREMENTS

1.3.1 Piling Lengths and Quantity

Provide prestressed pretensioned concrete piles. Base bids upon the number, size, and length of piles as indicated. Adjustments in the contract price will not be made for cutting off piles or for broken, damaged, or rejected piles.

1.3.2 Piles

Prepare in accordance with ACI SP-66. Indicate placement of reinforcement including tendons. Indicate location of special embedded or attached lifting devices, employment of pick-up points, support points other than pick-up points, and any other methods of pick-up. [Provide certification of a professional engineer registered in any jurisdiction in the U.S. or its territories, that layout and details of reinforcement and tendons conform with that shown on the structural design drawings.]

1.3.3 Driving Helmets, Capblocks, and Pile Cushions

Show details of driving helmets, capblocks, and pile cushions. Submit 2 weeks prior to [test] pile installation.

1.4 QUALITY ASSURANCE

1.4.1 Quality Control Procedures

Submit [_____] copies of precasting manufacturer's quality control procedures established in accordance with PCI MNL-116.

[1.4.1.1 Curing of Piles

Submit proposed materials and methods.

]1.4.2 Silica Fume Manufacturer's Representative

Provide statement that the manufacturer's representative will be present at plant to ensure proper mix, including high range water reducer (HRWR), and
batching methods.

1.4.3 Aggregates

Prior to pile fabrication, submit certified test reports for the following tests specified in ASTM C33/C33M:

a. Grading
b. Amount of material finer than 75 micrometers No. 200 sieve
c. Organic impurities
d. Soundness
e. Clay lumps and friable particles
f. Coal and lignite
g. Weight of slag
h. Abrasion of coarse aggregate
i. Fineness modulus
j. Reactive aggregates
k. Freezing and thawing

1.4.4 Fly Ash and Pozzolan

Furnish fly ash and pozzolan test results performed within 6 months of submittal date. Sampling and testing shall be in accordance with ASTM C311/C311M.

1.4.5 Silica Fume

Furnish silica fume test results performed within 6 months of submittal date. Sampling and testing shall be in accordance with ASTM C311/C311M.

1.4.6 Portland Cement

Certification identifying cement; brand name, type, mill location, quantity to be used, size of lot represented by quality control sample, lot number, and destination of shipment.

1.4.7 Concrete Mix Design

Certify, using a Government-approved independent commercial testing laboratory, that proportioning of mix is in accordance with ACI 211.1 or ACI 318M for specified strength and is based on aggregate data which has been determined by laboratory tests during last 12 months.

1.5 DELIVERY, STORAGE, AND HANDLING

Piles shall be stored, handled, and transported in accordance with PCI MNL-116 except as follows. Methods used for handling and storage of
piles shall be such that the piles are not subjected to excessive bending stress, cracking, spalling, or other damage.

1.5.1 Damaged Piles

The Contractor shall inspect each pile for sweep and structural damage such as cracking and spalling before transporting them to the project site and immediately prior to placement in the driving leads. Any unusual cracks (cracks other than crazing, surface drying, shrinkage cracks and end cracks) shall be brought to the attention of the Contracting Officer. Piles which are damaged during delivery, storage, or handling to the extent they are rendered unsuitable for the work, in the opinion of the Contracting Officer, shall be rejected and removed from the project site, or may be repaired, if approved, at no cost to the Government.

1.5.1.1 Repairable Cracks

Piles with cracks equal to or greater than 0.15 mm 0.006 inches but less than 1.5 mm 0.06 inches shall be rejected or repaired. As an alternate to pile rejection, the Contractor may submit a proposal to repair deficient piles, which shall be restored prior to driving to provide its required design capacity, perform its intended function in the structure, and take into consideration long term durability in corrosive environment.

1.5.1.2 Non-Repairable Cracks

Piles with cracks equal to or greater than 1.5 mm 0.06 inches shall be rejected.

1.5.2 Pile Sweep

Sweep shall be limited to 3 mm per 3 M 1/8 inch per 10 feet over the length of the pile. Piles having excessive sweep shall be rejected.

PART 2 PRODUCTS

2.1 MATERIALS

2.1.1 Cementitious Materials

Cementitious materials shall be portland cement, [blended cement] or portland cement in combination with natural pozzolan or fly ash [or ground granulated blast furnace slag] and conforms to appropriate specifications listed below.

2.1.1.1 Cement

******************************************************************************
NOTE: Insert type of cement required. Generally, Types II, or I/II, is preferred. Type I, or Type III with 8 percent maximum C3A and "low alkali" may be used. Do not use Type III in conjunction with silica fume. In very special cases, Type V, "low alkali," which has limited availability, may be used.
******************************************************************************

******************************************************************************
NOTE: Cement type and quantity of cement required
******************************************************************************
in mix design is dependent upon the environment, soil conditions, need for corrosion protection, and location of piling:

(a) CHLORIDE PROTECTION:

Normal Use. In fresh water or air environment, specify Type I or Type II cement. Type III may be permitted provided tricalcium aluminate (C3A) content is limited to 8 percent and it is low alkali.

Marine Use. In soil or water environments, subject to chlorides above 1,000 ppm, within about 300 m 1000 feet of the ocean or tidal water, specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement, a minimum cementitious materials content of 335 kilograms per cubic meter 564 pounds per cubic yard and a maximum water to cementitious materials ratio of 0.40.

Seawater Exposure. In direct contact with ocean water, specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement, a minimum cementitious materials content of 390 kilograms per cubic meter 658 pounds per cubic yard and a maximum water to cementitious materials ratio of 0.40.

(b) SULFATE RESISTANCE: A minimum cementitious materials content of 335 kilograms per cubic meter 564 pounds per cubic yard is recommended.

Normal Use. In soils with negligible amount of sulfate, specify Type I or Type II cement. Type III cement may be permitted provided tricalcium aluminate (C3A) content is limited to 8 percent and it is low alkali.

Moderate Sulfate Exposure. In exposures with moderate sulfate content (between 0.10 and 0.20 percent in soil and less than 1500 ppm in water), specify Type II or Type III (with a maximum tricalcium aluminate (C3A) content of 8 percent and low alkali) cement and a maximum water to cementitious materials ratio of 0.40. Do not use Class C fly ash, blast furnace slag, or silica fume for cement replacement.

Severe Sulfate Exposure. In exposures with high sulfate content (exceeds 0.20 percent in soil or 1500 ppm in water), specify Type V or Type II (with a maximum tricalcium aluminate content of 5 percent) cement, and a maximum water to cementitious materials ratio of 0.40. Do not use Class C fly ash, blast furnace slag, or silica fume for cement replacement.

Alkali-Silica Reactivity. When alkali-silica
reactivity is a concern, it is recommended to limit
the maximum alkali content of cement to 0.40 or
0.50, when it is locally available, otherwise use
0.60.

**************************************************************************

ASTM C150/C150M, [Type I, II, or III[_____] with a maximum alkali content
of 0.40 or 0.60 percent; or [ASTM C595/C595M, Type [IP(MS) or IS(MS)]
[_____]]] blended cement except as modified herein. The blended cement shall
consist of a mixture of ASTM C150/C150M cement (with alkali content not
exceeding 0.40 or 0.60 percent) and one of the following materials: ASTM C618
pozzolan or fly ash, or ASTM C989/C989M ground iron blast-furnace slag, or
ASTM C1240 silica fume. If no satisfactory test results are available (made
within the past six months) to prove that the cement alkali content is less
than 0.40 percent, then cement with a maximum of 0.60 percent alkali shall
be used. Cement certificates shall include test results in accordance with
ASTM C150/C150M, including equivalent alkalies indicated in the optional
chemical requirements. [Use cement with a tricalcium aluminate (C3A)
content of less than [8][5] percent.] Type III cement shall not be used in
conjunction with silica fume.

**************************************************************************

NOTE: Fly ash, pozzolan, and ground iron
blast-furnace slag increase durability. They may
produce uneven discoloration of the concrete during
the early stages of construction, depending upon the
type of curing provided. Use Fly ash/pozzolan (loss
on ignition not exceeding 3 percent) for frost areas
to reduce carbon interference with air entraining
admixture. Straight replacement with fly ash or
natural pozzolan beyond 15 percent may decrease the
cement's strength gain rate. The following options
can help mitigate this slower gain rate: (1) a lower
water/cement ratio may be used, (2) partial cement
replacement can be completed, e. g., 1 sack of
cement can be replaced by 1.5 sacks of fly ash, as
long as the final replacement ratio meets the
requirements, and (3) very fine fly ashes or
pozzolans (e. g. with average particle sizes below 5
microns) can be used.

**************************************************************************

2.1.1.2 Fly Ash and Pozzolan

**************************************************************************

NOTE: Loss on ignition greater than 3 percent may
result in significant variations in air content. The
air entrainment admixture content may need to be
varied often to maintain the same level of entrained
air.

**************************************************************************

ASTM C618, Class N, or F except that the maximum total alkalies shall be 3
[6] percent. If the aggregates are reactive the maximum calcium oxide
content shall be 13.0 percent. Class C shall not be used.
2.1.1.3 Ground Iron Blast-Furnace Slag

ASTM C989/C989M, Grade 120.

2.1.1.4 Silica Fume

**************************************************************************
NOTE: Use silica fume concrete for marine structures where low permeability and enhanced durability are necessary. The silica fume and HRWR additive should be from the same manufacturer. The Contractor and batch plant may need help from the manufacturer. Select weight percentage based on performance required. If used, a replacement of 7 percent is recommended.
**************************************************************************

**************************************************************************
NOTE: Use for high durability and low permeability. The initial cost of the concrete will increase, and supervision at the batch plant, finishing, and curing is necessary. A HRWR must be used with silica fume. The slump can be increased 50 to 125 mm 2 to 5 inches without reducing strength. Finishing may be more difficult. Proper curing is essential because there is a tendency for plastic shrinkage cracking.
**************************************************************************

ASTM C1240, provide silica fume that is a by-product of silicon or ferrosilicon production. Provide percent by weight of the total cementitious materials as indicated in table below.

2.1.1.5 Supplemental Cementitious Materials (SCM) Content

The concrete mix shall contain one of the four SCMs listed below, or a linear combination thereof.

#### 2.1.2 Water

Water shall be fresh, clean, and potable; free from injurious amounts of oils, acids, alkalis, salts, organic materials, or other substances deleterious to concrete or steel.

#### 2.1.3 Aggregates

NOTE: For piles in areas where reactive aggregates are likely to be supplied, provide for additional tests and certification to ensure that reactive aggregates will not be used. While not wholly conclusive, petrographic examination (ASTM C295/C295M), chemical test (ASTM C289/C289M), and mortar bar method (ASTM C227) are valuable indicators. While more reliable, the concrete prism test (ASTM C1293) takes 1 to 2 years to complete and is not practical. The accelerated mortar bar method (ASTM C1260) is similarly reliable and takes only 16 days to yield results. In areas where reactive aggregates can not be avoided, specify use of low alkali cement, and/or cements modified to mitigate alkali-silica reactivity. Service records of concrete made with these materials along with tests should be used in evaluating these materials.

NOTE: Include modification to ASTM C33/C33M when reactive aggregates could be encountered. More modifications may be required. Additional tests and certifications may be required in the submittal paragraphs.

ASTM C33/C33M[, except as modified herein. Provide aggregate free from any substance which may be deleteriously reactive with alkalis in cement in an amount sufficient to cause excessive expansion of concrete]. Do not mix, store in same stockpile, or use fine aggregates from different sources of supply in same concrete mix or same structure without approval. The fineness modulus of fine aggregate shall be not less than 2.40 or greater than 3.0. For piles that will be exposed to freezing and thawing, fine and coarse aggregate subjected to five cycles of the sodium sulfate soundness test shall show a loss not greater than 10 percent. If the selected aggregates fail the soundness test, the Contractor may use the aggregate source, provided concrete specimens made with the aggregates to be used for the piles shall have a durability factor of not less than 80 based on 300 cycles of freezing and thawing when tested in accordance with ASTM C666/C666M. Prior to pile fabrication, submit certified test reports for the following tests specified in ASTM C33/C33M[,] in addition, [twice]
during each shift when the concrete plant is operating, the gradation of each size of aggregate shall be tested in accordance with ASTM C136/C136M:

a. Grading
b. Amount of material finer than 75 micrometers No. 200 sieve
c. Organic impurities
d. Soundness
e. Clay lumps and friable particles
f. Coal and lignite
g. Weight of slag
h. Abrasion of coarse aggregate
i. Fineness modulus
j. Reactive aggregates
k. Freezing and thawing

2.1.3.1 Alkali-Silica Reactivity (ASR)

Fine and coarse aggregates to be used in all concrete shall be evaluated and tested by the Contractor for alkali-aggregate activity.

The fine and coarse aggregates shall be evaluated separately, using ASTM C1260. Test results of the individual aggregates shall have a measured expansion equal to or less than 0.08 percent at 16 days after casting. Should the test data indicate an expansion of greater than 0.08 percent, the aggregates(s) shall be rejected or additional testing, using ASTM C1567 shall be performed as follows: utilize the Contractor's proposed low alkali portland cement [blended cement] and SCM in combination with the proposed aggregate for the test portioning. The SCM quantity shall be determined that will meet all the requirements of these specifications and that will lower the ASTM C1567 expansion to equal or less than 0.08 percent at 16 days after casting.

If the above option does not lower the expansion to less than 0.08 percent at 16 days after casting, reject the aggregate(s) and submit new aggregate sources for retesting. Submit the results of testing to the Contracting Officer for evaluation and acceptance.

2.1.4 Admixtures

**************************************************************************
NOTE: For guidance in use of either water-reducing admixtures, set retarding admixtures, or combination of admixtures, refer to ACI 543R, "Recommendations for Design, Manufacture, and Installation of Concrete Piles."
**************************************************************************
Chemical admixtures shall conform to ASTM C494/C494M, [Type A] [Type B]. [Air-entraining admixture shall conform to ASTM C260/C260M.] Do not use admixtures containing chlorides.

2.1.5 Prestressing Steel

Use seven-wire stress-relieved or low-relaxation strand conforming to ASTM A416/A416M, Grade 270 psi. Use prestressing steel free of grease, oil, wax, paint, soil, dirt, and loose rust. Do not use prestressing strands or wire having kinks, bends, or other defects.

2.1.6 Reinforcing Steel

**************************************************************************
NOTE: Minimum cover for reinforcing steel in concrete structures is dependent upon the environment, soil conditions, need for corrosion protection, and location of piling. For normal exposure minimum cover is 50 mm 2 inches. For piles exposed to marine conditions (chloride content above 1000 ppm) in or within about 300 m 1000 feet of the ocean or tidal water, use 75 mm 3 inches minimum cover, including chamfered corners. For additional detailed guidance, see following publications: ACI 543R, "Recommendations for Design, Manufacture and Installation of Concrete Piles" (ACI Manual, Part 3); State of California, Department of Public Works, Design Specifications, Volume 1, Bridge Planning and Design Manual, Chapter 6. Piles to be used in a marine environment may receive a protective coating, particularly if the piles are steam cured. The protective coating should be applied to that portion of pile which remains aboveground or water line. Show areas to be protected on drawings.
**************************************************************************

**************************************************************************
NOTE: Insert grade of reinforcement. Specify ASTM A706/A706M reinforcing where welding or bending of reinforcement bars is important. In addition, ASTM A934/A934M may be specified for epoxy coating of reinforcing where extra reinforcement protection is required.
**************************************************************************

[ASTM A615/A615M, Grade [300][420] [40][60];] [ASTM A706/A706M, Grade [420] [60];] [ASTM A996/A996M, Grade [420] [60]]. Weld reinforcing steel in accordance with AWS D1.4/D1.4M.

2.1.7 Ties and Spirals

**************************************************************************
NOTE: If project has been designed for epoxy rebar, add ASTM A934/A934M, "Epoxy-Coated Prefabricated Steel Reinforcing Bars" in this paragraph and in the paragraph entitled "References."
**************************************************************************
Steel, ASTM A1064/A1064M for spirals and ASTM A615/A615M [ASTM A706/A706M ] for ties.

2.1.8  Pipe Sleeves

Use ASTM A53/A53M, Grade B, or ASTM A501/A501M galvanized pipe. Sleeves shall be galvanized in accordance with ASTM A153/A153M with chromate wash. Do not place galvanized pipe in contact with any prestressing or reinforcing steel.

2.1.9  Bolts, Nuts, and Washers

2.1.9.1  Bolts

ASTM A307, Grade A.

2.1.9.2  Nuts

ASTM A563M ASTM A563, Grade A, hex style.

2.1.9.3  Washers

ASTM F844.

2.1.10  Ultrahigh Molecular Weight Polyethylene (UHMWPE) Rubbing Surface

2.1.10.1  General

a. Materials including additives shall be traceable by original lot number.

b. Materials used shall be FDA approved or otherwise harmless to marine life.

c. Fabricated form shall be virgin resin.

2.1.10.2  Resin

a. ASTM D4020. Virgin resin shall be homopolymer of ethylene and have an intrinsic viscosity (IV) between 22.0 and 28.0 dl/g.

b. No reprocessed resin shall be used.

c. Resin shall be oil and moisture free (0.2 percent weight maximum).

2.1.10.3  Composition and Fabricated Form

a. Resin shall comprise a minimum 95.0 percent by weight concentration in the formulation.

b. The finished form shall maintain ultraviolet stability for a minimum of 25 years and be free of saltwater or petroleum product leachable materials.

c. No unfused areas or light patches greater than 300 micrometers No. 50 sieve shall be in the final fabricated form.

d. The fabricated form shall have the following properties:
Density (ASTM D792) | 0.92-0.94 g/cc 57.5-58.7 lb/cu.ft
---|---
Tensile Strength (ASTM D638) | 
Ultimate, minimum | 31.7 MPa 4600 psi
Ultimate Elongation, minimum | 250 percent
Impact Strength (ASTM D256) | 
Test Method A, Izod | Non-break for all five determinations in sample
Hardness (ASTM D2240), minimum | Shore D 65
Coefficient of Friction (ASTM D1894) | 
Kinetic, maximum | 0.13
Static, maximum | 0.20
Water Absorption (ASTM D570) | Nil
Abrasion Index (relative to steel = 100), maximum | 10

e. Color shall be black.

2.2 CONCRETE

2.2.1 Contractor-Furnished Concrete Mix Design

**************************************************************************
NOTE: Insert the specified compressive strength, f'c. Consider reducing average overstrength factor to produce a more economical concrete mix design, since these piles are not critical structural elements. ACI 318M may be modified for a specified compressive strength, f'c, over 35 MPa 5000 psi to permit a required average compressive strength, f'cr, of f'c plus 4.8 MPa 700 psi. Concrete may be proportioned in accordance with ACI 214R for the probability of 1 test in 10 falling below the specified compressive strength, f'c, if the mix design reflects actual concrete plant standard deviations and the resulting production concrete conforms to specified requirements. Do not use lightweight or fiber-reinforced concrete.
**************************************************************************

Concrete shall have a minimum specified compressive strength, f'c, of [_____] psi at 28 days. The minimum cementitious materials content shall be 354 kg per cubic meter 600 pounds per cubic yard of concrete. The design shall be prepared in accordance with ACI 211.1 or ACI 318M. The mix design shall be based on current materials previously evaluated by the concrete producer whose established methods of statistical quality control is in conformance with ACI 318M. In the absence of such data, the Contractor
shall sample and test the aggregates for the design of concrete.

2.2.2 Concrete Mix Design Proportioning

a. Water and cement ratio shall be equal to or less than 0.40. If fly ash is used, the water and cement ratio shall be calculated as the weight of water divided by the weight of cement plus 60 percent of the weight of fly ash. If silica fume is used, the water and cement ratio shall be calculated as the weight of water divided by the weight of cement plus the weight of silica fume.

b. Maximum aggregate size shall not exceed 19 mm 3/4 inch.

**************************************************************************
NOTE: Air-entrainment may be considered optional only in regions that do not experience freezing temperatures.
**************************************************************************

c. Air-entrainment shall be 4.5 to 7.5 percent. Determine air void structure in accordance with ACI 212.3R. Spacing factor shall be less than 2.5 mm 0.01 inch, the specific surface area shall be greater than 0.39 square meter per 0.000016 cubic meter 600 square inches per cubic inch of air void volume, and the number of air voids per mm inch of traverse shall be significantly greater than the numerical value of the percentage of air in the concrete.

2.2.3 Trial Mixtures

Trial mixtures having proportions and consistencies of the proposed mix design shall be made to document the Contractor's ability to produce workable concrete which does not segregate or show excessive slump loss characteristics.

2.3 FABRICATION OF PRETENSIONED PILES

Piles shall be pretensioned concrete piles. Workmanship shall conform to standard commercial practice in prestressing plants.

2.3.1 Formwork

Provide forms of metal, braced and stiffened against deformation, accurately constructed, watertight, and supported on unyielding casting beds. Forms shall permit movement of pile without damage during release of the prestressing force. Make piles to dimensional tolerances in accordance with PCI MNL-116 and as follows:

a. Length: 10 mm per 3 meters 3/8 inch per 10 feet.

b. Cross section: plus 13 mm to minus 6 mm plus 1/2 inch to minus 1/4 inch.

c. Deviation from straight lines: not more than 3 mm per 3 meters 1/8 inch per 10 feet of length.

d. Pile head: plus or minus 6 mm per 0.30 meter 1/4 inch per foot of head dimension from true right angle plane. Surface irregularities: plus or minus 3 mm 1/8 inch.

e. Location of reinforcing steel
(1) Main reinforcement: 3 to 6 mm \(\frac{1}{8}\) to \(\frac{1}{4}\) inch from position designated on drawings.

(2) Spacing of spiral: plus or minus 13 mm \(\frac{1}{2}\) inch from position designated on drawings.

f. Location of pipe sleeves from true position: plus or minus 10 mm \(\frac{3}{8}\) inch.

2.3.2 Pretensioning

Measure tension to which steel is to be pretensioned by jack pressure read on a calibrated gage and verify by elongation of steel. Use gage calibrated within last 6 months by a laboratory approved by Contracting Officer. Provide means for measuring elongation of steel to nearest 3 mm \(\frac{1}{8}\) inch. When difference between results of measurement and gage reading is more than 5 percent, determine cause of discrepancy and correct. Give tensioning steel a uniform prestress prior to being brought to design prestress. Induce same initial prestress in each unit when several units of prestressing steel in a pile are stretched simultaneously.

2.3.3 Casting

2.3.3.1 Conveying

Clean conveying equipment thoroughly before each run. Convey concrete from mixer to forms as rapidly as practicable by methods which will not cause segregation or loss of ingredients. Deposit concrete as nearly as practicable to its final position. During placing, make any free vertical drop of the concrete less than one meter 3 feet. Remove concrete which has segregated in conveying or placing.

2.3.3.2 Placing and Casting

**************************************************************************

NOTE: Select chamfer required. Consult with local producers. Where project requires a large quantity of piling, a specific value may be specified, otherwise, use a minimum or a range of values.
**************************************************************************

Perform concrete casting within 3 days after pretensioning steel; however, do not deposit concrete in forms until placement of reinforcement and anchorages have been inspected and approved by pile manufacturer's quality control representative. Produce each pile of dense concrete straight with smooth surfaces with reinforcement retained in its proper position during fabrication. Use vibrator with heads smaller than the minimum distance between steel for pretensioning. Make surface of pile ends perpendicular to axis of pile. Chamfer, [a minimum of 19 mm \(\frac{3}{4}\) inch,] [[_____] mm inch,] [between 19 and 31 mm \(\frac{3}{4}\) and 1 \(\frac{1}{4}\) inch,] ends of piles and corners of square piles.

2.3.4 Curing of Piles

Cure piles using moist or accelerated curing.
2.3.4.1 Moist Curing

a. Impervious sheeting: ASTM C171; waterproof paper, clear or white polyethylene sheeting, or polyethylene-coated burlap.

b. Pervious sheeting: AASHTO M 182.

c. Liquid membrane-forming compound: ASTM C309, white pigmented, Type 2, Class B.

2.3.4.2 Accelerated Curing

After placement of concrete, moist cure for a period of 4 hours. Follow by accelerated curing until concrete has reached specified release strength. Enclose casting bed for accelerated curing with a suitable enclosure.

During application of steam or heat, increase the air temperature at a rate not to exceed 22 degrees C 40 degrees F per hour. Cure at a maximum temperature of 65 degrees C 150 degrees F until concrete has reached specified release strength. Reduce temperature at a rate not to exceed 11 degrees C 20 degrees F per hour until a temperature of 11 degrees C 20 degrees F above ambient air temperature is reached. After accelerated curing, moist cure using either water or membrane curing until a total accelerated and moist curing time of 72 hours is achieved.

2.3.5 Detensioning

**************************************************************************

NOTE: Specify "release strength." Release strength of 30 MPa 4000 psi (design strength of 35 MPa 5000 psi) or 0.8 of the 28 day design strength is desirable; however, some regions use 0.7 of the design strength (25 MPa 3500 psi for design strength of 35 MPa 5000 psi). A minimum release strength of 0.6 of the design strength is required. Check with local pile manufacturers.
**************************************************************************

Perform releasing of prestressed steel in pretensioned piles in such an order that eccentricity of prestress will be minimized. Gradually release tension in strands from anchorage. Detension after approval by pile manufacturer's quality control representative. Perform transfer of prestressing force when concrete has reached a minimum compressive strength of [_____] MPa psi.

2.3.6 Marking

Mark pile to identify in-place impact face. Marking shall be clearly visible during driving.

2.4 PRODUCT QUALITY CONTROL

Where piling is manufactured in a plant with an established quality control program as attested to by a current certification in the PCI Certification Program for Quality Control, perform product quality control procedures in accordance with PCI MNL-116. Where piling is manufactured by specialists or in plants not currently enrolled in the PCI Certification Program for Quality Control, set up a product quality control system in accordance with PCI MNL-116 and perform concrete and aggregate quality control testing using an independent commercial testing laboratory approved by the
Contracting Officer in accordance with the following.

2.4.1 Aggregate Tests

Take samples of fine and coarse aggregate at the concrete batch plant and test. Perform mechanical analysis (one test for each aggregate size) in accordance with ASTM C136/C136M including determination of the specific gravity. Tabulate the results of the tests in accordance with ASTM C33/C33M.

2.4.2 Strength Tests

Sample concrete in accordance with ASTM C172/C172M at the time the concrete is deposited for each production line. Compression tests shall conform to methods of ASTM C39/C39M and ASTM C31/C31M. Perform slump tests in accordance with ASTM C143/C143M. Mold at least six cylinders per day or for every 15 cubic meter 20 cubic yards of concrete placed, whichever is greater. Test two cylinders of the set at 7 days of 14 days, or at a time for establishing transfer of prestressing force (release strength) and removal of pile from forms. Perform strength tests 28 days after molding using the remaining cylinders of the set. Cure the cylinders in the same manner as the piles and place at the point where the poorest curing conditions are offered. This is the coolest point in the bed for steam curing. Cylinders to be tested at 28 days shall be moist cured.

2.4.3 Changes in Proportions

If, after evaluation of strength test results, the compressive strength is less than the specified compressive strength, make adjustments in the proportions and water content and changes in the temperature, moisture, and curing procedures as necessary to secure the specified strength. Submit changes to the Contracting Officer in writing.

2.4.4 Compressive Strength Test Results

Evaluate compression test results at 28 days in accordance with ACI 214R using a coefficient of variation of 10 percent. Evaluate the strength of concrete by averaging the test results (two specimens) of each set (four specimens) of standard cylinders tested at 28 days. Not more than 10 percent of the individual specimens tested shall have an average compressive strength less than specified average compressive strength.

2.4.5 Chloride Ion Concentration

Sampling and determination of water soluble chloride ion content in accordance with ASTM C1218/C1218M. Maximum water soluble chloride ion concentrations in hardened concrete at ages from 28 to 42 days contributed from the ingredients including water, aggregates, cementitious materials, and admixtures shall not exceed 0.06 percent by weight of cement.

2.4.6 Chloride Ion Penetration

To ensure the durability of concrete in marine environment, concrete shall be proportioned to have the chloride ion penetration test in accordance with ASTM C1202, and be below 3000 coulombs for concrete specimens tested at 56 days.
PART 3 EXECUTION

3.1 PILE DRIVING

3.1.1 Driving Piles

Piles shall not be driven until 100 percent of design strength has been attained and until at least 14 days after detensioning. Drive piles to the indicated tip elevation and to the minimum embedment depth shown on the drawings. Pile driving shall be conducted as one continuous operation. The pile shall be driven until the resistance criterion is met. During the initial driving and until the pile tip has penetrated beyond layers of very soft soil or below the bottom of prejetted or preformed holes, use a reduced rated driving energy of the hammer of not more than 20,235 Joules or 15,000 foot-pounds per blow or as otherwise directed by the Contracting Officer, to prevent high tension-wave driving stresses which could damage the pile. Resistance criterion shall be 20 blows for 0.3 m one foot or less. The Contracting Officer may modify the criteria based upon the actual hammer being used and its rated energy and its compatibility as verified by a pile test program. If a pile fails to reach the indicated butt elevation or minimum embedment, the Contractor shall notify the Contracting Officer and perform corrective measures as directed. Provide hearing protection when noise levels exceed 140 dB.

3.1.2 Pile Driving Leads and Templates

Piles shall be driven with the hammer positioned in a fixed or swinging lead. "Free hammer" will not be permitted. Swinging lead shall be used only in conjunction with a template system to spot the piles.

3.1.3 Installation of Piles

Take care to avoid damage to piles during handling, when placing the pile in leads, and during pile-driving operations. Inspect piles when delivered, when in leads immediately before driving, and after installation. Notify the Contracting Officer of any unusual cracks and perform corrective measures as directed. Laterally support piles during driving, but allow rotation in leads. Take special care to maintain the pile orientation during driving. Square the top of the pile to the longitudinal axis of the pile. Maintain axial alignment of pile hammer with that of pile.

3.1.4 Tolerances in Driving

Drive piles with a variation of not more than one percent from vertical for plumb piles. Maintain and check axial alignment of pile and leads at start of pile driving and when the pile top is approximately 1.5 m 5 feet above the indicated elevation. Make intermediate checks of pile alignment if there is evidence of pile drifting. If subsurface conditions cause pile drifting beyond the allowable axial alignment tolerance, notify the Contracting Officer and perform corrective measures as directed. Place butts within 50 mm 2 inches of the location indicated. Manipulation of pile within specified tolerances is permitted, but do not manipulate piles more than one percent of their exposed length above the mudline. Check piles for heave. Redrive, to the indicated elevation, piles found to be heaved.
3.1.5 Jetting of Piles

**************************************************************************
NOTE: Jetting should generally not be permitted for piles:

1. Dependent on side friction in fine-grained low permeability soils (high clay or silt content) where considerable time is required for the soil to reconsolidate around the piles.

2. Subject to uplift or lateral forces.

3. Adjacent to existing structures.

4. In closely spaced clusters unless the load capacity is confirmed by test.
**************************************************************************

Water jets will not be permitted. Jetting may be used to assist driving piles through strata that cannot be penetrated practicably by use of the hammer alone. [Driving shall be restricted to a static weight while water is being injected to prevent inducing tensile stresses in the piles which damage the concrete.] After the penetration of the strata requiring jetting has been accomplished, jetting shall be discontinued and hammer driving shall be resumed. [Discontinue jetting when the pile tip is approximately 1.5 m 5 feet above the indicated pile tip elevation. Drive pile the final 1.5 m 5 feet of penetration.] [Adequate measures shall be taken for collecting and disposing of runoff water.] [Jetting method and equipment shall be approved by the Contracting Officer prior to commencing jetting operation.] Before starting final driving, firmly seat piles in place by application of a number of reduced energy hammer blows. [Measures, including use of a silt curtain, shall be employed to contain turbid water created by jetting piles.]

3.1.6 Pre-drilling of Piles

**************************************************************************
NOTE: Predrilling should generally not be permitted for piles:

1. Dependent on side friction in fine-grained low permeability soils (high clay or silt content) where considerable time is required for the soil to reconsolidate around the piles.

2. Subject to uplift or lateral forces.

3. Located in cohesionless soils.

4. In closely spaced clusters unless the load capacity is confirmed by test.
**************************************************************************

Predisdrill to remove soil or other material representing the bulk of the volume of the pile to be driven. [Predisdrill only to a depth of [_____] meters feet below the
Discontinue drilling when the pile tip is approximately 1.5 m 5 feet above the [calculated] [indicated] pile tip elevation. Drive pile the final 1.5 m 5 feet of penetration.

3.1.7 Splices

Splicing of piles is not permitted.

3.1.8 Buildup

Buildups are not permitted.

3.1.9 Pile Cutoffs

Cut off piles with a smooth level cut using pneumatic tools, sawing, or other suitable methods approved by the Contracting Officer. The use of explosives for cutting is not permitted.

3.1.10 Patching

a. Embedded Lifting Loops. Provide a 25 mm one inch minimum conical depression around embedded lifting loops. Cut off lifting loops at bottom of depression and patch depression with epoxy mortar.

b. Pile Butt. Apply 25 mm one inch thick layer of epoxy mortar cover over exposed prestressing strand on pile butt after driving.

3.2 EQUIPMENT

3.2.1 Pile Hammers

Furnish a hammer having a capacity at least equal to the hammer manufacturer's recommendation for the total weight of pile and character of subsurface material to be encountered. Obtain the required driving energy of the hammer, except for diesel hammers, by use of a heavy ram and a short stroke with low-impact velocity. The pile hammer shall be capable of operating at a reduced energy level (1/2 to 2/3 of rated energy level) during seating of the piles in preformed holes and when driving through soft or loose materials. The driving energy of the hammer, at final driving, shall be not less than 40,650 Joules 30,000 foot-pounds. At final driving, operate the pile hammer in accordance with the manufacturer's recommendation. At final driving, operate diesel-powered hammers at the rate recommended by the manufacturer for hard driving. Maintain sufficient pressure at the steam hammer so that (1) for double-acting hammer, the number of blows per minute during and at the completion of driving of a pile is equal approximately to that at which the hammer is rated; (2) for single-acting hammer, there is a full upward stroke of the ram; and (3) for differential-type hammer, there is a slight rise of the hammer base during each downward stroke.

3.2.2 Driving Helmets, Capblocks, and Pile Cushions

3.2.2.1 Driving Helmets or Caps and Pile Cushions

**************************************************************************

NOTE: Insert minimum and maximum thicknesses for pile cushion. An absolute minimum would be 75 mm 3 inches and the actual required thickness would depend upon pile length, hammer energy, design load,
required final penetration resistance, and character
of subsurface material to be encountered.
Generally thicker blocks are required for longer
piles, larger hammers, and harder driving. A wave
equation analysis is useful in determining required
thicknesses for pile cushion. Minimum thickness is
to protect head of pile. Pile cushion should also
have a maximum thickness to ensure effective
driving. Select when pile cushion is to be
replaced. It is generally recommended that a new
pile cushion be used at the start of driving of each
pile.

Use a steel driving helmet or cap, including a pile cushion between top of
pile and driving helmet or cap, to prevent impact damage to pile. The
driving helmet or cap-and-pile cushion combination shall be capable of
protecting the head of the pile, minimize energy absorption and
dissipation, and transmit hammer energy uniformly over the top of the
pile. The driving helmet or cap shall fit sufficiently loose around the
top of the pile so that the pile may be free to rotate without binding
within the driving helmet. The Contractor shall demonstrate to the
satisfaction of the Contracting Officer that the equipment to be used on
the project performs the above function. The pile cushion shall be of
laminated construction using softwood boards with the grain parallel to the
end of the pile. The thickness of the pile cushion shall be 300 mm 12
inches minimum. The cushion shall not be changed near the end of driving.
Replace the pile cushion when it has become compressed beyond two-thirds of
its original thickness, charred, or burned, or has become spongy or
deteriorated in any manner. Use new cushions for initial driving of each
pile. During redriving or restriking of piles, a used cushion assembly
shall be used. The Contractor shall submit to the Contracting Officer at
least 2 weeks before the start of pile driving operations detailed drawings
of the driving helmet and pile cushion to be used.

3.2.2.2 Hammer Cushion or Capblock

NOTE: Select either wood or aluminum/micarta
capblock. Delete inappropriate sentences. An
aluminum/micarta capblock is recommended because of
its consistent elastic properties and long life.
If final pile penetration resistance is based on a
wave equation analysis, the type capblock used
should be the same as that used in the analysis.

Use a hammer cushion or capblock between driving helmet or cap and hammer
ram consisting of [a solid hardwood block with grain parallel to the pile
axis and enclosed in a close-fitting steel housing] [aluminum and micarta
(or equal) discs stacked alternately in a steel housing]. Use steel plates
at top and bottom of capblock. [Replace wood capblock when it becomes
highly compressed, charred or burned, or becomes spongy or deteriorated in
any manner.] [Replace aluminum or micarta discs that have become damaged,
split, or deteriorated in any manner.] [Do not replace wood capblock
during final driving of any pile.] Do not use small wood blocks, wood
chips, rope, or other materials that permit excessive loss of hammer energy.
3.3 FIELD QUALITY CONTROL

3.3.1 Pile Records

For each pile, keep a record of the number of blows required for each 0.30 m 
0.985 feet of penetration and the number of blows for the last 150 mm 6
inch penetration or fraction thereof. Include in the record the beginning 
and ending times of each operation during driving of pile, type and size of 
the hammer used, rate of operation, stroke or equivalent stroke for diesel 
hammer, type of driving helmet, and type and dimension of the hammer 
cushion (capblock) and pile cushion used. Record re-tap data and any 
unusual occurrence during driving of the pile. Include in the record 
performance characteristics of jet pump, unassisted penetration of pile, 
jet-assisted penetration of pile, and tip elevation before driving and at 
end of driving. Notify Contracting Officer 10 days prior to driving of 
piles. Submit complete and accurate records of installed piles to 
Contracting Officer within 15 calendar days after completion of the pile 
driving. Make pile-driving records available to the Contracting Officer at 
the job site within 24 hours of each day's pile driving. A preprinted form 
for recording pile driving data, the Pile Driving Log, is included at the 
end of this section.

Pile Driving Log

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for polymeric marine fender piling. The specification is tailored for lateral load-bearing (fender) piling, bracketed items will require editing for axial load-bearing and lateral load-bearing piles. The intended use of bearing piles is for low-capacity (40 ton or less) "short" piles. Further testing will be required before these products can be used to replace concrete or steel marine bearing piles for primary piling on a berthing pier but may have applications at Magnetic Silencing Facilities.

Load combinations for polymeric piling are in accordance with UFC 4-152-01.

Axial load-bearing piles may require a site specific geotechnical report, pile drivability studies, and dynamic or static load tests; this type of testing may not be required for typical "secondary" fender pile system placed in soft marine soils.

Adhere to [UFC 1-300-02](https://www.navalengineeringshorebasedunits.com/ufc-1-300-02-unified-facilities-guide-specifications-ufgs-format-standard/) Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://www.navalengineeringshorebasedunits.com/criteria-change-request-ccr/).

NOTE: The extent and location of the work to be
accomplished should be indicated on the project drawings or included in the project specification.

**************************************************************************

NOTE: For lateral load-bearing fender piles, show the following information on the drawings:

1. Locations and types of the fender piles. If more than one type of fender pile (primary, secondary, corner) is used, indicate the location of each pile type.

2. Design loads (design vessel(s), berthing angle, berthing velocity).

3. Size, shape, and length of piles.

5. Length of polymeric pile protection. (Ensure that the camels, separators or watercraft bear on the protective layer throughout the entire tidal range.)

6. Soil data, where available.

7. Embedment depth. (The piles are typically designed as pinned/pinned, therefore ensure that the bottom of the piles have lateral restraint but not moment fixity.)

**************************************************************************

PART 1   GENERAL

1.1 REFERENCES

**************************************************************************

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the
extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

<tbody>
<tr>
<td>ASTM D2310</td>
<td>(2006; R 2012) Machine-Made &quot;Fiberglass&quot; (Glass-Fiber-Reinforced Thermosetting-Resin) Pipe</td>
</tr>
</tbody>
</table>
1.2 DEFINITIONS

See ASTM D883 for standard terminology related to plastics.

Axial load-bearing pile — A vertical or battered member driven into the ground to help support a load of any structure bearing upon it. Axial load-bearing piles are commonly divided into two kinds; point-bearing (end-bearing) and friction. A point-bearing pile derives a significant proportion of capacity at its tip and much less from contact with soil along the pile shaft. A friction pile derives its support principally from the soil along the pile shaft through the development of shearing resistance between the soil and the pile.

CFRP - Carbon Fiber Reinforced Polymers - Composite materials which consist of a polymer resin matrix, and carbon fiber reinforcement.

Extrusion - A manufacturing process where molten polymer is forced through a die of a desired shape to encapsulate fiberglass reinforced plastic or steel bars which run continuously throughout the length of the product without joints.

FRP - Fiber reinforced polymer. A polymer matrix, either thermoset or thermoplastic, reinforced with a fiber or other material with a sufficient aspect ratio (length to thickness) to provide a discernable reinforcing function in one or more directions.

GFRP - Glass fiber reinforced plastic. A composite made from fiberglass reinforcement in a plastic (polymer) matrix.

Lateral load-bearing pile — a vertical or battered member driven into the ground to resist lateral loads imposed upon it or a structure. A common application for a lateral load-bearing pile is to absorb lateral forces at points of impact and dissipate them horizontally into a structure and/or soil stratum. A fender pile is an example of a lateral load-bearing pile.

Polymer - Any of numerous natural and synthetic compounds of usually high molecular weight consisting of up to millions of repeated linked units, each a relatively light and simple molecule.

Polymeric Pile - Piling products characterized by the use of polymers, whereby (1) the pile strength or stiffness requires the inclusion of the polymer or (2) a minimum of 50 percent of the weight or volume is derived from the polymer. Polymeric piles may be reinforced by composite design for increased stiffness or strength.

Pultrusion - A continuous process for manufacturing composites that have a cross sectional shape. The process consists of pulling a fiber reinforcing material through a resin impregnation bath and through a shaping die, where the resin is subsequently cured.

Resin - Any of numerous physically similar polymerized synthetics or
chemically modified natural resins. Two main types of polymers used for resins include thermoset and thermoplastic materials.

Thermoset Plastics (thermosets) - Refer to a range of polymer materials that once cured do not flow or melt when heated. Thermoset materials are transformed through the addition of energy into a stronger substance. Thermoset materials are usually liquid or malleable prior to curing and designed to be molded into their final form; or used as adhesive. Thermoset polymer resins can be transformed into plastics or rubbers by cross-linking. A thermoset material cannot be melted and re-molded after it is cured. Thermoset materials are generally stronger than thermoplastic materials. They are also better suited to high temperature applications. They are not easily recyclable like thermoplastics, which can be melted and re-molded. Examples of thermoset plastics include: natural rubber, Bakelite, Urea-Formaldehyde, Melamine, Polyester Resin, and Epoxy Resin.

Thermoplastics - Most thermoplastics are high molecular weight polymer chains, mostly joined through weak dispersion forces and more rarely dipole-dipole interactions. Thermoplastic polymers are usually contrasted with thermosetting polymers, which cannot go through melt/freeze cycles. Many thermoplastic materials are addition polymers (chain growth polymers), such as polyethylene and polypropylene.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal
under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance with Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

1.4 DELIVERY, STORAGE, AND HANDLING

Inspect each pile for surface damage, cracks, blemishes, scarring and straightness upon delivery. Record the condition of each pile and submit the delivery inspection list to the Contracting Officer. Do not incorporate materials damaged in transport from plant to site. Handle the piles with ropes or nylon slings without dropping, breaking, bruising or penetrating outer surface with tools. Do not use cant dogs, peaveys, hooks or pikepoles. Protect piles from damage. Store piles above the ground on blocking which is shaped or padded and prevent scarring or sagging of the piles. Cover and arrange storage racks to permit air circulation.

1.5 BASIS OF BIDS

1.5.1 Polymeric Piles

Base bids on the type, number, diameter, and length of piles as indicated. Should the total number of piles vary from that specified as the basis for bidding, the Contract price will be adjusted in accordance with Contract Clause entitled "Changes". Adjustment in Contract price will not be made for cutting off piles, for any portion of a pile remaining above the cutoff elevation, or for broken, damaged or rejected piles.

PART 2 PRODUCTS

2.1 PILE CLASSIFICATION

1. Type I - Polymeric only

**************************************************************************
NOTE: Solid and tubular polymeric section are included.
**************************************************************************

2. Type II - Polymeric with reinforcement in the form of chopped, milled or continuous fiber or mineral
3. Type III - Polymeric with reinforcement in the form of metallic bars, or cages, or shapes

NOTE: The most common Type III piles are plastic piles with steel reinforcing or a steel pipe core.

4. Type IV - Polymeric with reinforcement in the form of non-metallic bars or cages

NOTE: The most common Type IV piles are plastic piles with a fiberglass reinforcing cage.

5. Type V - Polymeric composite tube with a concrete core

NOTE: The most common Type V piles are fiberglass tubes with concrete fill placed prior to driving.

6. Type VI - Any other polymeric piling meeting the requirements of this specification and not otherwise described above, such as hollow polymeric composite tubes driven without a concrete core.

NOTE: The Type VI pile section provides for new types of polymeric pilings. Examples of "new" piling types with respect to ASTM D7258, include polymeric composite tube installed (driven) without a concrete core.

2.2 POLYMERIC PILES

Provide polymeric piles manufactured as specified. Include dimensions, material specifications, and method of manufacturing. Provide all polymeric piles of a particular type manufactured by a single manufacturer. Permanently tag each pile with the pile's serial number, date of fabrication and manufacturer's name. Place the stamp or tag two to four feet from the top of the pile and ensure it is visible after installation. Splices will not be permitted, unless approved by the Contracting Officer. Provide pile driving tips, when required, per manufacturer's recommendations.

2.3 PERFORMANCE REQUIREMENTS

NOTE to Designer: Polymeric piles are not recommended for the replacement of single fender
piles when the polymeric pile stiffness is different than that of the pile being replaced. When this occurs, the more flexible pile will not carry its share of the berthing load. As an example, polymeric piles will usually be more flexible than timber piles, in which case the timber piles adjacent to the polymeric piles will take increased loads, which may cause the piles to fail. Therefore, single or limited replacement of the timber piles are not recommended. Transverse misalignment of the piles can also cause individual piles to fail, and precautions to minimize this occurrence should be taken.

Comparison values for a typical timber pile

Typical ASD Design Properties for treated Southern Yellow Pine (SYP) marine pile per ASTM D25:
- Allowable Axial compression: 1250 psi
- Allowable Bending Strength: 1950 psi
- Allowable Shear Perpendicular to Grain: 160 psi
- Allowable Compression Perp. to grain: 440 psi
- Modulus of Elasticity: 1,500,000 psi
- Modulus of Rupture (MOR): 7,300 psi
- 90 percent MOR (accidental berthing): 6,570 psi
- "Operational" Bending Strength: 3,900 psi

For a 12 in. butt 50 ft long SYP pile with a 7 in. tip treated for marine use (Bending moments taken at mid height):

- Allowable Axial Capacity "short": 24 ton (48 kip)
- Mid Height Diameter: 9.5 in.
- Mid Height Section Modulus: 84.2 in.\(^3\)
- Mid Height Moment of Inertia: 400.0 in.\(^4\)
- Stiffness = 'E' x 'I' = 600,000.0 kip-in\(^2\)
- Allowable Moment Capacity (FS = 3.73): 13.7 kip-ft
- Operational Moment Capacity (FS = 1.87): 27.3 kip-ft
- Accidental Moment Capacity (FS = 1.11): 46.1 kip-ft

See UFC 4-152-01 Section 5-4.4.3(a) for allowable timber stresses on fender piles for normal/operational and accidental berthing. FS = Factor of Safety based on rupture strength = 7.3 ksi x 84.2 in\(^3\)/12 = 51.2 kip-ft. Axial capacity does not consider Euler buckling (Short Column).

For pultruded members the minimum factor of safety is 2.5 for flexure and 3.0 for compression, shear, and connections.

**************************************************************************

Determine the cross-sectional dimensions of piles on the basis of the ability to perform satisfactorily under the physical loading and environmental conditions imposed and to effectively perform the energy absorption properties desired. Submit[ the Performance Test Data] to substantiate the performance. The performance requirements listed are allowable (service level) values. For berthing/flexure the minimum factor of safety is [2.0][2.5] for normal/operational loads. For compression and
shear, the minimum factor of safety is [2.5][3.0].

### 2.4 PERFORMANCE CHARACTERISTICS

**************************************************************************
NOTE: The designer must fill in the required performance characteristics for each pile, for a particular application. Provide a separate table for each pile type and application.
**************************************************************************

Provide the following performance characteristics for each pile:

<table>
<thead>
<tr>
<th>PERFORMANCE CHARACTERISTICS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Structural Outer Dimension/Diameter</td>
</tr>
<tr>
<td>Allowable Moment Capacity</td>
</tr>
<tr>
<td>Allowable Axial Capacity - Short Column</td>
</tr>
<tr>
<td>Flexural Rigidity (EI)</td>
</tr>
<tr>
<td>Allowable Shear Capacity</td>
</tr>
</tbody>
</table>

### 2.4.1 Allowable Moment Capacity

Submit the allowable bending moment for the particular pile selected based on the ASTM testing procedures indicated.

### 2.4.2 Allowable Axial Capacity

**************************************************************************
NOTE: Allowable axial capacity is the structural capacity of the piling. See UFC 3-220-01 for geotechnical capacity. A load test may be appropriate for critical load bearing applications to allow the use of the lowest geotechnical factor of safety.
**************************************************************************

Submit the allowable axial capacity based on the ASTM testing procedures indicated. Unless noted otherwise the allowable axial capacity must be based on a short member without considering slenderness effects.

### 2.4.3 Flexural Rigidity (EI)

**************************************************************************
NOTE: Maximum deflection and operational level deflections are based on the Flexural Rigidity of the member. Consider service level deflections
under all operational load combinations in UFC 4-152-01. Pay special attention to environmental loads which may cycle the product into a state of fatigue. For bearing piles consider deflection limits stated in UFC 1-200-01.

Flexural rigidity "EI" is defined as the product of Modulus of Elasticity "E" times Moment of Inertia "I". "EI" is related to the slope of a moment-deflection curve in accordance with ASTM D6109. Determine the values for "EI" from the peak load at failure.

2.4.4 Allowable Shear Capacity

Submit the allowable shear capacity based on the ASTM testing procedures indicated.

2.4.5 Allowable Stresses

Submit the following: allowable flexural stress, allowable shear stress, allowable bearing stress perpendicular to the member, allowable bearing stress parallel to the member, allowable tensile stress, and allowable compressive stress. See paragraph PERFORMANCE REQUIREMENTS for minimum factor of safety.[ Use allowable tensile and compressive stresses for Wave Equation Analysis.]

2.5 SIZE TOLERANCES

Unless specified otherwise refer to the tolerances listed in ASTM D7258.

2.6 MATERIALS

2.6.1 Physical Properties

NOTE: The designer must select the appropriate pile types and fill in the required physical properties for each pile. Properties which do not apply to a particular pile type may be deleted or indicated as n/a.

Submit Material Test Reports, as applicable, for each type of material. See below for the required:

1. Water Absorption, ASTM D570, < 3 percent at 24 hours.
2. Brittleness, ASTM D746, no break.
3. Hardness, ASTM D2240 Shore D, [60].
2.6.2 Type III and IV Polymeric Piles

2.6.2.1 Placement of Reinforcing

In accordance with ASTM D7258, place longitudinal reinforcement within 5 percent of the specified radial location as measured from centroid of the cross-section of the pile. Longitudinal reinforcement will not twist more than 5 degrees over any 6.1 m 20 foot section of the pile. The minimum cover is 25 mm 1 inch.

2.6.3 Type V Polymeric Piles

2.6.3.1 Polymeric Composite Tube

 Manufacture polymeric composite pile comprising of material which provides the tube strength. Manufacture the tube in accordance with ASTM D2996 and ASTM D2310.

2.6.3.2 Outer Surface

Furnish an outer surface comprising of a suitable, high impact, marine grade coating that provides a protective barrier as well as wear and impact resistance. It must provide an ultraviolet and chemical resistant barrier of at least 0.75 mm 0.03 inch thickness and be of a black opaque color.

2.6.3.3 Inner Surface

Provide an inner surface of a pure polymeric liner layer of at least 0.64 mm 0.025 inch thickness for alkalinity resistance. Roughen or wrinkle the inner surface to provide adhesion of the inner shell to the concrete fill.

2.6.3.4 Concrete Fill

Fill the composite tube completely with concrete in accordance with the manufacturer's written instructions. Furnish concrete with a minimum 28-day compressive strength of 41.4 MPa 5,000 psi. Submit a concrete mix design certifying that the proportioning of the mix is in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE for specified strength and is based upon aggregate data which has been determined by laboratory tests during the last twelve months.

2.6.3.5 HDPE Sleeve

Provide HDPE sleeve per paragraph POLYMERIC PILE PROTECTION.

2.6.3.6 Type VI Hollow Polymeric Piles

2.6.3.6.1 Hollow Polymeric Composite Tube

 Furnish hollow polymeric composite tube satisfying the requirements of ASTM D7258.

2.6.3.6.2 Concrete Fill

**************************************************************************
NOTE: For lateral-load bearing (fender) piles, at a minimum place a concrete "plug" a distance D above and a distance of 2*D below the upper support to prevent crushing/local buckling of the hollow tube

SECTION 35 59 13.14 20  Page 12
at the point of impact (D = outside diameter of the pile).

Fill the composite tube with concrete [to [_____] m [_____] ft below the pile top] [from the pile top to the mudline] after driving. Provide concrete with a minimum 28-day compressive strength of 34.5 MPa 5,000 psi. Submit a concrete mix design certifying that the proportioning of the mix is in accordance with Section 03 30 00 CAST-IN-PLACE CONCRETE for specified strength and is based upon aggregate data which has been determined by laboratory tests during the last twelve months.

2.6.3.6.3 HDPE Sleeve

Provide HDPE sleeve per paragraph POLYMERIC PILE PROTECTION.

2.7 PILE FINISHING

2.7.1 Polymeric Pile Protection

Furnish the polymeric piles such that the rubbing surface of the piles has an abrasion resistance less than 0.5g per ASTM D4060. If the materials are reactive to seawater, protect the pile by encasing in an HDPE sleeve or abrasion resistant polymer, with a minimum thickness of 13 mm 1/2 inch. [Extend the protective encasement, as a minimum, from 0.6 m 2 feet below the mean lower low water (MLLW) to 0.3 m 1 feet below the pile support, unless indicated otherwise.]

NOTE: The length of protection may need to be increased for barges or other flat sided vessels and for systems supporting deep draft separators. The contact surface for barges may be near the deck level if there is a rail, or if the piles are sloped the contact area may be near the bottom of the hull. The contact areas must consider the upper and lower rub strips for deep draft separators.

2.7.1.1 HDPE Sleeve

Provide ASTM D3350, 2 - 3 percent carbon black UV stabilized HDPE sleeve. Attach as indicated or per Manufacturer’s recommendation to protect the lateral load-bearing pile. Provide length as indicated in paragraph POLYMERIC PILE PROTECTION. Furnish sleeve with minimum wall thickness of 13 mm 1/2 inch, and hardness of 62 (Shore D) per ASTM D2240.

2.7.2 Surface Condition

Ensure that the pile surface exhibiting roughness or corrugations due to manufacturing processes, do not have depressions or projections greater than 12 mm 1/2 inch and less than 5,800 mm² 9 in² in surface area. The surface of the pile is required to be free of any cracks or splits, in any orientation.

2.7.3 Pile Cover

Furnish the polymeric piles with approved pile tops, concrete fill sloped to drain, or encapsulated in polymeric material.
2.7.3.1  Pile Tops

Furnish the polymeric top with a thickness of approximately 6 mm 0.25 inches and color to match the pile. Secure the top in place with 6 mm diameter by 38 mm 1/4 inch diameter by 1 1/2 inch long Type 316 stainless steel screws spaced a maximum of 100 mm 4 inches on center. Center the screws in the ribbon band of the top. Use appropriate screw types for the matrix material and place in pilot holes.

2.8  SOURCE QUALITY CONTROL

2.8.1  Plant Inspection

The Contracting Officer reserves the right to perform plant inspection of the polymeric pile manufacturing process. Provide the Contracting Officer a minimum two weeks advance notice, indicating the date manufacturing is to start and tests that will be conducted. Allow the Contracting Officer unlimited access to the plant and inspection privileges for each facet of the manufacturing process.

2.8.2  Curing

2.8.2.1  Type I, II, III, IV and VI Polymeric Piles

Cure piles at the plant as recommended by the manufacturers prior to shipment to the site.

2.8.2.2  Type V Polymeric Piles

Fill Type V piles with concrete prior to driving. Support the pile to prevent sag during concrete placement and curing. Cure a minimum of one week prior to placement of the concrete fill. Move piles to curing table within 20 minutes of wet concrete placement. Do not handle or transport piles for seven days or until concrete has reached 85 percent of the 28 day compressive strength. Drive concrete filled piles after full strength has been obtained or after 28 days of curing.

2.9  DRIVABILITY

Furnish piles capable of being driven by contractors vibratory, air, steam, diesel or hydraulic hammers without damage to the pile anywhere along its length, with the exception of a sacrificial 0.6 m 2 ft at pile head.

2.10 MANUFACTURER'S WARRANTY

Warranty all polymeric piles to be free from defects in materials and workmanship for a period of ten years. The Contracting Officer has the right to require complete replacement of any pile with material or workmanship defects. All construction costs related to the repair or replacement of the defective piles are at Manufacturer's expense. This warranty need not cover repairs required as a result of normal wear and tear, misuse, mishandling, extreme weather, failure to perform routine maintenance, non-recommended or improperly executed alterations by anyone other than the Manufacturer, tampering, loading of the pile beyond its rated capacity, improper installation, or other use inconsistent with Manufacturer's specifications.
2.11 CONTRACTOR'S WARRANTY

Warranty all polymeric piles to be free from defects in materials caused by mishandling prior to installation and improper installation for a period of 5 years. The Contracting Officer has the right to require complete replacement of any pile deemed by the Contracting Officer to have defects due to mishandling or improper installation. All construction costs related to the repair or replacement of the defective piles are at the Contractor's expense.

PART 3 EXECUTION

3.1 PILE DRIVING EQUIPMENT

Select the proposed pile driving equipment, including hammers and other required items, and submit complete descriptions of the proposed equipment. Provide driving helmet, pile caps, pile driving tips and driving pads as recommended by the pile Manufacturer for the polymeric piles.[ Final approval of the proposed equipment is subject to the satisfactory completion and approval of pile tests.] Changes in the selected pile driving equipment will not be allowed after the equipment has been approved except as specified and directed. No additional contract time will be allowed for Contractor proposed changes in the equipment.

3.1.1 Pile Driving Hammers

Provide impact[ or vibratory] type pile driving hammers.

3.1.1.1 Impact Hammers

Use an air, steam, diesel or hydraulic powered hammer, of an approved type. The capacity of the driving hammer is required to meet or exceed the hammer manufacturer's recommendation for the total weight of pile and character of subsurface material to be encountered. In accordance with paragraph SUBMITTALS, submit the following information for each impact hammer proposed:

a. Make and model.

b. Ram weight.

c. Anvil weight.

d. Rated stroke.

e. Rated energy range.

f. Rated speed.

g. Steam or air pressure, hammer, and boiler[ and][ or] compressor.

[ h. Rated bounce chamber pressure curves or charts, including pressure correction chart for type and length of hose used with pressure gage.

] i. Pile driving cap, make, and weight.

j. Cushion block dimensions and material type.

k. Power pack description.
[3.1.1.2 Vibratory Hammers

The use of vibratory hammers is dependent upon satisfactory driving and load testing of piles. Final approval of the proposed hammer and other driving equipment is subject to the satisfactory completion and approval of the pile tests. The size or capacity of hammers must be as recommended by the hammer manufacturer for the total pile mass and the character of the soil formation to be penetrated. Provide a rigid connection between the hammer and the pile. In accordance with paragraph SUBMITTALS, submit the following information for each vibratory hammer proposed:

- Make and model.
- Eccentric moment.
- Dynamic force.
- Steady state frequency or frequency range.
- Vibrating weight.
- Amplitude.
- Maximum pull capacity.
- Non-vibrating weight.
- Power pack description.

3.1.2 Pile Driving Leads

Support and guide hammers with fixed extended leads or fixed underhung leads. Operate vibratory hammers free hanging without leads. For driving battered piles, support and guide impact hammers with three-axis, fixed-extended leads capable of 1 H and 2-1/2 V fore and aft batter and 1 H on 6 V side batter, with 30 degree rotation each side of an axis running along the center line of rotation of the crane through the center line of the leads. Provide two intermediate supports for the pile in the leads to reduce the unbraced length of the pile during driving.

3.1.3 Pile Extractors

Use vibratory pile extractors for pile extraction.

3.1.4 Jetting Equipment

Provide jetting equipment with at least removable or fixed jet of the water or combination air-water type. Design water jet so that the discharge volume and pressure are sufficient to freely erode the material immediately under and adjacent to piles without resulting in pile drift. Submit jetting equipment including plant description, volume of water and pressure, and size and length of hoses and pipes in accordance with paragraph SUBMITTALS.
3.2 PRELIMINARY WORK

3.2.1 Wave Equation Analysis of Pile Drivability

NOTE: This section may be applicable for axial load-bearing piles only.

a. Prior to driving any pile, submit a pile Wave Equation Analysis, performed by the Contractor's Geotechnical Consultant, for each size pile and distinct subsurface profile condition. Take the following into account for the analysis: the proposed hammer assembly, pile cap block and cushion characteristics, the pile properties and estimated lengths and the soil properties anticipated to be encountered throughout the installed pile length based on static capacity analysis with consideration of driving gain/loss factors. Only one specific model of pile hammer may be used for each pile type and capacity.

b. Demonstrate with the Wave Equation Analysis that the piles will not be damaged during driving and the driving stresses will be maintained within the limits stated in paragraph ALLOWABLE STRESSES. Indicate the blow count necessary to achieve the required ultimate static pile capacities.

c. Upon completion of the dynamic and static testing programs outlined in this specification section, perform a refined Wave Equation Analysis taking into consideration the evaluated capacities, gain/loss factors and recommended production pile lengths. Develop production pile driving criteria based on the results of the refined Wave Equation Evaluations.

d. Furnish pile driving equipment approved by the Contractor's Geotechnical Consultant. Complete the attached pile and driving equipment data form, including hammer information, in full as part of the submittal of the results of the Wave Equation Analyses.

e. The cost of performing the Wave Equation Analyses must be paid for by the Contractor. Include the cost in the base bid.

3.2.2 Order List

Submit an itemized list for piles to the Contracting Officer for approval prior to placing the order with the supplier. Indicate the pile lengths required at each location as shown on the plans and the corresponding ordered length of each pile on the list. Complete load testing and refined wave equation analysis prior to submission of an order list.

3.3 INSTALLATION

3.3.1 On Site Storage

Continually support all stored piles in a manner which minimizes creep, saddling and sag.
3.3.2 Preexcavation

3.3.2.1 Jetting of Piles

**************************************************************************
NOTE: Jetting should generally not be permitted for piles:

1. When capacity is dependent on side friction in fine-grained, low-permeability soils high clay or silt content) where considerable time is required for soil to reconsolidate around the piles.

2. Subject to uplift.

3. Adjacent to existing structures.

4. In closely spaced clusters unless the load capacity is confirmed by test and unless all jetting is done before final driving of any pile in the cluster.
**************************************************************************

Jetting of piles is not permitted without the approval of the Contracting Officer.

3.3.2.2 Spudding of Piles

Spudding of piles is not permitted without the approval of the Contracting Officer. If spudding is allowed, limit it to an elevation 1.5 meters 5 feet above the specified pile tip elevation.

3.3.2.3 Predrilling of Piles

**************************************************************************
NOTE: If predrilling is permitted by the Geotechnical Engineer of Record, it is recommended to use an auger smaller than the diameter of the pile.
**************************************************************************

Predrilling of piles is not permitted without the approval of the Contracting Officer. If predrilling is allowed, limit it to an elevation 1.5 meter 5 feet above the specified pile tip elevation.

3.3.3 Driving Piles

Notify Contracting Officer 10 days prior to driving of test piles and load test. Drive piles to indicated or below calculated tip elevation to reach a driving resistance established by the wave equation analyses (WEAP) in accordance with the schedule which the will prepare from the test-pile driving data. During initial driving and until pile tip has penetrated beyond layers of very soft soil or below bottom of predrilled or prejetted holes, use a reduced driving energy of the hammer as required to prevent pile damage. Refusal criteria must be established by the Contracting Officer. If a pile fails to reach the indicated or calculated tip elevation, or if a pile reaches calculated tip elevation without reaching required driving resistance, notify Contracting Officer, provide pile record and perform corrective measures as directed. Provide
hearing protection in accordance with EM 385-1-1. Piles may be driven without pile guides or leads providing a hammer guide frame is used to keep the pile and hammer in alignment.

3.3.3.1 Protection of Piles

Square the heads and tips of piles to the driving axis. Laterally support piles during driving, but do not unduly restrain piles from rotation in the leads. The use of swinging or hanging leads is at the Contractor's risk. Repair any damage incurred by such use at the Contractor's expense.

3.3.3.2 Tolerances in Driving

Drive piles in the locations indicated. Place each pile, at its contact with the design mudline or mudline elevation indicated in the construction documents, no further than 40 mm per meter 0.5 inch per foot of free pile length (length in meters feet above the average soil contact line at each pile) in a direction parallel to the pier face and 10 mm per meter 0.125 inch per foot of the free pile length in a direction perpendicular to the pier face. Remove and replace with new piles those damaged, mislocated, driven below the design cutoff, or driven out of alignment.

3.3.4 Buoyant Piles

After driving buoyant piles, provide temporary framing or weights to prevent the pile from floating up out of the ground. Keep the temporary framing or weights in place until the pile is secured in place. If there is sufficient friction provided by the soil to prevent the pile from floating, the Contractor may, at his own risk, waive the temporary framing or weight requirement.

3.3.5 Pile Cutoff

Provide each polymeric pile a minimum of 0.6 meter 2 feet longer than the specified length to allow the top to be cut off if it is damaged during driving. Cut off piles with a smooth level cut using pneumatic tools, sawing, or other suitable methods per the polymeric pile Manufacturer's recommendations. Use of explosives for cutting is not permitted. Cut off pile heads level and sound. Cut off piles at no additional cost to the Government.

3.3.6 Fastening

Fasten the polymeric piles as indicated.

[3.4 PILE TESTS]

**************************************************************************

NOTE: Pile tests may be applicable for axial load-bearing piles.

This specification allows for two types of pile tests: pile driving tests and pile load tests. Pile driving tests are used to determine the blow count required to drive a pile to a given penetration or to refusal on a hard layer. Pile driving tests may be performed with a pile driving analyzer attached to piles to record the information listed below. Pile load tests are used to determine pile...
The combination of pile driving tests and pile load tests gives information on pile capacity versus refusal blow count. Pile driving analyzer data may be used in some instances in place of pile load tests to reduce the number of load tests required for a project.

3.4.1 Dynamic Testing of Piles

Provide an employ a specialty engineering firm to perform dynamic testing of piles and job piles to determine velocity of stress wave propagation, acceleration, monitor hammer and drive system performance, assess pile installation stresses and integrity, and to evaluate pile capacity. Furnish personnel experienced in performing wave equation analysis, dynamic testing, the use of the Pile Driving Analyzer and its related equipment, and interpretation of results to install and operate the testing equipment and to interpret its results. Furnish equipment to obtain dynamic measurements, record, reduce and display its data and meet the requirement of ASTM D4945. The equipment must have been calibrated within 12 months thereafter throughout the contract duration. Supply all power requirements for operating the equipment. Submit Pile Driving Analyzer data within one day after each test is completed.

3.4.1.1 Test Piles

Perform dynamic testing on [_____] test piles as indicated. Test piles are at least 3 m (10 ft) longer than minimum indicated job pile length. Perform testing during the full length of pile driving. Restrike piles installed as part of pile driving test after a minimum waiting period of [_____] days. Warm up the hammer prior to restriking. Restrike the pile for 50 blows or until the pile penetrates an additional 75 mm (3 inches), whichever occurs first. In the event the pile movement is less than one-quarter inch during restrike, the restrike may be terminated after 20 blows.

3.4.1.2 Job Piles

Perform dynamic pile testing on [_____] job piles during the full length of initial driving and during restrike driving. Tested piles must be as indicated [selected by the Contracting Officer over the duration of installation]. The Contracting Officer will direct testing of additional piles if the hammer or driving system is modified or replaced.

3.4.1.3 Reports

Prepare and submit a summary report of dynamic test results for test piles. Submit reports of the dynamic testing of piles within seven days after dynamic testing is completed. Discuss in the report pile capacity obtained from dynamic testing, velocity of stress wave propagation, acceleration, evaluation of hammer and driving system performance, driving stress levels, and pile integrity. Perform a CAPWAPC, or similar, analysis of the dynamic test data on data obtained from the end of initial driving and the beginning of restrike for [_____] test piles as directed. Use the analysis to predict pile capacity, establish resistance distribution, and predict quake and damping factors. Include refined wave equation analyses incorporating the results of dynamic testing and analysis. For job piles, prepare and submit a field summary report. Include energy transferred to the pile, calculated driving...
stresses, pile integrity and estimated pile capacity at the time of testing in the field summary report.] Include in the report for the test piles[ and the monthly report for job piles] the pile driving record as an attachment and also address the items listed in ASTM D4945, paragraph titled "Dynamic Testing."

[3.4.2 Pile Load Tests

**************************************************************************
NOTE: Each ASTM pile load test specification listed offers a number of options as to how the test is performed. Specify the required load testing option and any modifications to include other desired requirements.

Insert the number of test piles to be load tested. The safe design capacity of a test pile to be determined based on the failure criteria indicated.

**************************************************************************

Perform load tests at locations shown, or as directed. Provide testing and measuring equipment, perform loading, and provide observation facilities for personnel to inspect, record, and analyze settlement/movement and deflection of piles under test loads. Do not mobilize load test equipment until directed by the Contracting Officer. Perform pile load tests under the supervision of a registered professional engineer provided by the Contractor and experienced in conducting pile load tests. Loading frames and equipment for pile load tests must be ready to be placed in operation as soon as a load test pile has been driven. Provide loading equipment of sufficient capacity to apply the maximum load specified in a safe manner. Start loading of each test pile when directed.

The Contractor is responsible for the application of loads. Accurately determine and control the magnitude of applied loads using a calibrated load cell and readout device. The design working load, as confirmed by the results of load tests, will be determined by the Contracting Officer. Load test piles indicated or directed to be driven in permanent locations may be incorporated into the work if, after satisfactory completion of load test, they are approved for inclusion in the work. Any pile load test not accomplished in accordance with this specification will be rejected. A new pile load test must be conducted for each rejected pile load test. The Contractor must compile a report for each pile load test including, as a minimum, all applicable information required by the specified test.

[3.4.2.1 Compressive Load Test

Perform [_____] pile compressive load tests in accordance with ASTM D1143/D1143M [, as modified]. Apply a compressive load of [_____] kN ton to each compressive load test pile.

][3.4.2.2 Tensile Load Test

Perform [_____] pile tensile load tests in accordance with ASTM D3689[, as modified]. Apply a tensile load of [_____] kN tons to each tensile load test pile.
3.4.2.3 Lateral Load Test

Perform [_____] pile lateral load tests in accordance with ASTM D3966/D3966M [, as modified]. Perform lateral load tests consisting of jacking two piles apart with a hydraulic jack, with one pile serving as the reaction pile for the other. Apply a lateral load of [_____] kN tons to each pair of lateral load test piles. Take required movement readings and record for each pile.

3.4.2.4 Safe Design Capacity

Load test piles to twice the anticipated working load unless failure occurs first. The safe design capacity of a load test as determined from the results of load tests is the lesser of the two values computed according to the following:

a. One-half the load that causes a net settlement after rebound of not more than 0.029 mm per kN 0.01 inch per ton of total test load.

b. One-half the load that causes a gross settlement of not more than 25 mm 1 inch provided the load settlement curve shows no sign of failure.

3.5 FIELD TREATMENT

3.5.1 Polymeric Work

Field treat cuts, bevels, notches, refacing and abrasions made in the field in accordance with the Manufacturer’s recommendations.

3.6 FIELD QUALITY CONTROL

3.6.1 Inspections

Inspect piles when delivered and when in the leads immediately before driving. Secure piles in their proper alignment.

When Government inspections result in product rejection, promptly segregate and remove rejected material from the premises. The Government may also charge the Contractor an additional cost of inspection or testing when prior rejection makes reinspection or retesting necessary.

3.6.1.1 Straightness

ASTM D7258. Reject piles not meeting with the straightness criteria.

3.6.1.2 Cracks and Defects

Inspect each pile for cracks and defects prior to driving. After the piles are installed and all connections to the structure are completed, inspect each pile again for cracks and defects. Notify the Contracting Officer of any cracking or other defects observed and await direction. The Contracting Officer may reject any piles with defects. The Contractor is responsible for all costs incurred to replace the rejected piles.

3.6.2 Pile Driving Inspection

Perform special inspection of the pile installation. Employ approved Special Inspectors as required in the paragraph QC SPECIALIST DUTIES AND QUALIFICATIONS in Section [01 45 00.00 10] [01 45 00.00 20] [01 45 00.00 40]
QUALITY CONTROL.

3.6.3 Pile Records

For each pile, keep a legible record of the number of blows required for each 0.30 m foot of penetration and the number of blows for the last 150 mm 6 inch penetration or fraction thereof. Include in the record the beginning and ending times of each operation during driving of pile, type and size of the hammer used, rate of operation, stroke or equivalent stroke for diesel hammer, type of driving helmet, and type and dimension of the hammer cushion (capblock) and pile cushion used. Record re-tap data and any unusual occurrence during driving of the pile. Include in the record performance characteristics of jet pump, unassisted penetration of pile, jet-assisted penetration of pile, and tip elevation before driving and at end of driving. Notify Contracting Officer 10 days prior to driving of piles. Submit complete and accurate records of installed piles to Contracting Officer within 15 calendar days after completion of the pile driving. Make pile-driving records available to the Contracting Officer at the job site within 24 hours of each day's pile driving. A preprinted form for recording pile driving data, the Pile Driving Log, is included at the end of this section.

-- End of Section Table of Contents --
NOTE: This guide specification covers the requirements for marine fenders. This specification includes four different fender types. Each type is typically used for a different application. The author should choose the applicable fender types for the project. The subpart titles indicate the applicable fender type. The author should delete any subpart not applicable to the project.

Adhere to _UFC 1-300-02_ Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a [Criteria Change Request (CCR)](https://example.com/CCR).

NOTE: Fender type should be selected based on the following considerations:

1. Performance, including energy, berthing angle, reaction, and hull pressure.

2. Geometry, including stand-off, dock configuration, vessel configuration, and tidal variation.

3. Configuration and construction, including corrosion resistance, netted vs not netted, magnetic permeability, buoyancy and portability.
The following information shall be shown on the project drawings:

1. Location, size, and mounting elevation (if applicable) of each fender type.

2. Connection details to the waterfront structure. Include connection sizes, material type, embedment, plate sizes and hole sizes and locations, as applicable.

1.2 SYSTEM DESCRIPTION

1.2.1 Extruded Fenders

**************************************************************************
NOTE: Extruded fender systems typically absorb a minimum amount of energy. Therefore, they are typically used at the wale elevation of fender pile systems. They have also been used as festoon fenders, rub strips and as an energy absorbing element in a separator.
**************************************************************************

Extruded fenders are elements typically manufactured in a long length by an extrusion process. After manufacture, the elements are cut to length.
These fender elements are typically used as fenders for small craft, rub strips on marine structures, and energy absorbing elements at the wale. Examples of extruded fender shapes are 'Side Mounted Hollow Bore', 'Cylindrical', 'D', 'Square', 'W' and 'Wing'.

1.2.2 Molded Fenders

**************************************************************************
NOTE: Molded fenders are typically mounted to the vertical face of a marine structure. These systems are used to berth ships of similar size and hull curvature. Therefore, they are usually found in commercial ports.
**************************************************************************

Molded fenders are elements manufactured by the molded process. They typically have embedded metal plates cast into the molds. The fender elements are typically used as fenders for medium to large, flat sided vessels. The elements can be used as stand-alone fenders, combined with multiple fenders and a face panel, and energy absorbing elements at the wale. They include the shear fenders which absorb energy by deflecting parallel to the attachment plane. Examples of molded fender shapes are 'Arch Fender', 'Circle', 'Circular Dock', 'Fender Bars', 'Hexagonal', and the 'buckling fender' types, such as 'MV', 'V Leg' and 'V Section'.

1.2.3 Foam-Filled Fenders

**************************************************************************
NOTE: Foam-filled fenders are typically used at berths that support ships of various sizes and with a variety of hull curvatures. Due to the wide variety of ship types that berth at Naval facilities, the foam-filled fenders are typically the fender of choice.
**************************************************************************

Foam-Filled fenders are fenders typically manufactured by wrapping closed cell foam with a nylon reinforcement embedded in a polyurethane coating. The fenders typically used for fendering have an internal chain, though fenders having an external chain/tire netting have also been used. The fenders are typically used for berthing of medium to large vessels; vessels with considerable hull curvature; and at berths that support various ship types and sizes. The fenders can be used as stand-alone fenders, fendering between ships, or between a ship and a berthing structure.

1.2.4 Pneumatic and Hydro-pneumatic Fenders

**************************************************************************
NOTE: Pneumatic fenders are inflated with air and float on the surface of the water to serve as a protective buffer for ships. Hydro-pneumatic fenders are similar, but contain water in addition to the pressurized air, with a counterweight at one end so the fender is partially submerged and are specifically designed for the berthing of submarines.
**************************************************************************

Pneumatic and hydro-pneumatic fenders are constructed of an inner rubber layer, reinforcing cord layers and an outer rubber layer that form a
synthetic-cord-rubber sheet, which forms a cylindrical air-bag with hemispherical heads at each end, which can be inflated with air. These fenders can be used as stand-alone fenders, fendering between ships, or between a ship and a berthing structure. In hydro-pneumatic fenders, the upper hemispherical head has a top plate that allows internal placement of water and air into the bag, and the lower hemispherical head has a bottom plate that provides a connection location for the counterweight. The air-bag typically has a long cylindrical shape and is counter-weighted to float vertically. Hydro-pneumatic fenders are typically used as fenders for submarines, acting as buffers between submarines and berthing structures and as separators between submarines. Hydro-pneumatic fenders can be used in combination with foam-filled fenders or pneumatic fenders to support both ships and submarines at the same berth, if designed appropriately.

1.3 SUBMITTALS

**************************************************************************
NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Panels; G[, [_____]]

SD-03 Product Data

Stainless Steel Hardware; G[, [_____]]

Galvanized Steel Hardware; G[, [_____]]

Include Manufacturer's product data for all fender hardware, including bolts, anchor bolts, inserts, nuts, washers, chains, turnbuckles, dimensions, material specifications, working loads and ultimate loads, as applicable. For anchor bolts and inserts, include methods and materials for installation.

Restraint Chains; G[, [_____]]

Facing; G[, [_____]]

EXTRUDED FENDERS, MOLDED FENDERS

Extruded fender; G[, [_____]]

Molded fender; G[, [_____]]

Include dimensions, material specifications, and method of manufacture.

FOAM-FILLED FENDERS

Resilient, foam-filled marine fenders; G[, [_____]]

Prior to fabrication, copies of the manufacturer's catalog data including reaction, energy and percent compression curves, dimensions material specifications, and method of manufacture shall be submitted for approval. Include dimensions, material specifications, and method of manufacture.

PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

Resilient, pneumatic fenders; G[, [_____]]

Resilient, hydro-pneumatic fenders; G[, [_____]]

Prior to fabrication, copies of the manufacturer's catalog data, performance curves per ISO 17357-1, dimensions, material specifications, and method of manufacture shall be submitted for approval.
NOTE: Performance requirements: the rated energy of the fender shall be no less than the calculated berthing energy and the rated fender reaction shall not exceed the allowable load on the structure supporting it.

The maximum reaction divided by the corresponding contact area, shall be less than or equal to the maximum specified hull pressure for fender panels.

Deflected standoff at specified energy must be greater than or equal to minimum specified standoff. The undeflected standoff, including nets if any, shall not be greater than any specified undeflected standoff.

Fender design load shall be less than the rated reaction of the fender. Static shear force shall use the minimum static coefficient of friction. Dynamic shear force for foam-filled, pneumatic and hydro-pneumatic shall be the rated reaction times the difference between the coefficient of friction between the structure and fender and the coefficient between the fender and vessel times a factor of safety of 1.5. Dynamic shear force for rubber fenders for slicing surfaces shall be twice the maximum published dynamic coefficient of friction. For UHMW against steel, use 0.20 or the maximum published for the coefficient of friction.

The ultimate elastomeric elongation shall be at least three times the maximum elongation anticipated at maximum design conditions. The bond strength of the elastomer to its substrate shall be greater than the elastomer's tensile strength at the ultimate elongation.

Structural components shall be sized with a design load that does not exceed 80 percent of yield. Panel loads shall be based on the greater of: 1. Horizontal line contact applied at center of the footprint of the fender element against the panel. 2. Vertical line contact applied at the vertical center of the footprint of the fender element against the panel. 3. Simultaneous horizontal line contacts at top and bottom edge of the front face of the panel.

Design factor for attachment points, restraints and nets shall be based on 1.5 times the dynamic shear. The end attachment load shall not exceed 80 percent of yield. Restraints shall be sized such that the load applied to the weakest component does not exceed 50 percent of its breaking strength.

A weak link, preferably a shackle, swivel or other
readily replaceable, cost effective component shall be designed to fail first. Concrete embedments shall have a breaking load at least 1.25 times the breaking load of the weakest component attached to them.

Mechanical hardware, such as fasteners shall be sized with a design working load that does not exceed 60 percent of the lower of the yield or breaking load.

Foam-filled, pneumatic and hydro-pneumatic fenders should have at least 50 percent of the contact dimension in bearing on the supporting structure, or as recommended by the manufacturer. The contact surface for all floating fenders when not under load, should have low abrasion characteristics. Typically UHMWPE or plastic is used to face concrete or composite elements in the wear area.

**************************************************************************

EXTRUDED FENDERS, MOLDED FENDERS

Design data for rubber fenders; G[, [_____]]

Submit rated performance data (RPD) and published performance curves per ASTM F2192.

FOAM-FILLED FENDERS

Design data for foam filled marine fenders; G[, [_____]]

Submit rated performance data (RPD) and published performance curves per ASTM F2192.

PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

Design data for pneumatic fenders; G[, [_____]]
Design data for hydro-pneumatic fenders; G[, [_____]]

Submit rated performance data (RPD) and published performance curves per ISO 17357-1.

SD-06 Test Reports

EXTRUDED FENDERS, MOLDED FENDERS

Ozone Resistance; G[, [_____]]
Low Temperature Impact Resistance; G[, [_____]]
Water Absorption; G[, [_____]]
Heat Resistance; G[, [_____]]

Tests shall have been performed on the specified fender within 5 years of submittal of the reports for approval. Test reports shall be accompanied by notarized certificates from the
manufacturer certifying that the tested material is of the same type, quality, manufacture and make as that proposed to be supplied.

**POAM-FILLED FENDERS**

- **Fender cyclic-compression test; G[, [____]]**
- **Fender sustained-load test; G[, [____]]**
- **Fender pull-through test; G[, [____]]**
- **Skin thickness core test; G[, [____]]**

Submit copies of reports of tests specified herein. The tests shall have been performed within three years of submittal of the reports for approval. Also, submit reports for tests specified in referenced documents which are applicable to the particular material furnished for use.

**PNEUMATIC AND HYDRO-PNEUMATIC FENDERS**

- **Prototype fender performance confirmation; G[, [____]]**

**************************************************************************

**NOTE:** Prototype fender performance confirmation includes the following tests: (1) performance; (2) angular compression; (3) durability; (4) compression recovery; and (5) puncture resistance.

**************************************************************************

- **Material test of rubber; G[, [____]]**
- **Dimensional inspection; G[, [____]]**
- **Air-leakage test; G[, [____]]**
- **Hydrostatic-pressure test; G[, [____]]**
- **Pressure Relief Valve Test**
- **Design Proof; G[, [____]]**

Submit copies of reports of tests specified herein. Also, submit reports for tests specified in referenced documents which are applicable to the particular material furnished for use.

**SD-07 Certificates**

- **Stainless Steel Hardware; G[, [____]]**
- **Galvanized Steel Hardware; G[, [____]]**

Submit certificates of compliance certifying that materials meet the requirements specified herein. In addition, when the coating is shop applied, submit certificates of conformance or compliance certifying that surface preparation, coverage, and thickness meet the requirements specified.
Submit certificates of compliance certifying that materials meet the requirements specified herein.

**SD-08 Manufacturer's Instructions**

**Installation Instructions**

Provide installation instructions for each fender type.

**SD-10 Operation and Maintenance Data**

**Fender Manual**

Provide fender manual for each fender type.

### 1.4 DELIVERY, HANDLING AND STORAGE

Fenders shall be undamaged when delivered and shall be handled and stored so as to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight.

#### 1.4.1 Rejection

Fenders that are delivered to the site in a damaged condition or that are not in conformance with this specification are subject to rejection. Any rejected materials shall be replaced with suitable materials, at no additional cost to the Government.

#### 1.4.2 Fender Marking

Unless otherwise specified, all fenders shall be identified in readable characters at least 25 mm 1 in high, either directly or on corrosion- and sunlight resistant permanently attached tags. The markings shall include the following:

- a. full or abbreviated manufacturer name,
- b. fender size model or part number designation,
- c. fender serial number,
- d. ASTM designation (including type, grade and class) or ISO number and year, as applicable,
- e. initial or rated internal pressure (pneumatic and hydro-pneumatic fenders only),
- f. rated performance (energy and reaction), and
- g. type of reinforcement layer (pneumatic and hydro-pneumatic fenders only,) and
h. other information as the purchase specification or contract requires.

1.4.3 Fender Instructions and Manual

Provide installation instructions and a fender manual describing maintenance requirements for each fender type.

1.4.4 Handling Coated Material

Store, handle and place coated material in a manner that will minimize damage to the coating and will not reduce its effective protective value. Repair damaged surfaces as directed and per the Manufacturer's recommendations. Handle coated work which is flexible in a manner that will prevent flexing sufficient to crack coating, especially when temperature is below 40 degrees F. Do not place coated surfaces on strips or skids until coating has hardened thoroughly. Wide fabric slings used for lifting, and strips, slings, blocks, skids, cradles, and other supports shall provide ample bearing areas. In transporting, fasten and protect coated materials in a manner that will prevent movement and preclude chafing and rubbing, and when unloading, do not dump or drop. Place coated material in position carefully on suitably prepared beds and with a minimum of handling.

1.5 QUALITY ASSURANCE

1.5.1 Extruded Fenders, Molded Fenders

Fender elements shall be molded of rubber, homogeneous and free from any defects, impurities, pores or cracks. Where internal plates are used, the rubber shall be bonded to integral steel mounting plates. The plates shall be fully encased in rubber to a minimum thickness of 1.6 mm 1/16 inch.

1.5.2 Elastomer Skin

The elastomer skin of the fender shall be free from cracks, burrs, warpage, checks, chipped or blistered surfaces, and shall have a smooth surface.

1.5.3 Foam Core

The foam core shall be homogeneous and of one piece fabricated construction and shall not be in chip or granular form. The foam core shall not contain scraps, strips, or sheets of foam either rolled or stuffed into the required shape unless pieces are bonded together in layers of uniform patterns to form a homogeneous, one piece core. Homogeneous foam rings of adequate thickness to insure performance of the fender are acceptable provided the Contractor can show a minimum 5-year performance of similar fenders.

1.5.4 Steel Fabrication

The steel used in fabrication shall be free from kinks, sharp bends, and other conditions which would be detrimental to the finished product. Manufacturing processes shall not reduce the strength of the steel to a value less than intended by the design. Manufacturing processes shall be done neatly and accurately. Make bends by controlled means to insure uniformity of size and shape.
1.5.5 Welding

AWS D1.1/D1.1M. Welds shall be of sufficient size and shape to develop the full strength of the parts connected by the welds. Welds shall transmit stress without permanent deformation or failure when the parts connected by the weld are subjected to proof and service loadings.

1.6 FOAM-FILLED FENDERS, PNEUMATIC AND HYDRO-PNEUMATIC FENDERS - WARRANTY

**************************************************************************
NOTE: The warranty requirements in this guide specification have been approved by a Level I Contracting Officer in accordance with the requirements of Naval Facilities Acquisition Supplement (NFAS). NFAS can be found at the following link: https://portal.navfac.navy.mil/portal/page/portal/navfac/navfac_forbusinesses The paragraphs in this guide specification may be used without further approval.
**************************************************************************

Furnish the manufacturer's warranty. The warranty shall be issued directly to the Government and shall not be limited in dollar value. The warranty period shall be not less than 1 year from the date of Government acceptance of the work.

PART 2 PRODUCTS

2.1 EXTRUDED AND MOLDED FENDERS

2.1.1 Configuration

2.1.1.1 Extruded Fender

Fenders shall be extruded and continuous in the length indicated. The fenders shall be black in color. The fenders shall have a truncated "A" cross section shape and be attached to the structure at the base, the widest dimension, of the arch. The connecting hardware shall be fully exposed. No encased hardware or molded fenders shall be allowed. The fender and hardware shall be designed and factory tested to the loads per linear meter foot of fender specified in paragraph entitled "Performance," for angles of approach of 0 and 0.26 rad 0 and 15 degrees. Fender anchor bolts and method of anchorage shall be of the size and spacing required by the manufacturer's design and testing; however, the size and spacing of anchor bolts indicated on the drawings shall be construed to be the minimum required, unless exceeded by the requirements of the fender manufacturer's design.

2.1.1.2 Molded Fender

Fenders shall be molded and continuous in the length indicated. The fenders shall be black in color. Each fender shall be molded of rubber, homogeneous and free from any defects, impurities, pores or cracks, and bonded to integral, steel mounting plates. The mounting plates shall be fully encased in rubber with a minimum thickness of 1.6 mm 1/16 inch. The fender and hardware shall be designed for and factory tested to the loads specified. Fender anchor bolts and method of anchorage shall be of the size and spacing dimensions required by the manufacturer's design and testing; however, the size and spacing of anchor bolts indicated on the
drawings shall be construed to be the minimum required, unless exceeded by the requirements of the fender manufacturer's design.

2.1.2 Elastomer

The elastomer shall be the ethylene propylene dimonomer (EPDM), as specified in ASTM D2000, with the following line callout:

**************************************************************************
NOTE: Coordinate values with calculated design requirements. The 3BA 720 compound is the typical compound. The 3BA 620 compound has approximately 70 percent of the energy capacity and a reduced reaction. Other compounds may be available.
**************************************************************************

a. 3BA 720 A₁₄ B₁₃ C₁₂ EA₁₄ F₁₇
[b. 3BA 620 A₁₄ B₁₃ C₁₂ EA₁₄ F₁₇]

2.1.3 Performance Requirements

**************************************************************************
NOTE: This performance criteria should be tailored for extruded and molded shapes. Coordinate values with calculated design requirements.
**************************************************************************

Each of the rubber fenders shall have the following performance characteristics:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>ENERGY ABSORPTION</th>
<th>REACTION FORCE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>at 48 percent compression</td>
<td>at predicted energy attainment</td>
</tr>
<tr>
<td></td>
<td>[_____] kN-m</td>
<td>[_____] kN</td>
</tr>
<tr>
<td>[<strong><strong>]' x [</strong></strong>]'</td>
<td>[____] ft-kips</td>
<td>[____] kips</td>
</tr>
</tbody>
</table>

When vertically compressed by a plate extending the full length and width of a 300 mm one foot section of the fender, the fender shall absorb[____] [____] newton-meters [____] foot-pounds of energy plus10 percent when [48] [____] percent compressed (i.e., to a dimension of [52] [____] percent of its original height) with a corresponding load of not more than [____] [____] N [____] [____] pounds plus10 percent.

2.1.4 Break-In Deflection

Break-in deflection is required for buckling type fenders with reaction ratings of 100 tonnes or more, or if the energy-absorbing material has a reaction decrease of more than 10 percent between its original deflection and its fifth deflection. Break-in deflection shall be to at least the manufacturer's rated deflection. The number of break-in cycles shall be sufficient to assure each elements first on-dock reaction will not exceed it fully broken-in reaction by more than 5 percent.
2.1.5  **Stainless Steel Hardware**

**************************************************************************
NOTE: It is recommended that all concrete inserts be of stainless steel materials.
**************************************************************************

2.1.5.1  Plates and Angles

**ASTM A479/A479M**, Type 316L stainless steel for plates, angles, and miscellaneous hardware required to attach the fenders to the structure.

2.1.5.2  Bolts, Nuts, and Washers

**ASTM F593** or **ASTM F594**, Group 2 (316 alloy) stainless steel for nuts and bolts. **ASTM F844** for washers, except fabricate washers of 316 alloy stainless steel.

2.1.5.3  Antiseize Compound

**MIL-PRF-907**.

2.1.6  **Galvanized Steel Hardware**

**************************************************************************
NOTE: Galvanized steel hardware may be used at locations where the hardware can be easily replaced.
**************************************************************************

All hardware shall be hot-dip galvanized in accordance with **ASTM A123/A123M, ASTM A153/A153M** or **ASTM B695**, as applicable.

2.1.6.1  Plates

**ASTM A36/A36M**.

2.1.6.2  Bolts, Nuts and Washers

Bolts shall be **ASTM A307**. Nuts shall be **ASTM A563**, grade A heavy hex. Washers shall be **ASTM F844** of carbon steel.

2.1.7  **Restraint Chains and Shackles**

Chain and shackles shall meet the requirements of **FS RR-C-271**. The chain assembly shall have a design safety factor of 3:1 based on minimum breaking strength.

2.1.8  **Panels**

Panel design shall be of closed box construction for optimum strength and corrosion resistance. Material thickness shall be 9.5 mm 3/8 inch minimum when one side is exposed and 12.7 mm 1/2 inch minimum when both sides are exposed.

2.1.8.1  Facing

Facing on the panels shall be UHMWPE (ultra high molecular weight polyethylene), ultraviolet stabilized with 2.5 percent carbon black or equivalent, minimum 12.7 mm 1/2 inch wear thickness, with a 0.20 maximum
coefficient of friction per ASTM D1894. The UHMWPE shall exhibit no failure when tested per ASTM D256, Method B. The facing connections shall be configured to account for the thermal properties of the polyethylene.

2.2 FOAM-FILLED FENDERS

2.2.1 Configuration

Fenders shall have cylindrical mid-bodies with conical or hemispherical shaped ends terminating in an end fitting on the cylinder’s centerline at each end. If conical ends are provided, they shall have an angle of 60 to 75 degrees, when measured from the central axis of the fender. The fittings at either end shall be connected through the center of the fender by a chain, shall terminate in a clevis fitting sized for the indicated shackle and shall swivel to allow the end fitting to rotate freely on the axis of the fender. Design end fitting as small as possible to transmit the ultimate load of the shackle to the fender. End fitting shall be sized so as not to contact loading surfaces when the fender is compressed to 30 percent of its original diameter (70 percent compression). Fill interior of the fender with energy absorbing closed-cell foam as specified. The use of chipped or particulate foam is not acceptable.

2.2.2 Foam Core

The energy absorbing foam core shall be a closed-cell cross-linked polyethylene foam with the following properties:

a. Density, ASTM D1667, [52 to 104] [_____] to [_____] kg/m$^3$ [3.3 to 6.5] [_____] to [_____] lbs/ft$^3$

b. Tensile strength, ASTM D3575 or ASTM D412, [550] [_____] kPa [80] [_____] psi minimum

c. Elongation (ultimate), ASTM D3575 or ASTM D412, [40 percent] [_____] to [_____] minimum

d. Water absorption percent volume after 24 hour exposure, ASTM D1667, [5.0 percent] [_____] maximum

e. Continuous service temperature, [minus 54 to 49 degrees C] [minus 65 to 120 degrees F] [_____] to [_____] 

f. 25 percent compressive set, ASTM D1667, [8 percent] [_____] maximum *

g. 50 percent compressive set, ASTM D3575, [12 percent] [_____] maximum *

* Contractor option: Compressive Set of foam core material shall be based on either the 25 percent or the 50 percent requirement listed.

2.2.3 Fender Skin

The outer fender skin shall be minimum [32] [_____] mm [1.25] [_____] inches thick and constructed of elastomer as specified. Filament reinforcing is required. [Twelve] [_____] separate filament reinforcing wraps shall be applied as specified under Filament Wrap. The filament wraps shall be evenly distributed in the inner 80 percent to 90 percent of the coating thickness. The outer 10 percent to 20 percent of elastomer shall have no filament reinforcing. The elastomer and filaments shall be applied in a continuous manner to assure adhesion between the various layers. The
connection of the skin to the end fittings shall be designed and sized to transmit twice the safe tensile capacity of the chain into the fender skin.

2.2.3.1 Elastomer

The elastomer used in the fender skin shall be 100 percent PTMEG (polytetramethyleneether glycol) polyether urethane elastomer, ultraviolet stabilized with 2.5 percent carbon black or equivalent, with the following unreinforced properties:

a. Shore A. hardness, ASTM D2240, [80 to 95] [_____] to [_____]..
c. Elongation (ultimate), ASTM D412, [300 percent] [_____] minimum.
d. Tear strength, ASTM D470, [1.25] [_____] kg per mm [70] [_____] lbs/inch minimum.
e. Flex life (Ross), ASTM D1052, [200,000] [_____] cycles minimum.
f. Abrasion resistance (NBS), ASTM D1630, [100] [_____] minimum.

2.2.3.2 Filament Wrap

Construct each filament reinforcing wrap of continuous filaments applied in a helical pattern, at a helix angle of 0.79 to 1.05 rad 45 to 60 degrees to the longitudinal axis of the buoy. A wrap shall consist of two such filament helixes of equal but opposing helix angles. The spacing between the filaments in the same helix shall be no more than 3 mm 1/8 inch, measured in a direction parallel to the longitudinal axis of the fender. Each wrap shall extend along the entire longitudinal axis of the fender and shall also encase the fender end fittings and secure them to the fender body. The reinforcing filaments shall be nylon tire cord of 0.00028 kg per m 2540 denier weight with the following properties:

b. Elongation (ultimate), [18] [_____] percent

2.2.3.3 Color

Fender skin color shall be black throughout the entire thickness. Galvanized hardware shall be unpainted.

2.2.3.4 Repairability

The fender casing shall be repairable in the event of tears or punctures in the elastomer skin. The repaired area shall have not less than 90 percent of the properties as specified in paragraph entitled "Elastomer." Required repair materials shall be readily available from the fender manufacturer.

2.2.4 Internal Hardware

The internal chain connecting the two end fittings and the two end fittings shall be galvanized in accordance with ASTM A123/A123M or ASTM A153/A153M as appropriate. The chain and end clevis fitting shall have a minimum ultimate tensile capacity of [640,000] [_____] N [144,000] [_____] pounds.
The internal chain and end clevis fitting shall have a minimum ultimate tensile capacity of $[578,000]$ N $[130,000]$ pounds. Shackles shall be $[45]$ mm $[1 3/4]$ inches and shall have a minimum ultimate tensile capacity of $[289,000]$ N $[65,000]$ pounds.

### 2.2.5 Performance Requirements

Each foam-filled fender shall have the following performance characteristics:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>ENERGY ABSORPTION</th>
<th>REACTION FORCE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>at 60 percent compression</td>
<td>at predicted energy attainment</td>
</tr>
<tr>
<td>$[_____]$ kN-m</td>
<td>$[_____]$ kN</td>
<td>$[<em><strong><strong>]$ m x $[</strong></strong></em>]$</td>
</tr>
<tr>
<td>$[<em><strong><strong>]$' x $[</strong></strong></em>]$'</td>
<td>$[_____]$ ft-kips</td>
<td>$[_____]$ kips</td>
</tr>
</tbody>
</table>

The resilient, foam filled marine fenders shall be designed so that when compressed across its diameter by two parallel flat plates extending the full length and width of the fender, the fender shall absorb $[300,265]$ foot-pounds of energy plus $15$ percent when $[60]$ percent compressed (i.e. to a dimension of $[40]$ percent of its original diameter) with a corresponding load of not more than $[712,000]$ N $[160,000]$ pounds plus $15$ percent. The fender shall also be designed to withstand a sustained reaction force of $[667,200]$ N $[150,000]$ pounds for a duration of not less than 24 hours each occurrence for at least 200 occurrences during its 10-year predicted life.

### 2.2.6 Source Quality Control

#### 2.2.6.1 Fender Cyclic-Compression Test

Compress the fender along its diameter between two parallel flat plate surfaces to a compressed dimension of $40$ percent of its original diameter. Repeat the compression and release cyclic loadings for a minimum of $10$ full cycles of compression. Permanent deformation, cracking, or tearing of the fender skin, fender core, or end fittings shall constitute failure of this test.

#### 2.2.6.2 Fender Sustained-Load Test

Apply a $[667,000]$ N $[150,000]$ pound compressive load and hold this load for 24 hours. Record load and deflection each hour. Immediately after release of the load, measure rebound of the fender. Continue to record fender rebound for 24 hours. Failure of the fender or foam core to rebound to $90$ percent of its original diameter after 24 hours shall constitute failure of this test. If the foam core is not bonded to the skin of the fender, devise and execute a means for measuring rebound of the foam core and for measuring the void between the foam core and the skin. The maximum rate of compression per minute shall be $20$ percent of the total reaction force at $60$ percent compression. The full compression cycle, not including rebound, shall take a minimum of $5$ minutes.

#### 2.2.6.3 Fender Pull-Through Test

Devide and perform a test which will measure the resistance of the end
fittings and internal chain to pull through the longitudinal axis of the fender. Failure of the chain, end fittings, or skin to resist at least \([178,000] \text{ N} \) [40,000] pounds of pull-through tension shall constitute failure of this test. After loading, evidence of permanent deformation, cracking, or tearing of the fender or end fittings shall also constitute failure of this test.

2.2.6.4 Skin Thickness Core Test

**NOTE:** The suggested number of fenders that should be tested is as follows:

<table>
<thead>
<tr>
<th>Fenders Procured</th>
<th>Number to Test</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 3</td>
<td>1</td>
</tr>
<tr>
<td>4 - 8</td>
<td>2</td>
</tr>
<tr>
<td>9 - 20</td>
<td>3</td>
</tr>
<tr>
<td>21 and above</td>
<td>4</td>
</tr>
</tbody>
</table>

[AFTER delivery of all of the fenders to the construction site and before fender installation, perform a minimum of [3] [_____] skin thickness tests per fender for each of [1] [2] [3] [4] fenders to be selected at random by the Contracting Officer.] [After fabrication of all of the fenders and prior to fender shipment to the construction site, perform a minimum of [3] [_____] skin thickness tests per fender for each of [1] [2] [3] [4] fenders to be selected at random by the Contracting Officer.] Test locations on the fenders will be selected by the Contracting Officer. Each test shall consist of taking a 6 mm diameter (minimum) to 13 mm diameter (maximum) core from the fender skin which can be removed from the skin and examined for thickness of elastomer and placement of reinforcing (when reinforcing is required). Take skin thickness measurements from the core sample and record measurements noting placement of reinforcing. Where the skin thickness measurement is less than the specified minimum, or the minimum required by the Contractor's design (whichever is greater) by more than 10 percent, reject the fender. In addition, if the average of skin thickness tests for one fender is not equal to or greater than the specified minimum, or the minimum required by the Contractor's design (whichever is greater), reject the fender. If tested fender is rejected, at the option of the Contracting Officer, the Contractor shall then conduct thickness tests for additional fenders. Replace rejected fenders with fenders meeting the provisions of this specification. Test replacement fenders for skin thickness as specified herein. Skin thickness tests will be witnessed by the Contracting Officer. The Contractor shall notify the Contracting Officer 10 working days prior to conducting skin thickness tests. After skin thickness testing, patch core holes with elastomer of the same composition and thickness as the specified elastomer skin. Nylon reinforcing is not required in core hole patches.

2.2.7 Connecting Hardware

The connecting chain, swivel and shackles shall be galvanized in accordance with ASTM A123/A123M or ASTM A153/A153M, as appropriate. The hardware
shall be as follows:

<table>
<thead>
<tr>
<th>Item</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chain</td>
<td>ABS 2, Grade 2, Stud Link or Open Link</td>
</tr>
<tr>
<td>Shackle</td>
<td>FS RR-C-271, Type IVA, Class 3, Grade A</td>
</tr>
<tr>
<td>Swivel</td>
<td>FS RR-C-271, Type VII, Class 2</td>
</tr>
</tbody>
</table>

All connecting bolts and pins shall be of mild steel, matching the properties of the shackle bow. For Class 3 shackles, the bolt or pins shall be secured in place with stainless steel (Type 316) cotter pins or locking pins.

2.3 PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

2.3.1 Configuration

Fenders shall be manufactured in accordance with ISO 17357-1. Fenders shall have cylindrical mid-bodies with hemispherical shaped ends terminating in an end fitting on the cylinder's centerline at each end. The flange opening fittings shall be sized (not to exceed 12 percent of fender diameter) so as not to contact loading surfaces when the fender is compressed to 20 percent of its original diameter (80 percent compression). Pneumatic and Hydro-Pneumatic fenders shall incorporate a safety valve for fenders 2500mm 8 feet diameter or larger and pressure monitoring system in their manufacture.

2.3.2 Dimensions

Diameter and length as indicated.

2.3.3 Fender Skin

The fender skin shall have a minimum strength in accordance with ISO 17357-1. When designing the skin thickness, the Manufacturer shall consider skin strength and the stress induced by the internal operating and berthing pressure, and the abrasion and impact loads caused by handling and berthing operations. The Manufacturer shall ensure an adequate margin of safety is incorporated for the fender's intended use. The connection of the skin to the end fittings shall be designed to resist the specified minimum endurable pressure at 60 percent compression in ISO 17357-1 for the respective operating pressure. For hydro-pneumatic fenders, the Minimum Endurable Pressure value in Table 5 of ISO 17357-1 (Pneumatic 80 fender pressure requirements) should be used.

2.3.3.1 Elastomer

The elastomer shall meet the requirements of ISO 17357-1, material test of rubber.

**************************************************************************

NOTE: After aging refers to air oven aging at 70 degrees C 158 degrees F plus/minus 1 degree C 33.8 degrees F, 96 hours.

**************************************************************************
Per ISO 17357-1, the elastomer used in the outer skin shall be rubber, with the following unreinforced properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Before Aging</th>
<th>After Aging</th>
</tr>
</thead>
<tbody>
<tr>
<td>a. Durometer Hardness, Shore A (ASTM D2240 or ISO 37)</td>
<td>[50 to 70]</td>
<td>Not to exceed the original property by more than 8</td>
</tr>
<tr>
<td>b. Minimum Tensile strength (ASTM D412 or ISO 37)</td>
<td>[18] MPa [2600] psi</td>
<td>Not less than 80 percent of original property</td>
</tr>
<tr>
<td>c. Minimum Elongation (ultimate) (ASTM D412 or ISO 37)</td>
<td>[400 percent]</td>
<td>Not less than 80 percent of original property</td>
</tr>
<tr>
<td>d. Minimum Tear strength (ASTM D624 or ISO 34-1)</td>
<td>[400] N per cm [228 lbs/inch]</td>
<td></td>
</tr>
<tr>
<td>e. Compression set (ISO 815-1)</td>
<td>30 percent (70 degrees C 158 degrees F plus/minus 1 degree C 33.8 degrees F, 22 hours) or less</td>
<td></td>
</tr>
<tr>
<td>f. Static ozone aging test</td>
<td>No cracks after elongation by 20 percent and exposure to 50 ppm (parts of ozone per hundred million of air by volume) at 40 degrees C 104 degrees F for 96 hours</td>
<td></td>
</tr>
</tbody>
</table>

The elastomer used in the inner skin shall be rubber, with the following unreinforced properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Before Aging</th>
<th>After Aging</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Durometer Hardness, Shore A (ASTM D2240 or ISO 37)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Before Aging | [40 to 60] [_____]  
---|---  
After Aging | Not to exceed the original property by more than 8

2. Minimum Tensile strength

(\textit{ASTM D412} or \textit{ISO 37})

| Before Aging | [10] MPa [1450] psi [_____]  
---|---  
| After Aging | Not less than 80 percent of original property

3. Minimum Elongation (ultimate)

(\textit{ASTM D412} or \textit{ISO 37})

| Before Aging | [400 percent] [_____]  
---|---  
| After Aging | Not less than 80 percent of original property

2.3.3.2 Color

Fender skin color shall be black throughout the entire thickness. Galvanized hardware shall be unpainted.

2.3.3.3 Repairability

The fender casing shall be repairable in the event of tears or punctures in the elastomer skin. The repaired area shall have not less than 90 percent of the properties as specified in paragraph entitled "Elastomer". Required repair materials shall be readily available from the fender manufacturer.

2.3.4 Performance Requirements

The performance of each fender shall be meet the requirements of \textit{ISO 17357-1}. The performance of the fender shall be confirmed with a prototype fender performance confirmation per \textit{ISO 17357-1}. The tests shall include a parallel performance, angular compression, durability, compression-recovery and puncture-resistance.

2.3.4.1 Design Proof

Design proof shall document minimum endurable pressure based on at least 30 test samples that cover entire range of compression from 0 percent to 60 percent deflection.

2.3.4.2 Pneumatic Fenders

**************************************************************************  
\textbf{NOTE:} Refer to ISO 17357-1 for guaranteed energy absorption and reaction force values for nominal size of fender under consideration.  
**************************************************************************
Each pneumatic fender shall have the following performance characteristics:

<table>
<thead>
<tr>
<th>SIZE</th>
<th>ENERGY ABSORPTION</th>
<th>REACTION FORCE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>at 60 percent compression</td>
<td>at predicted energy attainment</td>
</tr>
<tr>
<td>[_____] kN-m</td>
<td>[_____] kN</td>
<td>[<em><strong><strong>] m x [</strong></strong></em>]</td>
</tr>
<tr>
<td>[<em><strong><strong>]' x [</strong></strong></em>]'</td>
<td>[_____] ft-kips</td>
<td>[_____] kips</td>
</tr>
</tbody>
</table>

2.3.4.3 Hydro-pneumatic Fenders

**************************************************************************
NOTE: The performance of the hydro-pneumatic fenders vary according to the size, water/air ratio and internal pressure. The Manufacturer should be consulted in the selection of the desired performance characteristics.
**************************************************************************

**************************************************************************
NOTE: Refer to ISO 17357-1 for guaranteed energy absorption and reaction force values for nominal size of fender under consideration.
**************************************************************************

Each hydro-pneumatic fender shall have the following performance characteristics:

<table>

<td>[<em><strong><strong>] m x [</strong></strong></em>]</td>
</tr>
<tr>
<td>[<em><strong><strong>]' x [</strong></strong></em>]'</td>
<td>[_____] ft-kips</td>
<td>[_____] kips</td>
</tr>
</tbody>
</table>

2.3.5 Source Quality Control

2.3.5.1 Dimensional Inspection

The dimensions of all fenders shall be inspected. They shall meet the requirements of ISO 17357-1.

**************************************************************************
NOTE: The dimensional tolerances per ISO 17357-18 are as follows:
- length: plus 10 percent, minus 5 percent
- diameter: plus 10 percent, minus 5 percent

The diameter shall be obtained from the average of at least two different measurements taken at the middle of the cylindrical section of the fender.
**************************************************************************
2.3.5.2 Air-leakage Test

Air leakage tests shall be performed per ISO 17357-1. The test shall confirm that there is no air leakage when the initial pressure is held for more than 30 minutes.

2.3.5.3 Hydrostatic-pressure Test

Each pneumatic and hydro-pneumatic fender shall be hydrostatic-pressure tested for its rated operating pressure (internal pressure at 0 percent deflection). Testing shall be in accordance with ISO 17357-1.

2.3.5.4 Pressure Relief Valve Test

The pressure relief valve shall be mounted to a test chamber for a pressure relief test. After mounting, the chamber internal pressure shall be slowly increased until the specified relief pressure is attained. The pressure relief valve shall be set to relieve pressure according to the manufacturers recommendations. If the pressure relief valve opens at a higher or lower pressure than allowed, it shall be adjusted as required and tested again until within the specified limits. A written test procedure and records pertaining to this test shall be maintained.

2.3.6 Connecting Hardware

The connecting chain, swivel and shackles have same requirements as those specified for foam filled fenders.

2.3.6.1 Hydro-pneumatic Guy Chain

Guy chains shall be provided for attachment from the upper fender end fitting assembly to the pier. That portion of the chain extending from the fender itself shall be covered with protective rubber sleeves to a point beyond which the fender will be contacted for fender body protection. Size and lengths shall be as indicated on the Drawings.

2.3.6.2 Hydro-pneumatic Hanging Chain

Hanging chains shall be provided for attachment from the counterweight to the pier. Size and lengths shall be as indicated on the Drawings.

2.3.6.3 Hydro-pneumatic Lower End Fitting Assembly

The lower end fitting shall be fabricated of steel and shall provide connecting points for the connecting chain and the hanging chain.

2.3.6.4 Hydro-pneumatic Upper End Fitting Assembly

The upper end fitting shall be fabricated of steel and shall be designed to house all necessary valves and fitting necessary to charge and discharge the fender body with air and water necessary for proper installation and operation of the deployed fender. This shall include the air charging assembly, the water charging assembly, the pressure safety relief valve assembly and lifting eyes adequately sized for guy chain attachment. All valves and related hardware shall be attached to the inner assembly plate. An outer assembly blind flange plate shall be included to provide protection during handling and operations. The pressure relief valve shall be bronze, shall be adjustable to ensure maintenance of the proper setting,
and shall be capable of adequate flow (volume of air released per second) to maintain a safe internal pressure.

2.3.6.5 Hydro-pneumatic Counterweight

A steel counterweight shall be provided for attachment to the fender's lower flange assembly by two shackles. It shall include an upper eye for shackle attachment of the hanging chain and shall be coated with a marine coating system. The counterweight shall be sized per the Manufacturer's recommendation.

PART 3 EXECUTION

3.1 EXTRUDED FENDERS AND MOLDED FENDERS

Install the fenders in the position and at the spacing indicated on the drawings. Tighten the bolts per the manufacturers requirements.

3.2 FOAM-FILLED FENDERS

Install fenders as indicated on the drawings and in accordance with the manufacturer's specifications and shop drawings. Bolts shall be tightened an additional 1/3 turn of the nut, from the snug tight condition, and secured with cotter pins.

3.3 PNEUMATIC AND HYDRO-PNEUMATIC FENDERS

The fendering system shall be installed in accordance with the Drawings, manufacturer's specifications and shop drawings. Bolts shall be tightened an additional 1/3 turn of the nut, from the snug tight condition, and secured with cotter pins or screw lock.

3.4 WELDING

Welding shall be performed in accordance with AWS D1.1/D1.1M.

3.5 CONNECTIONS

3.5.1 Antiseize Compound

Coat threads of bolts prior to applying washers and nuts. Recoat bolt thread projection beyond nut after tightening.

NOTE: This guide specification covers the requirements for arch-type rubber marine fenders.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

NOTE: On the project drawings, show location of fenders and size and spacing of fasteners.

PART 1   GENERAL

1.1 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also
use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS (ASME)

ASME B18.22M (1981; R 2017) Metric Plain Washers

ASTM INTERNATIONAL (ASTM)

ASTM D575 (1991; R 2012) Rubber Properties in Compression

Stainless Steel Bolts, Hex Cap Screws, and Studs

U.S. DEPARTMENT OF DEFENSE (DOD)

MIL-PRF-907  (2020; Rev H) Antiseize Thread Compound, High Temperature

1.2 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G". Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a “G” to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

The "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are [for Contractor Quality Control approval.][for information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the
Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-03 Product Data
   Fender
   Hardware

SD-05 Design Data
   Reaction--energy--percent compression curve
   Dimension
   Fender material specifications
   Design calculations

SD-06 Test Reports
   Minimum Tensile Strength
   Shore Hardness (Durometer)
   Modulus at 400 Percent Elongation
   Maximum Compression Set
   Tear Resistance
   Minimum Elongation
   Ozone Resistance
   Low Temperature Impact Resistance
   Water Absorption
   Heat Resistance
   Compression Deflection Resistance
   Fender Compression Test
   Angular Fender Compression Test

   Tests shall have been performed on the specified fender within 5 years of submittal of the reports for approval. Test reports shall be accompanied by notarized certificates from the manufacturer certifying that the tested material is of the same type, quality, manufacture and make as that proposed to be supplied.

SD-08 Manufacturer's Instructions

Installation Instructions
1.3 DELIVERY HANDLING AND STORAGE

Fenders shall be undamaged when delivered and shall be handled and stored so as to prevent damage, such as bending or abrading end fittings, cutting of rubber, or damage to coating of hardware. Protect fenders from exposure to damaging liquids, oils, greases and extended exposure to sunlight.

PART 2 PRODUCTS

2.1 CONFIGURATION

******************************************************************************
NOTE: Coordinate angle with angular compression test requirements.
******************************************************************************

**Fender** shall be extruded and shall be continuous in the length indicated. The fenders shall have a truncated "A" cross section shape and be attached to the structure at the base, the widest dimension, of the arch. The connecting hardware shall be fully exposed. No encased hardware or molded fenders shall be allowed. The fender and hardware shall be designed and factory tested to the loads per linear meter foot of fender specified in paragraph entitled "PERFORMANCE," for angles of approach of 0 and 0.26 rad 0 and 15 degrees. Fender anchor bolts and method of anchorage shall be of the size and spacing required by the manufacturer's design and testing; however, the size and spacing of anchor bolts indicated on the drawings shall be construed to be the minimum required, unless exceeded by the requirements of the fender manufacturer's design.

2.2 ELASTOMER

The elastomer shall be the ethylene propylene dimonomer (EPDM), as specified in ASTM D2000, with the following properties:

******************************************************************************
NOTE: Coordinate values with calculated design requirements.
******************************************************************************

### 2.3 HARDWARE

#### 2.3.1 Plates and Angles

ASTM A479/A479M, Type 316L stainless steel for plates, angles, and miscellaneous hardware required to attach the fenders to the structure.

#### 2.3.2 Nuts, Bolts, and Washers

ASTM F593 or ASTM F594, Group 2 (316 alloy) stainless steel for nuts and bolts. ASME B18.22M ASME B18.21.1 for washers, except fabricate washers of 316 alloy stainless steel.

#### 2.3.3 Antiseize Compound

MIL-PRF-907.

### 2.4 PERFORMANCE

**************************************************************************

NOTE: Coordinate values with calculated design requirements.
**************************************************************************

When vertically compressed by a plate extending the full length and width of a 0.30 m one foot section of the fender, the fender shall absorb [8950] _____ joules [6,600] _____ foot pounds of energy plus10 percent when [48] _____ percent compressed (i.e., to a dimension of [52] _____ percent of its original height) with a corresponding load of not more than...
2.4.1 FENDER COMPRESSION TEST

**************************************************************************
NOTE:  Coordinate values with calculated design requirements.
**************************************************************************

Compress fender along its longitudinal axis between two parallel flat plate surfaces to a compressed dimension of [48] percent of its original height. Record load and the corresponding deflection at 6 mm 1/4 inch increments and plot as a graph of load versus deflection. The Load-Deflection curve shall then be integrated to generate an Energy-Deflection curve for the fender. After compression of the fender to [48] percent of its original height, the fender shall be rebound to 98 percent of its original height within [ten] minutes after the load is removed.

2.4.2 ANGULAR FENDER COMPRESSION TEST

**************************************************************************
NOTE:  Coordinate values with calculated design requirements.
**************************************************************************

Compress fender along its longitudinal axis between two flat plate surfaces, at an angle of [0.26] rad [15] degrees to each other, to a compressed dimension of [48] percent of its original height. Record load and the corresponding deflection at 6 mm 1/4 inch increments and plot as a graph of load versus deflection. The Load-Deflection curve shall then be integrated to generate an Energy-Deflection curve for the fender. After compression of the fender to [48] percent of its original height, the fender shall rebound to 98 percent of its original height within [10] minutes after the load is removed.

PART 3 EXECUTION

3.1 INSTALLATION

Install fenders with the fender longitudinal axis vertical. Install the fenders in the position and at the spacing indicated on the drawings.

3.1.1 Antiseize Compound

Coat threads of bolts prior to applying washers and nuts. Recoat bolt thread projection beyond nut after tightening.

-- End of Section Table of Contents --
NOTES: This guide specification covers the requirements for preparing the embankment and blanket foundations and placing and compacting all permanent fills and backfills for earth and rock fill dams. This section was originally developed for USACE Civil Works projects.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

This guide specification has removed paragraphs for related construction activities that have their own UFGS Guide Specifications. These include Section 31 23 00.00 20 EXCAVATION AND FILL, Section 31 00 00 EARTHWORK, Section 31 60 00 FOUNDATION PREPARATION and Section 31 11 00 CLEARING AND GRUBBING among others. Those Guide Specifications should be included and referenced as is appropriate.

REMOVE INFORMATION AND REQUIREMENTS NOT REQUIRED IN RESPECTIVE PROJECT, WHETHER OR NOT BRACKETS ARE PRESENT.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: This guide specification provides for furnishing all plant, labor, and equipment, and performing all operations in connection with the placement of embankment materials for earthen or
rockfill dams.

The requirements for rock as prescribed herein are intended to be used on embankments involving rock fill sections. Where rock for slope protection is specified, Section 35 31 19 STONE, CHANNEL. SHORELINE/COASTAL PROTECTION FOR STRUCTURES should be used.

This specification provides for furnishing all materials, labor, and equipment, and performing all operations in connection with the placement of embankment materials for construction of the [earthen][rockfill] dam.

1.1 UNIT PRICES

**************************************************************************
NOTE: If Section 01 22 00.00 10 (USACE) or Section 01 20 00.00 20 (NAVFAC) PRICE AND PAYMENT PROCEDURES is included in the project specifications, this paragraph title (UNIT PRICES) should be deleted from this section and the remaining appropriately edited subparagraphs below should be inserted into Section 01 22 00.00 10 or Section 01 20 00.00 20 as appropriate.
**************************************************************************

1.1.1 Compacted Fill, [Impervious][Pervious][Random]

**************************************************************************
NOTE: Include separate paragraphs for each type of compacted fill material that will be required for the construction of the dam, and select the appropriate bracketed description for each.
**************************************************************************

1.1.1.1 Payment

Payment will be made for costs associated with placement of compacted [impervious] [pervious] [random] fill embankment; spreading, harrowing, moisture control, compacting, removing objectionable materials; and all other incidental work required for the construction, protection, and maintenance of the dam embankment. [This payment is separate to any payment for excavating and transporting of material as specified in Section 31 00 00 EARTHWORK.] Payment for preparation of foundations to receive compacted [impervious] [pervious] [random] fill will be made in accordance with Section 31 60 00 FOUNDATION PREPARATION.

1.1.1.2 Measurement of Fill Material

Compacted [impervious][pervious][random] fill will be measured for payment in place based upon the established limit lines and the payment lines shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [including the cut-off trench] and[ accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.
1.1.1.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.2 Backfill, [Impervious][Pervious][Random]

**************************************************************************
NOTE: Include separate paragraphs for each type of backfill material that will be required for the construction of the dam, and select the appropriate bracketed description for each.
**************************************************************************

1.1.2.1 Payment

Payment will be made for costs associated with preparation of contacting surfaces, including the spreading, compacting, moisture control, and all other operations incidental to the placement of [impervious] [pervious] [random] backfill. [This payment is in addition to any payment for excavating and transporting of the material as specified in Section 31 00 00 EARTHWORK.] Payment for preparation of rock foundations to receive [impervious] [pervious] [random] backfill will be done in accordance with Section 31 60 00 FOUNDATION PREPARATION.

1.1.2.2 Measurement

Backfill, [impervious][pervious][random], will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [and accomplishment of foundation preparation (except scarifying) ]and the lines, grades and slopes of the accepted embankment.

1.1.2.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.3 Filter [Sand][Gravel][Rock]

**************************************************************************
NOTE: If several classes of material are to be used to include transition zones or a multi-stage filter, a separate pay item should be included for each class.
**************************************************************************

1.1.3.1 Payment

Payment will be made for costs associated with obtaining filter [sand] [gravel] [rock], [transportation to the site (whether from required excavation, borrow, or commercial source),] mixing the materials to the required gradation, spreading, moisture control, compacting, removing objectionable materials, and all other incidental work required for the construction, protection, and maintenance of the filter. This payment is in addition to any payment for excavation (from required excavation or borrow) of the material as specified in Section 31 00 00 EARTHWORK.
1.1.3.2 Measurement

Filter [sand][gravel][rock] will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation and [accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.

1.1.3.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.4 Rock Fill

**************************************************************************
NOTE: If several classes of rock fill material are used, a separate pay item should be included for each class of material.
**************************************************************************

1.1.4.1 Payment

Payment will be made for costs associated with rock fill, including all operations with excavation, quarrying, stockpiling, hauling, placing, moisture conditioning, removing objectionable material, and all other operations incidental to the placement of the rock fill.

1.1.4.2 Measurement

Rock fill will be measured for payment in place based upon the established limit lines and the payment lines indicated on the cross sections shown on the plans or as otherwise established. Limit lines will be established by the volume between the foundation lines as determined on the basis of a survey made from excavation [and accomplishment of foundation preparation (except scarifying)] and the lines, grades and slopes of the accepted embankment.

1.1.4.3 Unit of Measure

Unit of measure: cubic meter yard.

1.1.5 Additional Rolling for Compaction

**************************************************************************
NOTE: If an end result (production) specification is used for compaction in section COMPACT, delete this item.
**************************************************************************

1.1.5.1 Payment

Payment will be made for costs associated with additional rolling for compaction.

1.1.5.2 Measurement

**************************************************************************
Additional rolling for compaction will be measured for payment on the basis of the number of roller hours the compaction equipment is operated in accomplishing the compaction specified in [Section 35 73 13 EMBANKMENT FOR EARTH DAMS, ]paragraph COMPACTION.

1.1.5.3 Unit of Measure

Unit of measure: hour.

1.1.6 Instrumentation [Piezometer] [Settlement Gage] [Survey Marker]

NOTE: The installation of instrumentation is not strictly speaking an activity of construction of an embankment dam. This activity should be placed within its own specification division as an item of SPECIAL CONSTRUCTION. There is presently no UFGS guide specification for this item. The specification writer should consider the use of a section for SPECIAL CONSTRUCTION, and if so, delete the following paragraphs.

Include paragraphs for all types of instruments as may be utilized.

1.1.6.1 Payment

Payment will be made for costs associated with furnishing, installing, [monitoring] and maintaining the [piezometers] [settlement gages] [survey markers] during construction as specified[ in Section 35 73 13 EMBANKMENT FOR EARTH DAMS] during construction, including measurements required to be made by the Contractor.

1.1.6.2 Measurement

[Piezometers] [Settlement gages] [Survey markers] to be installed will be measured for payment on the basis of the number specified[ in Section 35 73 13 EMBANKMENT FOR EARTH DAMS].

1.1.6.3 Unit of Measure

Unit of measure: each.

1.2 REFERENCES

NOTE: This paragraph is used to list the publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.
Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

**************************************************************************

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

ASTM INTERNATIONAL (ASTM)

ASTM D422 (1963; R 2007; E 2014; E 2014) Particle-Size Analysis of Soils

ASTM D698 (2012; E 2014; E 2015) Laboratory Compaction Characteristics of Soil Using Standard Effort (12,400 ft-lbf/cu. ft. (600 kN-m/cu. m.))

ASTM D1557 (2012; E 2015) Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3) (2700 kN-m/m3)

ASTM D2167 (2015) Density and Unit Weight of Soil in Place by the Rubber Balloon Method

ASTM D2487 (2017; E 2020) Standard Practice for Classification of Soils for Engineering Purposes (Unified Soil Classification System)
1.3 DEFINITIONS

**************************************************************************
NOTE: Add applicable definitions as appropriate for the project.
**************************************************************************

1.3.1 Embankment

Embarkment, as used in these specifications, is defined as the earth [and rock] fill portions of the dam structure and includes all types of earth [and rock] fill and filter materials for the dam [and cut-off trench,] and all other specified or directed earth and rock fills within the limits of the dam[, excepting those stone and filter materials used for slope protection in accordance with Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES].

1.3.2 Compacted Fill

Compacted fill includes all fill, except backfill and rock fill, deposited in layers and compacted by rolling or tamping. The types of compacted earth fill are:

a. Impervious fill for the [cut-off trench][, horizontal and inclined impervious blankets,][ and ]impervious section of the embankment;

b. Random fill where indicated on the plans;

c. Pervious fill forming the upstream and downstream sections of the embankment or where indicated on the plans, and
d. Filter drainage layers forming the horizontal [and/or vertical or inclined] pervious drainage blankets.

1.3.3 Uncompacted Fill

All fill, deposited in layers but not compacted except by the controlled movement of hauling and spreading equipment.

1.3.4 Backfill

Backfill, as used in these specifications, is defined as that excavation refill which cannot be placed around or adjacent to a structure until the structure is completed and reached a specified concrete strength, requires special compaction efforts, and is defined by limits indicated on the plans and specifications.

1.3.5 Filter Materials

Filter materials are defined as material used as drainage or transition zones between various types of fill and backfill (impervious, pervious, random, and rock fill).

1.3.6 Rock Fill

Those portions of the embankment where rock is used as embankment fill.

1.3.7 Unsatisfactory Materials

**************************************************************************

NOTE: Unsatisfactory material will be defined in accordance with ASTM D2487. This paragraph should be edited as appropriate to delete inapplicable materials.

**************************************************************************

[Materials which do not comply with the requirements for satisfactory materials are unsatisfactory.] [Materials unsatisfactory for use as fill and backfill are those earth and earth mixtures that classify by ASTM D2487 as [CH], [MH], OL, OH, and PT. In addition all topsoil, organics, roots and other organic matter, biodegradable materials, debris, trash, rubble and contaminated soil is unsatisfactory for use as embankment, backfill or engineered fills. Unsatisfactory materials or processes are not in compliance with these specifications.] Notify the Contracting Officer when encountering any contaminated materials.

1.3.8 Unsatisfactory vs Satisfactory

The use of the terms satisfactory and unsatisfactory in this section is in reference to the Contract requirements. Satisfactory materials or processes are in full compliance with these specifications and unsatisfactory materials or processes are not in compliance with these specifications.

1.4 SYSTEM DESCRIPTION

1.4.1 Haul Roads

**************************************************************************
NOTES: Where roads are to be used by other Contractors, the limits of responsibility should be stated in the specifications.

With reference to the coverage in this paragraph, it has been found advantageous to establish a project traffic pattern for jobs of considerable scope and to indicate on the plans acceptable haul road locations and to specify maximum grades and minimum road widths which are considered suitable. Where project operations are varied and the use of haul roads by other Contractors is required, the specifications should so indicate. Detailed requirements for haul roads should be based upon the anticipated length of time the roads will be in use, traffic load and probable types of hauling equipment applicable to the specific project. This paragraph should be modified as necessary to clarify the requirements of the particular project.

**************************************************************************

Haul roads must be [located as indicated and] located and constructed as approved. Design haul roads to maintain the intended traffic, to be free draining and maintain good condition throughout the contract period, unless otherwise directed. Remove haul roads within the area of contact between the embankment and its foundation and abutments and treat the area as specified in paragraph PREPARATION OF FOUNDATION, PARTIAL FILL SURFACE, AND ABUTMENTS.

Submit a Plan of Operations for approval thirty days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, for accomplishing all embankment and backfill construction and for the location and construction of haul roads.

1.4.2 Stockpiling from [Approved Borrow Sources] [Required Excavations]

When the excavation from [approved borrow sources] [or required excavations] progresses at a faster rate than placement in the fill is being accomplished, stockpile excavated material at approved locations adjacent to the work until its use is authorized. No payment will be made for such stockpiling nor for the reloading and hauling of this material to its final position in the embankment.

1.5 SUBMITTALS

**************************************************************************

NOTE: Review Submittal Description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item if the submittal is sufficiently important or complex in context of the project.
For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for Architect-Engineer; "DO" for District Office (Engineering Division or other organization in the District Office); "AO" for Area Office; "RO" for Resident Office; and "PO" for Project Office. Codes following the "G" typically are not used for Navy, Air Force, and NASA projects.

An "S" following a submittal item indicates that the submittal is required for the Sustainability eNotebook to fulfill federally mandated sustainable requirements in accordance with Section 01 33 29 SUSTAINABILITY REPORTING. Locate the "S" submittal under the SD number that best describes the submittal item.

Choose the first bracketed item for Navy, Air Force and NASA projects, or choose the second bracketed item for Army projects.

**************************************************************************

Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-01 Preconstruction Submittals

Plan of Operations; G, DO

30 days prior to commencement of haul road construction or placing embankment and backfill, whichever is earlier, submit for approval a Plan of Operations for accomplishing all embankment and backfill construction and for the location and construction of haul roads. This plan must include, but not be limited to, the proposed sequence of construction for embankment and backfill items, and methods and types of equipment to be utilized for all embankment and backfill operations, including transporting, placing, and compaction. Also include the names and addresses of the commercial testing labs which will perform the soil testing and inspection and describe how all required soils testing will be performed in this plan.

Embarkment and Backfill Materials; G, DO

At least 30 days prior to delivery of any Contractor-furnished material to the site of the work, submit soil classification test results, moisture-density curves, gradation curves, and laboratory results of the required tests of the proposed material.
SD-06 Test Reports

Foundation Inspection; G, DO

Provide a foundation inspection report, certified by a registered Professional Geotechnical Engineer or Geologist, documenting the inspection. The report must include, at a minimum, a description of each geologic stratum encountered along the slopes and excavation bottom, laboratory testing results if any tests were performed, and other pertinent information. The report's main body must be a color copy submitted to the Government within four calendar days of completion of the inspection by the Contractor's geologist. Include figures, tables and photographs as necessary.

Measurement of Fill Material; G, RO

Submit a copy of the records of each compliance survey the next work day following the survey.

Testing; G, RO

Within 24 hours of conclusion of physical tests, three copies of test results, including calibration curves and results of calibration tests.

SD-07 Certificates

Testing; G, RO

Qualifications of the [USACE validated] [validate] commercial testing laboratory or the Contractor's validated testing facilities.

Nuclear Density; G, RO

Use nuclear density testing equipment in accordance with ASTM D6938. In addition, the following conditions are applicable:

a. Prior to using the nuclear density testing equipment on the site, submit to the Contracting Officer a certification that the operator has completed a training course approved by the nuclear density testing equipment manufacturer, the most recent data sheet from the manufacturer's calibration, and a copy of the most recent statistical check of the standard count precision.

b. Provide nuclear density testing equipment capable of extending a probe a minimum of 12 inches down into a hole.

c. Field density reports must include the laboratory density reports applicable to the field data presented.

PART 2 PRODUCTS

2.1 MATERIALS

**************************************************************************
NOTE: This paragraph may be modified to specify soils for various types of fill in accordance with
**************************************************************************
the Unified Soil Classification System. When this is done, the optional sentence should be selected.

[Classification of soils will be in accordance with ASTM D2487.]

2.1.1 General

The origin of any fill material in no way determines where it may be used in the embankment. Obtain materials for embankment fills from required excavations, from the borrow areas indicated, or from off-site commercial sources as required. The intention is to use the most suitable materials obtainable from these sources. Material to be wasted will be specifically designated at the time the material is excavated. Materials containing brush, roots, sod, organics or other perishable materials will not be considered suitable. The suitability of the materials are subject to approval and their disposition in the embankment will be as directed. Excavate in the borrow areas in the location determined by the Contracting Officer, whenever such control is necessary to obtain the type of material required for the embankment. Use borrow pits in accordance with Section 31 00 00 EARTHWORK paragraph SELECTION OF BORROW MATERIAL and paragraph OPENING AND DRAINAGE OF EXCAVATION AND BORROW PITS. Mixing of materials during the excavating process at the borrow area may be required.

NOTE: The designer may choose to limit the definition of impervious with restriction on liquid limit, plasticity index, or fines content. If so, those restrictions should be added to paragraph 2.1.2.

2.1.2 Impervious Fill

Provide material for compacted impervious fill consisting of [GC SC ML CL MH CH clays, silty clays, or clayey silts] classified as cohesive materials in accordance with ASTM D4318, ASTM C136/C136M and ASTM D1140 obtained from the designated borrow areas [or required excavation] [or off-site commercial sources].

2.1.3 Random Fill

Provide material for compacted random fill consisting of any or all types of satisfactory material which are suitable for use in the dam embankment.

2.1.4 Pervious Fill

Material for compacted pervious fill must be clean, free draining sand or sand and gravel obtained from natural deposits [within borrow areas and from designated excavations][ from sources designated]. Provide particles of material that are free from any objectionable coating and not more than [_____] percent of the material, by weight, and passing a 0.075 mm No. 200 sieve.

2.1.5 Uncompacted Fill

Except as otherwise [indicated or ]required, material for uncompacted fill may consist of any or all types of material available from required excavations and designated borrow areas with the exception of material that
is considered unsatisfactory as defined in Unsatisfactory Materials.

2.1.6 Backfill

Provide backfill consisting of material of a type and quality conforming to that specified for the contiguous embankment fill material, unless otherwise directed.

2.1.7 Filter Drainage Layers

Filter materials must meet the quality requirements of ASTM C33/C33M concrete aggregate except as stated herein. Filter materials must consist of sand, gravel, or crushed stone composed of tough, durable, angular particles; must be free from thin, flat and elongated pieces, and must contain no organic matter or soft, friable particles. The material must be washed with clean water such that the final product has no visible soil, soil slurry, or objectionable coatings.

Gradation of the material must be determined in accordance with ASTM D2487, ASTM D422, ASTM D1140, and ASTM D4318. All points on individual grading curves obtained from representative samples of filter material must lie between the boundary limits as defined by smooth curves drawn through the tabulated grading limits plotted on a mechanical analysis diagram. The individual grading curves within these limits must not exhibit abrupt changes in slope denoting skip grading, scalping of certain sizes or other irregularities which would be detrimental to the proper functioning of the filter; and will be well-graded between the limits specified below:

<table>
<thead>
<tr>
<th>SIEVE SIZE</th>
<th>PERCENT BY WEIGHT PASSING</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2.1.8 Rock Fill

2.1.8.1 Rock

Stone classed as "rock" must be sound; well graded and free draining. The presence of rock meeting the requirements of slope protection, Section 35 31 19 STONE, CHANNEL, SHORELINE/COASTAL PROTECTION FOR STRUCTURES, will not be objectionable. Obtain rock from required excavation and from already existing stockpiles and from designated quarries. Shales, mudstone and other rock and excavated material unsuitable for use as rock fill, will be wasted in designated spoil areas.

PART 3 EXECUTION

3.1 CONSTRUCTION

3.1.1 Lines and Grades

**************************************************************************
NOTE: If settlement of the foundation is expected during construction, install settlement gages as detailed in 3.9.2 and 1.1.11.
**************************************************************************
Construct the embankment to the lines, grades and cross sections indicated, unless otherwise directed. The Government reserves the right to increase or decrease the foundation widths or the embankment slopes or make such other changes in the embankment sections as may be deemed necessary to produce a safe structure. Increases in height of section, made to compensate for shrinkage or consolidation of the embankment material or foundation during construction of the embankment, will not exceed five percent of the height above the foundation indicated without the approval of the Contracting Officer. The end slopes and side slopes of partial fill sections must not be steeper than [one vertical on [_____] horizontal][those shown].

3.1.2 Conduct on the Work

Maintain and protect the embankment in a satisfactory condition at all times until final completion and acceptance of all work under the contract. At all times protect pervious fills, filters, and drainage layers from erosion, runoff, and contamination from different soils or other materials. These materials must be uncontaminated for minimum dimensions shown on the plans. Minimize equipment travel on these zones to prevent segregation, contamination, and breakdown of materials.

If in the opinion of the Contracting Officer the hauling equipment causes horizontal shears or slickensides, rutting, quaking, heaving, cracking or excessive deformation of the embankment, limit the type, load or travel speed of the hauling equipment on the embankment. Replace any embankment material rendered unsuitable after being placed in the embankment and before final acceptance of the work in a satisfactory manner and no additional payment will be made therefor. Excavate and remove from the embankment any material which the Contracting Officer considers objectionable, dispose of such material, and refill the excavated area as directed, all at no cost to the Government. Do not place unsatisfactory materials in the embankment. The Contractor may be required to remove, without additional payment, any embankment material placed outside of prescribed slope lines.

3.2 PREPARATION OF FOUNDATION, PARTIAL FILL SURFACES AND ABUTMENTS

*******************************
NOTE: General preparation of the foundation for dam construction should be addressed in Section 31 60 00, FOUNDATION PREPARATION. The following paragraphs may be deleted or modified as appropriate to provide explicit direction to preparation of surfaces for placement of embankment fill.
*******************************

3.2.1 Earth

After excavation or stripping of the embankment foundation[ and excavation of the cut-off trench] to the extent indicated or otherwise required, break down the sides of stump holes, test pits, and other similar cavities or depressions where so directed to flatten out the slopes, and scarify the sides of the cut or hole to provide bond between the foundation material and the fill.[ Scarify the slopes and bottom of the cut-off trench as directed.] Unless otherwise directed, fill each depression with either pervious, random, or impervious[, or rockfill] material dependent upon the type of material which is to be placed immediately above the foundation.
Place the fill in layers; moisten and compact in accordance with the applicable provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION. Spread materials which cannot be compacted by roller equipment because of inadequate clearances in [_____] -mm-inch layers and compact with power tampers to an extent equal to that of the contiguous embankment fill material. After filling of depressions [and cut-off trench] and immediately prior to placement of compacted fill in any section of the embankment, loosen the foundation of such section thoroughly by scarifying, plowing, discing or harrowing to a minimum depth of [_____] mm [_____] inches, and adjust the moisture content to the amount specified in paragraph MOISTURE CONTROL for the appropriate type of material, except in areas where this requirement is waived by the Contracting Officer. After removal of roots or other debris turned up in the process of loosening, compact the entire surface of the embankment foundation area [by [_____] complete coverages of the compaction equipment as specified for the appropriate type of fill in accordance with paragraph COMPACTION.] [compacted to a density of [_____] percent in accordance with paragraph COMPACTION.][ Proof roll foundation areas in accordance with Section 31 00 00 EARTHWORK paragraph PROOF ROLLING.]

Prior to placement of compacted fill on or against the surfaces of any partial fill section, remove all soft or loose material, all material containing cracks or gullies, and all material that does not conform with the specified zoning of the embankment. Loosen the remaining surface of the partial fill by scarifying, plowing, discing or harrowing to a minimum depth of 150 mm 6 inches, and adjust the moisture content as specified in paragraph MOISTURE CONTROL for the appropriate type of material. Compact the surface of the partial fill section upon which fill is to be placed as specified in paragraph COMPACTION for the appropriate type of fill. No separate payment will be made for loosening and rolling the foundation area, the abutment area, or the surfaces of partial fill sections, but include the entire cost in the applicable contract price for fill.

3.2.2 Rock

Clean all rock surfaces upon which or against which embankment materials are to be placed in accordance with the applicable provisions of Section 31 00 00 EARTHWORK and Section 31 60 00 FOUNDATION PREPARATION.[ Prior to the placement of embankment material upon or against a rock surface, fill all open joints and cracks in that surface with mortar to the depths cleaned. Fill those portions of such rock surfaces where, in the opinion of the Contracting Officer, the compaction of the embankment materials cannot be accomplished satisfactorily with power tampers or other specified compaction equipment with mortar or concrete as directed to the extent necessary to permit satisfactory use of the compaction equipment. Do no leave a thin coat of mortar on smooth, intact rock surfaces. Remove large rock overhangs and protrusions by pre-splitting or line drilling techniques in such a manner as to minimize damage to the underlying rock, or the spaces beneath overhangs and fill around protrusions with consolidated concrete so that satisfactory compaction of embankment materials can be accomplished. Provide vertical surfaces that are no more than [_____] meters [_____] feet in height, and provide benches of sufficient width as necessary so that the average slope of any rock face is not steeper than [_____] vertical on [_____] horizontal. Provide mortar and concrete, including forming as necessary, conforming with the applicable provisions of Section [03 30 53 MISCELLANEOUS CAST-IN-PLACE CONCRETE] [03 30 00 CAST-IN-PLACE CONCRETE] [_____] .]
[3.2.3  **Foundation Inspection** and Mapping Procedures]

Foundation means any area of the excavation to receive concrete, backfill, or embankment, including the entire excavation bottom and side slopes.

Inspections to determine the adequacy of the foundations will be performed by the Contracting Officer in all foundation areas between completion of the surface preparation and placement of Embankment Fill, Filter Material, Mud Mat, or concrete. The Contractor will cooperate to the extent necessary to assist in the inspection. This will include having equipment and personnel available to assist excavating, compacting, proof rolling, cleaning, etc. The Contractor must coordinate his schedule for foundation preparation and final cleanup with the Contracting Officer to ensure that the cleanup and inspection proceed in an orderly manner.

[3.2.4  **Foundation Condition Evaluation**]

The Government will perform foundation condition inspection of the completed foundation after final cleanup, dental treatment (if required) and mapping/documentation are complete. Notify the Contracting Officer at least seven days before foundation cleanup will be completed and ready for inspection by the Government. Maintain the foundation in a cleaned condition for a period of at least [_____] [days] [hours] for Government foundation inspection. The [_____] [days][hours] for Government evaluation starts after the Contracting Officer receives notification from the Contractor that the foundation is completed and ready for mapping and inspection. Government will evaluate excavation surfaces to receive backfill or structures. As used in this Section, evaluation means inspection, testing, mapping, exploratory test pits, interpretation, and decision making. Government will perform inspection of excavated foundation subgrade and cut slopes at each site to obtain a geologic record.

Proof roll the earth foundation by a fully loaded dump truck or approved roller to detect and eliminate soft spots in the foundation.

During inspection, following cleanup for geologic mapping, if the Contracting Officer determines that additional excavation is required to improve foundation conditions, perform additional excavation as directed. Clean the areas of additional excavation. The Government will map and inspect the surfaces of additional excavation.

[3.2.5  **Excavation and Foundation Mapping**]

Foundation mapping will be performed by Government personnel throughout excavation, foundation cleanup, and foundation acceptance inspection. Permit and facilitate safe access to the excavation by Government personnel for geologic mapping, sampling, inspection, and testing of surfaces exposed during construction.

a.  Keep traffic and equipment away from test areas during testing to ensure personnel safety and to prevent ground vibrations;

b.  Keep traffic and equipment away from personnel performing mapping to ensure personnel safety;

c.  Provide support, such as excavating equipment, to permit proper inspection.

Foundation mapping will require excavated surfaces to be closely inspected
and documented. The Government will require surfaces to be cleaned by the Contractor to facilitate mapping. Cleaning will require cutting of fresh surface on the excavation bottom and on excavated slopes, and excavation of test pits on excavated slopes and excavation bottom. The Contractor must provide Government personnel access to the excavation bottom for a period of [_____] [days] [hours] after final cleanup and foundation preparation, and before dental treatment. During excavation and foundation mapping, remove any temporary ramps covering side slopes such that the excavation side slopes can be documented and mapped by the Government. The Contractor must provide equipment to perform test pits as deemed necessary by the Government geologist and engineers performing the excavation mapping.

3.2.6 Equipment for Foundation Excavation and Mapping

The Contractor must have on site and make available to Government personnel performing mapping and inspection the following equipment with equipment operators to aid in performing excavations for test pits, sampling, inspection and cutting fresh surfaces for inspection and mapping:

a. Excavating equipment - Backhoe with smooth edge bucket and bulldozer.

b. Proof roller - Fully loaded dump truck.

c. Hand tools - Shovels, bars, picks, wedges, and brooms.

d. Water jet - A water jet consists of a high flow nozzle with a supply hose connected to a suitable source of water. Provide a system capable of delivering up to 24 gpm. The flow rate must be controllable at the nozzle.

3.3 PLACEMENT

3.3.1 General

Do not place fill on any part of the embankment foundation until such areas have been inspected and approved by the Contracting Officer in writing. The gradation and distribution of materials throughout the compacted earth fill section of the dam must be such that the embankment will be free from lenses, pockets, streaks, and layers of material differing substantially in texture or gradation from surrounding material of the same classification. Dump successive loads of material at locations on the fill as directed or approved. Do not place fill upon a frozen surface, nor shall snow, ice, or frozen earth be incorporated in the embankment. Fill will not be placed on or against any dry surface, but against a surface that is moist or damp.

3.3.2 Frozen Material

Do not place embankment on frozen material, or on material which has been subjected to freeze-thaw action. This prohibition encompasses natural ground, all prepared subgrades, whether in an excavation or on an embankment, and all layers of previously placed and compacted earth fill upon which successive layers of embankment fill will be placed. Remove all material that freezes or has been subjected to freeze-thaw action during the construction work, or during periods of temporary shutdowns, such as, but not limited to, nights, holidays, weekends, or winter shutdowns or earthwork operations, to a depth that is acceptable to the Contracting Officer and replace with new material. Alternatively, the material must be thawed, dried, reworked, and recompacted to the specified criteria before additional material is placed. The Contracting Officer will determine when
placement of fill must cease due to cold weather. Embankment material containing frozen clumps of soil, snow, or ice is not acceptable.

3.3.3 Rate of Placement

**************************************************************************
NOTE: If construction of the embankment involves a closure section, the following considerations should be taken into account and specified by the designer, if required.

Placement of rock fill in the closure section may be delayed until completion of the compacted fill to elevation [_____] meters feet m.s.l. The rate of placement of materials in the embankment closure section will be such that this section will be completed to elevation [_____] meters feet m.s.l. within a period of [_____] calendar days from the authorized date of diversion, but in no event will the rate of placement in this section be faster than required to construct the embankment to elevation [_____] meters feet m.s.l. within [_____] days from the beginning of fill operations. Subsequent to completion of the embankment closure section to elevation [_____] meters feet m.s.l. and prior to the beginning of topping operations a period of [_____] calendar days will elapse, unless this provision is waived in writing by the Contracting Officer at the time of construction.

Rate of placement of clay fill materials should be governed by the potential for development of high pore pressures in the fill that could lead to instability of the embankment slopes. Appropriate paragraphs should be included to identify elevations where placement may need to cease until pore pressures have dissipated sufficiently to prevent slides or failure of the embankment.

**************************************************************************

Unless otherwise directed, maintain the embankment at approximately the same level regardless of the number of types of materials being placed, [except place rock fills and the adjoining filter blankets with sufficient lag to prevent mixture of embankment and filter blanket and/or rock materials].

3.3.4 Impervious Fill

Place impervious fill in the impervious section of the embankment as shown on the plans[, cut-off trench,][ and impervious blanket].

3.3.5 Random Fill

Place random fill in the random sections of the embankment as shown on the plans.

Except as specified below, limits of random sections shown indicate the maximum extent of random material. In general, place the finer grained
random material toward the impervious section or blanket and place the coarser-grained random material toward the outer edge of the random section so that a transition in permeability is effected from the impervious section to the pervious section[outer portions of the embankment].

3.3.6 Pervious Fill

Place pervious fill in the pervious sections of the embankment as shown on the plans.

3.3.7 Filter Drainage Layers

**************************************************************************
NOTE: Where there are vertical or inclined filters
and horizontal filters, a different tolerance may be indicated for each.
**************************************************************************

Place [sand filters],[ gravel filters,][ and ][sand and gravel filters] in the embankment in the manner described and to the lines and grades indicated. Tolerance of plus or minus [_____] mm inches will be allowed.

3.3.8 Rockfill

Construct the [upstream][,][ and ][downstream] [ and rock drain] sections of the embankment of quarry run sizes of durable rock dumped and bulldozed into place in not greater than [_____] mm foot lifts to the lines and grades shown, or as staked in the field, and in such manner as to produce a reasonably well graded mass with no objectionable pockets of small stones or clusters of larger stones. A tolerance of plus 300 mm 12 inches and minus 150 mm 6 inches from the slope lines and grades shown will be allowed in the finished surfaces of the rock fills, except that the extreme minus tolerance must not be continuous over an area greater than 20 square meters 200 square feet. All bridging in rock fills shall be broken as well as all slabs and slabby rock. Stone having a length to thickness ratio greater than 3:1 are considered flat, elongated, or flat and elongated and will be rejected. Special care must be exercised in placing rock fill in all areas within 1 m 3 feet of structures to avoid damage to such structures.

3.3.9 Spreading

After dumping, spread the materials by bulldozers or other approved means in approximately horizontal layers over the entire fill areas. Unless otherwise directed, the thickness of these layers before compaction with tamping type rollers must not be more than [_____] mm inches for impervious materials, nor more than [_____] mm inches for other embankment materials, except backfill which must be spread in accordance with paragraph BACKFILL. Unless otherwise directed, the thickness of layers before compaction with rubber-tired rollers must not be more than [_____] mm inches for impervious materials, nor more than [_____] mm inches for other embankment materials except backfill. Spread pervious fill and filters in layers not more than [_____] mm inches in thickness. As soon as practicable after commencement of construction of any section of the embankment, raise or crown the [central portion thereof][area adjacent to the inclined or vertical filter drain] with grades not to exceed [_____] percent so that the surface of the fill will drain freely and maintain throughout construction. Filter material placement should lead the placement of adjacent material to avoid contamination of the filter material. If the compacted surface of any layer of material, exclusive of
filter material[ and rock fill], is determined to be too smooth to bond properly with the succeeding layers, loosen it by harrowing, or by any other approved method, before the succeeding layer is placed. At all times during the dumping and spreading processes, maintain a force of men adequate to remove all roots and debris from all embankment materials and all stones of greater than [_____] mm inches in maximum dimension from impervious materials and greater than [_____] mm inches in maximum dimension from pervious materials, except filters. Remove stone, roots, and debris from the embankment and dispose of in an approved manner. Maintain the entire surface of any section of the embankment under construction in such condition that construction equipment can travel on any part of any one section. Remove ruts in the surface of any layer by scarifying before placing and compacting additional material.

3.4 MOISTURE CONTROL

Provide materials in each layer of the fill containing the amount of moisture, within the limits, specified below or as directed, necessary to obtain the specified compaction. Rework material that is not within the specified limits after compaction regardless of density.

3.4.1 Impervious Sections

******************************************************************************
NOTE: It is preferable to moisture condition the impervious fill material either at the excavation site, borrow site, or another area that is not on the embankment itself.
******************************************************************************

The moisture content after compaction must be uniform throughout any one layer of impervious materials placed. The moisture content after compaction as determined by ASTM D2216 must be within the limits of [_____] percentage points above optimum and [_____] percentage points below optimum moisture content.

Process material such that the moisture content is within [_____] percent of the specified range prior to placing the material on the embankment. This may require material processing either at the borrow/excavation site or other location near the embankment. Harrowing, or other approved methods may be required ensure a uniform distribution of moisture.

Accurately control the amount of water applied on a layer of fill such that free water does not appear on the surface during spreading and rolling. Should too much water be added to any part of the embankment, so that the material is too wet to obtain the specified compaction, the rolling on that section of the embankment will be delayed until the moisture content of the material is reduced to an amount within the specified limits. Material that is too wet may be worked by discing or harrowing, if necessary, until the moisture content is reduced to an amount within the specified limits. Wet material may also be blended with drier material to produce a product that meets the moisture requirements of this specification.

If, in the opinion of the Contracting Officer, the top or contact surfaces of the partial fill section become too dry to permit suitable bond with the succeeding lift, the Contractor will be required to moisture condition the materials on the fill. The Contractor will loosen the dried materials by scarifying or discing to such depths as may be directed by the COR, dampen the loosened material to an acceptable moisture content, and compact this
layer in accordance with the applicable requirements of paragraph COMPACTION, subparagraph IMPERVIOUS FILL.

3.4.2 Random Sections

**************************************************************************
NOTE: The designer should determine if specified control of the moisture content of the random portions of the embankment is important. In many cases, the density is the only consideration and the random sections may be specified to achieve a certain density regardless of moisture content.
**************************************************************************

The upper and lower limits of moisture content, and the moisture control procedures for random materials must be [the same as that specified for impervious material, or pervious material, dependent upon which of these types it most nearly resembles][such that the specified density can be achieved].

3.4.3 Pervious Section

Wet pervious material by sprinkling after spreading on the embankment and [maintain the moisture content of each layer at the optimum for compaction] [keep each layer in an approximately saturated condition] during rolling. Prewetting of pervious material at the sources of excavation or borrow will not be required. Sprinkle with hoses connected to header pipes along the faces of the embankment, by water trucks with pressure spray bars, or by any other approved method. All connections in the water supply system, including the hose connections to the header pipes, must be watertight. Do not direct jets at the embankment with such force that the finer materials will be washed out. Provide capacities of pumps and sizes of header pipes sufficient to supply the required amount of water at all times.

3.4.4 Filter Drainage Layers

Moisture control of graded gravel filter and bedding layers will not be required and sluicing will not be permitted. Moisture control of filters containing a predominate amount of sand particles will be as required to achieve the density specified in paragraph COMPACTION.

3.4.5 Rock Fill

[No moisture control will be necessary on rock fills. ][The moisture content of the rock fill must be reasonably uniform throughout each layer of material placed prior to and during compaction. Add water in an amount equal to [15] [_____] percent of the volume of the fill to the material on the embankment prior to compaction by uniform spraying from a water truck. The required water amount may be modified based on results of a test fill, as approved by the Contracting Officer.]

3.5 COMPACTION

3.5.1 Equipment

**************************************************************************
NOTES: In determining the use of a method specification versus an end-result (production) specification, the following should be considered:
**************************************************************************
a. The use of a method specification involving restrictions on material type, lift thickness, moisture content, and a specified number of passes with approved compaction equipment, a test fill should be required at the start of embankment work, to include foundation preparation. This will allow for the evaluation of the results achieved for particular efforts prior to the beginning of production work.

b. If the designer chooses an end-result (production) specification which would specify material type, lift thickness, moisture content, and in-place density, the requirements of COMPACTATION EQUIPMENT and ADDITIONAL ROLLING FOR COMPACTATION may be either removed or tailored to fit the project requirements.

With reference to the use of compaction equipment in this paragraph, the following precautions should be noted:

a. The following paragraphs are provided as examples of the information that should be provided within the specifications to describe the selection of equipment to perform construction. Specifications should be written to ensure that the type of compaction equipment will be used which, in the judgment of the designer and Contracting Officer, is best suited to obtain the desired compaction of the material being utilized. Consideration must be given to soil type, lift thickness and placement location. A requirement should be included in the specifications for the performance evaluation of each type of compaction equipment conforming with the specifications and intended for use by the Contractor at an early stage of embankment construction. This equipment evaluation should be accomplished through analysis of test fill areas that are carefully constructed under representative working conditions with materials and moisture contents as specified. Test fill areas may either be separate or part of the permanent work, and for clarity to prospective bidders, payment under a separate item is recommended to equitably cover costs of required variations in equipment coverages, possible changes in equipment loading or foot sizes, as well as intensified field soils testing.

b. For tamping rollers that are either towed or self-propelled, with drums capable of being ballasted with fluid, the provision for a pressure relief valve and safety head should be included. Over-pressurization of fluid ballasted compaction drums to the level of a safety hazard has been rare, but has occurred on several occasions at locations of high elevation and temperature.
c. In compacting materials consisting of shales, sandstones, weathered rock and similar random materials, consideration should be given to specifying sheepfoot-type tamping equipment that has been modified by replacing the standard feet with "chisel" point tamper feet generally referred to as "shale breakers". The end areas of these modified tamper feet tend to break up weathered rock to prevent the bridling effect sometimes created by large rock particles.

d. For compaction of sand and gravel fills or filter and drainage layers, equipment characteristics for both a large and small vibratory roller have been provided for optional selection by the designer, depending upon location, selected lift thickness, gradation, grain shape, and durability properties of the materials. The smaller roller should be specified for materials which exhibit degradation under compaction. Other options, based on construction experience may also be exercised. For example, it has been found that improved trafficability can often be achieved when compacting clean, fine grained, uniform sands by specifying a drum driven self-propelled vibratory roller.

Provide compaction equipment conforming to the following requirements and use as prescribed in subsequent paragraphs.

3.5.1.1 Tamping Rollers

3.5.1.1.1 Towed

NOTE: Towed rollers are generally obsolete and seldom used in modern construction. The specification writer should delete this section unless there is an expectation that towed roller will be used.

Provide tamping rollers consisting of two or more non-vibratory roller drums mounted side-by-side in a suitable frame and towed by either a crawler-type or rubber tired tractor having sufficient power to pull the roller satisfactorily when the drums are fully ballasted. Each drum must be free to pivot about an axis parallel to the direction of travel. Control rollers operating in tandem sets in a manner such that the prints produced by the tamping feet of the tandem units are staggered. Each drum of a roller must have an outside diameter of not less than [_____] m [_____] feet and must be not less than [_____] m [_____] feet in length. The space between two adjacent drums, when on a level surface, must not be less than [_____] m [_____] feet nor more than [_____] m [_____] feet. [Equip each drum ballasted with fluid with at least one pressure-relief valve and with at least one safety head. The safety head must be equal to union-type safety heads equipped with rupture discs suitable for rupturing pressures between 350 and 500 kPa\(^{50}\) and 75 psi. The pressure relief valve is a manually operated valve and must be opened periodically. Instruct personnel responsible for opening pressure-relief valves periodically to
ascertain that valve openings are free from plugging to assure that any pressure developed in roller drums is released at each inspection.]

Provide at least one tamping foot for each [____] square mm[____] square feet of drum surface. The length of each tamping foot from the outside surface of the drum must not be more than [____] mm [____] inches and must be maintained at not less than [____] mm [____] inches. The bearing surface of each tamping foot must be flat with a surface area not less than [____] mm [____] inches nor more than [____] mm [____] inches. During the operation of rolling, the spaces between the tamping feet must be maintained clear of materials which would impair the effectiveness of the tamping rollers. The weight of a roller when fully loaded must be not less than [____] N/m[____] pounds per foot of drum length, and the weight of a roller empty must be not more than [____] N/m[____] pounds per foot of drum length. The bearing surface, tamping foot size, the drum loading, and the operation of the rollers must be as required to obtain the desired compaction. If more than one roller is used on any one layer of fill, all rollers so used must be of the same type and essentially of the same dimensions. Draw rollers by crawler-type or rubber-tired tractors at a speed not to exceed [____] km/h[____] mph. Discontinue the use of rubber-tired towing equipment if the tires leave ruts that prevent uniform compaction by the tamping roller, and the substitution of crawler-type towing equipment may be directed.

3.5.1.1.2 Self-propelled

The use of self-propelled non-vibratory tamping rollers conforming with the following specification will be permitted, and their design and operation will be subject to approval, and subject to the right, at any time during the prosecution of the work, to direct such modifications to the tamping feet or variations in roller drum weight where applicable, as may be found necessary to secure optimum compaction of the earth fill materials. If use of self-propelled tamping rollers causes shearing of the fill, laminations in the fill, or results in inadequate compaction, the Contracting Officer may direct that such rollers be removed from the fill and that appropriate towed tamping rollers be used. Two- or three-drum side-by-side units that are either in drive position or drawn by separate power equipment must have a clearance between adjacent drums not less than [____] mm[____] inches nor more than [____] mm[____] inches. Two-drum or four-drum equipment separated by cab and differential and arranged in tandem must have its static weight equally distributed to all compaction drums and must have the tandem drums positioned such that the prints of the tamping feet produced by the tandem drums are staggered. The surface on which the tamping feet are mounted must have a minimum outside diameter of [____] mm[____] feet and at least one tamping foot for each [____] square mm[____] square feet of drum surface. The distance between the centers of any two adjacent tamping feet must be not less than [____] mm[____] inches. The length of each tamping foot from the outside mounting surface of the drum must be not more than [____] mm[____] inches and must be maintained at not less than [____] mm [____] inches. The bearing surface of each tamping foot must be flat and have a surface area not less than [____] square mm[____] square inches nor more than [____] square mm[____] square inches. Cupped recesses within the bearing surface of each tamping foot will be permitted but must not exceed [____] mm[____] inches in depth. During rolling operations, keep the spaces between the tamping feet clear of materials which would impair the effectiveness of the tamping roller. The weight of all roller drums during compaction of fill materials must be maintained uniform and with the weight per foot of drum length not less than [____] N[____] pounds. [For self-propelled rollers with drums capable of being ballasted with fluid, equip each drum with at least one pressure-relief
valve and with at least one safety head. The safety head must be equal to union type safety heads equipped with rupture discs suitable for rupturing pressures between 350 and 500 kPa and 75 psi. The pressure relief valve is a manually operated valve and must be opened periodically. Instruct personnel responsible for opening pressure-relief valves periodically to ascertain that valve openings are free from plugging to assure that any pressure developed in roller drums is released at each inspection. For self-propelled rollers in which steering is accomplished through the use of rubber-tired wheels, the tire pressure must not exceed [___] kPa[___] psi. Discontinue use of the compactor if the tires leave ruts that prevent uniform compaction by the tamping roller and the substitution of appropriate towed tamping rollers may be directed. When a self-propelled roller is provided with a dozer blade, do not count coverages made with the blade in operation as compaction coverages. Operate self-propelled rollers at a speed not to exceed [___] km/h[___] mph.

3.5.1.2 Vibratory Rollers

Equip vibratory rollers for compacting rock fills, pervious sand and gravel fills, or filter and transition drainage layers with a smooth steel compaction drum and operate at a frequency of vibration during compaction operations between 1100 and 1500 vibrations per minute (vpm). Provide vibratory rollers that are either towed or self-propelled and that have an unsprung drum weight that is a minimum of 60 percent of the rollers' static weight. Provide towed rollers that have at least 90 percent of their weight transmitted to the ground through the compaction drum when the roller is standing in a level position hitched to the towing vehicle. Rollers for compacting rock fill, [sand and gravel fills, or filter and drainage layers] must have a minimum static weight of [___] kN [___] pounds, a minimum dynamic force of [___] kN [___] pounds when operating at 1400 vpm, and an applied force not less than [___] kN/m [___] pounds per foot of compaction drum length. [Rollers for compacting sand and gravel fills or filter and drainage layers must have a minimum static weight of [___] kN [___] pounds, a minimum dynamic force of [___] kN [___] pounds when operating at 1400 vpm, and an applied force not less than [___] kN/m [___] pounds per foot of compaction drum length.] The level of amplitude and vibration frequency during compaction will be maintained uniform throughout the embankment zone within which it is operating. Operate rollers at speeds not to exceed [___] km/h[___] mph.

3.5.1.3 Rubber-tired Rollers

Provide rubber-tired rollers that have a minimum of four wheels equipped with pneumatic tires. The tires must be of such size and ply to maintain tire pressures between [___] and [___] kPa [___] and [___] psi for a [___] kN [___] pound wheel load during rolling operations. Locate the roller wheels abreast and design so that each wheel will carry approximately equal load in traversing uneven ground. The spacing of the wheels will be such that the distance between the nearest edges of adjacent tires will be greater than 50 percent of the tire width of a single tire at the operating pressure for a [___] kN [___] pound wheel load. Provide the roller with a body suitable for ballast loading such that the load per wheel may be varied, from [___] to [___] kN [___] to [___] pounds. Tow roller at speeds not to exceed [___] km/h [___] mph. The character and efficiency of this equipment will be subject to approval.
3.5.1.4 Power Tampers

Perform compaction of material, in areas where it is impracticable to use a roller or tractor, as provided in paragraph EARTHWORK, by the use of approved power tampers.

3.5.2 Impervious Fill

After a layer of impervious fill material has been dumped and spread, harrow it if required, to break up and blend the fill materials, to remove laminations, ruts or smooth surfaces to enhance bonding between layers. Perform harrowing to the full depth of the layer.

When the moisture content and the condition of the layer is satisfactory, compact the lift [to at least [_____] percent of maximum dry density as determined by ASTM D698, prior to placement of the next layer. Determination of in-place density must be in accordance with ASTM D1556/D1556M and ASTM D6938. Provide complete coverage consisting of the coverage of the entire lift to be compacted with the roller specified. A complete coverage must consist of the application of compactive effort to the entire lift to be compacted with a single roller drum having the characteristics as specified in paragraph SELF-PROPELED. The use of four-drum self-propelled equipment that is laterally separated by operator's cab and differential may be used; however, two complete coverages of the lift to be compacted will be achieved by a subsequent offset trip of the roller for coverage of the previously uncompacted central portion of the roller path. Place portions of the fill which are not accessible to the roller [_____] mm inch layers loose measurement and compacted with power tampers to a degree equal to that obtained on the other portions of the compacted fill by rolling as specified in accordance with paragraph BACKFILL. Dumping, spreading, sprinkling, and compacting may be performed at the same time at different points along a section when there is sufficient area to permit these operations to proceed simultaneously.

3.5.3 Pervious Fill

After each layer of pervious material has been dumped and spread, and the moisture content is in accordance with the provisions of paragraph PERVIOUS SECTION, compact the entire surface of the layer [to an average of [_____] percent minimum relative density] by not less than [_____] complete coverages of [the rubber-tired roller][the vibratory roller].

3.5.4 Additional Rolling for Compaction

If, in the opinion of the Contracting Officer, the desired compaction of any portion of the embankment is not achieved by the minimum number of coverages specified, make additional complete coverages over the surface area of such designated portion until the desired compaction has been obtained.

3.5.5 Filter and Transition Drainage Layers

**************************************************************************
NOTE: The following paragraph for Transition Layers does not include bedding for riprap slope protection, which should be provided under Section
Accomplish compaction of filter soil using the compaction equipment described in subparagraph VIBRATORY ROLLERS of paragraph COMPACTION above. The roller must make a minimum of two (2) passes, acting in vibratory mode, across the initial lift of filter material. Upon completion of these first 2 passes, check the density of the filter material. Make additional passes of the vibratory roller until a relative density between [_____] and [_____] percent is attained based on the maximum dry density obtained in accordance with ASTM D4253 and minimum dry density as determined by ASTM D4254. The number of passes required to achieve a relative compaction of [_____] percent must be the minimum required number of passes on subsequent lifts of filter material. Compaction equipment must be clean and free from other fill types or debris and must not result in contamination of the filter material. Slightly slope adjacent lifts of other fill types to drain away from the filter material. Remove and replace any contaminated filter material at no additional cost. Placement methods must not result in segregation of the filter material (such as but not limited to placement via conveyor of chute).

3.5.6 Rock Fill

After the rock fill has been dumped and spread to the thickness specified, compact the entire surface of the layer by not less than [_____] complete coverages of the vibratory roller specified in paragraph VIBRATORY ROLLERS. Provide a complete coverage consisting of the entire coverage of the area with one trip of the equipment specified. Each trip of the roller must overlap the adjacent trip not less than [_____] mm feet.

3.6 BACKFILL

3.6.1 General

Do not place embankment fill, filter soil or backfill against a concrete structure until the top of the structure has been completely placed, and has reached 80 percent of its design strength. Bring fill up in lifts evenly on both sides of structure and headwall structures with no more than [_____] m[_____] feet difference in elevation on opposing sides of the structure.

Subsequent to the concrete structure attaining 80 percent of design strength, backfill operations may be initiated but no rolling or hauling equipment will be permitted to pass over the structure, or within [_____] mm [_____] feet of any part of the structure. During this period, backfill may be placed against the sides of the structure and to a minimum thickness of [_____] mm [_____] feet over the top of the structure, if compaction is accomplished by power tampers as specified in paragraph POWER TAMPERS. Before passage of hauling and rolling equipment over the top of the conduit or other structure will be permitted, the depth of fill over the concrete must be sufficient to permit such passage without inducing harmful stresses or vibrations in the structure.

3.6.2 Placement

Place backfill in [_____] mm inch layers and thoroughly compact. Unless otherwise directed, the placing and compacting of all backfill material and the control of its moisture content must conform to the applicable
provisions of paragraphs PLACEMENT, MOISTURE CONTROL, and COMPACTION. Keep fill in back of wing walls at approximately the same elevations as that of the backfill, gravel blankets, riprap, or derrick stone on the opposite side of the wall until placement has reached the maximum elevation of the materials to be placed on the toe of the wall. Keep drainage openings through walls open at all times.

3.7 FIELD QUALITY CONTROL

******************************************************************************
NOTE: FAR Part 46.312 establishes a requirement for Contractor Quality Control (CQC) in construction contracts and ER 1180-1-6 requires that a CQC section based on Sections 01 45 00.00 10, 01 45 00.00 20, and 01 45 00.00 40 QUALITY CONTROL be included in contracts of $1,000,000 or more. Use of Section 01 45 00.00 10, 01 45 00.00 20 and 01 45 00.00 40 for contracts of less than $1,000,000 is discretionary. This part of the specifications must be consistent with the CQC section.

Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of mica, halloysite, some other chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density. Sand Cone or similar field density tests should be performed periodically at the same location as Nuclear Tests to assure nuclear testing is providing accurate information.

Specifier may desire the use of a tabular format for frequency of testing of materials.
******************************************************************************

Establish and maintain field quality control for embankment and backfill operations to assure compliance with contract requirements and maintain detailed records of field quality control for all operations including but not limited to the following:

3.7.1 Materials Testing

******************************************************************************
NOTE: Types of tests and frequency of testing should be detailed below. Types of tests and frequency of testing will be dependent upon the types of materials utilized, configuration of foundation and embankment, placement and compaction procedures required, moisture control requirements etc. Testing requirements are material type specific rather than embankment fill type specific. It is desirable to present the testing frequency and type in tabular form.
******************************************************************************

Perform sufficient testing to ensure that the fill is being constructed as specified. The testing program specified below will be considered the minimum acceptable frequency of testing. This does not relieve the Contractor from the responsibility of performing additional testing, if
required to ensure compliance with these specifications.

[3.7.1.1 Soil Classification Tests]

Soil classification tests will be performed in accordance with ASTM D2487. One initial classification test will be required for each different classification of material to be utilized as embankment fill or backfill. As prescribed in ASTM D2487, grain size analyses in accordance with ASTM D422 and Atterberg limits in accordance with ASTM D4318 will be performed on each different classification. Submit additional tests for every [_____] cubic m/cubic yards of embankment or backfill material. Soil classification tests will be performed on foundation material as required to determine the acceptability of the in-situ soils. Additional tests will be required if noticeable changes in the material occur.

[3.7.1.2 Cohesive Material Testing]

**************************************************************************
NOTE: Edit the following to comply with the method selected to determine the optimum properties (i.e., density and moisture content, LL, PL, PI).
**************************************************************************

3.7.1.3 Moisture Density Relationships

The moisture-density relations for each different classification of cohesive material utilized will be determined in accordance with [_____] [ASTM D698], [Method A] [Method B] [Method C]. Prior to placing any fill material containing cohesive material, a minimum of [_____] five-point [_____] compaction test will be performed on representative samples of the material to be used as fill. During fill placement a minimum of one additional moisture-density test will be performed for every [_____] cubic m/cubic yard placed. Additional tests will be required each time a new material is encountered. The moisture-density curves will be compiled to form a family of curves which will be utilized to estimate optimum properties (maximum dry density and optimum moisture content) to be used with field density test.

3.7.1.4 Water (Moisture) Content Tests

Determination of water content will be performed in accordance with ASTM D2216.[ ASTM D4643 may be used when rapid moisture content results are needed. All rapid results obtained by ASTM D4643 will be confirmed by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic m/cubic yards of material placed [or each lift of material whichever is less]. [These tests will be in addition to the water content tests performed in conjunction with in-place density tests.] Backfill and fills not meeting the required specifications for water content will be retested after corrective measures have been applied.

3.7.1.5 In-place Density Testing for Cohesive Materials

**************************************************************************
NOTE: The designer should pick the method or methods of In-place density which are acceptable. If uncompacted fill is specified density control may not be required.
Use caution when applying nuclear gages for in-place density measurement of cohesive and cohesionless soils. Soils consisting of certain chemical composition, or oversize rocks and large voids would affect the measurement accuracy of wet density.

The in-place density of the cohesive materials will be determined in accordance with \[\text{ASTM D1556/D1556M}, \text{ASTM D2167}, \text{ASTM D6938}, \text{ASTM D2937} \], or \[\text{ASTM D5195}\]. At least one (1) in-place density test will be performed on [each lift of material or] every [_____] cubic m cubic yards of completed fill whichever is more frequent with the horizontal locations randomly staggered in the fill. At each field density test location, soil samples will be obtained and one [one-point] [two-point] compaction test, one moisture content, [one grain size analysis,] [ and one Atterberg limits test,] [if applicable,] will be performed on the sample. The results of the [one-point] [two-point] compaction test and the moisture content test will be utilized to obtain the optimum properties to compare to the results of the in-place density test. For use with the family of curves to determine the optimum properties of the material a [one-point] [two-point] compaction tests will be performed in conjunction with each in-place density. A portion of the soil from the in-place field density test and soil obtained immediately adjacent to the field density test location will be used for a [one-point] [two-point] compaction test. The minus 19 mm 3/4-inch portion of the soil will be subjected to [_____] compactive effort using a [150 mm] [6-inch] [_____] compaction mold in accordance with the procedures presented in ASTM D[_____] [ASTM D698] [ASTM D1557]. Fill not meeting the required specifications for in-place density will be retested after additional compaction has been completed. When nuclear method is used for in-place density testing according to ASTM D6938, the first test and every tenth test thereafter for each material type will include a sand cone correlation test in accordance with ASTM D1556/D1556M. The sand cone test will be performed adjacent to the location of the nuclear test, will include a nominal 150 mm6 inch diameter sand cone, and will include a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. Nuclear density testing equipment will not be used during rain. The density correlations will be submitted with test results. Each transmittal including density test data will include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of Lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.
l. Pass/Fail.
m. Retest.
n. Comments.]
3.7.1.6 Cohesionless Material Testing

3.7.1.6.1 Compaction Tests

Run not less than one relative density test for every [3,000] [_____] cubic m [3,900] [_____] cubic yards of cohesionless fill in accordance with ASTM D4253 and ASTM D4254.

3.7.1.6.2 In-place Density Tests

The in-place density of the cohesionless materials will be determined in accordance with [ASTM D1556/D1556M], [ASTM D2167], [ASTM D6938], [ASTM D2937], [ASTM D5195]. Run not less than one (1) field in-place density test on [each lift of material or] every [shift][day] [_____] cubic m cubic yards of completed embankment fill or backfill whichever is less. Horizontal locations will be randomly staggered in the fill. When nuclear method is used for in-place density testing according to ASTM D6938, the first test and every tenth test thereafter for each material type will include a sand cone correlation test in accordance with ASTM D1556/D1556M. The sand cone test will be performed adjacent to the location of the nuclear test, and will include a nominal 150 mm 6 inch diameter sand cone, and will include a minimum wet soil weight of 2.7 kg 6 pounds extracted from the hole. The density correlations will be submitted with test results. Each transmittal including density test data will include a summary of all density correlations for the job neatly prepared on a summary sheet including at a minimum:

a. Test Identification Number.
b. Test location.
   Station.
   Coordinates.
c. Elevation of Lift.
d. Lift number (if appropriate).
e. Photo number (if appropriate).
f. Meter serial number and operators initials.
g. Standard count for each test.
h. Material type.
i. Probe depth.
j. Moisture content by each test method and the deviation.
k. Wet density by each test method and the deviation.

3.7.1.6.3 Water (Moisture) Content Tests

Determination of water content will be performed in accordance with ASTM D2216. [ASTM D4643 may be used when rapid moisture content results are needed. All rapid results obtained by ASTM D4643 will be confirmed by a test on a duplicate sample performed in accordance with ASTM D2216. In the event of disagreement between the results, ASTM D2216 will govern.] One water content test will be performed for each [_____] cubic mcubic yards of material placed[ or each lift of material whichever is less]. [These tests will be in addition to the water content tests performed in conjunction with in-place density tests.] Backfill and fills not meeting the required specifications for water content will be retested after corrective measures have been applied.

3.7.1.6.4 Additional Testing

The Contracting Officer may request additional tests if there is reason to doubt the adequacy of the compaction, or special compaction procedures are
being used, or materials change, or if the Contracting Officer determines that the Contractor’s testing is inadequate, or the Contractor is concentrating backfill and fill operations in a relatively small area.

3.7.1.7 Materials

Suitability of embankment and backfill materials.

3.7.1.8 Fill Placement

Layout, maintaining existing drainage, moisture control, thickness of layers, removal of oversized material, spreading and compaction for embankment and backfill.

3.7.1.9 Grade and Cross Section

Surveys to verify that the dimensions, slopes, lines and grades conform to those shown on the drawings. [Surveys to monitor settlement gages to measure foundation settlement.] [Surveys to locate core boring locations and elevations to determine foundation settlement.]

3.7.1.10 Testing by the Government

During the life of this contract, the Government [or its Contractors] will perform quality assurance tests. Make available to the Government [or its Contractors] the equipment to perform these tests.

3.7.1.11 Reporting

On a daily basis, furnish the inspection records and all material testing results, [the quantity of fill placed,] as well as the records of corrective action taken, in accordance with Sections 01 45 00.00 10, 01 45 00.00 20, and 01 45 00.00 40 QUALITY CONTROL.

3.8 SLIDES

In the event of slides, in any part of the embankment prior to final acceptance of the work, remove material from the slide area, as directed, and rebuild such portion of the embankment. In case it is determined that the slide was caused through the fault of the Contractor, perform the removal and disposal of material and the rebuilding of the embankment without cost to the Government; otherwise this work will be paid for at the applicable contract unit prices for borrow excavation and compacted fill or backfill.

3.9 PIEZOMETERS, SETTLEMENT GAGES AND SURFACE REFERENCE MARKS

**************************************************************************

NOTE: The installation of instrumentation is not strictly speaking an activity of construction of an embankment dam. This activity should be placed within its own specification division as an item of SPECIAL CONSTRUCTION. There is presently no UFGS guide specification for this item. The specification writer should consider the use of a section for SPECIAL CONSTRUCTION, and if so, delete the following paragraphs.

Include paragraphs for all types of instruments to
be utilized.

**************************************************************************

3.9.1 Government Installed Piezometers

A number of piezometers will be installed on the embankment foundations by
the Government with its own forces. Connections and extensions of riser
pipes must be made by the Contractor with materials furnished by the
Contractor. Determine the elevation of the top of the riser pipe
immediately before and immediately after each extension is added to the
pipe. Keep the top of such pipes at least 600 mm 2 feet above the
embankment surface. During construction, place a mound of fill around the
riser pipes and compact to the same density and moisture content as the
surrounding fill material. Conduct the required operations in such a
manner that the devices will not be damaged. Place suitable markers and
guard posts around the gages for protection. No separate payment will be
made for such protection or for special measures required in connection
with the installation of these devices; include all costs in the contract
prices bid for related items of work.

3.9.2 Location and Installation of Settlement Gages

Furnish and install settlement gages for determining foundation and
embankment settlement during construction. Provide type, arrangement and
location of gages as shown. The areas in which adjustment in quantities
will be made as a result of foundation settlement are as indicated on the
plans. Place the base plate on a level surface of well compacted
foundation material. Determine the elevations of the base plates before
placing fill material and again within 48 hours after completion of the
embankment. Determine the elevation of the stem immediately before and
immediately after each extension is added. These elevations will be
verified by the Contracting Officer. Carefully install the stem plumb.
Extend the stem in increments as the embankment rises with the top of the
stem at a minimum of 600 mm 2 feet above the surface of the embankment.
Conduct these operations in such a manner that the gages will not be
damaged. Place suitable guard posts around the gages for protection.
Compact fill around the stem to the same density and moisture content as
the surrounding material. Restore or replace any settlement gage damaged
or destroyed due to fault or negligence at no additional cost to the
Government. No additional payment will be made for compaction of fill
around and over the settlement gages or for interference with the
Contractor's operations resulting from the settlement gage installations.

3.9.3 Surface Reference Marks

Furnish and install surface reference marks as shown. Furnish the
horizontal and vertical location of each reference mark with respect to
established bench marks at the time of installation, and every [_____]}
calendar days thereafter until completion of the contract. Conduct these
operations in such a manner that the reference marks will not be disturbed
or damaged. Replace or repair any reference mark disturbed or damaged due
to negligence on the Contractor's part and furnish the correct horizontal
and vertical locations the Contractor's expense.

NOTE: This guide specification covers the requirements for above and below grade liquid process piping located both inside and outside of treatment plants.

Adhere to UFC 1-300-02 Unified Facilities Guide Specifications (UFGS) Format Standard when editing this guide specification or preparing new project specification sections. Edit this guide specification for project specific requirements by adding, deleting, or revising text. For bracketed items, choose applicable item(s) or insert appropriate information.

Remove information and requirements not required in respective project, whether or not brackets are present.

Comments, suggestions and recommended changes for this guide specification are welcome and should be submitted as a Criteria Change Request (CCR).

PART 1 GENERAL

NOTE: Show the following information on the project drawings:

a. Location of pipelines indicating pipe designation, diameter and valves.

b. Pipe schedule relating pipe designation and service.

c. Valve schedule indicating valve designation and service.

d. Piping details.
1.1 UNIT PRICES

**************************************************************************
NOTE: This paragraph does not apply to invitation for bid (IFB) contracts. If it is determined that a lump sum contract may be more advisable, this paragraph will be deleted. If a unit price contract is to be used, the bid items for the unit price contract will be defined for each unit to be furnished and installed.
**************************************************************************

Measurement and payment will be based on completed work performed in accordance with the drawings, specifications and the contract payment schedules. No payment will be made under this section for excavation, trenching, or backfilling. Payment for such work will be made under Section 31 00 00 EARTHWORK.

1.1.1 Measurement

The length of pipelines, for which payment will be made, shall be determined by measuring along the centerlines of the various piping systems and sizes as furnished and installed. Pipe shall be measured from the center of fitting to center of fitting and from center of main header to end of pipe. No deduction shall be made for the space occupied by valves or fittings.

1.1.2 Payment

Payment will be made at the price per linear meter foot listed in the bid form for the various types and sizes of piping, and will be full compensation for all pipes, joints, fittings and specialties, complete in place. Payment for valves and other appurtenances will be made at the respective contract unit price for each item complete in place. Payment will include the furnishing of all testing, plant, labor, and material and incidentals necessary to complete the work, as specified and as shown in contract documents.

1.1.2.1 Connections to Existing Piping

Connections to existing piping systems where new fittings in the existing line are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the removal and replacement of the existing pipe as necessary.

1.1.2.2 Connections to Existing Equipment

Connections to existing equipment where new fittings for the existing equipment are required will be paid for according to the contract prices for such connection. The price will be considered as full compensation for material and labor required for the installation of new fittings or the removal and replacement of existing fittings, as necessary.

1.2 REFERENCES

**************************************************************************
NOTE: This paragraph is used to list the
**************************************************************************
publications cited in the text of the guide specification. The publications are referred to in the text by basic designation only and listed in this paragraph by organization, designation, date, and title.

Use the Reference Wizard's Check Reference feature when you add a Reference Identifier (RID) outside of the Section's Reference Article to automatically place the reference in the Reference Article. Also use the Reference Wizard's Check Reference feature to update the issue dates.

References not used in the text will automatically be deleted from this section of the project specification when you choose to reconcile references in the publish print process.

The publications listed below form a part of this specification to the extent referenced. The publications are referred to within the text by the basic designation only.

NOTE: Review submittal description (SD) definitions in Section 01 33 00 SUBMITTAL PROCEDURES and edit the following list to reflect only the submittals required for the project.

The Guide Specification technical editors have designated those items that require Government approval, due to their complexity or criticality, with a "G." Generally, other submittal items can be reviewed by the Contractor's Quality Control System. Only add a "G" to an item, if the submittal is sufficiently important or complex in context of the project.

For submittals requiring Government approval on Army projects, a code of up to three characters within the submittal tags may be used following the "G" designation to indicate the approving authority. Codes for Army projects using the Resident Management System (RMS) are: "AE" for
Government approval is required for submittals with a "G" designation; submittals not having a "G" designation are for [Contractor Quality Control approval.] [information only. When used, a designation following the "G" designation identifies the office that will review the submittal for the Government.] Submittals with an "S" are for inclusion in the Sustainability eNotebook, in conformance to Section 01 33 29 SUSTAINABILITY REPORTING. Submit the following in accordance with Section 01 33 00 SUBMITTAL PROCEDURES:

SD-02 Shop Drawings

Qualifications

Welders

Waste Water Disposal

Manufacturer's Field Services

Delivery, Storage and Handling

Materials and Equipment

Installation

Pipe Schedule

Valve Schedule

Operator Schedule

SD-06 Test Reports
1.4 QUALIFICATIONS

1.4.1 Experience

Submit a statement certifying that the Contractor has the specified experience. Contractor shall have successfully completed at least [three] [_____] projects of the same scope and size or larger within the last [six] [_____] years. Demonstrate specific experience in regard to the system installation to be performed.

1.4.2 Double Containment Piping System Manufacturer

**************************************************************************

NOTE: Delete the following paragraph when it is not required.
**************************************************************************

The double containment piping system manufacturer shall have at least [ten] [_____] years of installation experience with leak detection/location sensor cable technology.

1.4.3 Welders

Submit the names of all qualified welders, their identifying symbols, and the qualifying procedures for each welder including support data such as test procedures used, standards tested to, etc. The welding of pressure piping systems shall be in accordance with qualifying procedures using performance qualified welders and operators. Procedures and welders shall be qualified in accordance with Section 40 05 13.96 WELDING PROCESS PIPING. Structural members shall be welded in accordance with Section 05 05 23.16 STRUCTURAL WELDING.
1.5 DELIVERY, STORAGE, AND HANDLING

Materials delivered and placed in storage must be stored with protection from the weather, excessive humidity variation, excessive temperature variation, dirt, dust and/or other contaminants. Proper protection and care of material before, during and after installation is the Contractor's responsibility. Any material found to be damaged must be replaced at the Contractor's expense. During installation, piping must be capped to keep out dirt and other foreign matter. A Safety Data Sheet in conformance with 29 CFR 1910 Section 1200(g) must accompany each chemical delivered for use in pipe installation. At a minimum, this includes all solvents, solvent cements, glues and other materials that may contain hazardous compounds. Handling must be in accordance with ASTM F402. Storage facilities must be classified and marked in accordance with NFPA 704. Materials must be stored with protection from puncture, dirt, grease, moisture, mechanical abrasions, excessive heat, ultraviolet (UV) radiation damage, or other damage. Pipe and fittings must be handled and stored in accordance with the manufacturer's recommendation. Plastic pipe must be packed, packaged and marked in accordance with ASTM D3892.

1.6 PROJECT/SITE CONDITIONS

1.6.1 Environmental Requirements

******************************************************************************

NOTE: HTRW sites are typically well studied and investigated. Site conditions found during these previous investigations (e.g., soil resistivity testing for corrosion control design) must be incorporated into the design. The next paragraph must be edited carefully to address existing site conditions.

******************************************************************************

Buried piping at the site may be subject to corrosion from the surrounding soil. Testing and measurements [shall be] [has been] conducted in accordance with [Section 26 42 14.00 10 CATHODIC PROTECTION SYSTEM (SACRIFICIAL ANODE)] [Section 26 42 17.00 10 CATHODIC PROTECTION SYSTEM (IMPRESSED CURRENT)]. Piping system design, supply and installation shall address the external corrosion conditions so indicated.

1.6.2 Existing Conditions

******************************************************************************

NOTE: Connection locations and wet/dry connections must be clearly indicated to avoid confusion and claims.

******************************************************************************

Verify existing piping and penetrations. Prior to ordering materials, expose all existing pipes which are to be connected to new pipelines. Verify the size, material, joint types, elevation, horizontal location, and pipe service of existing pipes, and inspect size and location of structure penetrations to verify adequacy of wall sleeves, and other openings before installing connecting pipes.

1.7 SEQUENCING AND SCHEDULING

For slab, floor, wall, and roof penetrations, keep on site pertinent wall
pipes and sleeves before they are required for placement in concrete forms. Verify and coordinate the size and location of building and structure pipe penetrations before forming and placing concrete.

1.8 MAINTENANCE

1.8.1 Service

**************************************************************************
NOTE: Selectively require manufacturer's service. Automatic valves in critical or hazardous systems require service assistance. Coordinate these services with specification sections that address instrumentation and control.
**************************************************************************

Services for [automatic valve] [double containment leak detection monitoring system] [double containment leak sensor cable] [_____] systems shall be provided by a manufacturer's representative who is experienced in the installation, adjustment and operation of the equipment specified. The representative shall inspect the installation, and supervise the adjustment and testing of the equipment.

1.8.2 Extra Materials

**************************************************************************
NOTE: Include items needed for future maintenance and repair, items that might be difficult to obtain because of color or pattern match, or spare parts to ensure operation of critical systems.
**************************************************************************

Submit the manufacturer's installation recommendations or instructions for each material or procedure to be utilized, including materials preparation. Concurrent with delivery and installation of the specified piping systems and appurtenances, spare parts for each different item of material and equipment specified that is recommended by the manufacturer to be replaced any time up to [3 years] [_____] of service shall be furnished. For each type and size of valve, the following extra materials shall be provided: lubricator, lubricant (with appropriate temperature rating), lubricator/isolating valve; [galvanized operating wrench, [1.2] [_____]m [4.1] [_____] feet long, for T-handled operators;] [galvanized operating key for cross handled valves;] [______]. Extra materials shall include [2] [_____] of the following spare parts for each type and size of valve: gaskets; [O-ring seals;] [diaphragms (molded);] all elastomer parts; stem packing; [seat rings [and seat ring pulling tool];] [______].

PART 2 PRODUCTS

**************************************************************************
NOTE: All materials of construction specified will be retained except under conditions where they would not be suitable (see UFC 3-240-01); upon specific instructions of HQUSACE; as stipulated in specific project directives.; and as described within notes throughout the specification. A study of the process conditions will be made to determine the suitability of the materials. Where a material would be altogether unsuitable, every mention of the
unsuitable material and referenced publications that pertain only to the unsuitable material will be deleted. If a material would be suitable in a part of the system and unsuitable in other parts, the locations where the material may and may not be used will be stated in the contract specifications and shown on the contract drawings.

Soil conditions that may affect the corrosion rate of buried ferrous piping should be evaluated. The evaluation and corrosion control design will be performed in accordance with the directions provided in UFC 3-570-02A.

2.1 SYSTEM REQUIREMENTS

This specification covers the requirements for above and below grade liquid process pipe, pipe supports, fittings, equipment and accessories located both inside and outside of treatment plants.

2.1.1 Design Requirements

NOTE: Determine the design wind speed from ASCE 7-16 and/or UFC 3-301-01 STRUCTURAL ENGINEERING, although a minimum of 161 km/h (100 miles per hour) will be used. Similarly, use 1.2 kPa 25 psf snow load for most heavy snow climates. In some cases, local climates and topography will dictate that a larger value is required. This may be determined from ANSI A58.1, local codes or by research and analysis data of the effect of local climate and topography. Snow load requirements can be deleted for locations where the maximum snow is insignificant. Provide seismic requirements and show on the drawings. Delete the bracketed phrase if seismic details are not included. Pertinent portions of UFC 3-301-01 and Sections 13 48 73 and 23 05 48.19, properly edited, must be included in the contract documents.

Support systems shall be selected and designed in accordance with MSS SP-58 within the specified spans and component requirements. The absence of pipe supports and details on the contract drawings does not relieve the Contractor of responsibility for sizing and providing supports throughout facility. The structural design, selection, fabrication and erection of piping support system components shall satisfy the seismic requirements in accordance with UFC 3-301-01 and Sections 13 48 73 SEISMIC CONTROL FOR MECHANICAL EQUIPMENT and 23 05 48.19 [SEISMIC] BRACING FOR HVAC [as indicated], accounting for a [_____] MPa psf soil bearing capacity, a maximum wind speed of [_____] km/h mph, a ground snow load of [_____] kPa psf, a maximum ambient air temperature of [_____] degrees Cdegrees F and a minimum ambient air temperature of [_____] degrees C degrees F.

2.1.2 Performance Requirements

The pressure ratings and materials specified represent minimum acceptable
standards for piping systems. The piping systems shall be suitable for the services specified and intended. Each piping system shall be coordinated to function as a unit. Flanges, valves, fittings and appurtenances shall have a pressure rating no less than that required for the system in which they are installed.

2.1.2.1 Buried Piping Systems

Piping systems shall be suitable for design conditions, considering the piping both with and without internal pressure. Consideration shall be given to all operating and service conditions both internal and external to the piping systems. Buried ferrous piping shall have cathodic protection in accordance with Section [26 42 14.00 10 CATHODIC PROTECTION SYSTEM (SACRIFICIAL ANODE)] [26 42 17.00 10 CATHODIC PROTECTION SYSTEM (IMPRESSED CURRENT)]

2.1.2.2 Above Grade Piping Systems

Piping systems shall be suitable for design conditions, considering the piping both with and without internal pressure, and installation factors such as insulation, support spans, and ambient temperatures. Consideration shall be given to all operating and service conditions both internal and external to the piping systems.

2.2 MATERIALS AND EQUIPMENT

**************************************************************************

NOTE: Verify that the pipe schedule is included in the contract drawings.
**************************************************************************

Submit manufacturer's descriptive and technical literature for each piping system, including design recommendations; pressure and temperature ratings; dimensions, type, grade and strength of pipe and fittings; thermal characteristics (coefficient of expansion and thermal conductivity); and chemical resistance to each chemical and chemical mixture in the liquid stream. Provide piping materials and appurtenances as specified and as shown on the drawings, and suitable for the service intended. Piping materials, appurtenances, and equipment supplied as part of this contract shall be of equal material and ratings as the connecting pipe, new and unused except for testing equipment. Components that serve the same function and are the same size shall be identical products of the same manufacturer. The general materials to be used for the piping systems shall be in accordance with TABLE I and are indicated by service in the [Pipe Schedule] [contract drawings] [______]. Submit a list of piping systems, pressure ratings and source of supply for each piping system broken out by material, size and application as indicated on the contract drawings. A list of any special tools necessary for each piping system and appurtenances furnished for adjustment, operation, maintenance and disassembly of the system. Pipe fittings shall be compatible with the applicable pipe materials.

2.2.1 Standard Products

Provide material and equipment which are the standard products of a manufacturer regularly engaged in the manufacturing of the products and that essentially duplicate items that have been in satisfactory use for at least [2] [_____] years prior to bid opening. Submit the following: Equipment shop drawings and support system detail drawings showing piping
systems and appurtenances, such as mechanical joints, valves, local indicators and hangers, including a complete list of equipment and materials. As-built drawings showing pipe anchors and guides, and layout of piping systems relative to other parts of the work including clearances for maintenance and operation. As-built piping and instrumentation diagrams (P&IDs) identifying and labeling equipment, instrumentation, valves, vents, drains, and all other inline devices; if the contract drawings contained P&IDs, the P&IDs found in the contract drawings shall be revised to reflect the constructed process system, as directed by the Contracting Officer. Nominal sizes for standardized products shall be used. Pipe, valves, fittings and appurtenances shall be supported by a service organization that is, in the opinion of the Contracting Officer, reasonably convenient to the site.

2.2.2 Identification and Tagging

Each piece of pipe shall bear the ASTM designation and all other markings required for that designation. Valves shall be marked in accordance with MSS SP-25 and shall bear an identification tag securely attached using [No. 12 AWG copper wire] [stainless steel wire] [chrome-plated beaded chain] [plastic straps designed for that purpose]. Identification tags shall be [35 mm 1.375 inch] [[_____] mm inches] minimum diameter, made of [brass] [engraved laminated plastic] [engraved anodized aluminum] [stamped stainless steel] [_____.] [Indentations shall be black for reading clarity.] The service, valve identification number shown on the [Operator Schedule] [Valve Schedule] in the contract drawings, the manufacturer's name, and the valve model number shall be displayed.

2.3 DUCTILE IRON PIPING SYSTEM

2.3.1 Ductile Iron Pipe

**************************************************************************

NOTE: Standard thicknesses of ductile iron pipe are governed by AWWA C150/A21.50 or AWWA C151/A21.51, except for integral flanged piping. The thickness of integral flanged pipe is regulated in AWWA C115/A21.15. If restrained joint pipe is used, thickness must conform to AWWA C151/A21.51.

**************************************************************************

Ductile iron pipe for pressure service shall have a design and wall thickness conforming to [AWWA C150/A21.50] [AWWA C151/A21.51] [AWWA C115/A21.15]. Ductile iron pipe shall have a [[standard] [double thickness] cement lining conforming to AWWA C104/A21.4] [standard asphaltic lining] [______].

2.3.2 Ductile Iron Joints

**************************************************************************

NOTE: Flanged connections should not be used for buried service. Use joints for pipe and fittings installed underground (buried).

**************************************************************************

Joints shall have a working pressure rating for liquids equal to the pressure rating of the connected pipe. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.
2.3.2.1 Mechanical Joints

Mechanical joints shall conform to AWWA C110/A21.10 and AWWA C111/A21.11. [Gaskets, glands, bolts and nuts shall be furnished in sufficient quantity for the complete assembly of each mechanical joint. Glands shall be ductile] or [gray] iron with an asphaltic coating. Gaskets shall be [vulcanized synthetic rubber, reclaimed rubber is not acceptable] for grooved shoulder piping, self-centering gasketed couplings designed to mechanically engage piping and lock in a positive watertight couple shall be used.) [Housings shall be composed of malleable iron, ASTM A47/A47M or ductile iron, ASTM A536] and gaskets of molded synthetic rubber, [halogenated isobutylene isoprene] [nitrile] shall be used. Bolts and nuts shall be heat treated carbon steel, ASTM A183, minimum tensile 760 MPa 110,000 psi. Mechanical joints shall have bolt holes oriented straddling the vertical centerline of the valves and fittings.

2.3.2.2 Push-on Joints

Push-on type joints shall conform to AWWA C111/A21.11. Each push-on joint shall be supplied complete with gasket and lubricant. Gaskets shall be compatible with joint design and comprised of vulcanized synthetic rubber, reclaimed rubber is not acceptable]. Lubricant shall be specifically formulated for use with push-on joints and shall be non-toxic, odorless, tasteless and shall not support bacteria growth.

2.3.2.3 Restrained Joints

Restrained joints shall conform to the requirements of AWWA C111/A21.11, and be designed for a working pressure equal to connected pipe rating. When using ductile iron pipe with restrained joints, field cuts shall be supplied with a lock ring complete with retainer, retainer lock and roll-pin, as required by manufacturer's recommendations, procedures and/or installation instructions.

2.3.2.4 Flanged Joints

Flanged joints shall conform to AWWA C110/A21.10. Gaskets, bolts and nuts shall be provided with flanged joints in sufficient quantity for the complete assembly of each joint. Gaskets shall be vulcanized synthetic rubber, reclaimed rubber is not acceptable.

2.3.3 Ductile Iron Fittings

**************************************************************************

NOTE: Fittings for ductile-iron or gray-iron piping involving 1.03 MPa 150 psi and 1.72 MPa 250 psi service are specified in AWWA C110/A21.10; for 2.41 MPa 350 psi service use AWWA 153. Typically, either gray or ductile iron fittings are acceptable. Specify the exact material if service conditions warrant.

Take special precaution with mating flanges specified in this paragraph; that is, mating flanges conforming to AWWA C110/A21.10 with flanges that are specified elsewhere using ASME B16.1 or B16.5 standards.

**************************************************************************
Fittings shall be gray iron ASTM A48/A48M or ductile iron [AWWA C110/A21.10] [AWWA C153/A21.53]. Up to [300] [_____] mm [12] [_____] inches inclusive, the fittings shall be [1.7] [_____] MPa [250] [_____] psig rated. Gray iron fittings shall be cement mortar lined [standard] [double] thickness. Flanges and flanged fittings shall conform to [AWWA C110/A21.10] [ASME B16.1] and shall be rated for [1.03 MPa 150 psig] [1.72 MPa 250 psig] [_____ MPa psig] service. Materials shall be [ductile iron] [or] [gray iron] [_____]. For tie-in to existing flanges, field check existing flanges for nonstandard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolts and nuts shall be [carbon steel conforming to ASTM A307, Grade [B] [_____]] [______]. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall be [rubber] [ring] [_____] [full face], maximum [3.2] [_____] mm [0.125] [_____] inch thick.

2.3.4 Corrosion Control

Ductile iron piping shall be [coated with the manufacturer's standard asphaltic coating, approximately [0.025 mm 1 mil] [_____ mm mil] thick, applied to the outside of pipe and fittings] [hot-dipped galvanized in accordance with ASTM A153/A153M] [______]. Buried pipe shall be coated and wrapped, and provided with cathodic protection in accordance with [Section 26 42 14.00 10 CATHODIC PROTECTION SYSTEM (SACRIFICIAL ANODE)] [Section 26 42 17.00 10 CATHODIC PROTECTION SYSTEM (IMPRESSED CURRENT)].

2.4 CARBON STEEL PIPING SYSTEM

*******************************************************************************
NOTE: Consult the referenced standards for the proper carbon steel use and fittings. For example, ASTM A53/A53M carbon steel piping is a good general piping material and ASTM A106/A106M carbon steel is for high temperature applications. In addition, some of the types and grades may not be suitable for certain joining methods or cold bending; etc. Steel pipe meeting API Spec 5L is specified only with 50 mm 2 inch and smaller pipe that is subject to a low pressure application and the use of taper-threaded couplings.
*******************************************************************************

2.4.1 Carbon Steel Pipe

2.4.1.1 General Service

Carbon steel pipe shall meet the requirements of [ASTM A53/A53M [seamless] [butt welded] [electric-resistance welded], Grade [A] [B] [API Spec 5L, Schedule [40] [80] [_____]]] and shall be [in accordance with Pipe Schedule [___], hot-dipped galvanized]. Buried carbon steel piping and fittings shall be Schedule [80] [_____].

2.4.1.2 High Temperature Service

Seamless carbon steel pipe for high temperature service shall [conform to ASTM A106/A106M Grade [A] [B] [C], [hot-finished] [cold-drawn], Schedule [40] [80] [_____]] [be in accordance with Pipe Schedule] with dimensions conforming to ASME B36.10M.
2.4.1.3 Chemical Process Service

Electric-resistance welded low-carbon steel pipe shall conform to ASTM A587 with a nominal wall thickness [of [_____] mm inch] [in accordance with Pipe Schedule].

2.4.2 Carbon Steel Tubing

Tubing shall meet the requirements of [ASTM A334/A334M, [seamless] [welded], Grade [1] [_____] carbon steel] [ASTM A423/A423M, [seamless] [electric-resistance-welded], Grade [1] [2] low-alloy carbon steel] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____]..

2.4.3 Carbon Steel Joints

Carbon steel piping shall be joined by [straight-threaded couplings] [taper-threaded couplings] [welding fittings] [flanges] [mechanical joints for grooved ends meeting the requirements of AWWA C606]. Tubing shall be joined using [compression] [_____] fittings. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.

2.4.4 Carbon Steel Fittings

[Fittings shall be [cast malleable iron] [carbon steel] [heat-treated low-carbon steel] [______].] [Where cast fittings are not available, segmental welded steel fittings, ASTM A53/A53M, Grade B, meeting the requirements of manufacturer's recommended wall thicknesses shall be fabricated.]

2.4.4.1 Threaded Fittings

Threaded fittings shall be Class [150] [300] [______], [malleable iron, ASTM A47/A47M, conforming to ASME B16.3, black, banded] [forged carbon steel ASTM A105/A105M, conforming to ASME B16.11] [low carbon steel, ASTM A858/A858M, conforming to ASME B16.11] [______], and threaded in accordance with ASME B1.20.2MASME B1.20.1. Threaded, rigid couplings shall be [welded] [seamless] [black] [Type I (hot-dipped galvanized)] [Type II (electrogalvanized)] carbon steel in accordance with [ASTM A865/A865M] [______] and threaded in accordance with ASME B1.20.2MASME B1.20.1. [Polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [______] shall be used for lubricant/sealant.

2.4.4.2 Welding Fittings

Welding fittings shall be [butt-welding] [or] [socket-welding]. Welding fittings shall be forged [steel, ASTM A105/A105M Class [150] [300] [______]] [low-carbon steel, ASTM A858/A858M [seamless ] [or] [welded]] [______] conforming to [ASME B16.9] [, or] [ASME B16.11].

2.4.4.3 Flanged Fittings

The internal diameter bores of flanges and flanged fittings shall be the same as that of the associated pipe. The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Flanges and flanged fittings shall be [forged steel, ASTM A105/A105M] [ASTM A727/A727M] [______] [______], faced and drilled to ASME B16.5 Class [150] [300] [______] with a [1.6 mm 0.0625 inch] [raised face] [flat face] [______]. [Cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, shall be drilled in conformance with [ASME B16.5] [ASME B16.1] Class
[150] [____]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall be [alloy-steel ASTM A193/A193M Grade [B5] [B7] [____] hex head bolts and ASTM A194/A194M Grade [____] hex head nuts] [____]. When mating flange on valves or equipment is cast iron, [ASTM A193/A193M Grade [B8 Class 1] [____] bolts and ASTM A194/A194M Grade [B] [____] heavy hex head nuts] [____] shall be used. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall meet the requirements of ASME B16.5. [Nonmetallic gaskets shall conform to ASME B16.21 and be a maximum [3.2] [____] mm [0.125] [____] inch thick [chloroprene rubber, durometer hardness No.80,) [____] 10.34 MPa 1,500 psi minimum tensile strength, [125] [____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Metallic ring joint gaskets shall conform to ASME B16.20 and be constructed of [____].]

2.4.4.4 Compression Fittings for Tubing

Compression fittings shall be of [carbon steel [ASTM A108] [ASTM A576]] [____] nuts, ferrules and bodies rated to a minimum [____] kPa psig. Threads shall be straight conforming to [ISO 228-1] [ASME B1.1].

2.4.5 Carbon Steel Coatings

******************************************************************************
NOTE: Carbon steel piping system components will be coated with corrosion resistant materials suitable for exposure to the environmental and process conditions of the site. For potential exposures to pressures less than 70 kPa 10 psi, temperatures less than 100 degrees C 212 degrees F and mild chemicals, the surfaces shall be prepared in accordance with SSPC SP 6/NACE No.3.

For potential exposures to pressures and temperatures greater than those previously mentioned, and mild chemicals, intermediate options may be appropriate. For severe chemical exposures, the thermoplastic resin system should be used.
******************************************************************************

Carbon steel piping components shall be coated with corrosion resistant materials. Coatings and finishes shall be 100 percent holiday free.

2.4.5.1 Silicone Coating

Carbon steel piping surfaces shall be prepared in accordance with SSPC SP 6/NACE No.3. The surfaces shall have an alkyd primer of [0.0625] [____] mm [2.5] [____] mils dry film thickness followed by two alkyd modified silicone final coats.

2.4.5.2 Zinc Coating

Galvanizing shall be hot-dip applied and meet the requirements of ASTM A153/A153M; electroplated zinc or cadmium plating is unacceptable. Stainless steel components may be substituted where galvanizing is specified.
2.4.5.3 Thermoplastic Resin Coating System

[Carbon steel piping surfaces shall have a minimum of [4] [_____] coats of phenolic type coatings applied at a minimum dry film thickness of [0.040] [_____] mm [1.6] [_____] mils per coat. Each coat shall be baked at [149] [_____] degrees C [300] [_____] degrees F for [10] [_____] minutes. The full coating system shall be cured in an oven at [190] [_____] degrees C [375] [_____] degrees F for [30] [_____] minutes.] [Carbon steel piping system components shall be coated with an adhesively mounted polyethylene coating system. The continuously extruded polyethylene and adhesive coating system materials shall conform to NACE SP0185 Type A.]

2.4.6 Carbon Steel Cathodic Protection

Buried ferrous piping shall have cathodic protection.

2.5 LINED STEEL PIPING SYSTEM

2.5.1 Outer Pipe Shell

**************************************************************************
NOTE: For the outer shell, carbon steel is most common; stainless steel will considerably limit suppliers. Flanged joining, Class 150 or 300, is commonly used. Most thermoplastic liners allow some vapors to permeate and become trapped between the liner and the shell. Therefore, venting via weep holes in the outer shell or venting flange collars (note that a single manufacturer has a patent on venting collars) are required to avoid gas accumulation. These are not required for nonpermeable liners such as PVDC. The use of thermoplastics with aggressive chemicals may result in a lower maximum operating temperature than that rated for an unlined pipe composed of the same material.
**************************************************************************

The outer shell of the lined piping system shall be [carbon steel meeting the requirements of [ASTM A53/A53M [electric-resistance welded] [____], Grade [B] [____]] [____], Schedule [40] [80] [in accordance with Pipe Schedule] [TP304 stainless steel, [ASTM A312/A312M [seamless] [welded]] [____], Schedule [10S] [40S] [80S] [5S] [in accordance with Pipe Schedule]] [____]. The outer pipe shall be equipped with [3] [_____] mm [0.125] [_____] inch vent holes spaced axially at [_____] mm inches on center or locking and venting collars at each flange. If insulated, the vents of the lined piping system shall be equipped with the manufacturer's standard vent extensions to avoid blocking. [Carbon steel piping components shall be externally coated with corrosion resistant materials. Coatings and finishes shall be 100 percent holiday free.]

2.5.2 Lined Steel Joints

Lined piping shall be joined by [[cast steel] [forged steel] flanges] [____].

2.5.3 Lined Steel Fittings

Fittings shall be [cast gray iron, [ASTM A126 Grade B] [____], conforming
2.5.4 Lined Steel Flanged Fittings

The internal diameter bores of flanges and flanged fittings shall be the same as that of the associated pipe. [Cast steel, [ASTM A216/A216M Grade WCB] [____],] [Forged steel, [ASTM A105/A105M] [____],] [Stainless steel, [ASTM A312/A312M Grade 304L] [____],] flanges and flanged fittings shall be faced and drilled to ASME B16.5 Class [150] [300] [____]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall be [alloy-steel ASTM A193/A193M Grade [B5] [B7] [____] hex head bolts and ASTM A194/A194M Grade [____] hex head nuts] [____]. When mating flange on valves or equipment is cast iron, [ASTM A193/A193M Grade [B8 Class 1] [____] bolts and ASTM A194/A194M Grade [____] heavy hex head nuts] [____] shall be used. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall meet the requirements of ASME B16.5 and shall be nonmetallic conforming to ASME B16.5.

2.5.5 Lined Steel Spacers

For making connections between lined piping systems and other types of pipe or equipment, spacers shall be used. The spacers shall be composed of the same material as the liner, and shall have a bore identical to the internal diameter of the associated lined pipe. Unless otherwise specified for the liner systems, a gasket shall be used between the spacer and the unlined piping system or equipment that conforms to the gaskets required for the unlined piping system or equipment nozzle. Spacers shall be [standard ring] [standard full face] [lined steel ring] [as indicated on the contract drawings] [____] for flanged connections. Spacers shall be a minimum of [13] [____] mm [1/2] [____] inch thick for piping 200 mm 8 inches and smaller in diameter, and a minimum of [15] [____] mm [5/8] [____] inch thick for piping larger than 200 mm 8 inches in diameter. A tapered face spacer [may] [shall not] be used for piping directional changes less than [5] [____] degrees, and shall not be used for piping directional changes larger than [5] [____] degrees.

2.5.6 Glass Liner

**************************************************************************
NOTE: A pressure rating of 2 MPa 300 psi is available for the lining and piping system if Class 300 split flanges are used as joints.
**************************************************************************

The liner shall be locked to the shell. The liner shall consist of [1.6] [____] mm [1/16] [____] inch of [chemical resistant, low-expansio, Type-I borosilicate glass, Glass A] [porcelain enamel] [____] conforming to ASTM E438 rated to operate between -29 and plus 66 degrees C -20 and plus 450 degrees F at a nominal working pressure of [1.03] [____] MPa [150] [____] psig and full vacuum. [Thermal shock resistance shall be tested in accordance with ASTM C600.] [Polytetrafluoroethylene (PTFE)] [____] enveloped gaskets shall be used that conform to ASTM F336.
2.5.7 Perfluoroalkoxy (PFA) Liner

**************************************************************************
NOTE: Liner thicknesses range from 1.5 to 3.8 mm 60 to 150 mil, depending on the size of the pipe. Nominal pipe diameters 25 mm 1 inch through 80 mm 3 inches are rated for full vacuum up to 230 degrees C 450 degrees F; 100 mm 4 inches diameter pipe is rated for full vacuum to 150 degrees C 300 degrees F; 150 mm 6 inches diameter pipe is rated for full vacuum at 120 degrees C 250 degrees F; and 200 mm 8 inches diameter pipe is rated for full vacuum at 65 degrees C 150 degrees F. Larger pipe diameters are available.
**************************************************************************

The liner shall be locked to the shell. The liner shall consist of PFA, ASTM D3307 Type II, conforming to ASTM F1545, and shall be rated to operate between -29 and plus 260 degrees C -20 and plus 500 degrees F. The lined piping system shall be rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. The pipe liner shall have a minimum wall thickness of [_____] mm mil. The liner for fittings shall have a minimum wall thickness and minimum uniform face thickness of [_____] mm mil. The part of the liner that extends onto a gasket face shall have a uniform thickness of not less than 80 percent of the pipe liner wall thickness.

2.5.8 Polypropylene (PP) Liner

**************************************************************************
NOTE: Liner thicknesses range from 3.8 to 8.6 mm 150 to 340 mil), depending on size of pipe. Nominal pipe diameters 25 mm 1 inch through 300 mm 12 inch are rated for full vacuum up to 107 degrees C 225 degrees F, if the liner is of swaged construction. For interference fit type liners, pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum to 107 degrees C 225 degrees F; 250 mm 10 inch and 300 mm 12 inch diameter pipe is rated for full vacuum to 38 degrees C 100 degrees F.
**************************************************************************

The liner shall be locked to the shell. The liner shall consist of PP, ASTM D4101, shall conform to ASTM F1545, and shall be rated to operate between -18 and plus 107 degrees C 0 and 225 degrees F. The lined piping system shall be rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. The pipe liner shall have a minimum wall thickness of [_____] mm mil. The liner for fittings shall have a minimum wall thickness and minimum uniform face thickness of [_____] mm mil. The part of the liner that extends onto a gasket face shall have a uniform thickness of not less than 80 percent of the pipe liner wall thickness.

2.5.9 Polytetrafluoroethylene (PTFE) Liner

**************************************************************************
NOTE: Liner thicknesses range from 1.5 to 3.8 mm 60 to 150 mil, depending on pipe dimensions. Nominal
pipe diameters 25 mm 1 inch through 300 mm 12 inch are rated for full vacuum up to 107 degrees C 225 degrees F, if the liner is of swaged construction. For interference fit type liners, pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 230 degrees C 450 degrees F; 150 mm 6 inch and 200 mm 8 inch diameter pipe is rated for full vacuum at 180 degrees C 350 degrees F. For swaged fit type liners, pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum to 230 degrees C 450 degrees F. For slip fit type liners, pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 230 degrees C 450 degrees F.

The liner shall be locked to the shell. The liner shall consist of PTFE, shall conform to [______], and shall be rated to operate between -29 and plus 260 degrees C -20 and plus 500 degrees F. The lined piping system shall be rated at a maximum pressure of [______] MPa psig at a temperature of [______] degrees C degrees F. The pipe liner shall have a minimum wall thickness of [______] mm mil. The part of the liner that extends onto a gasket face shall have a minimum uniform face thickness of [______] mm mil.

2.5.10 Polyvinylidene Fluoride (PVDF) Liner

NOTE: Liner thicknesses range from 3.81 to 5.33 mm 150 to 218 mil depending on the pipe dimensions. Proper liner thickness assures a non-permeable lining. Nominal pipe diameters 25 mm 1 inch through 200 mm 8 inch are rated for full vacuum up to 135 degrees C 275 degrees F, if the liner is of swaged or interference fit construction. For loose fit type liners, nominal pipe diameters 25 mm 1 inch through 100 mm 4 inch are rated for full vacuum to 135 degrees C 275 degrees F, and 150 mm 6 inch and 200 mm 8 inch diameter pipe is rated for 64.2 kPa 19 inch of mercury of vacuum to 135 degrees C 275 degrees F.

The liner shall be locked to the shell. The liner shall consist of PVDF, ASTM D3222, and shall be rated to operate between -18 and plus 135 degrees C 0 and 275 degrees F. The lined piping system shall be rated at a maximum pressure of [______] MPa psig at a temperature of [______] degrees C degrees F. The pipe liner shall have a minimum wall thickness of [______] mm mil. The liner for fittings shall have a minimum wall thickness and minimum uniform face thickness of [______] mm mil. The part of the liner that extends onto a gasket face shall have a uniform thickness of not less than 80 percent of the pipe liner wall thickness.

2.5.11 Rubber Liner

NOTE: Liner thicknesses range from 3.2 mm 0.125 inch to 12.7 mm 0.5 inch. Rubber lined pipe is not rated for vacuum service. Use a standard gasket for hard rubber lining. For soft rubber use a coating
or sheet of polyethylene or similar material consistent with the application as a gasket. Operating temperature ranges are as follows:

<table>
<thead>
<tr>
<th>Material</th>
<th>Temperature Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Natural rubber</td>
<td>-54 to plus 82 degrees C -65 to plus 180 degrees F</td>
</tr>
<tr>
<td>Chloroprene</td>
<td>-54 to plus 107 degrees C -65 to plus 225 degrees F</td>
</tr>
<tr>
<td>Isobutylene isoprene</td>
<td>-54 to plus 149 degrees C -65 to plus 300 degrees F</td>

<tr>
<td>Nitrile</td>
<td>-54 to plus 107 degrees C -65 to plus 225 degrees F</td>
</tr>
<tr>
<td>EPDM</td>
<td>-54 to plus 149 degrees C -65 to plus 300 degrees F</td>
</tr>
<tr>
<td>Chlorosulfonated polyethylene</td>
<td>-54 to plus 121 degrees C -65 to plus 250 degrees F</td>
</tr>
</tbody>
</table>

The liner shall be locked to the shell. The liner shall consist of [_____] mm inch of elastomeric material, ASTM D1418 Class [_____), with a hardness of [_____]. The lining shall be terminated inside of the bolt holes. The remaining space from the liner to the flange edge shall be filled with a [_____] mm inch [polytetrafluoroethylene (PTFE)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [_____] spacer. Flange gaskets shall be [a maximum [3] [_____] mm [1/8] [_____] inches thick [polyethylene (PE)] [_____] [sheet] [or] [coating]] [_____] gasket].

2.5.12 Polyvinylidene Chloride (PVDC) Liner

**NOTE:** No vents are needed in the outer pipe for PVDC. Liner thicknesses range from 3.8 to 5.5 mm 150 to 218 mil depending on the pipe dimensions.

The liner shall be locked to the shell. The liner shall consist of PVDC conforming to ASTM F1545, and shall be rated to operate between -18 and plus 79 degrees C 0 and 175 degrees F. The lined piping system shall be rated at a maximum pressure of [_____] MPa psig at a temperature of [_____] degrees C degrees F. The pipe liner shall have a minimum wall thickness of [_____] mm mil. The fittings liner shall have a minimum wall thickness and minimum uniform face thickness of [_____] mm mil. The part of the liner that extends onto a gasket face shall have a uniform thickness of not less than 80 percent of the pipe liner wall thickness.

2.5.13 Lined Steel Cathodic Protection

Buried ferrous piping shall have cathodic protection.
2.6 STAINLESS STEEL PIPING SYSTEM

**************************************************************************
NOTE: The following paragraphs specify general liquid service use of stainless steel piping. To specify the material, review the application. For example, of the austenitic steels, TP316 or TP316L have better resistance to pitting corrosion than TP304 or TP304L where brines, sulphur-bearing waters or halogen salts, such as chlorides, are present.

The option for crimped couplings and fittings requires a low pressure application - less than 1.03 MPa 150 psig, service where the stainless steel piping materials (TP304, TP304L, TP316 and TP316L) are compatible to the fluid and thin wall (schedule 5S) pipe or tubing. A limited number of manufacturers are available so include other joint/fitting option(s).
**************************************************************************

2.6.1 Austenitic Piping

2.6.1.1 Stainless Steel Pipe

Stainless steel pipe intended for general corrosive service shall meet the requirements of [ASTM A312/A312M, [seamless] [welded]] [ASTM A813/A813M for fit-up and alignment quality, Class [SW] [DW]] [ASTM A814/A814M for flanged and cold-bending quality, Class [SW] [DW]] [____], Grade [TP304] [TP304L] [TP316] [TP316L] [____], Schedule [10S] [40S] [80S] [5S] [in accordance with Pipe Schedule] [____] with dimensions conforming to ASME B36.19M.

2.6.1.2 Stainless Steel Tubing

Stainless steel tubing shall meet the requirements of [[ASTM A269/A269M] [ASTM A632], [seamless] [welded], Grade [TP304] [TP304L] [TP316] [TP316L] [____]] [ASTM A789/A789M, [seamless] [welded], Grade [S32760] [____]] with nominal size and wall thickness [in accordance with Pipe Schedule] [____].

2.6.1.3 Stainless Steel Joints

Stainless steel piping shall be joined by [threaded couplings] [welded fittings] [flanges] [crimping couplings]. Tubing shall be joined using [crimping couplings] [compression] [____] fittings. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.

2.6.1.4 Stainless Steel Threaded Fittings

Threaded fittings shall be [austenitic stainless steel, [ASTM A182/A182M Grade [TP304] [TP304L] [TP316] [TP316L] [____], conforming to [ASME B16.11] [____], and threaded in accordance with ASME B1.20.2MASME B1.20.1.]] [Polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [____] shall be used for lubricant/sealant.

2.6.1.5 Stainless Steel Welding Fittings

Welding fittings shall be [butt-welding] [or] [socket-welding]. Welding fittings shall be forged austenitic stainless steel, [ASTM A403/A403M Grade
2.6.1.6 Stainless Steel Flanged Fittings

The internal diameter bores of flanges and flanged fittings shall be the same as that of the associated pipe. The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Flanges and flanged fittings shall be [forged austenitic stainless steel, ASTM A182/A182M Grade [TP304] [TP304L] [TP316] [TP316L] [_____,] [butt-welding fittings, Class [CR], conforming to ASME B16.9] [socket-welding fittings, Class [WP-S] [WP-W] [WP-WX] [WP-WU], conforming to ASME B16.11].

2.6.1.7 Stainless Steel Crimping Fittings

Crimping fittings shall be cold drawn, [TP304] [TP304L] [TP316] [TP316L] austenitic stainless steel. O-ring seals shall be [butadiene acrylonitrile] [ethylene propylene diene monomer (EPDM)] [fluoro-elastomeric] [_____.]

2.6.1.8 Compression Fittings for Tubing

Compression fittings shall be of [ASTM A479/A479M] [_____] stainless steel, Grade TP316, nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Threads shall be straight conforming to [ISO 228-1] [ASME B1.1].

2.6.1.9 Stainless Steel Cathodic Protection

Buried ferrous piping shall have cathodic protection.

2.6.2 Ferritic and Martensitic Piping

2.6.2.1 Pipe

Stainless steel pipe shall meet the requirements of [ASTM A268/A268M, [seamless] [welded], Grade [S44627] [S43035TP430] [_____,] [_____] with dimensions conforming to ASME B36.19M.]
2.6.2.2 Tubing

Stainless steel tubing shall meet the requirements of [ASTM A268/A268M, [seamless] [welded], Grade [TP410] [_____] [ASTM A789/A789M, [seamless] [welded], Grade [S31500] [_____] [ASTM A268/A268M, welded, unannealed Grade [S44627] [_____] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____]].

2.6.2.3 Joints

Stainless steel piping shall be joined by [threaded couplings] [welding fittings] [flanges]. Tubing shall be joined using [compression] [_____] fittings. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.

2.6.2.4 Threaded Fittings

Threaded fittings shall be [stainless steel, ASTM A182/A182M Grade [TP430] [6a Class 1] [_____]], conforming to [ASME B16.11] [_____] and threaded in accordance with [ASME B1.20.1] [ASME B1.20.2MASME B1.20.1]. Polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308 [_____] shall be used for lubricant/sealant.

2.6.2.5 Welding Fittings

Welding fittings shall be [butt-welding] [or] [socket-welding]. Welding fittings shall be forged stainless steel, [ASTM A815/A815M Grade [TP430] [TP410] [_____] [butt-welding fittings, Class CR, conforming to ASME B16.9] [socket-welding fittings, Class [WP-S] [WP-W] [WP-WX], conforming to ASME B16.11] [_____].

2.6.2.6 Flanged Fittings

The internal diameter bores of flanges and flanged fittings shall be the same as that of the associated pipe. The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Flanges and flanged fittings shall be [forged stainless steel, ASTM A182/A182M Grade [TP430] [6a Class 1] [_____] [______], Class [150] [300] [_____]], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [______]. [Cast stainless steel backing flanges, ASTM A352/A352M Grade [_____]], Van Stone type, shall be drilled to [ASME B16.5] [ASME B16.1] Class [150] [______]. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall be [alloy-steel ASTM A193/A193M Grade [L7] [L7A] [_____] hex head bolts and ASTM A194/A194M Grade [7] [7A] [_____] hex head nuts] [______]. When mating flange on valves or equipment is cast iron, [ASTM A193/A193M Grade Grade [B8 Class 1] [_____] bolts and ASTM A194/A194M Grade [8] [_____] heavy hex head nuts] [______]. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall meet the requirements of ASME B16.5. [Nonmetallic gaskets shall conform to ASME B16.21 and be a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [______], 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Metallic ring joint gaskets shall conform to ASME B16.20 and be constructed of [______].]
2.6.2.7 Compression Fittings for Tubing

Compression fittings shall be of [ASTM A479/A479M] [_____] stainless steel, Grade TP316, nuts, ferrules and bodies rated to a minimum [_____] kPa psig. Threads shall be straight conforming to [ISO 228-1] [ASME B1.1].

2.6.2.8 Cathodic Protection

Buried ferrous piping shall have cathodic protection.

2.7 NICKEL AND NICKEL ALLOYS PIPING SYSTEMS

**************************************************************************
NOTE: The preferred method for joining nickel and nickel alloy pipe is welding due to cost of flanges. In all cases, only Schedules 40S and 80S can be threaded due to wall thickness. Flanges should be used when attaching nickel pipe to pumps, process vessels, and other equipment that requires removal periodically. Generally, for temperatures up to 115 degrees C 240 degrees F, and normal pressures encountered, the chloroprene gasket specified is appropriate for most "dilute" process liquids, water and sludge services. However, other liquids may require other, more suitable gasket materials.
**************************************************************************

2.7.1 Nickel

**************************************************************************
NOTE: Alloy N02200 and alloy N02201 are the 2 basic compositions of nickel pipe. Alloy N02200 is limited to a maximum operating temperature of 315 degrees C 600 degrees F.
**************************************************************************

2.7.1.1 Nickel Pipe

[Alloy N02200] [Alloy N02201] nickel pipe shall be [seamless conforming to ASTM B161 and ASTM B829] [welded conforming to ASTM B725 and ASTM B775/B775M], and dimensioned Schedule [5S,] [10S,] [40S,] [80S] [in accordance with the Pipe Schedule in the contract drawings].

2.7.1.2 Nickel Joints

Joining shall use [welded] [or] [threaded] [_____] methods, except that connections to equipment or spool pieces that may be periodically removed shall be [flanged] [______]. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.

2.7.1.3 Nickel Fittings

Fittings including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43 shall be [butt] [or] [socket] welding and shall meet the requirements of ASTM B366/B366M. Fittings for alloy N02200 shall be [corrosion resistant, Grade CRN] [Class [150] [______], Grade WPN] and for alloy N02201, fittings shall be [corrosion resistant, Grade CRNL]
2.7.1.3.1  Welding Fittings

Welding shall be conducted in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.1.3.2  Threaded Fittings

Threads shall be in accordance with ASME B1.20.2M/ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] for lubricant/sealant.

2.7.1.3.3  Flanged Fittings

Flanges and flanged fittings shall be [ASTM B564 forged nickel alloy [N02200] [_____] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [_____]], Class [150] [300] [600], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [_____] . The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to ASME B16.5 [ASME B16.1] Class [150] [_____] shall be used. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall consist of [nickel-copper alloy, ASTM B164 alloy [N04400] [_____] Temper [_____] , bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [_____] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M Grade [_____] hex head nuts] [_____] . Bolts shall be provided with washers of the same material as the bolts. Gaskets shall meet the requirements of ASME B16.5. [Nonmetallic gaskets shall conform to ASME B16.21 and be a maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber, durometer hardness No.80] [_____] , 10.34 MPa 1,500 psi minimum tensile strength, [125] [_____] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Nonmetallic enveloped gaskets used for corrosive service shall conform to ASTM F336.] [Metallic ring joint gaskets shall conform to ASME B16.20 and be constructed of [_____] .]

2.7.2  Nickel-Molybdenum-Chromium (NMC) Alloy

2.7.2.1  NMC Pipe

[Alloy N06022] [Alloy N06455] [Alloy N10276] [Hastelloy] [_____] NMC alloy pipe shall be [seamless conforming to ASTM B622 and ASTM B829] [welded conforming to ASTM B619/B619M and ASTM B775/B775M], and dimensioned Schedule [5S,] [10S,] [40S,] [80S] [in accordance with the Pipe Schedule].

2.7.2.2  NMC Tubing

Tubing shall be seamless and shall conform to ASTM B622 NMC alloy [N06022] [N06455] [Hastelloy] [_____] with nominal size and wall thickness [in accordance with Pipe Schedule] [_____] .

2.7.2.3  NMC Joints

Joining shall use [welded] [or] [threaded] [_____] methods, except that
connections to equipment or spool pieces that may be periodically removed shall be [flanged] [______]. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.

2.7.2.4 NMC Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, shall be [butt] [or] [socket] welding and shall meet the requirements of ASTM B366/B366M. Fittings for alloy N06022 shall be [corrosion resistant, Grade CRHC22] [Class [150] [______], Grade WPHC22]; for alloy N06455, fittings shall be [corrosion resistant, Grade CRHC4] [Class [150] [______], Grade WPHC4]; and for alloy N10276, fittings shall be [corrosion resistant, Grade CRHC276] [Class [150] [______], Grade WPHC276] [______].

2.7.2.4.1 Welding Fittings

Welding shall be conducted in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.2.4.2 Threaded Fittings

Threads shall be in accordance with ASME B1.20.2/ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [______] for lubricant/sealant.

2.7.2.4.3 Flanged Fittings

Flanges and flanged fittings shall be [ASTM B564 forged NMC alloy [N06022] [N10276] [Hastelloy] [______]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system, Class [150] [300] [600] and drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face]] [______]. The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. Cast steel backing flanges, [ASTM A216/A216M Grade WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1 Class [150]] [______] shall be used. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall consist of [low carbon NMC alloy, ASTM B574 alloy [N06022] [______] Temper [______], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [______] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [______] hex head bolts and ASTM A194/A194M Grade [______] hex head nuts] [______]. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall meet the requirements of ASME B16.5. [Nonmetallic gaskets shall conform to ASME B16.21 and shall be a maximum [3] [______] mm [1/8] [______] inch thick [chloroprene rubber, durometer hardness No.80] [______], 10.34 MPa 1,500 psi minimum tensile strength, [125] [______] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Nonmetallic enveloped gaskets used for corrosive service shall conform to ASTM F336.] [Metallic ring joint gaskets shall conform to ASME B16.20 and be constructed of [______].]

2.7.2.5 NMC Compression Fittings for Tubing

Compression fittings shall be of ASTM B574 [low carbon NMC alloy] [Hastelloy], nuts, ferrules and bodies rated to a minimum [______] kPa psig.
Threads shall be straight conforming to [ISO 228-1] [ASME B1.1].

2.7.3 Nickel-Copper Alloy

2.7.3.1 Nickel-Copper Pipe

Alloy [N04400] [_____] nickel-copper alloy pipe shall be [seamless conforming to ASTM B165, [annealed] [stress-relieved] condition, and ASTM B829] [welded conforming to ASTM B725 and ASTM B775/B775M], and dimensioned Schedule [5S,] [10S,] [40S,] [80S] [in accordance with the Pipe Schedule].

2.7.3.2 Nickel-Copper Tubing

Tubing shall be seamless and shall conform to ASTM B165 nickel-copper alloy N04400, [annealed] [stress-relieved] condition, with nominal size and wall thickness [in accordance with Pipe Schedule] [______].

2.7.3.3 Nickel-Copper Joints

Joining shall use [welded] [or] [threaded] [_____] methods, except that connections to equipment or spool pieces that may be periodically removed shall be [flanged] [______]. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.

2.7.3.4 Nickel-Copper Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, and MSS SP-43, shall be [butt] [or] [socket] welding and shall meet the requirements of ASTM B366/B366M. Fittings for alloy [N04400] [_____] shall be [corrosion resistant, Grade CRNC] [Class [150] [______], Grade WPNC] [______].

2.7.3.4.1 Welding Fittings

Welding shall be conducted in accordance with AWS A5.11/A5.11M and AWS A5.14/A5.14M.

2.7.3.4.2 Threaded Fittings

Threads shall be in accordance with ASME B1.20.2/ASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [______] for lubricant/sealant.

2.7.3.4.3 Flanged Fittings

Flanges and flanged fittings shall be [ASTM B564 forged nickel-copper alloy [N04400] [______]] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [______], Class [150] [300] [600], and drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [______]. The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. [Cast steel backing flanges, ASTM A216/A216M Grade WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1] Class [150] [______] shall be used.] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall consist of [nickel-copper alloy, ASTM B164 alloy [N04400] [______] Temper [______],
bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and
ASTM A194/A194M Grade [_____] heavy hex head nuts [alloy-steel
ASTM A193/A193M Grade [B5] [B7] [_____] hex head bolts and ASTM A194/A194M
Grade [_____] hex head nuts] [______]. Bolts shall be provided with washers
of the same material as the bolts. Gaskets shall meet the requirements of
ASME B16.5. [Nonmetallic gaskets shall conform to ASME B16.21 and be a
maximum [3] [_____] mm [1/8] [_____] inch thick [chloroprene rubber,
durometer hardness No.80] [______], 10.34 MPa 1,500 psi minimum tensile
strength, [125] [______] percent minimum elongation, flat ring type for use
with raised face flanges and full face type for use with flat face
flanges.] [Nonmetallic enveloped gaskets used for corrosive service shall
conform to ASTM F336.] [Metallic ring joint gaskets shall conform to
ASME B16.20 and be constructed of [______].]

2.7.3.5 Nickel-Copper Compression Fittings for Tubing

Compression fittings shall be of ASTM B164 nickel-copper alloy [N04400]
[N04405] nuts, ferrules and bodies rated to a minimum [_____] kPa psig.
Threads shall be straight, conforming to [ISO 228-1] [ASME B1.1].

2.7.4 Nickel-Chromium-Iron (NCI) Alloy

2.7.4.1 NCI Pipe

Alloy [N06600] [N06025] [N06045] [_____] NCI alloy pipe shall be [seamless
conforming to ASTM B167 and ASTM B829] [welded conforming to ASTM B517 and
ASTM B775/B775M] [electric fusion-welded conforming to ASTM B546, and
dimensioned Schedule [5S,] [10S,] [40S,] [80S]] [in accordance with the
Pipe Schedule in the contract drawings].

2.7.4.2 NCI Joints

Joining shall use [welded] [or] [threaded] [_____] methods, except that
connections to equipment or spool pieces that may be periodically removed
shall be [flanged] [______]. Dielectric fittings or isolation joints shall
be provided between all dissimilar metals.

2.7.4.3 NCI Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps,
tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9,
ASME B16.11, and MSS SP-43, shall be [butt] [or] [socket] welding and shall
meet the requirements of ASTM B366/B366M. Fittings for alloy N06600 shall
be [corrosion resistant, Grade CRNCl] [Class [150] [______], Grade WPNCM];
for alloy N06025, fittings shall be [corrosion resistant, Grade CRV602]
[Class [150] [______], Grade WPV602]; and for alloy N06045, fittings shall
be [corrosion resistant, Grade CRV45TM] [Class [150] [______], Grade
WPV45TM] [______].

2.7.4.3.1 Welding Fittings

Welding shall be conducted in accordance with AWS A5.11/A5.11M and
AWS A5.14/A5.14M.

2.7.4.3.2 Threaded Fittings

Threads shall be in accordance with ASME B1.20.2MASME B1.20.1 with
[polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308]
[______] for lubricant/sealant.
2.7.4.3.3  Flanged Fittings

Flanges and flanged fittings shall be [ASTM B564 forged NCI alloy [N06600] [_____] [forged stainless steel, ASTM A182/A182M Grade F316L with a serrated insert constructed of the same material or alloy as the piping system] [______], Class [150] [300] [600], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [______]. The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. [Cast steel backing flanges, ASTM A216/A216M Grade [WCA] [WCB] [WCC], Van Stone type, and drilled to [ASME B16.5] [ASME B16.1] Class [150] [______] shall be used.] For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall consist of [NCI alloy, ASTM B164 alloy [N06600] Temper [______], bolts dimensioned to ASME B18.2.1 with ASME B1.1 coarse threads and ASTM A194/A194M Grade [______] heavy hex head nuts] [alloy-steel ASTM A193/A193M Grade [B5] [B7] [______] hex head bolts and ASTM A194/A194M Grade [______] hex head nuts] [______]. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall meet the requirements of ASME B16.5. [Nonmetallic gaskets shall conform to ASME B16.21 and be a maximum [3] [______] mm [1/8] [______] inch thick [chloroprene rubber, durometer hardness No.80] [______], 10.34 MPa 1,500 psi minimum tensile strength, [125] [______] percent minimum elongation, flat ring type for use with raised face flanges and full face type for use with flat face flanges.] [Nonmetallic enveloped gaskets used for corrosive service shall conform to ASTM F336.] [Metallic ring joint gaskets shall conform to ASME B16.20 and be constructed of [______].]

2.8  ALUMINUM PIPING SYSTEM

******************************************************************************
NOTE: Alloys 1060, 3003, 5052, 6061 and 6063 are the most common compositions of aluminum pipe. Alloy 6063 is most widely used due to economical cost, good corrosion resistance and mechanical properties.

The preferred method for joining aluminum pipe to handle corrosives is welding. Be aware that welding reduces tensile strength. Threading is not recommended for aluminum piping systems that handle corrosives. Flanges are usually limited to connecting aluminum pipe to pumps, process vessels, etc.
******************************************************************************

2.8.1  Aluminum Pipe

Aluminum and aluminum alloy pipe shall be seamless alloy [6063] [6061] [5052] [3003] [1060], Temer [TL] [______], Schedule [5S] [10S] [40S] [80S] [in accordance with the Pipe Schedule], with AA ANSI H35.2M standard dimensions, and conforming to [ASTM B241/B241M with [ASME B1.20.2M ASME B1.20.1 threaded] [standard] ends] [ASTM B345/B345M with [ASME B1.20.2M ASME B1.20.1ASME B1.20.2M threaded] [grooved] [beveled] [standard] [______] ends].

2.8.2  Aluminum Tubing

Tubing shall be drawn seamless and shall conform to ASTM B210/B210M alloy
2.8.3 Aluminum Joints

Joining shall use [welded] [mechanical coupling] [or] [threaded] [_____] methods, except that connections to equipment or spool pieces that may be periodically removed shall be [flanged] [______]. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.

2.8.4 Aluminum Fittings

Fittings, including 45 degree and 90 degree elbows, 180 degree bends, caps, tee reducers, lap-joint stub ends and other parts as covered by ASME B16.9, ASME B16.11, shall be [butt] [or] [socket] welding and shall meet the requirements of ASTM B361. Fittings shall be Grade [WP1060] [WP3003] [WP Alclad 3003] [WP6061] [or] [WP6063].

2.8.4.1 Aluminum Welding Fittings

Welding fittings shall be [butt-welding] [or] [socket-welding] and shall be factory made, wrought alloy [WP6063] [_____] in accordance with ASTM B361. Butt-welding fittings shall conform to ASME B16.9. Socket-welding fittings shall conform to ASME B16.11. Welding shall be conducted in accordance with AWS A5.3/A5.3M and AWS A5.10/A5.10M.

2.8.4.2 Aluminum Threaded Fittings

Threaded fittings shall be forged aluminum alloy [3003] [6061] [______], Temper [______], in accordance with ASTM B247M ASTM B247 and conforming to ASME B16.11. Threads shall be in accordance with ASME B1.20.2MASME B1.20.1 with [polytetrafluoroethylene (PTFE) pipe-thread tape conforming to ASTM D3308] [_____] for lubricant/sealant.

2.8.4.3 Aluminum Flanged Fittings

Flanges and flanged fittings shall be designed in accordance with ASME B31.3. Flanges shall be forged aluminum alloy [3003] [6061] [______], Temper [______], conforming to ASTM B247M ASTM B247, Class [150] [300] [600] [______], drilled to ASME B16.5 with a [1.6 mm 0.0625 inch raised face] [flat face] [______]. The flanges shall be [welding neck] [slip-on] [socket welding] [lapped] [or] [threaded] type. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Bolting shall consist of [aluminum bolting material, conforming to ASTM B211/B211M and ASME B16.5, dimensioned to ASME B18.2.1 and ASME B18.2.2 and with ASME B1.1 coarse threads] [______]. Bolts shall be provided with washers of the same material as the bolts. [Gaskets listed in ASME B16.5, Annex E, Fig. E1, Group 1a may be used with any flange rating class and bolting.] [Nonmetallic enveloped gaskets used for corrosive service shall conform to ASTM F336.]

2.8.4.4 Aluminum Compression Fittings for Tubing

Compression fittings shall be of ASTM B211/B211M aluminum alloy [2014], temper [T4] [T6], nuts, ferrules and bodies rated to a minimum [______] kPa psig. Threads shall be straight conforming to [ISO 228-1] [ASME B1.1].
2.8.5 Aluminum Piping Supports

******************************************************************************
NOTE: Galvanic corrosion must be prevented from occurring on piping support systems. Conventional steel hangers should not be used. Galvanized steel is acceptable only as long as the galvanizing is intact; therefore, a galvanized system should not be used where expansion/contraction or other piping movement is likely.
******************************************************************************

The piping system shall be supported using [aluminum] [[galvanized] [alloy] [_____] steel units, integrally padded with [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] piping supports conforming to MSS SP-58. Conventional steel and galvanized pipe hangers shall not be used for aluminum piping systems.

2.9 COPPER PIPING SYSTEM

******************************************************************************
NOTE: This paragraph covers copper pipe that may be used for corrosive services, and tubing used for noncorrosive water; refrigerant, and sample lines, etc. Copper is rapidly corroded by oxidizing acids such as chromic and nitric acids. The most common copper alloy is alloy 122 (C12200); however, other alloys may also be suitable for use. These include C10200, C10300, C10800 and C12000.

Thin walled piping systems (ASTM B302) can only be assembled using brazed joint pipe fittings. However, for high pressure and Class 'M' fluid services soldered or brazed joints and fittings are not permitted pursuant to ASME B31.3.
******************************************************************************

2.9.1 Copper Pipe

Seamless [C12200] [_____] copper alloy pipe, shall be a [[061 (annealed) [H55 (light-drawn)] [or] [H80 (hard-drawn)] Temper with [regular] [extra strong] standard dimensions conforming to ASTM B42] [H (drawn) Temper with standard dimensions conforming to ASTM B302].

2.9.2 Copper Tubing

Seamless copper alloy tubing shall conform to [ASTM B88M ASTM B88 alloy C12200, Type [K] [L] [or] [M], with a [060 (annealed)] [H (drawn)] temper] [ASTM B75/B75M alloy [C12200] [_____] with a [060 (soft-annealed)] [_____] temper]. Specifications for applications include: [refrigerant tubing - Type L, hard drawn] [P-trap priming connection - Type L, soft Temper] [sample lines - Type L, hard drawn] [_____].

2.9.3 Copper Joints

Pipe shall be joined using [threaded] [soldered] [or] [brazed] fittings and [flanged] [_____] connections to equipment. Tubing shall be joined using [solder] [flared] [or] [press] [compression] fittings. Dielectric fittings or isolation joints shall be provided between all dissimilar metals.
2.9.4 Copper Fittings

Component castings of flanges and fittings shall be copper alloy [C92200, Temper [_____] conforming to ASTM B61] [C83600 (also known as alloy 85-5-5-5), Temper [_____] in accordance with ASTM B62]. Solder joint fittings shall conform to ASME B16.22 and ASME B16.18. Fittings for flared copper tube shall conform to ASME B16.26. Cast bronze threaded fittings shall conform to ASME B16.15 and shall be threaded in accordance with ASME B1.20.2M. Flanges and flanged fittings shall be faced and drilled Class [150] [300] [_____] in accordance with ASME B16.26. Copper and bronze press fittings shall conform to material requirements of ASME B16.18 or ASME B16.22 and performance criteria of IAPMO PS 117. Sealing elements shall be of EPDM and be factory installed or an alternative supplied by fitting manufacturer. For tie-in to existing flanges, field check existing flanges for non-standard bolt hole configurations and design as required to assure new pipe and flange mate properly. Tubing compression fittings shall be [forged brass alloy C37700, conforming to ASTM B124/B124M] [______, nuts, ferrules and bodies rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.9.4.1 Bolting For Copper Piping

Bolting materials shall meet the requirements of ASME B31.1 and shall consist of [ASTM B98/B98M alloy [C66100] [C66100]] [ASTM B150/B150M alloy [C63000] [C64200]] [ASTM B164 alloy [N04400] [N04405]] [_____] materials. Bolts shall be provided with washers of the same material as the bolts.

2.9.4.2 Gaskets For Copper Piping

[Gaskets listed in ASME B16.5, Annex E, Group [1a] [1b] may be used with any flange rating class and bolting.] [Nonmetallic, full faced gaskets used with low strength or non-ferrous bolting shall have a seating pressure less than 11.0 MPa 1,600 psi.] Gasket dimensions shall conform to [ASME B16.21] [ASME B16.20].

2.9.5 Solder For Copper Piping

**************************************************************************
NOTE: Solder compositions can be selected from Table 5 contained in ASTM B32. Common solder types are Sb5 and SN95. Selection should be made based on suitability to the application considering temperature and corrosivity.
**************************************************************************

Solder [and flux] shall conform to ASTM B32 [and AWS A5.8/A5.8M]. The solder alloy shall be [_____] [contain less than 0.2 percent lead]. [The flux type shall be [R] [RMA] [RA] [OA] [OS] [IS] and shall conform to ASTM B813.]

2.9.6 Copper Piping Supports

**************************************************************************
NOTE: Galvanic corrosion must be prevented from occurring to piping support systems; conventional and galvanized steel hangers should not be used.
**************************************************************************
The piping system shall be supported using [copper] [brass] [padded steel] [_____] piping supports that conform to MSS SP-58. Conventional steel and galvanized pipe hangers shall not be used for copper piping systems. All valves, instruments and other equipment attached to the piping system shall be individually supported.

2.10  PLASTIC PIPING SYSTEM

**************************************************************************
NOTE: Plastic Piping Systems - Many of the thermoplastic piping systems are available in both a nominal pipe schedule dimension or in a standard dimension rating (SDR). Schedule based piping has the same dimensions, outer diameter and wall thickness, as steel pipe but the pressure rating decreases with increasing pipe diameter. For SDR pipe, the pressure rating is kept uniform for all nominal pipe sizes of a given material and SDR value by increasing wall thickness. Refer to ASTM D2241 and ASTM D1785 for PVC SDR piping.

Backing flanges for plastic piping systems can be stainless steel, ductile iron, steel (galvanized and plain), or aluminum, depending on the application. Change the flange subparagraphs accordingly. Similarly, change the gasket material selections as required by the liquid application.

Use PVC for selected chemical services, where pipelines may be subjected to exterior corrosion, and liquid processes of 60 degrees C 140 degrees F or below.

Schedule 40 pipe should not be threaded at all. Schedule 80 pipe should not be threaded in sizes larger than 100 mm 4 inch. Schedule 80 threaded joints larger than 50 mm 2 inch must be back-welded to achieve fully rated maximum operating pressures.

**************************************************************************
Submit documentation certifying that the manufacturer of each thermoplastic piping system is listed with the Plastic Pipe Institute as meeting the recipe and mixing requirements of the resin manufacturer for the resin used to manufacture each of the respective thermoplastic pipe systems.

2.10.1  PVC Pipe

PVC, ASTM D1784, minimum cell classification [12545-C] [____], pipe shall be [Schedule [40] [80] [_____] conforming to ASTM D1785 [manufactured to an SDR rating in accordance with ASTM D2241, so that the pressure rating of the pipe is consistent for all pipe sizes. The pipe shall be SDR [_____] with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F] [____].

2.10.2  PVC Tubing

Tubing shall be flexible and clear with nominal size and wall thickness [in accordance with Pipe Schedule] [_____] [and reinforcement].
2.10.3 PVC Joints

The piping system shall be joined by [socket-weld] [flanged] [or] [mechanical] connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Connections at those points shall be threaded and back-welded. Tubing connections shall use compression fittings.

2.10.4 PVC Fittings

**************************************************************************
NOTE: Specify ASTM D2464 for Schedule 80 threaded type; ASTM D2466 for Schedule 40 socket type; ASTM D2467 for Schedule 80 socket type.
**************************************************************************

The schedule rating for the fittings shall not be less than that for the associated pipe. Fittings shall be ASTM D1784, minimum cell classification [_____] , PVC conforming to the requirements of [ASTM D2464, threaded in accordance with ASME B1.20.2MASTM B1.20.1] [ASTM D2466, socket type] [ASTM D2467, socket type]. [No] [_____] thread lubricant is required.

2.10.4.1 Push-on Joints

Push-on type joints shall be sealed with [ethylene propylene rubber (EPR)] [_____] gaskets in accordance with ASTM F477.

2.10.4.2 Flanged Fittings

Flanges and flanged fittings shall be Class [125] [_____], [one piece, molded hub type, flat faced, and shall conform to ASME B16.1] [ASME B16.5 ] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with ASME B16.1] [ASME B16.5] drilling. Flanges shall be complete with one-piece, molded PVC stub ends]. Flanged connections shall have the same pressure rating as the pipe or greater. Bolting shall be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [B8] [B8M] [_____] hex head nuts. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall be full-faced, maximum [3] [_____] mm [1/8] [_____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, a flat ring gasket shall be used and a filler gasket shall be provided between outer diameter of the raised face and the flange outer diameter to protect the PVC flange from bolting moment.

2.10.4.3 Tubing Fittings

Fittings shall be compression type comprised of [forged brass alloy C37700, conforming to ASTM B124/B124M] [_____], nuts, ferrules and bodies] [acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [polypropylene] [_____] bodies, barb and holding nut] [_____], rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.10.5 PVC Solvent Cement

Socket connections shall be joined with PVC solvent cement conforming to ASTM D2564. Manufacture and viscosity shall be as recommended by the pipe
and fitting manufacturer to assure compatibility. [Joints shall be prepared with primers conforming to ASTM F656 prior to cementing and assembly.]

2.11 CHLORINATED POLYVINYL CHLORIDE (CPVC)

******************************************************************************
NOTE: Use CPVC for chemical or corrosive services that are between 60 degrees C 140 degrees F and 99 degrees C 210 degrees F.

Like PVC, CPVC Schedule 40 pipe should not be threaded at all. Schedule 80 pipe should not be threaded in sizes larger than 100 mm 4 inch. Schedule 80 threaded joints larger than 50 mm 2 inch must be back-welded to achieve fully rated maximum operating pressures.
******************************************************************************

2.11.1 CPVC Pipe

CPVC, ASTM D1784, minimum cell classification [23447] [_____] , pipe shall be [Schedule [40] [80] conforming to ASTM F441/F441M] [manufactured to an SDR rating in accordance with ASTM F442/F442M, so that the pressure rating of the pipe shall be consistent for all pipe sizes. The pipe shall be SDR [_____] with a pressure rating of [_____] MPa psig at [_____] degrees C degrees F] [______].

2.11.2 CPVC Joints

The piping system shall be joined by [socket-weld] [flanged] [or] [mechanical] connections except where connecting to unions, valves, and equipment with threaded connections that may require future disassembly. Connections at those points shall be threaded and back-welded.

2.11.3 CPVC Fittings

******************************************************************************
NOTE: Specify ASTM F437 for Schedule 80 threaded type; ASTM F438 for Schedule 40 socket type; ASTM F439 for Schedule 80 socket type.
******************************************************************************

The schedule rating for the fittings shall not be less than that for the associated pipe. Fittings shall be ASTM D1784, cell classification [23447] [______], CPVC conforming to the requirements of [ASTM F437, threaded in accordance with ASME B1.20.2MASME B1.20.1] [ASTM F438, socket type] [ASTM F439, socket type]. [No] [_____] thread lubricant is required.

2.11.3.1 Push-on Joints

Push-on type joints shall be sealed with [ethylene propylene rubber (EPR)] [_____] gaskets in accordance with ASTM F477.

2.11.3.2 Flanged Fittings

Flanges and flanged fittings shall be Class [125] [______], [one piece, molded hub type, flat faced, and conforming to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [_____] }
Drilling. Flanges shall be complete with one-piece, molded CPVC stub ends. Flanged connections shall have the same pressure rating as the pipe or greater. Bolting shall be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall be full-faced, maximum [3.2 mm 0.125 inch] [_____] mm [inch] thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21. When the mating flange has a raised face, a flat ring gasket shall be used and a filler gasket shall be provided between outer diameter of the raised face and the flange outer diameter to protect the CPVC flange from the bolting moment.

2.11.4 Solvent Cement

Socket connections shall be joined with PVC solvent cement conforming to ASTM F493. Manufacture and viscosity shall be as recommended by the pipe and fitting manufacturer to assure compatibility.

2.12 POLYVINYLIDENE FLUORIDE (PVDF)

******************************************************************************
NOTE: PVDF pipe is chemically resistant to most acids, bases and organics, and can transport liquid halogen solutions of chlorine or bromine. PVDF should not be used with strong alkalis, fuming acids, polar solvents, amines, ketones or esters. PVDF does not degrade in sunlight; therefore, PVDF does not require UV stabilizers or antioxidants. Use on liquids above 49 degrees C 120 degrees F require continuous support. Care must be used in using PVDF piping under suction.
******************************************************************************

2.12.1 PVDF Pipe

[High Purity] PVDF, conforming to ASTM D3222, pipe shall be [Schedule [40] [80]] [manufactured to a SDR rating so that the pressure rating of the pipe shall be consistent for all pipe sizes. The pipe shall be SDR with a pressure rating of [1.03 MPa 150 psig at 23 degrees C 73.4 degrees F] [1.6 MPa 232 psig at 23 degrees C 73.4 degrees F]] [____].

2.12.2 PVDF Tubing

Tubing shall be flexible with nominal size and wall thickness [in accordance with Pipe Schedule] [____].

2.12.3 PVDF Joints

******************************************************************************
NOTE: Fusion welding is the preferred method for joining PVDF pipe. Threading can only be accomplished on Schedule 80 pipe.
******************************************************************************

PVDF pipe shall be joined by [thermal butt-fusion] [socket heat fusion] [or] [socket electric-resistance fusion], except where connecting to valves and equipment that may require future disassembly, then joints shall be [threaded] [or] [flanged]. Tubing connections shall use compression...
fittings.

2.12.4 PVDF Fittings

PVDF fittings shall be molded. Fittings shall have the same or higher pressure rating as the pipe when installed in accordance with the latest technical specifications. Flanges and flanged fittings shall be Class [125] [____], [one piece, molded hub type, flat faced, and conforming to [ASME B16.1] [ASME B16.5]] [[ASTM A240/A240M, TP304 stainless steel] [____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Flanges shall be complete with one-piece, molded PVDF stub ends]. Flanged connections shall have the same pressure rating as the pipe or greater. Bolting shall be stainless steel, ASTM A193/A193M, Grade [B8] [B8M] [____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [____] hex head nuts. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall be full-faced, maximum [3] [____] mm [1/8] [____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [____] in accordance with ASME B16.21. When the mating flange has a raised face, a flat ring gasket shall be used and a filler gasket shall be provided between outer diameter of the raised face and the flange outer diameter to protect the PVDF flange from bolting moment. Tubing fittings shall be compression type comprised of [forged brass alloy C37700, conforming to ASTM B124/B124M [____], nuts, ferrules and bodies] [acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [____] nuts and bodies, with elastomeric O-ring seals [polypropylene] [____] bodies, barb and holding nut] [____], rated to a minimum [____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.13 ACRYLONITRILE-BUTADIENE-STYRENE (ABS) Piping

**************************************************************************

NOTE: ABS piping is resistant to many chemicals, however, for mixed waste systems chemical analyses and corrosion testing may be necessary to properly select the piping system. The recommended maximum temperature for continuous liquid applications is 82 degrees C 180 degrees F.

Verify acceptance and installation of ABS piping systems with local code enforcement authorities having jurisdiction.

**************************************************************************

2.13.1 ABS Pipe

ABS, ASTM D3965, minimum cell classification [42222][____], pipe shall be Schedule [40][80] conforming to ASTM D1527, so that the pressure rating of the pipe shall be consistent for all pipe sizes. The pipe shall be SDR [_____] with a pressure rating of [____] MPa psig at [____] degrees C degrees F. Where ABS pipe is subjected to severe temperature fluctuations, provisions for expansion and contraction must be provided. This shall be accomplished with the use of expansion joints and offset piping arrangements.

2.13.2 ABS Joints

Pipe shall be joined by solvent cementing, except where connecting to valves and equipment that may require future disassembly, then [flanged] [____] joints shall be provided.
2.13.3 ABS Fittings

ABS fittings shall be molded. Fittings shall have the same or higher pressure rating as the pipe when installed in accordance with the specifications. Flanges and flanged fittings shall be Class [125][____], [one piece, molded hub type, flat faced, and shall conform to [ASME B16.1][ASME B16.5)) [(ASTM A240/A240M, TP304 stainless steel) [____] backing flanges with [ASME B16.1][ASME B16.5] drilling. Flanges shall be complete with one-piece, molded ABS stub ends]. Flanged connections shall have the same pressure rating as the pipe or greater. Bolting shall be stainless steel, ASTM A193/A193M, Grade [B8][B8M][____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [____] hex head nuts. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall be full-faced, maximum [3.2 mm 0.125 inch] [____] mm inch] thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [____] in accordance with ASME B16.21. When the mating flange has a raised face, a flat ring gasket shall be supplied and a filler gasket shall be provided between outer diameter of the raised face and the flange outer diameter to protect the ABS flange from bolting moment.

2.13.4 ABS Solvent Cement

Socket connections shall be joined with ABS solvent cement conforming to ASTM D2235. Viscosity shall be as recommended by the pipe and fitting manufacturer to assure compatibility.

2.14 POLYETHYLENE (PE)

******************************************************************************
NOTE: The requirements listed below are for normal pressure applications, and where operating temperatures will not exceed 38 degrees C 100 degrees F. For more difficult installations and/or higher temperatures, the ASTM D3350 cell classification should be carefully chosen. In addition, use the cell classification to specify UV stabilizers and color additives.
******************************************************************************

2.14.1 PE Pipe

The pipe shall be extruded from PE, ASTM D3350 with a minimum cell classification of [32433-C] [____]. The PE pipe shall be [Schedule [40] [80)] [[manufactured to an SDR rating in accordance with ASTM D3035 for piping systems less than 100 mm 4 inch in diameter, or in accordance with ASTM F714 for piping systems with a diameter equal to or greater than 100 mm 4 inch] [manufactured to an SDR rating in accordance with ASTM D2239 for use with insert fittings], so that the pressure rating of the pipe shall be consistent for all pipe sizes. The pipe shall be SDR [____] with a pressure rating of [____] MPa psig at [____] degrees C degrees F] [Schedule 40 conforming to ASTM D2239 for use with insert fittings] [____].

2.14.2 PE Tubing

Tubing shall be flexible [low-density PE conforming to ASTM D3350, minimum cell classification [____], and dimensioned in accordance with ASTM D2737] [crosslinked PE conforming to ASTM D3350, minimum cell classification}
UFGS

[35400] [_____], and dimensioned in accordance with ASTM F876 with nominal size [in accordance with Pipe Schedule] [_____].

2.14.3 PE Joints

PE pipe shall be joined by [thermal butt-fusion] [socket heat fusion] [and/or] [socket electrofusion], except where connecting to valves and equipment that may require future disassembly, then joints shall be [threaded [polystyrene] [_____] fittings] [or] [flanged].

2.14.4 PE Fittings

PE fittings shall have the same or higher pressure rating as the pipe when installed in accordance with the latest technical specifications. PE fittings shall be molded. Butt-fusion fittings shall conform to ASTM D3261. Socket-fusion fittings shall conform to ASTM D2683 with tools meeting the requirements of ASTM F1056. Insert fittings shall conform to ASTM D2609.

2.14.4.1 Couplings

Couplings and saddle joints shall be joined by electrofusion in accordance with ASTM F1055.

2.14.4.2 Flanged Fittings

Flanges and flanged fittings shall be [Class [125] [_____]], [ASTM A240/A240M, TP304 stainless steel] [_____] backing flanges with [ASME B16.1] [ASME B16.5] drilling. Flanges shall be complete with one-piece, molded PE stub ends. Flanged connections shall have the same pressure rating as the pipe or greater. Bolting shall be stainless steel, ASTM A193/A194M, Grade [B8] [B8M] [_____] hex head bolts and ASTM A194/A194M, Grade [8] [8M] [_____] hex head nuts. Bolts shall be provided with washers of the same material as the bolts. Gaskets shall be full-faced, maximum [3] [_____] mm [1/8] [_____] inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [_____] in accordance with ASME B16.21.

2.14.4.3 Tubing Fittings

Fittings shall be compression type comprised of [forged brass alloy C37700, conforming to ASTM B124/B124M [_____], nuts, ferrules and bodies] [[acetal] [polypropylene] [polyvinylidene fluoride (PVDF)] [_____] nuts and bodies, with elastomeric O-ring seals] [[polypropylene] [_____] bodies, barb and holding nut] [_____], rated to a minimum [_____] kPa psig with straight threads conforming to [ISO 228-1] [ASME B1.1].

2.15 RUBBER/ELASTOMER PIPING SYSTEM

**************************************************************************
NOTE: Rubber/elastomer piping systems are generally useful in applications requiring unusual flexing, resilience and abrasion service.
**************************************************************************

2.15.1 Elastomeric Hose

Elastomeric hose shall consist of an elastomeric tube, [reinforced] [not reinforced], and [with] [without] an external cover. The hose shall conform to RMA IP-2 Class [212-A] [_____], rated for [1.03 MPa 150 psig]
[_____] MPa psig with a minimum burst pressure of [4] [_____] times the rated working pressure. The hose shall be a nominal diameter [of [_____] mm inch] [as indicated in the Pipe Schedule in the contract drawings] with tolerances conforming to RMA IP-2. The minimum bend radius shall be [6] [_____] times the hose internal diameter.

2.15.1.1 Elastomeric Tube

The hose tube shall be composed of [fluoro-elastomer] [isobutylene isoprene] [butadiene acrylonitrile] [chloroprene] [natural polyisoprene] [_____], [ASTM D2000 Grade [_____]], Type [_____], Class [_____] base requirements] [_____] materials.

2.15.1.2 Tube Reinforcement

[The tube shall be strengthened with [one] [_____] wire-braid] [two spiral wire and one wire-braid] [two rayon-braid] [one textile-braid and one wire-braid] [synthetic-fiber] [[four] [six] -ply, [light] [heavy] spiral-wire] [_____] reinforcement.] [The tube shall not be reinforced.]

2.15.1.3 Hose Cover

[The hose shall be protected with a [synthetic rubber] [thin, nonskive] [textile-braid] [thermoplastic] [_____] cover.] [The hose shall not have a cover.]

2.15.2 Hose Joints

[Hose shall be continuous, without joints] [Hose shall be supplied cut to length with integral end connections] [Hose shall be joined using [swaged] [crimped] [insert] [internally expanded - full flow] [_____] fittings]. [_____].

2.15.3 Fittings For Elastomeric System

All fittings shall be supplied by the same manufacturer. Fittings shall join to the hose assembly as specified. Fittings shall be [supplied in accordance with the Pipe Schedule in the contract drawings and] shall be constructed of [aluminum] [TP304 stainless steel] [TP316 stainless steel] [_____]. Interconnections shall be accomplished through integral couplers configured as [ASME B1.20.7 threaded] [quick connect interlocking] [compression ring] [_____] couplings.

2.16 FIBERGLASS REINFORCED PLASTIC (FRP) PIPING SYSTEM

**************************************************************************
NOTE: Consult a reputable manufacturer to determine the FRP type for given application and temperature.
Temperature is ambient if unlisted.
**************************************************************************

Submit the name and qualifications of the manufacturer's representative and written certification from the manufacturer stating that the representative is technically qualified to supply and install FRP piping systems. All FRP pipe, fittings, and flanges for each system shall be provided complete by one manufacturer and shall have a design internal pressure rating [in accordance with the Pipe Schedule in the contract drawings] [of 0.69 MPa 100 psig] [of [_____] MPa psig], as specified in ASTM D2310 and ASTM D2992.
2.16.1 FRP Pipe

The pipe shall be FRP pressure pipe conforming to ASTM D3754 Type [1] [2] [3] [4], liner designation [____], surface layer grade [____], pressure Class [____], pipe stiffness [____]. Size shall be [in accordance with the Pipe Schedule in the contract drawings] [____] mm inches [____]. The inside diameter of the pipe shall be consistent with the inside diameter of the fittings.

2.16.2 FRP Joints

The pipe shall be joined using [axially unrestrained bell and spigot gasket joints, conforming to ASTM D4161, with elastomeric gaskets meeting the requirements of ASTM F477] [butt-joints with laminated overlays in accordance with ASTM D3754] [bell and spigot joints with laminated overlays in accordance with ASTM D3754] [adhesive bonded bell and spigot joints in accordance with ASTM D3754] [flanged] [____].

2.16.3 FRP Fittings

Fittings, other than flanges, shall conform to [ASTM D5685] [____]. Filament wound fittings shall be of the same thickness specified for adjoining pipe or duct. Other fitting types shall be of the minimum pipe wall thickness required for the specified pressure class. Contact molded flanges and flanged fittings shall conform to ASTM D5421 Type [A] [B], Grade [____], Class [I] [II], pressure rating [____]. All other flange types shall conform to ASTM D4024 Type [____], Grade [____], Class [____], pressure rating [____]. Flanges mating with flanges on thermoplastic-lined steel pipe shall be ductile iron castings, ASTM A395/A395M or cast steel, ASTM A216/A216M Grade WCB, Van Stone type, conforming to [ASME B16.1] [ASME B16.5] Class [150] [____].

2.16.3.1 FRP Bolting

With flat ring gaskets, the bolting shall be stainless steel, ASTM A193/A193M Grade [B8] [B8M] [____], hex head bolts and, ASTM A194/A194M Grade [B8] [B8M] [____], hex head nuts. Bolts shall be provided with washers of the same material as the bolts.

2.16.3.2 FRP Gaskets

Gaskets shall be full-faced, maximum [3.2 mm 0.125 inch] [____] mm inch thick, fabricated from [ethylene propylene rubber (EPR)] [chloroprene rubber] [polytetrafluoroethylene (PTFE)] [____]. When the mating flange has a raised face, a flat ring gasket shall be used and a filler gasket shall be provided between the outer diameter of the raised face and the flange outer diameter in order to protect the FRP flange from the bolting moment. When mating a FRP flange, Van Stone type, to a thermoplastic-lined steel pipe, a [polytetrafluoroethylene (PTFE)] [____] enveloped, flat ring type gasket shall be used in accordance with ASTM F336.

2.17 DOUBLE CONTAINMENT PIPING SYSTEM

*************************************************************************
NOTE: Due to the difficulty of proper installation of double containment pipe, double containment piping should only be specified when it is absolutely required. Refer to the Handbook of Double Containment Piping Systems, Christopher G. 
Submit manufacturer's engineering end load calculations for anchors in double containment piping systems. Double containment piping systems shall conform to the requirements of ASME B31.3.

2.17.1 Primary (Carrier) Pipe

The primary, or carrier, pipe of the double containment piping system shall be [[PVC][CPVC][PVDF][PE][_____] [Schedule [40] [80] [_____] [SDR [_____]][TP304 stainless steel, Schedule [10] [40] [_____]][FRP], pressure class [_____] [_____]], as specified elsewhere in this Section. The primary piping shall be rated at a working pressure of at least [_____] MPa psig at a maximum operating temperature of [_____] degrees C degrees F. The piping shall be free of flanges and other joints that are not compatible with the secondary piping installation. The piping shall be equipped with expansion loops, offsets, or direction changes as necessary to counter thermal expansion and contraction, which shall be coordinated with the secondary piping.

2.17.2 Secondary (Containment) Pipe

The secondary, or containment, pipe of the double containment piping system shall be [[PVC][CPVC][PVDF][PE][_____] [Schedule [40] [80] [_____] [SDR [_____]][carbon steel, Schedule [40] [80] [_____] [TP304 stainless steel, Schedule [10] [40] [_____] [_____], as specified elsewhere in this Section. The secondary piping shall be resistant to weathering, impacts, and ambient temperature variations, and rated at a working pressure of at least [_____] MPa psig at a maximum operating temperature of [_____] degrees C degrees F. The piping shall be equipped with expansion joints, expansion loops, offsets, or direction changes as necessary to counter thermal expansion and contraction. Equipment for addressing thermal movement shall be coordinated with the primary piping. The secondary piping shall be drainable and dryable [, and capable of being tested using air pressure]. The secondary piping system shall be [compartmentalized] [continuous] and equipped with drains at all low points and vents at all high points. Pressurized secondary piping systems shall be equipped with pressure relief devices. Drains, vents and pressure relief devices shall be provided as specified elsewhere in this Section. The piping shall be designed to allow pulling of the leak detection cable into the containment pipe both during and after piping installation. Minimum annular clearance shall be [19] [_____] mm [0.75] [_____] inch. Containment pull ports shall be located a maximum of [150] [_____] m [492] [_____] feet apart for straight runs and reduced by [45] [_____] m [148] [_____] feet for every 90 degree change in direction.

2.17.3 Cathodic Protection For Double Containment System

Buried ferrous piping shall have cathodic protection.

2.17.4 Connections and Fittings For Double Containment System

All fittings shall be factory manufactured of material compatible with the process fluids and associated piping. [All secondary contained fittings
shall be of unitized construction with the carrier and containment integrally anchored together to prevent the movement of the carrier relative to the containment within the fitting.] Anchors shall be of sufficient thickness to withstand the maximum possible end loads that will be generated by the carrier pipe during the life of the system. [Elbows must be anchored on both ends.] [Tees must be anchored on both the run and the branch.]

2.17.4.1 Fitting Pressure Rating

Pressure rating of connections and fittings shall be greater than or equal to the design pressure of the system with a minimum safety factor of [five] [____].

2.17.4.2 End Seals

End seals and other subassemblies shall be designed and factory prefabricated to prevent the ingress of moisture into the system. Subassemblies shall be designed to allow for complete draining of the secondary containment.

2.17.5 Leak Detection

The leak detection system shall be a [cable detection] [sensing probe] [visual detection] system. [The leak detection system shall be equipped with an electronic monitoring and control unit.]

2.17.5.1 Leak Detection Monitoring Unit

The monitoring unit shall be microprocessor based. The monitoring unit shall indicate when any liquid leaks into the secondary containment piping by sounding an alarm, actuating output relays, displaying a message that a leak has been detected and the location of that leak. The unit shall be capable of monitoring [sensor cables] [probe sensors] [and] [switch sensors]. The monitoring unit power requirements shall be [120] [240] [____] VAC, [60] [____] Hz, [single] [____] phase. Monitoring units shall be equipped with [an RS-232 communication port] [and] [one common and one SPDT output relay per cable, rated for 250 VAC, 10 amp]. [A complete cable-type leak detection and location system consisting of a microprocessor based monitoring unit, sensor cable, probes, system layout map and auxiliary equipment required to provide continuous monitoring of the sensing strings for leaks, shorts, breaks and probe activation shall be furnished. If any of these conditions should occur at any point along the cable, an alarm shall sound, type of condition shall be clearly identified and the location clearly displayed. The system shall monitor the interstitial space of double contained piping.]

2.17.5.1.1 Enclosure

The monitoring unit shall be enclosed in a NEMA 250 Type [12] [____] enclosure. [The unit shall be Underwriters Laboratory (UL) listed and Factory Mutual approved to provide connections for intrinsically safe sensor circuits for use in Class [1] [____], Division [I] [____], Groups [C and D] [____] hazardous locations.] Ability to locate a leak shall not depend on battery backed up functions. In the event of power failure, system conditions and parameters shall be stored in nonvolatile memory allowing the unit to automatically resume monitoring, without resetting, upon restoration of power. An on-off switch shall be provided in the panel for servicing. [A NEMA 250 Type 4X outer enclosure shall be furnished with
a viewing window for mounting outdoors] [A NEMA 250 Type 7 explosion proof outer enclosure shall be furnished] [______].

2.17.5.1.2 Relay Outputs

The system shall provide relays for remote indication of an alarm condition. The relays shall provide indication that no alarm conditions exist, an alarm condition exists but has not yet been acknowledged, and an alarm condition exists and has been acknowledged. [Communications shall be available via RS-232 and ASCII communication protocols to allow central point monitoring and control via a remote computer.]

2.17.5.1.3 Storage Memory

The system shall record significant events in permanent memory. A minimum of [_____] events shall be stored. When the memory becomes full, the recorded events shall be deleted from memory in sequential order beginning with the oldest event. Each recorded event shall include the time and date that the event occurred. [Archives shall be retrievable through RS-232 and ASCII communication protocols.]

2.17.5.1.4 Status Indication

The system shall continuously provide positive indication that it is monitoring the sensing string and the status of the sensing string.

2.17.5.1.5 Security

The system shall have assignable password security. The system shall have multilevel security passwords for access to operating functions with recording of all password entries to nonvolatile memory.] The system shall not permit unauthorized modifications to the sensing string to be made without causing an alarm condition.

2.17.5.2 Cable System

Submit an as-built location map for the cable leak detection system in double containment piping systems indicating the as installed system configuration and sensing string layout. Marks in meters feet along the length of the cable shall be provided as references to locate leaks. [The sensor cable, connectors, [probes] and jumpers shall be supplied by the manufacturer of the monitoring unit.] The cable sensing principle shall provide for continuous monitoring while short lengths of the cable are in contact with liquids, without altering the system's sensitivity and/or accuracy. The cable system shall be a [conductance][ or ][impedance] type system.

2.17.5.2.1 Requirements

The leak detection system shall locate the point of origin of the first liquid leak within [0.1] [_____] percent of the sensor string length. The system shall identify the type of alarm as well as the location. The system shall be able to monitor (detect and locate) with up to [30 m 98.4 feet] [_____] m feet of wetted cable without significant inaccuracy in location. The system shall be capable of monitoring up to [600 m 1,970 feet] [_____] m feet of cable per sensor string from a single monitoring unit. [The system shall be capable of monitoring (detecting and locating) for multiple leaks or additional liquid on the sensor cable.]
2.17.5.2.2 Detection Capabilities

[The system shall be capable of detecting all liquids, including, but not limited to aqueous, hydrocarbon, and conductive and nonconductive liquids.] [Two cables shall be furnished to detect and differentiate between hydrocarbons/solvents and aqueous liquids.] [Only hydrocarbons are to be detected.] [Only acids are to be detected.] The sensitivity of the system shall be field adjustable to increase or decrease the amount of wetted cable needed to cause an alarm from several mm to inches to feet. The system shall be capable of identifying the location of breaks and shorts on the cable. When either of these faults occur, an alarm shall sound and a display visible on the front of the monitoring unit shall clearly indicate the type of fault and display the location of the fault.

2.17.5.2.3 Materials

The sensor cables shall be suitable for use with the monitoring unit. The sensor cables shall be of coaxial construction consisting of an insulated [copper] [_____] center conductor, a suitable spacer material, and an outer braid. Center conductors shall be not less than [twenty AWG] [_____] for mechanical strength. Cables shall be capable of field installation of connectors by trained technicians. The cable shall be available in bulk spools. All cables shall be field repairable by trained technicians.

2.17.5.3 Sensing Probes

Sensing probes for the leak detection system shall be [pH probes] [conductivity probes] [liquid level switches] [specific ion probes] [or] [pressure transducers].

2.17.5.4 Visual Leak Detection System

All low points of the secondary piping system shall be equipped with sample valves meeting the requirements specified in paragraph [SAMPLE PORTS] [_____] of this Section.

2.17.6 Supports

Supports shall be designed and supplied for the conveyance and containment piping to prevent distortion of the pipes and strain on joints and fittings. Supports shall be designed by the double containment piping system manufacturer. No field fabricated supports will be allowed. The manufacturer shall design and fabricate the system taking into account pressure and temperature requirements when placing the pipe supports. [Double supports shall be required throughout the system to minimize stresses due to point loading.] [Support clips will not be allowed.]

2.18 ISOLATION JOINTS AND COUPLINGS

*********************************************************************************************************************************************

NOTE: Isolation joints and couplings require gaskets for isolating and/or sealing. The gaskets are typically shaped to meet each particular manufacturer's coupling requirements and may not be interchangeable. Refer to manufacturers' catalogs for material compatibility and selection.

*********************************************************************************************************************************************
2.18.1 Dielectric Fittings

Dielectric fittings shall be provided between threaded ferrous and nonferrous metallic pipe, fittings and valves. Dielectric fittings shall prevent metal-to-metal contact of dissimilar metallic piping elements and shall be suitable for the required working pressure, temperature and corrosive application.

2.18.2 Isolation Joints

Isolation joints shall be provided between nonthreaded ferrous and nonferrous metallic pipe fittings and valves. Isolation joints shall consist of an isolation gasket of the dielectric type, isolation washers and isolation sleeves for flange bolts. Isolation gaskets shall be full faced with an outside diameter equal to the flange outside diameter. Bolt isolation sleeves shall be full length. Units shall be of a shape to prevent metal-to-metal contact of dissimilar metallic piping elements.

2.18.3 Metallic Piping Couplings

Thrust ties shall be provided where shown on the contract drawings and where required to restrain the force developed by 1.5 times the maximum allowable operating pressures specified. For metallic pipe other than ductile iron, thrust ties shall be attached with fabricated lugs. For ductile iron pipe, thrust ties shall be attached with socket clamps against a grooved joint coupling or flange. For exposed installations, zinc-plated nuts and bolts shall be used. However, high-strength, low-alloy steel, in accordance with AWWA C111/A21.11, may be substituted for use on cast iron and ductile iron couplings. For buried and submerged installations, stainless steel bolts and nuts shall be provided. Steel middle rings and followers shall be fabricated with fusion bonded epoxy-lined and coated in accordance with Section 09 90 00 PAINTS AND COATINGS and pressure tested beyond yield point.

2.18.3.1 Sleeve-Type Couplings

Sleeve-type couplings shall be used for joining plain end pipe sections in a flexible manner with a diameter to properly fit the pipe. A coupling shall consist of one steel middle ring, two steel followers, two elastomeric [wedge] section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. For pipe sizes between 13 through 40 mm 0.5 through 1.5 inch, the followers shall be ductile iron and the middle ring shall be in accordance with ASTM A513/A513M with AWWA C111/A21.11 bolting, [light pattern coupling]. For pipe sizes 50 mm 2 inch and larger, the followers shall be [ASTM A395/A395M] and the middle ring shall be [ASTM A513/A513M] with AWWA C111/A21.11 bolting, [light pattern coupling]. Gaskets shall be natural rubber [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric]. [Split sleeve-type couplings may be used in aboveground installations under special situations and when approved in advance by the Contracting Officer.]

2.18.3.2 Transition Couplings

Transitional couplings may be used to connect two pipes of the same material that have small differences in outside diameter. A fully assembled transitional coupling shall be sized to properly fit pipe
diameters. The coupling shall consist of one [steel] [ductile iron] [_____] middle ring, two [steel] [ductile iron] [malleable iron] [_____] followers, two elastomeric [wedge] [_____] section gaskets and elliptic-neck, track-head steel bolts designed to properly compress the gaskets. The coupling shall use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____], [wedge] [insulated] gaskets. The coupling shall be sized to match the associated piping.

2.18.3.3 Flanged Coupling Adapters

Flanged coupling adapters shall be fully assembled units manufactured to meet [ASTM A126 Class [B] [_____]], cast iron. The flanges shall mate with [ASME B16.1] [ASME B16.5] [AWWA C207] Class [_____] flanges of the same nominal size. [A factory applied corrosion resistant coating shall be applied.] The coupling shall use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____], [wedge] [insulated] gaskets. Where pipe movement out of the adaptor may occur, proper anchorage of the pipe shall be provided [and couplings shall be furnished with lock pins]. The coupling shall be sized to match the associated piping.

2.18.4 Couplings for Nonmetallic Piping

2.18.4.1 Bellows Coupling

A bellows coupling shall have a minimum of two [polytetrafluoroethylene (PTFE)] [_____] convolutions unless otherwise shown, with [[ductile iron] [_____] flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [125] [150] [300] [_____]}, [_____] end connections, and metal reinforcing bands. The maximum allowable working pressure shall be [960 kPa 140 psig] [_____] at [49] [_____] degrees C [120] [_____] degrees F. Bolting shall be limited to restrain the force developed by [1.5] [_____] times the specified maximum allowable operating pressure. The coupling shall be sized to match the associated piping.

2.18.4.2 Compression Coupling

A compression coupling shall consist of one [steel] [_____] middle section, two [steel] [_____] mechanical nuts, two elastomeric gaskets and two machined steel lock rings. The coupling shall use [natural rubber] [butadiene acrylonitrile] [isobutylene isoprene] [ethylene propylene diene monomer (EPDM)] [ethylene propylene terpolymer (EPT)] [fluoro-elastomeric] [_____]}, [wedge] [insulated] gaskets. The maximum allowable working pressure shall be [1.03 MPa 150 psig] [_____] at [49] [_____] degrees C [120] [_____] degrees F. The coupling shall be sized to match the associated piping.

2.19 VALVE BOXES[, SERVICE BOXES][, VALVE MANHOLES][ AND VALVE PITS]

******************************************************************************

NOTE: Construction of valve manholes is to be avoided where feasible because of problems with dewatering/drainage and frostproofing. Use manually operated gate and butterfly valves suitable for direct burial and fitted with valve boxes in lieu of valves in manholes whenever possible. Review
The box length shall adapt [to the length required for the depth of the line] [to the depth of cover required over the pipe at the valve location] without full extension. Boxes shall be cast iron or concrete, except that concrete boxes may be installed only in locations not subjected to vehicular traffic. The boxes shall have housings of sufficient size to completely cover the valve or service stop and shall be complete with covers.

2.19.1 Valve Boxes

Cast-iron valve boxes shall have minimum metal thickness of 5 mm $\frac{3}{16}$ inch and boxes shall be extension type with slide-type adjustment and with flared base. Concrete boxes shall be the standard product of a manufacturer of precast concrete equipment.

2.19.2 Service Boxes

Service boxes shall be extension service boxes with either screw or slide-type adjustment.

2.19.3 Valve [Manholes] [or Pits]

Valve [manholes] [or pits] for automatic valves and meters installed below grade shall be constructed in accordance with Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES.

2.20 VALVES

NOTE: This paragraph will be coordinated with Section 33 61 13.19 VALVES, PIPING, AND EQUIPMENT IN VALVE MANHOLES. Material selection based on piping materials and liquid characteristics is also provided. For critical or hazardous applications, insert specific material requirements, grades and alloys, and standards rather than a general material name.

Valves are grouped together by type. If a valve is required for your application that is not listed, insert the valve specification and notify the Contracting Officer. Check manufacturer's catalogs to make sure valves selected are current. Operator options vary by both manufacturer and valve size.

2.20.1 General Requirements For Valves

Valves shall include operator, actuator, handwheel, chain wheel, extension stem, floor stand, worm and gear operator, operating nut, chain, wrench, and all other accessories required for a complete operation. The valves shall be suitable for the intended service. Renewable parts are not to be of a lower quality than those specified. [Valves shall be the same size as adjoining pipe]. Valve ends shall be compatible with adjacent piping.
system. An operator shall be sized to operate the associated valve for the full range of pressures and velocities. Valves will open by turning [counterclockwise] [______]. Operators, actuators, and accessories shall be factory mounted.

2.20.2 Valve Schedule

**************************************************************************

NOTE: Verify that the schedules are included in the contract drawings. Delete this subparagraph if the valve schedule is not used.

**************************************************************************

Submit a list of valve materials, pressure ratings, valve operator's materials, air supply pressure, electrical service, location, source of supply, and reference identification as indicated in the contract drawings. Provide a list of any special tools necessary for each valve type and appurtenances furnished for adjustment, operation, maintenance and disassembly. Requirements relative to this paragraph are shown on the [Valve Schedule] [and Operator Schedule] located [in the contract drawings] [______].

2.20.3 Factory Finishing

[Valves shall have an epoxy [lining and] coating in accordance with AWWA C550 unless otherwise specified. The epoxy shall be either a two-part liquid material or a heat-activated (fusion) material except that only a heat-activated material shall apply if a valve coating is specified as "fusion" or "fusion bonded" epoxy. The epoxy [lining and] coating shall have a minimum [0.180 mm 7.0 mils] [______ mm mils] dry film thickness except where it is limited by valve operating tolerances.] Exposed valves shall be finished in accordance with Section 09 90 00 PAINTS AND COATINGS. [Safety isolation valves and lockout valves with handles, handwheels, or chain wheels shall be painted "safety yellow."]

2.20.4 Check Valves

**************************************************************************

NOTE: "Check valves" are generally service oriented. Specific types of check valves should be specified for the specific applications; for example, the ball check valve is capable of passing solids. Rated operating pressures vary based on body and seat materials, size and other parameters such as wafer class. Consult manufacturer's information to select the appropriate rating for the application.

Piping plane and valve orientation may affect check valve performance. Certain types of check valves will only operate under specific conditions; for example, lift check valves can only operate in horizontal lines, and swing check valves can operate in either horizontal or vertical (flow up) positions.

**************************************************************************

2.20.4.1 Swing Check Valves

**************************************************************************
NOTE: The requirements on subpart c. below are based on general water service and AWWA ratings.

---------------------------------------------------------------------------------
Swing check valves shall conform to the following:

a. Swing check valves, 50 mm 2 inches and smaller, shall have a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] [_____] ends. Valves shall have a swing type, replaceable [butadiene acrylonitrile] [polytetrafluoroethylene (PTFE)] [_____] disc. Valves shall be rated for [1.4 MPa 200 psig] [_____] MPa psig] service.

b. Swing check valves, 65 mm 2.5 inches through 300 mm 12 inch, shall have a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [_____] ends. Valves shall have a bronze-mounted swing type, [bronze] [ductile iron] [cast iron] [_____] disc, [solid bronze] [ductile iron] [_____] hinges, and stainless steel hinge shaft [with outside lever and [weight] [spring]]. Valves shall be rated for [1.4 MPa 200 psig] [_____] MPa psig] service.

c. Swing check valves, 50 mm 2 inch through 900 mm 36 inch, shall conform to AWWA C508, and have [ASME B16.1 Class [_____] flanged], [welding], [mechanical joint] [grooved] [_____] end connections. Valves shall have a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, [bronze] [_____] -mounted disc, solid [bronze] [ductile iron] [_____] hinges, and a stainless steel hinge shaft. Valves 50 mm 2 inch through 300 mm 12 inch shall be rated for [1.2 MPa 175 psig] [_____] MPa psig] service and valves 350 through 900 mm 14 through 36 inch shall be rated for [1.03 MPa 150 psig] [_____] MPa psig] service at 60 degrees C 140 degrees F. Valves shall be fitted with an [adjustable outside lever and spring] [adjustable outside lever and weight]. An increasing-pattern body valve may be used where increased outlet piping size is shown.

2.20.4.2 Thermoplastic Check Valve

Thermoplastic check valves, 8 mm 0.25 inch through 400 mm 16 inch, shall be a [Y-check] [ball-check] design, manufactured of [polyvinyl chloride (PVC)] [chlorinated polyvinyl chloride (CPVC)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF)] [_____] with [flanged] [socket] [threaded, in accordance with ASME B1.20.2NASME B1.20.1] end connections. Valves shall be rated for [1.03 MPa 150 psig] [_____] MPa psig] service. Valves shall have [fluoro-elastomeric O-ring] [_____] seals and seats. [Discs shall be fitted with a polyvinyl chloride (PVC) coil guide.] [Caps shall be of hex design.]

2.20.4.3 Double Disc Swing Check Valve

Double disc swing check valves, 50 mm 2 inch through 1300 mm 52 inch, shall be wafer style, spring loaded swing check valve, with a [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] body, a [aluminum-bronze] [ductile iron] [stainless steel] [bronze] [carbon steel] [_____] disc, resilient seats, stainless steel hinge pin, and a stainless steel stop pin spring. Valves 50 mm 2 inch through 300 mm 12 inch
shall be rated for \[1.4 \text{ MPa} 200 \text{ psig}\] \[\text{______} \text{ MPa psig}\] service at 60 degrees C 140 degrees F and valves 350 mm 14 inch through 1300 mm 52 inch shall be rated for \[1.03 \text{ MPa} 150 \text{ psig}\] \[\text{______} \text{ MPa psig}\] service at 60 degrees C 140 degrees F.

2.20.4.4 Slanting Disc Check Valve

Slanting disc check valves, 50 mm 2 inch through 1500 mm 60 inch, shall be of a slanting or tilting disc design, with off-center pivot. Valve bodies shall be [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [______], and of a [two-piece] [wafer-style] design. Seats shall be [bronze] [stainless steel] [______] set on a [55] [______] -degree angle. Discs shall be [bronze] [ductile iron] [cast iron] [stainless steel] with pivot pin and bushing constructed of [TP304 stainless steel] [aluminum bronze] [______], [butadiene acrylonitrile] [______] disc seal, [TP316 stainless steel] [Monel] [______] spring, [bottom mounted buffer cylinder for cushion closing] [and] [valve disc position indicator]. Valves shall be rated for \[1.03 \text{ MPa} 150 \text{ psig}\] \[\text{______} \text{ MPa psig}\] service [and have [ASME B16.5] [ASME B16.1] Class [______] flanged end connections].

2.20.4.5 Silent Check Valve

Silent check valves shall conform to the following:

a. Silent check valves, 50 through 250 mm 2 through 10 inch, shall be wafer style, center guided valve with a [cast iron] [cast steel] [bronze] [TP316 stainless steel] [______] body, [bronze] [stainless steel] [______] trim, [butadiene acrylonitrile] [______] seat, and [bronze] [stainless steel] [______] springs. Valves shall be rated for [1.4 MPa 200 psig] \[\text{______} \text{ MPa psig}\] service at 60 degrees C 140 degrees F.

b. Silent check valves, 65 through 1050 mm 2.5 through 42 inch, shall be globe style, center guided valve with [ASME B16.1] [ASME B16.5] Class [125] [250] [______] flanged end connections, a [cast iron] [ductile iron] [cast steel] [bronze] [TP316 stainless steel] [______] body, [bronze] [stainless steel] [______] trim, [butadiene acrylonitrile] [______] seat, and [bronze] [stainless steel] [______] spring. Valves shall be rated for \[1.03 \text{ MPa} 150 \text{ psig}\] \[\text{______} \text{ MPa psig}\] service.

2.20.4.6 Ball Check Valve

Ball check valves, 25 mm 1 inch and larger, shall be in accordance with [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] ends, and [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [polyvinyl chloride (PVC)] [______] bodies with a cleanout and [floating] [sinking] type [hollow steel] [phenolic] [butadiene acrylonitrile covered metal] ball. [Flanges shall be ASME B16.1 Class [125] [______].] Valves shall be rated for \[690 \text{ kPa} 100 \text{ psig}\] \[\text{______} \text{ MPa psig}\] service and shall be suitable for vertical or horizontal flow.

2.20.5 Ball Valves

**************************************************************************

NOTE: Top or bottom entry bronze ball valves are not readily available. An end entry valve requires additional unions or ability to spring pipe clear in order to service valve. Flanged and wafer style valves can be readily removed.

SECTION 40 05 13 Page 63
2.20.5.1 General Purpose Ball Valves

General purpose ball valves shall conform to the following:

a. Ball valves, 50 mm 2 inch and smaller, shall be end entry type with [bronze] [brass] [_____] bodies and [threaded, in accordance with ASME B1.20.2][ASME B1.20.1] [soldered] [____], [full bore] [regular] ports. Valves shall have [polytetrafluoroethylene (PTFE)] [____] seats and packing, [chrome plated] [brass] [stainless steel] [____] balls and [hand lever] [tee-handle] [hand wheel] [pneumatically actuated] [electrically actuated] [____] operators. Valves shall be rated for [2.76 MPa 400 psig] [____] MPa psig service at 66 degrees C 150 degrees F and shall conform to ASME B16.34 Class [____]. [A union shall be installed adjacent to the valves to provide access to the seat.]

b. Ball valves, 65 mm 2.5 inch and larger, shall be end entry type with [bronze] [cast iron] [_____] bodies and [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.18 solder joint] [_____] ends. Valves shall have [polytetrafluoroethylene (PTFE)] [_____] packing and seats, a [chrome plated] [brass] [stainless steel] [____] ball, [regular] [full bore] ports, and [hand lever] [tee-handle] [hand wheel] [pneumatically actuated] [electrically actuated] [____] operators. Valves shall be rated for [2.76 MPa 400 psig] [____] MPa psig service at 66 degrees C 150 degrees F and shall conform to ASME B16.34 Class [____].

c. Ball valves, 50 to 300 mm 2 to 12 inch, shall conform to ASME B16.34 Class [____], and have a [cast iron] [ductile iron] [carbon steel] [TP316 stainless steel] [_____] body, stainless steel ball and stem, polytetrafluoroethylene (PTFE) packing and gasket, and [flanged] [welding] [_____] ends, full port. Valves shall be rated for [1.38 MPa 200 psig] [____] MPa psig service, and have [hand lever] [pneumatically actuated] [electrically actuated] [____] operators.

2.20.5.2 Multiple Piece Body Ball Valves

Multiple piece body ball valves, 40 to 150 mm 1.5 to 6 inch, shall have [three] [_____] piece bodies constructed of [stainless steel ASTM A276/A276M Grade [TP316] [____]] [cast steel ASTM A351/A351M Grade [CF8M] [____]] [ASTM A216/A216M] [_____] stainless steel. Valves shall have a [TP316] [____] stainless steel ball, and [ASME B16.11 threaded] [ASME B16.5 flanged] [_____] end connections. Valves shall be rated for [6.89 MPa 1000 psig] [____] service and shall conform to ASME B16.34 Class [____]. Valves shall have [reinforced polytetrafluoroethylene (PTFE)] [_____] seats and stem packing, shall be [full] [standard] bore, and shall be equipped with [handwheel] [hand lever] [tee-handle] [pneumatically actuated] [electrically actuated] [____] operators.

2.20.5.3 Thermoplastic Ball Valve

Thermoplastic ball valves, 150 mm 6 inch and smaller, shall be rated for [1.03 MPa 150 psig] [1.55 MPa 225 psig] [____] MPa psig service at 49 degrees C 120 degrees F, and have ASTM D1784, minimum cell classification [____], [polyvinyl chloride (PVC)] [chlorinated polyvinyl chloride (CPVC)] [ASTM D3222 polyvinylidene fluoride (PVDF)] [____] bodies, balls, and stems. Valves shall be end entry, double union design, with [solvent-weld
UFGS

socket] [threaded, in accordance with ASME B1.20.2M, ASME B1.20.1,] [flanged] [butt] [_____] ends connections, a [ethylene propylene diene monomer (EPDM)] [fluoro-elastomer] [_____] seat, and [fluoro-elastomer] [polytetrafluoroethylene (PTFE)] [ethylene propylene diene monomer (EPDM)] [_____] O-ring stem seals. Valves shall have [hand lever] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.6 Gate Valves

2.20.6.1 General Service Gate Valves

**************************************************************************
NOTE: The requirements on subpart b. below are based on general water service and AWWA ratings.
**************************************************************************

General service gate valves shall conform to the following:

a. Gate valves, 50 mm 2 inch and smaller, shall have [bronze] [_____] bodies and stems, [screwed] [union] [bolted] [yoke] bronze [_____] bonnets, single [solid] [split] wedge bronze discs, and [rising] [non-rising] stems. Valves shall be rated for [1.2 MPa 175 psig] [_____ MPa psig] service and conform to ASME B16.34 Class [____]. End connections shall be [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [_____] . Valves shall be equipped with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

b. Gate valves, 65 mm 2.5 inch and larger, shall have [Ni-resistant] [3 percent nickel-iron] [cast-iron] [_____] bodies with [iron] [bronze] [Ni-resistant stainless steel] [_____] trim. Valves shall meet the requirements of [AWWA C500] [AWWA C509] and have Class [125] [250] [_____] [flanged] [welding] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1,] [mechanical joint] [push-on] [_____] end connections. Bonnet shall be a [clamp] [OS&Y Bolted] [NRS Bolted] type. Discs shall be [wedge] [double] type of [iron] [bronze] [ductile iron] [_____] construction, and have [nonrising] [rising] stems [with backseats]. Each gate valve, 400 mm 16 inch and larger, shall include a by-pass of the same materials as the gate valve. The bypass shall meet the requirements of AWWA C500. Valves shall be rated for [1.4 MPa 200 psig] [_____ MPa psig] service. Valves shall be equipped with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.6.2 Thermoplastic Gate Valve

Thermoplastic gate valves, 13 mm1/2 inch and larger, shall have [ASTM D1784 polyvinyl chloride (PVC), minimum cell classification [_____],] [ASTM D1784 chlorinated polyvinyl chloride (CPVC), minimum cell classification [_____],] [_____] bodies, [bolted] [_____] bonnets, single [styrene butadiene rubber] [polypropylene] [_____] wedge discs, [non-rising] [rising] stems, and [flanged] [threaded, in accordance with ASME B1.20.2M ASME B1.20.1,] [_____] end connections. Valves shall be rated for [1.03 MPa 150 psig] [_____ MPa psig] service at 60 degrees C 140 degrees F. Valves shall be equipped with [handwheel] [_____] [pneumatically actuated] [electrically actuated] operators.
2.20.7  Globe Valves

2.20.7.1  General Requirements For Globe Valves

Globe valves, 80 mm 3 inch and smaller, shall be [angle pattern] [globe style] valve and shall have [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] bodies, with [bronze] [brass] [stainless steel] [_____] trim, and [bronze] [brass] [_____] bonnets. Valves shall conform to ASME B16.34 Class [_____], and shall have [ASME B16.11 socket-welding] [ASME B16.11 threaded] [ASME B16.5 flanged] [ASME B16.16 flanged] [ASME B16.18 solder joint] [_____] end connections. Valves shall include [union] [threaded] [OS&Y] bonnets, inside screws, rising stems, [plug] [needle] [conventional] discs constructed of [polytetrafluoroethylene (PTFE)] [butadiene acrylonitrile] [bronze] [stainless steel] [_____], and [bronze] [brass] [stainless steel] [_____] rings. Valves shall be rated for [1.4 MPa 200 psig] [_____] MPa [psig] service. Valves shall be equipped with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.7.2  Needle Valve

Needle valves, 25 mm 1 inch and smaller, shall be of a [straight] [angle] [cross] pattern and shall have [brass] [TP316 stainless steel] [_____] bodies and trim. Valves shall [conform to ASME B16.34 Class [_____] with ASME B16.11 [male] [female] threaded, in accordance with ASME B1.20.2M ASME B1.20.1),] [have tubing compression fittings, that match associated tubing fittings,] [_____] end connections. Valves shall include [threaded] [integral] [union] [_____] bonnets, [TP316 stainless steel] [_____] stems, [plug] [soft tip] [non-rotating ball] [_____] stem tips constructed of [polytetrafluoroethylene (PTFE)] [butadiene acrylonitrile] [bronze] [stainless steel] [_____], [fluoro-elastomer] [polytetrafluoroethylene (PTFE)] [ethylene propylene diene monomer (EPDM)] [_____] packing [and O-ring stem seals]. Valves shall be rated for [2.07 MPa 300 psig] [_____] MPa [psig] service. Valves shall be equipped with [toggle-handle] [handwheel] [tee-handle] [pneumatically actuated] [_____] operators.

2.20.7.3  Hose Valve

Hose valves, 20 through 80 mm 0.75 through 3 inch, shall be [globe style] [angle pattern] hose valves with [cast iron] [ductile iron] [carbon steel] [bronze] [TP316 stainless steel] [_____] bodies, [bronze] [stainless steel] [_____] trim, inside screws, rising stems, and [polytetrafluoroethylene (PTFE)] [rubber] [_____] disc. The outlet ports shall be [cast brass] [_____] in accordance with [ASME B1.20.2M ASME B1.20.1 pipe threads, male by male, nipple adapter with hexagonal wrench feature [and brass cap with chain]] [_____]. Valves shall be rated for [860 kPa 125 psig] [_____] MPa [psig] service.

2.20.8  Plug Valves

2.20.8.1  Eccentric Valve

Nonlubricated type eccentric valves, 80 mm 3 inch and smaller, shall be rated for [1.2 MPa 175 psig] [_____] MPa [psig] service at 60 degrees C 140 degrees F. Valves shall have drip-tight shutoff with pressure from either direction, and [cast iron] [bronze] [Ni-resistant] [acid resistant bronze] [aluminum] [carbon steel] [stainless steel] [nickel] [_____] bodies, in accordance with [ASME B16.6 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [AWWA C606 grooved] [_____] end connections, [all metal, matching
body [rubber lined] [_____] plugs with [round] [rectangular] ports, [stainless steel] [nickel] [_____] seats, self-lubricating [stainless steel] [Monel] [nickel] [_____] stem bearings, and [butadiene acrylonitrile] [polytetrafluoroethylene (PTFE)] [filled polytetrafluoroethylene (PTFE)] [fluoro-elastomer filled polytetrafluoroethylene (PTFE)] [_____] [U-cup] [_____] seals. [Valves shall conform to ASME B16.34 Class [_____.]] Valves shall be equipped with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.8.2 Lined Eccentric Valve

Nonlubricated type eccentric valves, 80 through 1350 mm 3 through 54 inch, shall be rated for [1.2 MPa 175 psig] [_____] MPa psig service at 60 degrees C 140 degrees F. Valves shall have drip-tight shutoff with pressure from either direction, and [cast iron] [bronze] [Ni-resistant] [aluminum] [carbon steel] [stainless steel] [nickel] [_____] bodies in accordance with [ASME B16.5 flanged] [ASME B16.1 flanged] [ASME B16.11 threaded] [AWWA C606 grooved] [AWWA C111/A21.11 mechanical joint] [_____] end connections. Plugs shall be cast iron with [round] [or] [rectangular] ports of no less than [80] [_____] percent of the connecting pipe area [and coated with] [butadiene acrylonitrile] [chloroprene] [fluoro-elastomer] [hard natural rubber] [_____.]. Valves shall have [stainless steel] [nickel] [_____] seats, self-lubricating [stainless steel] [reinforced polytetrafluoroethylene (PTFE)] [_____] stem bearings, and [multiple V-rings] [U-cups] [O-rings] stem seals [nitrile rubber] grit seals on the stems. [Valves shall be equipped with [handwheel] [pneumatically actuated] [electrically actuated] [_____] operators.] [Valves 150 mm 6 inch and smaller shall have a wrench lever manual operator and valves 200 mm 8 inch and larger shall have a totally enclosed, geared, manual operator with handwheel, 2-inch nut, or chain wheel.] [Valves shall conform to ASME B16.34 Class [_____.]]

2.20.9 Butterfly Valves

**************************************************************************
NOTE: Refer to AWWA C504 and manufacturers' data for valve selection and torque calculation data.
Only valves with high velocities, heavy grit loads, or severe throttling service should be specified with a seat in the body.
**************************************************************************

2.20.9.1 Standard Service Butterfly Valve

Butterfly valves, 50 mm 2 inch and larger, shall have [ASTM A126 cast iron] [ductile iron] [carbon steel] [stainless steel] [_____] bodies, [wafer] [lugged] styled [with [ASME B16.5 flanged] [ASME B16.1 flanged] [AWWA C111/A21.11 mechanical joint] [_____] end connections]. Valves shall conform to [AWWA C504 Class [125] [150] [_____.]] [ASME B16.34 Class [_____.]]. Discs shall be contoured [ASTM A436 Type 1 Ni-resist cast iron with maximum lead content of 0.003 percent] [ASTM A536 Grade 65-45-12 ductile iron] [stainless steel] [polyvinylidene fluoride (PVDF) coated ductile iron] [bronze] [_____.]. The valve shafts shall be [carbon steel] [stainless steel] [_____] with self-lubricating, corrosion-resistant sleeve type bearings. Valve seats for [600 mm 24 inch] [_____] and smaller valves shall be attached to either the valve body or the disc and shall be constructed of [chloroprene] [_____.]. Valve seats for valves larger than [750 mm 30 inch] [_____] mm inch shall be field replaceable in accordance...
with AWWA C504. Valves shall have [manual, locking hand lever] [hand wheel] [crank] [chain wheel] [pneumatically actuated] [electrically actuated] [_____] operators.

2.20.9.2 Thermoplastic Butterfly Valves

Thermoplastic butterfly valves, 40 mm 1.5 inch and larger, shall have [wafer] [lugged] style bodies constructed of [polyvinyl chloride (PVC)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF) coated ductile iron] [______]. Valves shall have [polyvinyl chloride (PVC)] [polyvinylidene fluoride (PVDF)] [polypropylene (PP)] [polytetrafluoroethylene (PTFE)] [______] discs, [ethylene propylene diene monomer (EPDM)] [fluoro- elastomeric] [butadiene acrylonitrile] [natural rubber] [ethylene propylene diene monomer (EPDM) backed] [______] seats, [ethylene propylene diene monomer (EPDM)] [polytetrafluoroethylene (PTFE)] [same material as seats] [______] seals, and [lever] [gear] [______] pneumatically actuated [electrically actuated] operators. Valves shall be rated for [1.03 MPa 150 psig] [______] service at 60 degrees C 140 degrees F.

2.20.10 Pinch Valves

**************************************************************************
NOTE: Pinch valves are commercially available in sizes ranging from 50 mm 2 inch to 1500 mm 60 inch. Consider using an enclosed bevel gear operator for valves 150 mm 6 inch and larger and above 500 kPa 72.6 psig. The pinch valve included is illustrative, consult manufacturers' catalogs for other styles, pressure ratings, and operators.
**************************************************************************

Pinch valves shall have [aluminum] [stainless steel] [carbon steel] [ductile iron] [cast iron] [______] bodies, in accordance with [ASME B16.1] [ASME B16.5 Class 125] [150] [______] flanged end connections, [natural rubber] [chloroprene] [chlorobutyl] [butadiene acrylonitrile] [fluoro-elastomeric] [ethylene propylene diene monomer (EPDM)] [______] seats, [full port] [double wall] [reduced port] [cone] [variable orifice] sleeves, and [manual] [pneumatically actuated] [electrically actuated] [upper] [and] [lower] pinch bars.

2.20.11 Diaphragm Valves

**************************************************************************
NOTE: Diaphragm valves are commercially available in sizes ranging from 15 mm 0.5 inch to 250 mm 10 inch depending upon the materials of construction. Contact manufacturers to confirm availability based upon size and material.
**************************************************************************

2.20.11.1 Standard Service Diaphragm Valve

Diaphragm valves, 13 mm 1/2 inch and larger, shall have [aluminum] [stainless steel] [carbon steel] [ductile iron] [cast iron] [______] bodies, [ASME B16.1] [ASME B16.5 Class 125] [150] [______] flanged [______] end connections and [natural rubber] [chloroprene] [chlorobutyl] [butadiene acrylonitrile] [fluoro-elastomeric] [ethylene propylene diene monomer (EPDM)] [______] seals, and are [manually] [pneumatically] [______]
actuated. Position indicators shall be provided to indicate diaphragm position. Valves shall be rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 60 degrees C 140 degrees F.

2.20.11.2 Thermoplastic Diaphragm Valve

Thermoplastic diaphragm valves, 13 mm 1/2 inch and larger, shall have [polyvinyl chloride (PVC)] [polypropylene (PP)] [polyvinylidene fluoride (PVDF)] [[_____] bodies, [ASME B16.1] [ASME B16.5 Class [125] [150] [_____] [flanged] [union socket] [butt-fusion] [_____] end connections and [ethylene propylene diene monomer (EPDM)] [polytetrafluoroethylene (PTFE)] [_____] seals, and shall be [manually] [pneumatically] [_____] actuated. Pneumatically operated valves shall be [fail-closed] [fail-open] [double acting]. Position indicators shall be provided to indicate diaphragm position. Valves shall be rated for [1.03 MPa 150 psig] [[_____] MPa psig] service at 20 degrees C 68 degrees F.

2.20.12 Self-Contained Automatic Valves

2.20.12.1 Pressure-Reducing Valve

**************************************************************************
NOTE: Verify that the valve schedule is included in the contract drawings.
**************************************************************************

Pressure-reducing valves, 13 mm 1/2 inch and larger, shall be [direct] [hydraulically] operated, diaphragm actuated, [pilot] [spring] controlled [angle] [globe] valves with [cast iron] [ductile iron] [steel] [aluminum] [stainless steel] [bronze] [_____] bodies. End connections shall be [ASME B16.1] [ASME B16.5 Class [150] [_____] flanged [ASME B16.11 [threaded] [socket-welded]]. Trim and stem shall be [stainless steel] [_____] . Valves shall be normally [open] [closed] to maintain a constant downstream pressure regardless of fluctuations in flow or upstream pressure [, and prevents backflow,] [and have externally mounted strainers with cocks]. Valves sizes and ratings shall be as [shown in the Valve Schedule on the contract drawings.] [as follows.] PCV [_____] mm inch, maximum flow of [_____] cubic m/s gpm with inlet pressure of [_____] MPa psig. Outlet pressure set at [_____] MPa psig.

2.20.12.2 Pump Control Valve

Pump control valve shall be [hydraulically operated, diaphragm actuated, pilot controlled globe valve with [cast iron] [ductile iron] [cast steel] [_____] bodies, [ASME B16.1] [ASME B16.5] Class [_____] flanged end connections, [bronze] [stainless steel] [_____] trim, stainless steel stems, and externally mounted strainers with cocks] [_____]. Valves shall be designed to eliminate pipeline surge caused by pump startup and shutdown, and shall include automatic check features.

2.20.13 Operators

2.20.13.1 Operator Schedule

**************************************************************************
NOTE: Verify that the operator schedule is included in the contract drawings. Delete this subparagraph if an operator schedule is not used.
**************************************************************************
Requirements relative to this paragraph are shown on the Operator Schedule located [in the contract drawings] [____].

2.20.13.2 Manual Operator

The force in a manual operator shall not exceed [175 N 39.3 pound] [[____] N pound] under any operating condition, including initial breakaway. The operator shall be equipped with gear reduction when force exceeds [175 N 39.3 pound] [[____] N pound]. The manual operator shall be a self-locking type or shall be equipped with a self-locking device. A position indicator shall be supplied on quarter-turn valves. Worm and gear operators shall be a one-piece design with worm-gears of gear bronze material. Worm shall be hardened alloy steel with the thread ground and polished. Traveling nut type operators shall have threader steel reach rods with an internally threaded bronze or ductile iron nut.

2.20.13.2.1 Exposed Operators

Exposed operators shall have galvanized and painted handwheels. Lever operators are allowed on quarter-turn valves [200 mm 8 inch] [[____] mm inch] and smaller. Cranks shall be supplied on gear type operators. If located off of the operator floor, chain wheel operator with tiebacks, extension stem, floor stands, and other accessories shall be provided to permit operation from normal operation level. Valve handles shall be capable of padlocking, and wheels shall be lockable with a chain and padlock.

2.20.13.2.2 Underground Operators

Buried service operators on valves larger than [65 mm 2.5 inch] [[____] mm inch] shall have a [50 mm 2 inch] [[____] mm inch] operating nut. Buried operators on valves [50 mm 2 inch] [[____] mm inch] and smaller shall have a cross handle for operation by a forked key. The moving parts of valve and operator shall be enclosed in housing to prevent contact with the soil. Buried service operators for quarter-turn valves shall be designed to withstand an input torque of [~610 N-m (450 foot-pound) 450 foot-pound] [[____] N-m foot-pound] of input torque at the fully open or fully closed positions, and shall be grease packed and gasketed to withstand a submersion in water to [70 kPa 10.2 psig] [[____] MPa psig]. Buried valves shall have extension stems, bonnets, and valve boxes.

2.20.13.3 Pneumatic Operator

**************************************************************************
NOTE: Associated transducers shall pneumatically provide the same pressure range as used by the actuator. Piston actuators shall not be used at less than 275 kPa 40 psig supply pressure. Include a safety vented isolation valve in the operator paragraph for use on air sets.
**************************************************************************

Pneumatic operators shall be provided complete with actuators, air sets, exhaust mufflers, speed controls, pilot solenoids, safety vented isolation valves, and accessories. The pneumatic operators shall be suitable for full operation range of valve at air supply pressure indicated. Actuators shall return the valve to the closed position upon loss of signal unless otherwise indicated. [Springs shall return valve to this failed position.]
Pneumatic operators shall be furnished with features noted on the [Operator Schedule] [Valve Schedule] in the contract drawings. [Limit switches shall be provided on all actuators.]

2.20.13.3.1 Cylinder Actuators

Cylinder actuators shall conform to ANSI/AWWA C541 and ANSI/AWWA C542, and operate with an air supply pressure of [550 kPa 80 psig] [[_____] MPa psig]. The nonswivel type shall be totally enclosed with travel stops and position indicator, and shall be factory lubricated and sealed, requiring no additional lubrication. The double acting type shall be nonmetallic for operation on nonlubricated air and shall have a [manual] [handwheel] override independent of the cylinder. The manual override shall be located [_____.]

2.20.13.3.2 Diaphragm Actuators

Diaphragm actuators shall have a spring return with a [steel or aluminum] [_____] diaphragm case and spring barrel, steel spring and actuator stem, and [fabric-reinforced chloroprene] [_____] diaphragm. The actuators used on quarter-turn valves shall include a totally enclosed valve actuating mechanism with adjustable travel stops and valve position indicator with manual override if indicated. The actuating mechanism shall be factory lubricated and sealed. Diaphragm actuators shall be sized and configured for the service indicated and an air supply pressure of [240 kPa 35 psig] [[_____] MPa psig].

2.20.13.3.3 Air Sets

The air set shall include a pressure regulator with internal relief, filter, outlet pressure gauge, and adjustable reduced pressure range as required by the valve actuator. The air set shall have an aluminum body and handwheel, safety vented lockout isolation valve, and gauge range [1.33 to 2] [[_____] times maximum operating pressure.

2.20.13.3.4 Limit Switches

Limit switches shall be single-pole, double-throw (SPDT) type, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type [4] [_____] enclosure, and adjustable for open and closed valve positions.

2.20.13.3.5 Positioners

The positioners for modulating actuators shall be pneumatic force balance instruments to control valve positions as a function of the input signals. The positioners shall accomplish positive positioning of valve by a mechanical feedback connection from the valve actuating mechanism. Position feedback shall be provided through a characterized linear cam to allow adjustment of valve positioning and input signal. The positioner shall be suitable for either a double acting or spring return actuator. The positioner shall have zero and span adjustment and be field reversible for direct or reverse action. Gauges shall be included for supply and output pressure and for input signal pressure. Modulating valve positioners shall operate on a [21 to 103 kPa 3 to 15 psig pneumatic] [or] [4 to 20 mA] [1 to 5 v dc] electric input signal unless otherwise indicated. [A positioner for dc input signal with transducers shall convert the electrical signal to the appropriate pneumatic signal. The transducer shall be [integral with the positioner] [or] [a separate component]. If separate, the transducer shall be factory mounted on the
pneumatic operator. Line electric power not shall not be required for transducer operation. Corrosion-resistant enclosures for positioners and transducers shall be splash- and moisture-proof with gasketed covers.

2.20.13.3.6 Solenoid Valve

A solenoid valve shall pilot the control actuator in the appropriate configuration for the type of actuator being controlled. A pilot operated diaphragm type solenoid valve shall have a [brass] [_____] body and resilient seat and operate with minimum operating pressure differential no greater than [70 kPa 10.2 psi] [_____] kPa psi and maximum operating pressure differential no less than [1.03 MPa 150 psi] [_____] MPa psi. Internal parts shall be corrosion-resistant. The solenoid valve shall have Class F molded coils for operation on 120 volts, 60-Hz, ac, unless otherwise indicated. The solenoid enclosure shall conform to NEMA 250 Type [4] [_____] . Solenoids on double acting cylinders for open-close and throttling valves shall be four-way with dual coils. Solenoids on spring return cylinders for open-close and throttling valves shall be three-way, spring return. An air exhaust muffler shall be furnished in the exhaust port of all actuator pilot solenoid valves.

2.20.13.4 Electric Operator

Electric operators shall be provided complete with actuators, speed controls and accessories. The actuators shall operate on [120 VAC, 60 Hz] [_____] with a [75] [_____] percent duty cycle and shall be equipped with an AC thermal overload protector with automatic rest, reversing (bi-directional) operation for use with quarter-turn valves, or rotating equipment to full rotation. Gearing shall be a two-stage planetary, permanently lubricated self-locking gear train with self-lubricating bearings; connections via male output staff. The start-up torque shall be [163 N-m 120 foot-pound] [_____] N-m foot-pound. The stall torque shall be [203 N-m 150 foot-pound] [_____] N-m foot-pound. [Two] [_____] travel stop limit switches with cams, internal, independent, adjustable, and actuated by cams shall be mounted on the drive shaft. A side mounted hand turn wheel shall be provided for a manual override. The actuators shall have a NEMA 250 Type [4] [_____] enclosure with a corrosion resistant, baked epoxy finish as standard. The actuator shall operate in a temperature range of -40 to plus 65 degrees C -40 to plus 150 degrees F. Actuators shall fail in last position unless otherwise indicated. Electric operators shall be furnished with features noted on the [Operator Schedule] [Valve Schedule] in the contract drawings. [Limit switches shall be provided on all actuators.]

2.20.13.4.1 Limit Switches

Limit switches shall be single-pole, double-throw (SPDT) type, rated 10 amps at 120 volts ac, housed in a NEMA 250 Type [4] [_____] enclosure, and adjustable for open and closed valve positions.

2.20.13.4.2 Positioners

The positioners for modulating actuators shall control valve positions as a function of the input signals. The positioner shall operate on [120 VAC, 60 Hz.] [_____] voltage. The mode of operation shall be [direct acting] [reverse acting]. Modulating valve positioners shall operate on a [4 to 20 mA] [1 to 5 v DC] [_____] input signal unless otherwise indicated. Corrosion-resistant enclosures for positioners shall be splash-and moisture-proof with gasketed covers.
2.20.14 Valve Accessories

2.20.14.1 Extension Bonnet for Valve Operator

All extension bonnets shall be provided as necessary, complete with stem and accessories applicable to the specific valve and operator.

2.20.14.2 Floor Stand and Extension Stem

A floor stand and extension stem shall be the nonrising, indicating type; complete with stem, coupling, handwheel, stem guide brackets, and yoke attachment. The stem guide shall be spaced such that stem L/R ratio does not exceed [200] [_____]_. Anchors shall be supplied as required.

2.20.14.3 Floor Box and Stem

A floor box and stem shall be the plain type, for support of nonrising type stem; complete with stem, operating nut, and stem guide brackets. The stem guide shall be spaced such that stem L/R ratio does not exceed [200] [_____]_. Anchors shall be supplied as required.

2.20.14.4 Chain Wheel and Guide

A chain wheel and guide shall be the handwheel direct-mount type, complete with galvanized or cadmium-plated chain.

2.21 DRAINS

Valved drains may not be shown on the detailed drawings for individual pipelines; their absence will not relieve the Contractor of the responsibility for providing and installing them as indicated in the piping and instrumentation diagrams to complete the piping system for the use intended.

2.21.1 Locations

[Drains shall be located as indicated on the contract drawings] [All pipeline low points shall be drained] [_____]_.

2.21.2 Sizes

For pipelines 65 mm 2.5 inch and larger, drains shall be [20 mm 0.75 inch] [[_____] mm inch] and equipped with [gate valves] [globe valves] [ball valves] [_____]_. For pipelines [50 mm 2 inch] [[_____] mm inch] and smaller, drains shall be [13 mm 1/2 inch] [[_____] mm inch] and equipped with [gate valves] [globe valves] [ball valves] [_____]_.

2.22 SAMPLE PORTS

**************************************************************************

NOTE: Sample port materials of construction typically match the piping system.

For highly critical situations where the materials being sampled are very hazardous or where valves may tend to clog or leak, the first sampling valve option is used to specify a sampling valve. Otherwise, the second option is used to specify the
UFGS

*************

[Sampling ports, shown on the flow diagrams and piping and instrument diagrams of the contract drawings, may not be shown on the detailed drawings of the individual pipelines; their absence shall not relieve the Contractor of the responsibility for providing them.] [Sample ports shall be provided as indicated in the piping and instrument diagrams to complete the piping systems for the use intended.] The sample ports shall be located in easily accessible locations, and shall avoid potential stagnant points and/or areas where material could collect. [A plug-type sampling valve with a stainless steel piston that extends beyond the inner surface of the pipe when closed shall be provided at [all the sampling ports] [the sampling ports indicated]. The piston shall be sealed by two compressible replaceable [polytetrafluoroethylene (PTFE)] [_____] rings, one above the discharge port, the other below the discharge port. The valve body shall be stainless steel Class [150] [_____] with a [male ASME B1.20.2M ASME B1.20.1 pipe threads] [_____] inlet connection and [female ASME B1.20.2ASME B1.20.1 pipe threads] [_____] outlet connection] [Sampling ports shall be comprised of pipe fittings, pipe, and [ball] [gate] [_____] valves which comply with material, temperature, and pressure requirements of the associated piping system as specified elsewhere in this Section.] [A double block and bleed configuration shall be provided] [_____.]

2.23 MISCELLANEOUS PIPING COMPONENTS

2.23.1 Air Release and Vacuum Breakers

**************************************************************************

Air release vents shall be located, and vented, such that a hazardous atmosphere will not be created upon operation.

2.23.1.1 Locations

[Air release and vacuum breakers shall be located as indicated on the contract drawings.] [All pipeline high points shall have air release vents [and vacuum breakers].] [_____.] [Vacuum breakers shall be provided on all tanks and process equipment.]

2.23.1.2 Vacuum Breakers

Vacuum breakers [50] [_____] mm [2] [_____] inch and smaller shall be an angle type with all [bronze] [cast iron] [semi-steel] [_____] bodies and bonnets, and shall [be installed at least [152] [_____] mm [6] [_____] inch above the flood line of associated equipment] [and] [shall conform to ASSE 1001 for pipe applied units].

2.23.1.3 Air and Vacuum Valve Suitable for Corrosive Service

The air and vacuum valve shall conform to [ASSE 1001] [ASSE 1020] [_____.], and automatically exhaust air during the filling of a system while allowing
air to re-enter during draining or when vacuum occurs. The valve shall be rated for \( 1.03 \text{ MPa} \) working pressure and built with a [special short body] [standard elongated body]. The valve shall have a [cast iron] [ductile iron] [semi-steel] body and cover, with [stainless steel] flat and trim. End connections shall be as follows: for 13 through 80 mm 1/2 through 3 inch ASME B1.20.2M, for 100 mm 4 inch and larger ASME B16.5 Class [ ] flanged inlet with outlet. The air and vacuum valve shall be fitted with blowoff valve, quick disconnect couplings, and a minimum \( 2 \text{ m} \) [6.6] feet of hose in order to permit back flushing after installation without dismantling the valve.

2.23.1.4 Air Release Valve Suitable for Corrosive Service

The air release valve shall automatically exhaust entrained air that accumulates in a system and shall be [Factory Mutual listed] [ASSE approved] [ ]. The valve shall be rated for \( 1.03 \text{ MPa} \) [ ] psig working pressure and built with a [special short body] [standard elongated body]. The valve shall have a [cast iron] [ductile iron] [semi-steel] body and cover, with [stainless steel] flat and trim. Valve end connections shall be ASME B1.20.2M, ASME B16.1 Class [ ] flanged [ ]. The air and vacuum valve shall be fitted with blowoff valve, quick disconnect couplings, and a minimum \( 2 \text{ m} \) [6.6] feet of hose in order to permit back flushing after installation without dismantling the valve.

2.23.1.5 Combination Air Valve Suitable for Corrosive Service

The valve combines the operating functions of both an air and vacuum valve and an air release valve. The air and vacuum portion shall automatically exhaust air during filling of a piping system and allow air to re-enter during draining or when a vacuum occurs. Air release portion shall automatically exhaust entrained air that accumulates in the piping system. The valve shall be a [single body unit] [or] [an individual air and vacuum valve and an air relief valve mounted on a common header]. The valve shall be rated for \( 1.03 \text{ MPa} \) [ ] psig working pressure and built with a [special short body] [standard elongated body]. The valve shall have a [cast iron] [ductile iron] [semi-steel] body and cover, with [stainless steel] flat and trim. Valve end connections shall be ASME B1.20.2M, ASME B16.1 Class [ ] flanged [ ]. [The air and vacuum valve to be fitted with a blowoff valve, quick disconnect couplings, and a minimum \( 2 \text{ m} \) [6.6] feet of hose in order to permit back flushing after installation without dismantling the valve.]

2.23.2 Backflow Preventer

*NOTE: Under process conditions, backflow prevention can be handled with either a double check valve assembly or a backflow preventer specifically manufactured for that purpose. The backflow preventer should be used if pressure loss is a concern. However, if the backflow prevention device is to be installed on a potable water line at a treatment plant and the potential for contamination of the potable water line exists, a backflow preventer specifically manufactured for that purpose must be used.*
The reduced pressure backflow preventer can be used on continuous duty systems only. The other backflow preventer can be used on either continuous or intermediate services.

The backflow preventer shall be identical in size to pipe. Total head loss through the complete backflow assembly shall not exceed [70] [_____] kPa [10.1] [_____] psi at rated flow.

2.23.2.1 Double Check Valve Assembly

The backflow preventer shall consist of two [check valves] [independently operating, spring loaded, "Y" check valves] rated for [1.25] [_____] MPa [175] [_____] psig service at 60 degrees C 140 degrees F, with [one isolation gate valve] [one isolation ball valve], [one differential relief valve], [and testing cocks]. Port size shall be [25] [_____] mm [1] [_____] inch and be ASME B1.20.2M ASME B1.20.1 threaded, [female] [male]. The check valve assembly shall be rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F. The assembly shall meet the requirements of [ASSE 1015] [AWWA C510].

2.23.2.2 Reduced Pressure Backflow Preventer

The assembly body shall be two independent [bronze] [epoxy coated cast iron] [_____] body check valves rated at [1.2] [_____] MPa [150] [_____] psig at 60 degrees C 140 degrees F, with an intermediate relief valve, and [isolation gate valve] [full-ported [ball valves] [gate valves] [_____] as testing cocks. [All internal parts shall be serviceable in-line.] Port sizes shall be [25] [_____] mm [1] [_____] inch and be ASME B1.20.2M ASME B1.20.1 threaded, [female] [______]. The reduced pressure backflow prevention assembly shall be rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F. The assembly body shall be in accordance with [AWWA C511] [ASSE 1013].

2.23.2.3 Backflow Preventer with Intermediate Vent

The assembly body shall be two independent [bronze] [epoxy coated cast iron] [_____] body check valves rated at [1.2] [_____] MPa [175] [_____] psig at 60 degrees C 140 degrees F, with an intermediate atmospheric vent, and [isolation gate valve] [full-ported [ball valves] [gate valves] [_____] as testing cocks. Port sizes shall be [25] [_____] mm [1] [_____] inch and be ASME B1.20.2M ASME B1.20.1 threaded, [female] [______]. The backflow prevention assembly shall be rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F. The assembly body shall be in accordance with [AWWA C511] [ASSE 1012].

2.23.3 Strainers

Strainers shall be [simplex] [duplex] with a [Y-pattern] [_____] body. Port sizes shall be [25] [_____] mm [1] [_____] inch and be ASME B1.20.2M ASME B1.20.1 threaded, [female] [male]. The strainers shall be rated for [1.03] [_____] MPa [150] [_____] psig working pressure at 65 degrees C 150 degrees F and conform to [ASTM F1199] [ASTM F1200]. The body shall be [cast bronze] [cast iron] [welded steel] [_____] with a [screwed bronze] [bolted iron] [_____] cap. The screen shall be heavy-gauge [stainless steel] [Monel] [_____] [30] [_____] mesh [and be equipped with a ASME B1.20.2MASME B1.20.1 pipe threaded blowoff hole].
2.23.4 Indicating Devices

**************************************************************************
NOTE: This subparagraph will be coordinated with requirements for remote or control instrumentation. The devices specified by this section may be in addition to the control instrumentation.
**************************************************************************

2.23.4.1 Pressure and Vacuum Gauges

Pressure and vacuum gauges shall be [stem] [flush] [semi-flush] [panel] [_____] mounted, with [phenolic] [aluminum] [glass filled nylon] [glass filled polypropylene (PP)] [stainless steel] [brass] [acrylonitrile-butadiene-styrene (ABS)] [_____] cases [equipped with safety pressure blowout backs] and [dry] [glycerine] [_____] filled) [_____] dials. The gauge sensors shall be [diaphragm] [C-Type Bourdon tube] [helical Bourdon tube] [bells] [_____] actuated and constructed of [phosphor bronze] [stainless steel] [Monel] [silicone rubber] [Inconel] [beryllium-copper] [_____] . The gauges shall be equipped with [brass] [Monel] [TP316 stainless steel] [alloy steel] [_____] threaded [8] [_____] mm [0.25] [_____] inch male] [female] connections. The dials of the gauges shall be [114] [152] [_____] mm [4.5] [6] [_____] inch in diameter with scale readings in [MPa and mm of mercury psig and inches of mercury] [_____] ranging from zero to approximately twice the anticipated process operating or equipment pressure. A slotted adjustable pointer shall be provided with accuracy to conform to [ASME B40.100, Grade A] [_____] . [A lever handled gauge cock and filter type snubber shall be provided.] [A snubber shall be installed between the pipeline and the gauge.] The gauges shall be isolated from the process fluids using remote corrosion resistant diaphragm seals. The housing of the corrosion resistant seals shall be constructed of [stainless steel] [Monel] [tantalum] [titanium] [polytetrafluoroethylene (PTFE)] [polypropylene (PP)] [polyvinyl chloride (PVC)] [Inconel] [Hastelloy] [_____] . Seals shall be composed of [stainless steel] [Monel] [Hastelloy] [nickel] [polytetrafluoroethylene (PTFE)] [_____] .

2.23.4.2 Thermometers

Thermometers shall be bi-metal actuated, with [127] [_____] mm [5] [_____] inch dished anti-parallax dials that have [external] [_____] calibration adjustment and [stainless steel] [_____] cases. Mercury shall not be used in thermometers. The thermometers shall have [stainless steel] [_____] stems, [adjustable angle] [back-connection] [left side-connection] [or] [right side-connection] type for the correct viewing angle. The union connections with associated thermowells shall be included. Scale shall be [—5 to plus 50 degrees C 25 to 125 degrees F] [_____] to [_____] degrees C degrees F] with accuracy within one scale division.

2.23.4.3 Thermowells

Thermowells shall be [TP316 stainless steel] [brass] [steel] [_____] with a diameter of [25] [_____] mm [1] [_____] inch. The length shall be as shown on the contract drawings and coordinated with the associated temperature element. Process connections shall be constructed of [stainless steel] [_____] and shall have [flanges, faced and drilled to ASME B16.5 Class [150] [300] [_____] ] [fixed hex nipples [male ASME B1.20.2MASME B1.20.1 threaded] [female ASME B1.20.2MASME B1.20.1 threaded sockets]] [_____] .

SECTION 40 05 13 Page 77
Thermowells that shall be used with thermocouples or RTDs shall be equipped with terminal connection heads rated NEMA 250 Type [4X] [4] [7] [____].

2.23.5 Static Mixer

The static mixer shall be designed to disperse the design flow, [____] cubic m/s gpm of added chemicals in a process flow stream with flows ranging from [____] to [____] cubic m/s gpm. The minimum allowable pressure drop shall be [____] kPa feet of water column. The maximum allowable pressure drop for the static mixer shall be [____] kPa feet of water column in accordance with the requirements of the process stream pumping system. The diameter of the mixer housing shall be sized identical to the process piping. The length shall be in accordance with the number of mixing elements required. Housing materials shall be [TP316 stainless steel] [____], providing chemical resistance to both the chemical additives and process stream. [The coatings on coated components shall be factory spark-tested to verify that the coating is free from pinholes.] End configurations shall be [plain ends] [ends prepared for welding] [ASME B1.20.2/ASME B1.20.1 threaded ends] [forged steel, [ASTM A105/A105M] [ASTM A727/A727M]] [____], flanged faced and drilled to [ASME B16.5] [ASME B16.1] Class [150] [300] [____] and shall compatible with the piping system. Injection ports shall be of the same materials as the mixer housing in the number, dimensions, and positions shown on drawings, and with [female ASME B1.20.2/ASME B1.20.1 threaded] [flanged] [____] connections compatible with the chemical feed piping system. Each housing shall be supplied with a name plate which at a minimum provides the manufacturer's name and address, part model number, and direction of flow. Mixing elements shall be constructed of [TP316 stainless steel] [____] providing resistance to both the chemical additives and process stream. Elements shall be installed consecutively, with the number required designed to provide mixing with a homogeneity of the final mix of less than or equal to [0.05] [____] by the end of the static mixer.

2.23.6 Expansion Joints

**************************************************************************
NOTE: Thermal expansion of the piping systems must be taken into account. One of the most common methods to accommodate thermal expansion, the incorporation of expansion loops into the piping system, should be carefully investigated when corrosive materials are handled due to the potential of inducing stress corrosion. Alternatives are expansion joints and flexible connections or sections. Calculate maximum expansion compensation based on maximum pipeline temperature and pressure.
**************************************************************************

Provide all structural work and equipment required to control expansion and contraction of piping. Verify that the anchors, guides, and expansion joints provided, adequately protect the piping systems.

2.23.6.1 Expansion Joint for Metallic Pipe

The expansion joint shall be a [single slip] [double slip] [ball] [bellows] [elastomer sleeve] [____] type with [stainless steel] [____] wetted materials of construction. The expansion joint shall be sized to match the associated piping. The maximum allowable working pressure shall be [1.03] [____] MPa [150] [____] psig at [48.9] [____] degrees C [120] [____]
degrees F. The expansion joint shall be sized for a maximum axial [compressing] [expanding] deflection of [_____] mm inches [a lateral movement of [_____] mm inch,] [and] [an angular rotation of [15] [_____] degrees.] End connections shall be [as specified for the associated pipe joints] [[ASME B16.5] [ASME B16.1] Class [_____] flanged] [ASME B16.11 [threaded] [welding]]. Required accessories for a complete assembly shall be provided including: [swivel joints,] [limit stops,] [internal guides,] [anti-torque device,] [internal flow liners,] [control rods,] [control cables,] [______].

2.23.6.2 Expansion Joint for Nonmetallic Piping

A bellows expansion joint shall have a minimum of [_____] convolutions to accommodate an axial deflection of [_____] mm inch, [a lateral movement of [_____] mm inch,] [and] [an angular rotation of [_____] degrees,] with [[ductile iron] [_____] flanged, faced and drilled to [ASME B16.1] [ASME B16.5] Class [125] [150] [300] [______],] [______] end connections, and metal reinforcing bands. The maximum allowable working pressure shall be [960] [_____] kPa [140] [_____] psig at [49] [_____] degrees C [120] [_____] degrees F. Bolting shall be limited to restrain the force developed by [1.5] [_____] times the specified maximum allowable operating pressure. The expansion joint shall be sized to match the associated piping.

2.23.7 Pressure Relief Devices

******************************************************************************
NOTE: Pressure relief devices must discharge to a safe location that does not endanger either operators or the environment. Discharge piping and the supports for the discharge piping must be carefully designed to prevent failure during a pressure relief event. Select all materials based upon the application; refer to manufacturers' catalogs.
******************************************************************************

Pressure relief devices shall conform to the requirements of ASME B31.3.

2.23.7.1 Pressure-Relief Valve

******************************************************************************
NOTE: Verify that the valve schedule is included in the contract drawings.
******************************************************************************

Pressure-relief valves shall conform to the following:
